### ATTRIBUTE AtmIf Vpt Uni Ptt txTrafficDescParm (txTdp)

| | |
|---|---|
| Access | Read: All<br>Write: All |

Description

This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled.

When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero.

When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero.

Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be

optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

Vector of — Decimal (0..2147483647)

Index — Decimal (1..5)

Default — ([5] 0)

## ATTRIBUTE AtmIf Vpt Uni Ptt rxTrafficDescParm (rxTdp)

Access — Read: All
Write: All

Description — This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in
cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC).

When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused).

When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused).

When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

## COMPONENT AtmIf Vpt Uni ServiceTrace (SrvTrace)

| | |
|---|---|
| Groups | "GROUP AtmIf Vpt Uni SrvTrace Operational" |
| Scope | Application |
| Description | *AtmIf/n [Vpt/m] Uni ServiceTrace*<br>*AtmIf/n [Vpt/m] Iisp ServiceTrace*<br>*AtmIf/n [Vpt/m] Pnni ServiceTrace*<br>*AtmIf/n [Vpt/m] Aini ServiceTrace* |

The *ServiceTrace* component of the ATM service determines if the trace capability is allowed on this service. If it is not provisioned, then a service trace session cannot be started on this service.

Currently, the ATM Trace features only support ***frAtmTraceRcvr*** and ***atmTraceRcvr*** features, if the name of a X25 or FR receiver is set to the *receiver* attribute of this component, the *Start* command responses with a “Receiver Not Supported” message.

## VERB Start AtmIf Vpt Uni SrvTrace

Impact: Service

Description:
*Start AtmIf/n [Vpt/m] Uni ServiceTrace*
*Start AtmIf/n [Vpt/m] Iisp ServiceTrace*
*Start AtmIf/n [Vpt/m] Pnni ServiceTrace*
*Start AtmIf/n [Vpt/m] Aini ServiceTrace*
This command starts a service trace session.

## VERB Stop AtmIf Vpt Uni SrvTrace

Impact: Service

Description:
*Stop AtmIf/n [Vpt/m] Uni ServiceTrace*
*Stop AtmIf/n [Vpt/m] Iisp ServiceTrace*
*Stop AtmIf/n [Vpt/m] Pnni ServiceTrace*
*Stop AtmIf/n [Vpt/m] Aini ServiceTrace*
This command stops a service trace session.

## GROUP AtmIf Vpt Uni SrvTrace Operational

Properties: Operational

Description: This group provides the operational attributes for the *SrvTrace* component.

### ATTRIBUTE AtmIf Vpt Uni SrvTrace receiverName (rcvr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started. |
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni SrvTrace duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active. |
| Values | Decimal (0..9999) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE AtmIf Vpt Uni SrvTrace queueLimit

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately. |
| Values | Decimal (1..100) |
| Units | Kbyte |
| Default | 20 |

## ATTRIBUTE AtmIf Vpt Uni SrvTrace session

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active. |
| Values | The name of the component |
| Default | No default |

## COMPONENT AtmIf Vpt Uni Reroute

| | |

### VERB OPTIMIZE AtmIf Vpt Uni Reroute

| | |
|---|---|
| Impact | Service |
| Description | *Optimize [-all] AtmIf/n Uni outeouteouteouteouteoute*sBy default, only connection segsforation. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection.<br>The *-all* option causes all connection segments subscribed to path optimization to be considered.s |

### GROUP AtmIf Vpt Uni Reroute LocalOperational (LOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the local rerouting activities at the interface level. |

### ATTRIBUTE AtmIf Vpt Uni Reroute localSubscribedConnections (lsub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that are subscribed to one or more local rerouting capabilities. Note that a given connection segment is subscribed to either local rerouting capabilities capabilities, not both. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni Reroute localEligibleRecoveredCon (lerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered using local rerouting and are eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni Reroute localIneligibleRecoveredCon (lirc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered by local rerouting but are not eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni Reroute localLastRrCauseCode (lrrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last local rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni Reroute localPathsOptimized (lPathsOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the paths that were successfully optimized by local rerouting or EBR during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP AtmIf Vpt Uni Reroute GlobalOperational (GOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the global and EBR rerouting activities at the interface level. |

### ATTRIBUTE AtmIf Vpt Uni Reroute globalSubscribedConnections (gsub)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the connection segments that are subscribed to one or more global and EBR rerouting capabilities. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni Reroute globalEligibleRecoveredCon (gerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connections that have been recovered by global and EBR rerouting and are eligible for global or EBR path optimization. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni Reroute globalIneligibleRecoveredCon (girc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connections that have been recovered by global and EBR rerouting but are not eligible for global or EBR path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni Reroute globalLastRrCauseCode (grrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last global or EBR rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Uni Reroute globalPathsOptimized (gPathsOpt)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the paths that were successfully optimized by global and EBR rerouting during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |

### GROUP AtmIf Vpt Uni Reroute Ov Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface. |

### ATTRIBUTE AtmIf Vpt Uni Reroute Ov protocol

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the rerouting protocols which are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting |

node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute.
***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values

localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsARtgPnniReroute (sameAs)

Default

sameAsARtgPnniReroute

## ATTRIBUTE AtmIf Vpt Uni Reroute Ov numOptAttempts

Access

Read and write

Description

This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better

optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Values: Decimal (0..15)
sameAsARtgPnniReroute (sameAs)

Default: sameAs

## ATTRIBUTE AtmIf Vpt Uni Reroute Ov moduleOptimizationConnections

Access: Read and write

Description: This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni Reroute* component.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute.
***none***: No connection segments are considered for path optimization.
***recoveredOnly***: Only connection segments which are foration. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
***allSubscribed***: All connection segments subscribed to path optimization are considered.

### GROUP AtmIf Vpt Uni Reroute Ov LocalProvisioned (LProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for EBR and local rerouting protocols. |

### ATTRIBUTE AtmIf Vpt Uni Reroute Ov localConnectionRecoverySubscr (lConRec)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which connection segments on the interface request subscription to local connection recovery. This attribute only affects connection segments that request the local |

rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local connection recovery.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local connection recovery and EBR connection recovery. Only one will be granted.

One or more of the following values can be specified:
***sameAsARtgPnniReroute:*** If this value is set, the local connection recovery subscription rule is determined by the *ARtg Pnni Reroute localConnectionRecoverySubscr* attribute. This value takes precedence over any other values.
***svcSvp***: If this value is set, all SVC and SVP connection segments request subscription to local connection recovery.
***sourceSpvcSpvp***: If this value is set, all source SPVC and SPVP connection segments request subscription to local connection recovery.
***transitSpvcSpvp***: If this value is set, all transit SPVC and SPVP connection segments request subscription to local connection recovery.

Set of — sameAsARtgPnniReroute (sameAs)

| Common Verbs | Help<br>List<br>Display |

## GROUP AtmIf Vpt Tm Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes for the *Tm* component to reflect operational traffic attributes. |

## ATTRIBUTE AtmIf Vpt Tm txTrafficDescType (txTdt)

| | |
|---|---|
| Access | Read only |
| Description | T his attribute indicates the type of traffic management which is applied to the transmit direction of this connection as defined in the ATM Forum. The *txTrafficDescType* determines the number and meaning of the parameters in the *txTrafficDescParm* attribute. |
| Values | 1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9 |
| Default | No default |

## ATTRIBUTE AtmIf Vpt Tm txQosClass (txQos)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the quality of service for the calling to called direction for this connection. This is only applicable to Soft PVC and SVC connections.<br><br>Class 1 supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video).<br><br>Class 2 supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video).<br><br>Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).<br><br>Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).<br><br>Class 0 is the unspecified QOS class; no objective is specified for the performance parameters.<br><br>A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance. |
| Values | 0<br>1<br>2<br>3<br>4<br>notApplicable |
| Default | No default |

## ATTRIBUTE AtmIf Vpt Tm txQueueLength (txQLen)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of cells in the transmit queue for this connection.<br><br>If this connection has *unshapedTransmitQueueing* attribute |

displayed as ***common***, this attribute displays the length of the common queue which is used for this ATM service category.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***fifo***, this attribute indicates the number of cells for this connection which are enqueued in a first-in-first-out queuing method for this ATM service category. This will only occur for connections on ATM IP cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the length of the per-VC queue.

For ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute displays the current number of cells in the link class queue used by this connection to buffer its traffic.

This attribute does not apply to basic *Vpt*s.

Values — Decimal (0..512000)

Units — cells

Default — No default

### ATTRIBUTE AtmIf Vpt Tm txQueueCongestionState (txQCong)

Access — Read only

Description — This attribute indicates the congestion state of the transmit queue for this connection.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the congestion state of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the congestion state of the per-VC queue.

The congestion state of a queue is indicated by a numeric value ranging from 0 to 3. When a queue is in a congested state x, only traffic with discard priority (DP) 0 to x are enqueued. Traffic with

DP > x is discarded.

For example, if the congestion state is 3, there is no congestion and all traffic is enqueued. Likewise, when the congestion state is 0, there is maximum congestion and only traffic with DP=0 is enqueued on that queue.

For ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute displays the current congestion state of the link class queue used by this connection to buffer its traffic.

This attribute does not apply to basic *Vpt*s.

Values: Decimal (0..3)

Default: No default

## ATTRIBUTE AtmIf Vpt Tm holdingPriority (hpri)

Access: Read only

Description: This attribute indicates the actual holding priority in effect for this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. Some applications, for example *Vcc Test*, may override the provisioned holding priority.

A value of ***notApplicable*** is displayed when this is an elastic connection. Holding priority does not apply to bandwidth elastic connections.

Holding priority has no effect if the equivalent cell rate (ECR) for a connection is zero.

This attribute does not apply to *Vpt Vcc*s.

Values:
0
1
2
3

4
notApplicable

Default No default

### ATTRIBUTE AtmIf Vpt Tm rxTrafficDescType (rxTdt)

Access Read only

Description This attribute indicates the type of traffic management which is applied to the receive direction of this connection as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute.

Values
1
2
3
4
5
6
7
8
9

Default No default

### ATTRIBUTE AtmIf Vpt Tm rxQosClass (rxQos)

Access Read only

Description This attribute indicates the quality of service for the called to calling direction for this connection. This is only applicable to Soft PVC and SVC connections.

Class 1 supports a QOS that meets Service Class A performance requirements (circuit emulation, constant bit rate video).

Class 2 supports a QOS that meets Service Class B performance requirements (variable bit rate audio and video).

Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class 0 is the unspecified QOS class; no objective is specified for the performance parameters.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Values

0
1
2
3
4
notApplicable
sameAsFwd

Default

No default

## ATTRIBUTE AtmIf Vpt Tm atmServiceCategory (service)

Access

Read only

Description

This attribute indicates the ATM service category used for traffic in both directions of the connection.

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to have significantly reduced value for the application.

The ***rtVariableBitRate*** service category is intended for real time applications; that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced

value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non-real time applications, that is those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Values
unspecifiedBitRate (ubr)
constantBitRate (cbr)
rtVariableBitRate (rtVbr)
nrtVariableBitRate (nrtVbr)
availableBitRate (abr)

Default
No default

## ATTRIBUTE AtmIf Vpt Tm trafficShaping (trShaping)

Access
Read only

Description
This attribute indicates the traffic shaping state of the connection.

A value of ***notApplicable*** indicates that traffic shaping is not applicable or not supported for this connection. This is the case:
- when the *txTrafficDescType* is 1 or 2.
- for standard *Vpt Vcc*s and basic *Vpt*s.
- for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, when the *atmServiceCategory* is ***constantBitRate***.

In these cases, the value of ***notApplicable*** is indicated regardless of whether traffic shaping is enabled or disabled in the provisioning data.

A value of ***disabled*** indicates that traffic shaping is applicable and supported for the type of connection but has been turned off in the provisioning data.

A value of ***linear*** or ***inverseUpc*** indicates that traffic shaping is applicable and supported for the type of connection and has been turned on in the provisioning data. This is the only case that indicates that traffic shaping is performed on the connection. In this case, the actual shaping rate is reflected in the *txTrafficDescParm* attribute, parameter number 4. A value of ***linear*** indicates that traffic is being shaped at the constant rate indicated in *txTrafficDescParm* 4. A value of ***inverseUpc*** indicates that the shaper strictly conforms to the requirements of a dual leaky bucket UPC enforcer. This value is indicated if traffic shaping is enabled, and the *txTrafficDescType* for this connection is 6, 7 or 8.

For ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, traffic shaping is not available, therefore this attribute is always ***disabled***.

Traffic shaping for connections with *atmServiceCategory* as ***availableBitRate*** (*txTrafficDescType* 9) depends upon the *abrConnectionType* attribute. If *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, the value of this attribute is ***linear***. If *abrConnectionType* is ***erSwitch*** or ***efciSwitch***, this attribute is ***notApplicable***.

### ATTRIBUTE AtmIf Vpt Tm bearerClassBbc (bcBbc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bearer capability for this connection.<br><br>Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is displayed, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.<br><br>Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements.When ***c*** is displayed, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.<br><br>Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***cbr*** or ***vbr***), and timing requirements are user defined (that is, transparent to the network). When the value of this attribute is ***x***, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.<br><br>Class vp service is used to indicate a transparent VP service when the user is requesting an ATM only service from the network. In this case, the network does not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except for VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP and SVP connections. |

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Values

### ATTRIBUTE AtmIf Vpt Tm transferCapabilityBbc (tcBbc)

Access

Read only

Description

This attribute indicates the transfer capability for this connection. Uni 3.0/3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance, or in the case that the transfer capability in the call request was set to NoIndication.

The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The value NoIndication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing.

The value yes for end-to-end timing indicates that end-to-end

timing is required for the connection.

The value no for end-to-end timing indicates that end-to-end timing is not required for the connection.

Values

### ATTRIBUTE AtmIf Vpt Tm clippingBbc (cBbc)

Access
Read only

Description
This attribute indicates the value of the clipping susceptibility parameter in the broadband bearer capability (BBC) Information Element.

Clipping is an impairment in which the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Values
no
yes
notApplicable

Default
No default

### ATTRIBUTE AtmIf Vpt Tm unshapedTransmitQueueing (unshap)

Access
Read only

Description
This attribute indicates the unshaped transmit queuing state of the connection.

A value of ***common*** indicates that transmit traffic is being enqueued onto the common transmit queue for this service category.
The *txQueueLength* attribute indicates the current length of the common transmit queue.

A value of ***fifo*** indicates that transmit traffic is being queued in a first-in-first-out basis for this service category. This is similar to ***common*** queuing, but the *txQueueLength* attribute indicates the number of cells in this connection queue. A value of ***fifo*** will only be indicated for connections on ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***.

A value of ***perVc*** indicates that transmit traffic is being enqueued onto a per-VC queue for this connection.

A value of ***notApplicable*** indicates that transmit traffic is being shaped for this connection, or that unshaped transmit queuing is not applicable for this type of connection. Transmit traffic for a shaped connection is enqueued onto a per-VC queue, but this attribute is only applicable for unshaped connections. Unshaped transmit queuing is not applicable for basic *Vpt*s.

Values

perVc
common

### ATTRIBUTE AtmIf Vpt Tm forceTagging (tagging)

Access
Read only

Description
This attribute indicates the state of force tagging option for this connection. Force tagging refers to setting the CLP bit for all cells on a connection.

A value of ***enabled*** indicates that the CLP bit is being set to 1 for all cells in the transmit direction on this connection.

A value of ***disabled*** indicates that the CLP bit is unchanged for cells in the transmit direction on this connection. The value ***disabled*** is always displayed for *Vpt*s since forced tagging is applied on a per *Vpt Vcc* basis.

Values
disabled
enabled

Default
No default

### ATTRIBUTE AtmIf Vpt Tm weight

Access
Read only

Description
This attribute indicates the relative weight of this unshaped connection. Connections with a larger weight get a larger proportion of the link bandwidth or in the case of standard *Vpt Vcc*s, the *Vpt* bandwidth.

For all but standard *Vpt Vcc*s, the default connection weight is determined by the weight policy for a service category and the traffic descriptor for a connection. For standard *Vpt Vcc*s, the default connection weight is determined by the *Vcc*'s service category.

A value from 1 to 4095 indicates an actual weight. The value ***upToQueueLimit*** indicates that the weight of a connection is up to the transmit queue limit for this connection and is used for connections which have the value of the *unshapedTransmitQueueing* attribute displayed as ***fifo***.

This attribute has a displayed value of ***notApplicable*** in the following cases:
- This connection has the value of the *trafficShaping* attribute displayed as either ***linear*** or ***inverseUpc***.
- This connection has the value of the *trafficShaping* attribute displayed as ***disabled***, but the connection's service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc***.
- This connection has the value of the *unshapedTransmitQueueing* attribute displayed as ***common***.
- This is a basic *Vpt* connection.
- For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, since per-connection weight is not supported.

Values

Decimal (1..4095)
upToQueueLimit
notApplicable

Default

No default

## ATTRIBUTE AtmIf Vpt Tm usageParameterControl (upc)

Access

Read only

Description

This attribute indicates the UPC state of the connection.

A value of ***notApplicable*** indicates that UPC is not applicable or not supported for the connection. This is the case:
- when the connection's *rxTrafficDescType* is 1 or 2.

- for standard *Vpt Vcc*s and basic *Vpt*s.

A value of ***notApplicable*** is set regardless of whether UPC is disabled or enabled in provisioning data.

A value of ***disabled*** indicates that UPC is applicable and supported for the type of connection but has been turned off in the provisioning data.

A value of ***enforced*** indicates that UPC is actively checking conformance for the connection and is discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. On some ATM cards, the counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

A value of ***monitored*** indicates that UPC is actively checking conformance for the connection and counting the violations, but is not discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. The counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt. rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

If the *atmServiceCategory* for this connection is ***availableBitRate***, a value of ***enforced*** indicates that Dynamic Generic Cell Rate Algorithm (DGCRA) is active for the connection. The traffic descriptor parameters used for DGCRA enforcement are reflected in the *rxTrafficDescParm* of the connection.

Values

enforced
disabled
monitored
notApplicable

No default

## ATTRIBUTE AtmIf Vpt Tm txPacketWiseDiscard (txpd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current set of packet-wise discard functions in effect in the transmit data direction at this connection point.<br><br>A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.<br><br>A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point.<br><br>A value of ***wred*** indicates that Weighted Random Early Detection is in effect at this connection point. W-RED can be enabled by provisioning for PVCs and SPVCs.<br><br>For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Packet-wise functions are not applicable to virtual path connections (VPCs) on these cards.<br><br>On all other ATM cards, all packet-wise discard functions also apply to virtual path connections (VPCs).<br><br>This attribute is not applicable for *Vpt*s. |
| Set of | ppd<br>epd<br>wred |
| Default | No default |

## ATTRIBUTE AtmIf Vpt Tm rxPacketWiseDiscard (rxpd)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the current set of packet-wise discard functions in effect in the receive data direction at this connection point.

A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.

A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, packet-wise functions are not applicable to virtual path connections (VPCs).

For ***16pOC3PosAtm*** cards, PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

On all other ATM cards, all packet-wise discard functions also apply to virtual path connections (VPCs).

This attribute is not applicable for *Vpt*s.

Set of

ppd
epd

Default

No default

## ATTRIBUTE AtmIf Vpt Tm bandwidthElastic (bwElastic)

Access

Read only

Description

This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical

links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application (for example, *Trunk*) running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced is displayed in the *bandwidthReduction* attribute.

A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection is not released.

A value of ***no*** indicates that the bandwidth for this connection is not reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority.*

Bandwidth elasticity has no effect for connections which have an equivalent cell rate (ECR) of zero.

This attribute is not applicable for *Vpt*s and *Vpt Vcc*s.

Values
no
yes

Default
No default

### ATTRIBUTE AtmIf Vpt Tm bandwidthReduction (bwReduction)

Access
Read only

Description
This attribute shows the amount by which the bandwidth has been reduced for this connection. This value is non-zero only for connections which have *bandwidthElastic* displayed as ***yes***, and which are also operating in a reduced bandwidth mode. This is typically the case for selected connections running over an IMA link. This attribute takes a value from 0 (no reduction) up to the ECR. For all connections which are running at their full allocated bandwidth, *bwReduction* has the value 0. Connections which have been reduced in allocated bandwidth have a positive number for this attribute. The *bwReduction* may be subtracted from the ECR (which is displayed as *txTrafficDescParm* 5) to determine the actual bandwidth allocated to this connection.

Values
Decimal (0..2147483647)

| | |
|---|---|
| Units | cell/s |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Tm abrConnectionType (abrType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of ABR behavior which is in effect at this connection. This attribute is only applicable if the *atmServiceCategory* attribute is ***availableBitRate***. If the *atmServiceCategory* attribute is not ***availableBitRate***, this attribute value is set to ***notApplicable***.<br><br>For ATM cards which do not support ABR connections, the possible values for this attribute are ***notApplicable***, ***efciSwitch***, or ***nonAbrInterworking***. In EFCI marking mode, the Explicit Forward Congestion Indication (EFCI) field in the data cell headers is used to indicate transmit queue congestion.<br><br>For ATM cards which do support ABR connections, if the *connectionPointType* is ***connectionEndPoint***, the value of this attribute is ***sourceDest***. In this mode, the ABR Source and Destination behavior is in effect at this connection. This attribute is also ***sourceDest*** in the case where the next hop connection is specified as ***nonAbrInterworking***. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of the *Nrp* or *Rp* component.<br><br>If the *connectionPointType* is not ***connectionEndPoint***, the value of this attribute depends upon the *abrConnectionType* provisioning and the card type to which the traffic is forwarded on the backplane. The default *abrConnectionType* is provisioned at the *CA Abr abrConnectionType* attribute, and may be overridden for a provisioned connection in the *Vcd Tm abrConnectionType* or *Vpd Tm abrConnectionType* attribute. If the *CA Abr abrConnectionType* attribute is ***virtualSourceDest*** at either one of the two connection points, and if both the connection points are defined on ATM cards which support ABR connections, virtual source and destination behavior is applied to the connection. In this instance, the attribute displays the value ***virtualSourceDest***. |

This attribute has the value ***erSwitch*** if ABR explicit rate functionality is in effect at this connection. In this mode, the switch may modify the Explicit Rate (ER) field of backward Resource Management (RM) cells to indicate the status of congestion at this connection point.

This attribute has the value ***nonAbrInterworking*** in the case where this connection point is functioning as an SPVC origin for an ABR connection where the link side of this connection is configured as a non-ABR ATM service category. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***.

Values

erSwitch
efciSwitch
virtualSourceDest
sourceDest
nonAbrInterworking
notApplicable

Default

No default

## ATTRIBUTE AtmIf Vpt Tm txTrafficDescParm (txTdp)

Access

Read only

Description

This attribute is a vector of five transmit traffic parameters whose mapping is defined by the *txTrafficDescType* attribute.

The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR), actual cell rate (ACR), explicit rate (ER), equivalent cell rate (ECR), and actual shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds.

When *txTrafficDescType* is 1 or 2, parameters 1 through 5 are unused.

In this description, PCR is the greater of either the PCR or the requested shaping rate (parameter 1 or parameter 5) specified in

the *txTrafficDescParm* attribute under the *Vcd Tm* or *Vpd Tm* component.

When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 or 1 traffic; parameters 2 and 3 are unused.

When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard.

When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging.

When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, parameter 4 reflects the actual shaping rate in cell/s for this connection. For CQC-based ATM cards, the set of available shaping rates is based on the number of interfaces doing shaping (attribute *perVcQueueInterfaces*), and the *shapingScalingFactor* attribute of the *Arc Cqc Override* component. A rate of zero (0) indicates that shaping is not performed, or that the interface is down.

When *txTrafficDescType* is 9**,** parameter 1 represents the PCR; parameter 2 represents the Cell Delay Variation Toleration (CDVT); parameter 3 represents the Minimum Cell Rate (MCR); the meaning of parameter 4 depends upon the value of the

*abrConnectionType* attribute. if *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, parameter 4 represents the Allowed Cell Rate (ACR); If *abrConnectionType* is ***erSwitch***, parameter 4 represents the Explicit Rate (ER); and if *abrConnectionType* is ***efciSwitch***, parameter 4 reflects the actual shaping rate in cell/s for this connection.

When *txTrafficDescType* is 3, 4, 5, 6, 7, 8, or 9, parameter 5 reflects the equivalent cell rate in cell/s for this connection as determined by the Connection Admission Control (CAC) algorithm. The equivalent cell rate is useful in determining the admission characteristics of this connection.

## ATTRIBUTE AtmIf Vpt Tm txQueueThresholds (txQThresh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the queue limit and the discard thresholds for the transmit queue of this connection.<br><br>If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the thresholds of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the thresholds of the per-VC queue.<br><br>The first element indicates the queue limit. The provisioned value of the transmit queue limit is derived from the *txQueueLimit* attribute under the service category subcomponents of the *CA* component for the service category of this connection.<br><br>The second element is the threshold that marks the transition from congestion state 1 to congestion state 0. This is the threshold at which traffic with discard priority (DP) = 1 is discarded. This threshold is set at approximately 90 percent of the first parameter, the operational queue limit. |

The third element is the threshold that marks the transition from congestion state 2 to congestion state 1. This is the threshold at which traffic with DP = 2 is discarded. This threshold is set at approximately 75 percent of the first parameter, the operational queue limit.

The fourth element is the threshold that marks the transition from congestion state 3 to congestion state 2. This is the threshold at which traffic with DP = 3 is discarded. This threshold is set at approximately 35 percent of the first parameter, the operational queue limit.

For ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute displays the thresholds of the link class queue used by this connection to buffer it traffic.

This attribute does not apply to basic *Vpt*s.

|---|---|
| Vector of | Decimal (0..512000) |
| Units | cells |
| Index | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Tm rxTrafficDescParm (rxTdp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. Cell delay variation tolerance (CDVT) is expressed in microseconds.<br><br>When *rxTrafficDescType* is 1 or 2, none of the parameters are used.<br><br>When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT. |

When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents CDVT; parameter 3 represents the MCR; parameter 4 is not used.

If *upc* is ***disabled*** for this connection, the values of PCR, SCR, MBS and CDVT are the provisioned parameters.

If *upc* is ***enabled***, the values of PCR, SCR, MBS, and CDVT are exactly the values used by the usage parameter control hardware in policing the arriving traffic. These may vary slightly from the provisioned values due to granularity of the hardware. In the case where the PCR is equal to the SCR, the effective MBS is zero.

|---|---|
| Access | Read only |
| Description | This attribute indicates the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the resource to send during start-up periods, before the first Resource Management (RM) cell returns.<br><br>For nailed-up connections, this attribute is determined by the provisioned value of the *transientBufferExposure* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element. |
| Values | Decimal (0..16777215) |
| Units | cells |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Tm Abr fixedRoundTripTime (frtt)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back.<br><br>For nailed-up connections, this attribute is determined by the provisioned value of the *fixedRoundTripTime* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element. |
| Values | Decimal (0..16700000) |
| Units | microsec |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Tm Abr rateDecreaseFactor (rdf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256.<br><br>RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.<br><br>For nailed-up connections, this attribute is determined by the provisioned value of the *rateDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Tm Abr rateIncreaseFactor (rif)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64.

RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR.

For nailed-up connections, this attribute is determined by the provisioned value of the *rateIncreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Values

Decimal (0..15)

Default

No default

## ATTRIBUTE AtmIf Vpt Tm Abr maxCellPerRmCell (nrm)

Access

Read only

Description

This attribute indicates the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell.

For nailed-up connections, this attribute is determined by the provisioned value of the *maxCellsPerRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.

Values

Decimal (2; 4; 8; 16; 32; 64; 128; 256)

Units

cells

Default

No default

### ATTRIBUTE AtmIf Vpt Tm Abr maxTimeBetweenRmCell (trm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the TRM parameter for this connection.<br><br>TRM provides an upper bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least 2 other cells have been sent, the next cell to be transmitted would be a forward RM cell.<br><br>For nailed-up connections, this attribute is determined by the provisioned value of the *maxTimeBetweenRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element. |
| Values | Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000) |
| Units | microsec |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Tm Abr cutoffDecreaseFactor (cdf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero.<br><br>CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the *forwardRmCellLimit* attribute, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.<br><br>For nailed-up connections, this attribute is determined by the provisioned value of the *cutoffDecreaseFactor* attribute. For |

signaled connections, it is indicated in the ABR Additional Parameters Information Element.

Values: Decimal (0; 1; 2; 4; 8; 16; 32; 64)

Default: No default

### ATTRIBUTE AtmIf Vpt Tm Abr acrDecreaseTimeFactor (adtf)

Access: Read only

Description: This attribute indicates the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection.

ADTF is the time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*.

For nailed-up connections, this attribute is determined by the provisioned value of the *acrDecreaseTimeFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.

Values: Decimal (0..1023)

Units: centiseconds

Default: No default

### ATTRIBUTE AtmIf Vpt Tm Abr forwardRmCellLimit (crm)

Access: Read only

Description: This attribute indicates the CRM parameter for this connection.

CRM is the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

The value of CRM is obtained as *transientBufferExposure* divided by *maxCellsPerRmCell*.

Values: Decimal (1; 3; 7; 15; 31; 63; 127; 255; 511; 1023; 2047; 4095)

Units: cells

Default: No default

### ATTRIBUTE AtmIf Vpt Tm Abr txRateChangeInfo (txrci)

Access: Read only

Description: This attribute indicates the rate change information put into the last forward Resource Management (RM) cell turned around as a backward-RM cell. For connections configured as an ABR Source or Destination, the turned around backward-RM cell is sent over the interface. For connections configured as an ABR Virtual Source or Virtual Destination, the turned around backward-RM cell is sent over the backplane.

Values:
congestionIndicated
noIncreaseIndicated
explicitRateIndicated

Default: No default

### ATTRIBUTE AtmIf Vpt Tm Abr acrRateChangeInfo (arci)

Access: Read only

Description: This attribute indicates the type of change in the Allowed Cell Rate (ACR) as a result of the information in the last backward Resource Management (B-RM) cell received from the interface.

This attribute value is only applicable when the *Vcc Tm* or *Vpc Tm abrConnectionType* attribute is ***sourceDest*** or ***VirtualSourceDest***. In all other cases, this attribute value is ***notApplicable***.

A value of ***noChange*** indicates that the rate did not change as a result of the last backward RM cell received.

A value of ***decreasedByRdf*** or ***increasedByRif*** indicates that the

ACR was increased or decreased by the corresponding factor. This change is as a result of the CI or NI bit setting in the last backward RM cell, or an ADTF timeout.

A value of ***setToExplicitRate*** indicates that the ACR was set to the ER value in the last backward RM cell.

Values
noChange
decreasedByRdf
increasedByRif
setToExplicitRate
notApplicable

Default
No default

## ATTRIBUTE AtmIf Vpt Tm Abr txFwdRmCells

Access
Read only

Description
This attribute counts the number of forward Resource Management (RM) cells sent over the interface since the last backward RM-cell was received from the interface. If the value of this attribute is greater than or equal to the value of *forwardRmCellLimit*, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*.

This counter is reset to zero each time a backward-RM cell is received.

This counter does not wrap to zero if it reaches its maximum value of 4095 in order to indicate that no backward RM cell has been received.

Values
Decimal (0..4095)

Units
cells

Default
No default

## ATTRIBUTE AtmIf Vpt Tm Abr rxEfci

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the value of the Explicit Forward Congestion Indication (EFCI) bit of the last data cell received from the interface.<br><br>When a forward Resource Management (RM) cell is turned around as a backward-RM cell, the Congestion Indication (CI) field of the backward-RM cell is set to 1, if the value of this attribute is ***indicated***.<br><br>This attribute is set to ***notIndicated*** each time a backward-RM cell is transmitted. |
| Values | notIndicated<br>indicated |
| Default | No default |

| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Aini* component. |

## ATTRIBUTE AtmIf Vpt Aini side

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute indicates which side the interface is, user or network. |
| Values | networkSide<br>userSide |
| Default | networkSide |

### ATTRIBUTE AtmIf Vpt Aini softPvpAndPvcRetryPeriod (sRetryPeriod)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time to wait between soft PVP or soft PVC call setup retries. The resolution is to the nearest 10 seconds. |
| Values | Decimal (20..999999) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE AtmIf Vpt Aini softPvpAndPvcHoldOffTime (sHoldOffTime)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how long to hold of retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value. |
| Values | Decimal (0; 50..20000) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE AtmIf Vpt Aini passAlongRequest

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether unrecognized messages and information elements with the pass along request set are accepted when received at the interface. If they are not allowed, then they are discarded and the procedures specified by the message or information element’s action indicator field are followed. |
| Values | allowed<br>discarded |

| | |
|---|---|
| Default | allowed |

### GROUP AtmIf Vpt Aini AccountingOptions (AcctOpt)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for accounting. |

### ATTRIBUTE AtmIf Vpt Aini accountCollection (aco)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit***, or ***force***.<br><br>If the set of reasons is not empty then accounting records will be generated by this interface in the following situations:<br>- on a TODA changeover if TODA is enabled;<br>- every 12 hours (per connection) if TODA is disabled;<br>- on every call clear (a call record with final cell counts).<br><br>If none of the reasons is present, then accounting will be suppressed.<br><br>The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate. |
| Set of | bill<br>test<br>study<br>audit<br>force |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini accountConnectionType (act)

| | |
|---|---|
| Access | Read: All<br>Write: All |

Description

This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records.

If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***.

If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***.

Values

origTerm
intermediate

Default

intermediate

### ATTRIBUTE AtmIf Vpt Aini accountClass (acl)

Access

Read: All
Write: All

Description

This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator.

Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate.

Values

Decimal (0..255)

Default

0

### ATTRIBUTE AtmIf Vpt Aini serviceExchange (sre)

Access

Read: All
Write: All

Description

This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator.

Its value is simply recorded in the accounting records generated

| | |
|---|---|
| | by this interface, in the attribute *callingDse* or *calledDse* as appropriate. |
| Values | Decimal (0..255) |
| Default | 0 |

### GROUP AtmIf Vpt Aini VAiniProvisioned (VProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Aini* component which are specific to virtual AINI interfaces. |

### ATTRIBUTE AtmIf Vpt Aini vpci

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the Virtual Path Connection Identifier (VPCI) to be used between this signalling entity and its peer. The VPCI of the peer virtual AINI must have the same value for switched connections to be set up across the interface. |
| Values | Decimal (0..255) |
| Default | 0 |

### COMPONENT AtmIf Vpt Aini Signalling (Sig)

| | |
|---|---|
| Groups | "GROUP AtmIf Vpt Aini Sig Provisioned (Prov)"<br>"GROUP AtmIf Vpt Aini Sig OsiState (State)"<br>"GROUP AtmIf Vpt Aini Sig Operational (Oper)"<br>"GROUP AtmIf Vpt Aini Sig Statistics (Stats)" |

## GROUP AtmIf Vpt Aini Sig Provisioned (Prov)

Properties Provisioned

Description This attribute group contains the provisionable attributes for the *Signalling* component.

## ATTRIBUTE AtmIf Vpt Aini Sig vci

Access
Read: All
Write: All

Criticality Component

Description This attribute specifies the signaling channel number.

Values Decimal (0..65535)

Default 5

## ATTRIBUTE AtmIf Vpt Aini Sig addressConversion

Access
Read: All
Write: All

Description This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then

the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.

Values
none
nativeE164
nsap

Default
none

### ATTRIBUTE AtmIf Vpt Aini Sig operatingMode

Access
Read: All
Write: All

Description
This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces.
***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.

Values
normal
provisionedOnly

Default
normal

### GROUP AtmIf Vpt Aini Sig OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE AtmIf Vpt Aini Sig adminState (osiAdmin)

Access
Read only

Description
This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE AtmIf Vpt Aini Sig operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE AtmIf Vpt Aini Sig usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP AtmIf Vpt Aini Sig Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute contains the operational attributes for the AtmSignalling component. |

### ATTRIBUTE AtmIf Vpt Aini Sig lastTxCauseCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Sig lastTxDiagCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0. |
| Values | Hex (H.0..H.ff) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Sig lastRxCauseCode

## ATTRIBUTE AtmIf Vpt Aini Sig Vcd atmServiceCategory (service)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the ATM service category for both directions of the connection.<br><br>The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application.<br><br>The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.<br><br>The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.<br><br>The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service |

guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Values
unspecifiedBitRate (ubr)
constantBitRate (cbr)
rtVariableBitRate (rtvbr)
nrtVariableBitRate (nrtvbr)

Default
rtVariableBitRate

### ATTRIBUTE AtmIf Vpt Aini Sig Vcd weight

Access
Read and write

Criticality
Component

Description
This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m.

This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs.

When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***.

When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are

allocated to this connection, compared to other connections associated with the VPT.

When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.

Values
Decimal (1..4095)
sameAsCa
upToQueueLimit

Default
sameAsCa

## ATTRIBUTE AtmIf Vpt Aini Sig Vcd qosClass (qos)

Access
Read and write

Criticality
Component

Description
This attribute specifies the quality of service for both the forward and backward direction for this connection.

Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video).

Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video).

Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values
0
1
2
3
4

Default
2

### ATTRIBUTE AtmIf Vpt Aini Sig Vcd trafficShaping (trShaping)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface.<br><br>When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.<br><br>When ***disabled*** is selected, traffic shaping for this connection is disabled. |
| Values | disabled<br>sameAsCa |
| Default | disabled |

### ATTRIBUTE AtmIf Vpt Aini Sig Vcd unshapedTransmitQueueing (unshap)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute.<br><br>When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator.* |

When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values
common
sameAsCa

Default
sameAsCa

## ATTRIBUTE AtmIf Vpt Aini Sig Vcd usageParameterControl (upc)

Access
Read and write

Criticality
Component

Description
This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface.

When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component.

When ***disabled*** is selected, UPC for this connection is disabled.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values
disabled
sameAsCa

Default
disabled

## ATTRIBUTE AtmIf Vpt Aini Sig Vcd trafficDescParm (tdp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.<br><br>When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.<br><br>When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.<br><br>When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and |

parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

| | |

## GROUP AtmIf Vpt Aini Addr Operational (Oper)

Properties Operational

Description This attribute group contains the operational attributes for the *Address* component.

## ATTRIBUTE AtmIf Vpt Aini Addr scope

Access Read: All
Write: Illegal

Description This attribute indicates the scope of the ATM address, which is the highest level to which this address will be advertised in the PNNI hierarchy. If no *PnniInfo* subcomponent has been provisioned, then the scope will default to the level of this node in the PNNI hierarchy. If this node does not participate in a PNNI hierarchy, then this attribute will have the value of -1.

Values Signed (-1..104)

Default No default

## ATTRIBUTE AtmIf Vpt Aini Addr reachability (reach)

Access Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates whether the address is internal or exterior. An internal reachable address is an address of a destination that is directly attached to the logical node advertising the address. An exterior reachable address is an address that can be reached through a PNNI routing domain, but which is not located in that PNNI routing domain. |
| Values | internal<br>exterior |
| Default | No default |

Groups
"GROUP AtmIf Vpt Aini Ptf Criteria"
"GROUP AtmIf Vpt Aini Ptf Operational (Oper)"
"GROUP AtmIf Vpt Aini Ptf RecordControl (Record)"

Scope
Device

Description
*AtmIf/n Aini PathTraceFilter*
*AtmIf/n Iisp PathTraceFilter*
*AtmIf/n Uni PathTraceFilter*
*AtmIf/n Pnni PathTraceFilter*
*AtmIf/n Vpt/vpi Aini PathTraceFilter*
*AtmIf/n Vpt/vpi Iisp PathTraceFilter*
*AtmIf/n Vpt/vpi Uni PathTraceFilter*
*AtmIf/n Vpt/vpi Pnni PathTraceFilter*

This component represents the path trace filtering capability on the ATM signaling interface. This capability allows the user to trace connections during the call setup phase against the criteria associated with this component. Only the connections that match all the criteria are traced.

When this component is provisioned, the network operator can control tracing activities by using the *Start*, *Stop*, and *Clear* verbs. When the *Start* verb is issued, the *traceTimeout* timer restarts. Once the timer times out, filtering stops and records are not removed. When the *Stop* verb is issued, the filter stops and the trace records are kept until the user clears them. When the *Clear* verb is issued, the trace records are cleared. When *AtmPathTraceFilter* component is deleted, all records are cleared.

Once the maximum specified by *maxTraceRecords* attribute under the *PathTraceFilter* component or *maxTraceRecords* attribute under the *Lp/n Eng PTrace* component has been reached, the oldest record is deleted.

The *AtmPathTraceFilter* component is not permitted to be added when the *Lp/n Eng PTrace Ov maxTraceRecords* attribute is set to zero.

This command is rejected on an active filter. |

### GROUP AtmIf Vpt Aini Ptf Criteria

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational criteria for the *PathTraceFilter* component. |

### ATTRIBUTE AtmIf Vpt Aini Ptf traceInfo (tInfo)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the trace information that is included in the trace records.<br><br>***crankBack***: Crankback information is included if the connection is cranked back during the connection setup phase. If the option is turned on, all attempted paths including the final one are recorded. If the option is turned off, only the information of the final path is recorded. If the connection fails to reach the destination, no path information is returned.<br><br>***connId***: Connection Identifier information is included.<br><br>***callRef***: For point-to-point connections, the call reference is included. For point-to-multipoint connections, the call reference and end point reference are both included.<br><br>Basic trace information, such as node and port identifiers, are always included. |
| Set of | crankBack<br>connId<br>callRef |
| Default | (crankBack, connId, callRef) |

### ATTRIBUTE AtmIf Vpt Aini Ptf calledPartyPrefix (cldPref)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies an NSAP address prefix, which is compared with the called party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced.<br><br>An empty string matches any address. |
| Values | String (0..20, Hex) |
| Default | No default |

## ATTRIBUTE AtmIf Vpt Aini Ptf callingPartyPrefix (clgPref)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies an NSAP address prefix, which is compared with the calling party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced.<br><br>An empty string matches any address. |
| Values | String (0..20, Hex) |
| Default | No default |

## ATTRIBUTE AtmIf Vpt Aini Ptf connectionType (type)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a connection type (SVC, SPVC, SVP, SPVP), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced. |
| Set of | svc<br>spvc<br>svp<br>spvp |
| Default | (svc, spvc, svp, spvp) |

## ATTRIBUTE AtmIf Vpt Aini Ptf connectionConfiguration (config)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a type of topology (point-to-point or point-to-multipoint), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced. |

| | |
|---|---|
| Set of | ptp<br>ptmp |
| Default | (ptp, ptmp) |

### ATTRIBUTE AtmIf Vpt Aini Ptf serviceCategory (svcCat)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the service categories, which is compared against the connection setup request. When the all criteria in the filter match successfully, the call is traced. |
| Set of | cbr<br>rtVbr<br>nrtVbr<br>ubr |
| Default | (cbr, rtVbr, nrtVbr, ubr) |

### GROUP AtmIf Vpt Aini Ptf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *PathTraceFilter* component. |

### ATTRIBUTE AtmIf Vpt Aini Ptf state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the filter.<br><br>***active***: Indicates the filter is active.<br><br>***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out. |

| | |
|---|---|
| Values | active<br>inactive |
| Default | inactive |

### ATTRIBUTE AtmIf Vpt Aini Ptf recordCount

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords*, which ever is less. |
| Values | Decimal (0..200) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf matchedConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of connections that match the criteria of this filter. |
| Values | Decimal (0..2147483647) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf elapsedTime

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of minutes that have elapsed since the start of the filter. |
| Values | Decimal (0..70560) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf timeRemaining

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of minutes remaining before the filter terminates itself. |
| Values | Decimal (0..70560) |
| Units | minutes |
| Default | No default |

### GROUP AtmIf Vpt Aini Ptf RecordControl (Record)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the record control of the *PathTraceFilter* component. |

### ATTRIBUTE AtmIf Vpt Aini Ptf traceTimeout

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available. |
| Values | Decimal (1..70560) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE AtmIf Vpt Aini Ptf maxTraceRecords (mRecords)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of records allowed to be stored with the filter.<br><br>Once the maximum has been reached, the oldest record is removed. |

| | |
|---|---|
| Values | Decimal (1..200) |
| Default | 2 |

## COMPONENT AtmIf Vpt Aini Ptf PathTraceRecord (PTRecord)

| | |
|---|---|
| Groups | "GROUP AtmIf Vpt Aini Ptf PTRecord Operational (Oper)" |
| Scope | Device |
| Description | *AtmIf/n Aini Ptf PTRecord*<br>*AtmIf/n Iisp Ptf PTRecord*<br>*AtmIf/n Uni Ptf PTRecord*<br>*AtmIf/n Pnni Ptf PTRecord*<br>*AtmIf/n Vpt/n Aini Ptf PTRecord*<br>*AtmIf/n Vpt/n Iisp Ptf PTRecord*<br>*AtmIf/n Vpt/n Uni Ptf PTRecord*<br>*AtmIf/n Vpt/n Pnni Ptf PTRecord*<br><br>This component represents the path trace record for the last failed connection against this filter. |
| Dyn. Subcomp. | "COMPONENT AtmIf Vpt Aini Ptf PTRecord Hop" |
| Common Verbs | Help<br>List<br>Display |

## GROUP AtmIf Vpt Aini Ptf PTRecord Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the path trace record component. |

## ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord status

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the status of the trace. The string is one of the following:<br><br>***Completed normally****:* The trace completed normally. |

***Incomplete**:* Partial trace returned.

***Exceeded information element length limitations**:* The number of traced nodes exceeded the maximum number of hops.

***Exceeded message length limitations**:* The message length exceeded the maximum allowed size.

Values
Completed normally
Incomplete
Exceeded information element length limitations
Exceeded message length limitations

Default
No default

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord timeStamp

Access
Read: All
Write: Illegal

Description
This attribute records the date and time of when the trace is completed.

Values
Time (DHMS)

Default
No default

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord srcPortId

Access
Read: All
Write: Illegal

Description
This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.

Values
Decimal (1..4294967295)

Default
No default

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord srcPortName

Access
Read: All
Write: Illegal

Criticality
Component

| | |
|---|---|
| Description | This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop. |
| Values | String (40, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord causeCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord diagCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL. |
| Values | String (0..8, ASCII) |
| Default | No default |

### COMPONENT AtmIf Vpt Aini Ptf PTRecord Hop

| | |
|---|---|
| Instance | Decimal (0..200) |

| | |
|---|---|
| Groups | "GROUP AtmIf Vpt Aini Ptf PTRecord Hop Operational (Oper)" |

| Description | *AtmIf/n Aini Ptf PTRecord Hop/n*<br>*AtmIf/n Iisp Ptf PTRecord Hop/n*<br>*AtmIf/n Uni Ptf PTRecord Hop/n*<br>*AtmIf/n Pnni Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Aini Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Iisp Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Uni Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Pnni Ptf PTRecord Hop/n*<br>*AtmIf/n Vcc/x.y PTRecord Hop/n*<br>*AtmIf/n Vpc/n PTRecord Hop/n*<br>*AtmIf/n Vpt/n Vcc/x.y PTRecord Hop/n*<br><br>This component stores the result of a hop from a trace. An instance of this component is dynamically created for each hop in a trace record.<br><br>Depending on the hops, different attributes are present. |
| Dyn. Subcomp. | "COMPONENT AtmIf Vpt Aini Ptf PTRecord Hop VendorSpecificInfo (Vsi)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP AtmIf Vpt Aini Ptf PTRecord Hop Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the component *AtmPathTraceFilterRecordHop*. |

## ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop ingressVpiVci (vpiVci)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute indicates the VPI.VCI values used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. This attribute is displayed for ATM interfaces only.<br><br>The VPI.VCI values are included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Integer Sequence (0..4095; 0..65535) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop ingressDlci (dlci)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the DLCI value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. This attribute is displayed for FrAtm interfaces only.<br><br>The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop ingressCallReference (callref)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the call reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message.<br><br>The call reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value |

| | |
|---|---|
| Values | Hex (H.0..H.ffffff) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop ingressEndPointReference (epref)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages.<br><br>The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop nodeId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the lowest level node ID traversed for this hop. |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop nodeName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the *nodeName* under the *ModuleData* component for this hop. Only Passport nodes provide this information by including it in the Vendor Specific group. |

| | |
|---|---|
| Values | String (12, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop portId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop portName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | String (55, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop pnniTraceContRefusalIndPresent (refusal)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace. |

| | |
|---|---|
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop crankbackDestNodeIndPresent (dest)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop pnniCrankbackGapIndPresent (gap)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop crankBackCause (cause)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information.<br><br>This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure. |
| Values | Decimal (0..1000) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop blockedTransitType (type)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked transit type.<br><br>This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure. |
| Values | Succeeding end blocked<br>Blocked node<br>Blocked link |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop blockedNodeId (bNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked node ID during the call setup request. The blocked node ID identifies the logical node where the connection or party has been blocked.<br><br>This attribute is present when the *blockedTransitType* attribute is ***Blocked node.*** |

| | |
|---|---|
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop blockedLinkPrecedingNodeId (pNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked link's preceding node ID during the call setup request. The blocked link's preceding node ID identifies the logical node preceding a link, where the connection or party has been blocked.<br><br>This attribute is present when the *blockedTransitType* attribute is ***Blocked link***. |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop blockedLinkPortId (bPortId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked link's port identifier used for this connection during the call setup request. The blocked link's port identifier identifies a logical port of the blocked link's preceding node identifier.<br><br>This attribute is present when the *blockedTransitType* attribute is ***Blocked link.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop blockedLinkSucceedingNodeId (sNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked link's succeeding node ID during the call setup request. The blocked link's succeeding node ID identifies the logical node succeeding a link where the connection or party has been blocked.<br><br>This attribute is present when the *blockedTransitType* attribute is ***Blocked link.*** |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop dstVpiVci

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the VPI.VCI values on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for ATM interfaces.<br><br>The VPI.VCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Integer Sequence (0..4095; 0..65535) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop dstDlci

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute indicates the DLCI value on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for FrAtm interfaces.<br><br>The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop dstCallReference (dcr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the call reference value on the destination side. This attribute only appears in the trace result for the trace destination node.<br><br>The call reference value is included in the trace when the *traceInfo* attribute sets the ***callRef*** value. |
| Values | Hex (H.0..H.ffffff) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop dstEndPointReference (depr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the end point call reference value on the destination side. This attribute only appears in the trace result for the trace destination node.<br><br>The call reference value is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint. |

| | |
|---|---|
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop specifiedPath

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether this hop is the originator of this manually configured path. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | no<br>yes |
| Default | no |

### COMPONENT AtmIf Vpt Aini Ptf PTRecord Hop VendorSpecificInfo (Vsi)

| | |

### ATTRIBUTE AtmIf Vpt Aini Ptt atmServiceCategory (service)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the ATM service category for both directions of the connection.<br><br>If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection.<br><br>If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used.<br><br>The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications.<br><br>The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources.<br><br>The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS.<br><br>The ***unspecifiedBitRate*** service is intended for non-real time |

applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.

Values
unspecifiedBitRate (ubr)
constantBitRate (cbr)
rtVariableBitRate (rtvbr)
nrtVariableBitRate (nrtvbr)
derivedFromBBC (derived)

Default
unspecifiedBitRate

### ATTRIBUTE AtmIf Vpt Aini Ptt fwdQosClass (fwdQos)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the quality of service for the forward direction for this connection.

Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video).

Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video).

Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer).

Class ***4*** supports a QOS that will meet Service Class D performance requirements (connectionless data transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

## ATTRIBUTE AtmIf Vpt Aini Ptt transferCapabilityBbc (tcBbc)

Access Read: All
Write: All

Criticality Component

Description This attribute specifies the transfer capability for this connection. UNI 3.0/3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
***0***: NoIndication, NoIndication
***1***: NoIndication, yes
***2***: NoIndication, no
***5***: CBR, yes
***8***: VBR, NoIndication
***9***: VBR, yes
***10***: VBR, no

***NotApplicable*** specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data.

The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing.

The value ***yes*** for end-to-end timing indicates that end-to-end timing is required.

The value ***no*** for end-to-end timing indicates that end-to-end timing is not required.

The value ***derivedFromServiceCategory*** specifies that the actual

value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

### ATTRIBUTE AtmIf Vpt Aini Ptt txTrafficDescParm (txTdp)

| | |
|---|---|
| Access | Read: All<br>Write: All |

Description

This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled.

When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero.

When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero.

Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be

optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

Vector of — Decimal (0..2147483647)

Index — Decimal (1..5)

Default — ([5] 0)

## ATTRIBUTE AtmIf Vpt Aini Ptt rxTrafficDescParm (rxTdp)

Access — Read: All
Write: All

Description — This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in
cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC).

When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused).

When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused).

When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

## COMPONENT AtmIf Vpt Aini ServiceTrace (SrvTrace)

| | |
|---|---|
| Groups | "GROUP AtmIf Vpt Aini SrvTrace Operational" |
| Scope | Application |
| Description | *AtmIf/n [Vpt/m] Uni ServiceTrace*<br>*AtmIf/n [Vpt/m] Iisp ServiceTrace*<br>*AtmIf/n [Vpt/m] Pnni ServiceTrace*<br>*AtmIf/n [Vpt/m] Aini ServiceTrace* |

The *ServiceTrace* component of the ATM service determines if the trace capability is allowed on this service. If it is not provisioned, then a service trace session cannot be started on this service.

Currently, the ATM Trace features only support ***frAtmTraceRcvr*** and ***atmTraceRcvr*** features, if the name of a X25 or FR receiver is set to the *receiver* attribute of this component, the *Start* command responses with a “Receiver Not Supported” message.

## VERB Start AtmIf Vpt Aini SrvTrace

Impact: Service

Description:

*Start AtmIf/n [Vpt/m] Uni ServiceTrace*
*Start AtmIf/n [Vpt/m] Iisp ServiceTrace*
*Start AtmIf/n [Vpt/m] Pnni ServiceTrace*
*Start AtmIf/n [Vpt/m] Aini ServiceTrace*
This command starts a service trace session.

## VERB Stop AtmIf Vpt Aini SrvTrace

Impact: Service

Description:

*Stop AtmIf/n [Vpt/m] Uni ServiceTrace*
*Stop AtmIf/n [Vpt/m] Iisp ServiceTrace*
*Stop AtmIf/n [Vpt/m] Pnni ServiceTrace*
*Stop AtmIf/n [Vpt/m] Aini ServiceTrace*
This command stops a service trace session.

## GROUP AtmIf Vpt Aini SrvTrace Operational

Properties: Operational

Description: This group provides the operational attributes for the *SrvTrace* component.

### ATTRIBUTE AtmIf Vpt Aini SrvTrace receiverName (rcvr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started. |
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini SrvTrace duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active. |
| Values | Decimal (0..9999) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE AtmIf Vpt Aini SrvTrace queueLimit

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately. |
| Values | Decimal (1..100) |
| Units | Kbyte |
| Default | 20 |

## ATTRIBUTE AtmIf Vpt Aini SrvTrace session

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active. |
| Values | The name of the component |
| Default | No default |

## COMPONENT AtmIf Vpt Aini Reroute

### VERB OPTIMIZE AtmIf Vpt Aini Reroute

| | |
|---|---|
| Impact | Service |
| Description | *Optimize [-all] AtmIf/n Uni outeouteouteouteouteoute*sBy default, only connection segsforation. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection.<br>The *-all* option causes all connection segments subscribed to path optimization to be considered.s |

### GROUP AtmIf Vpt Aini Reroute LocalOperational (LOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the local rerouting activities at the interface level. |

### ATTRIBUTE AtmIf Vpt Aini Reroute localSubscribedConnections (lsub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that are subscribed to one or more local rerouting capabilities. Note that a given connection segment is subscribed to either local rerouting capabilities capabilities, not both. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute localEligibleRecoveredCon (lerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered using local rerouting and are eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute localIneligibleRecoveredCon (lirc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered by local rerouting but are not eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute localLastRrCauseCode (lrrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last local rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute localPathsOptimized (lPathsOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the paths that were successfully optimized by local rerouting or EBR during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP AtmIf Vpt Aini Reroute GlobalOperational (GOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the global and EBR rerouting activities at the interface level. |

### ATTRIBUTE AtmIf Vpt Aini Reroute globalSubscribedConnections (gsub)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the connection segments that are subscribed to one or more global and EBR rerouting capabilities. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute globalEligibleRecoveredCon (gerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connections that have been recovered by global and EBR rerouting and are eligible for global or EBR path optimization. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute globalIneligibleRecoveredCon (girc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connections that have been recovered by global and EBR rerouting but are not eligible for global or EBR path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute globalLastRrCauseCode (grrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last global or EBR rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute globalPathsOptimized (gPathsOpt)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the paths that were successfully optimized by global and EBR rerouting during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP AtmIf Vpt Aini Reroute Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the rerouting statistics for the interface. |

### ATTRIBUTE AtmIf Vpt Aini Reroute totalLocalConnectionRecoveries (tLConRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful local connection recovery attempts. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute totalLocalFailedRecoveries (lFailedRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts failed local connection recovery attempts. A connection recovery attempt fails if a rerouting connection segment can not be established. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute totalLocalPathOptimizations (tLPathOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful local path optimization attempts. A successful path optimization attempt results in a switch to a |

| | |
|---|---|
| | better route. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute totalGlobalConnectionRecoveries (tGConRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful global and EBR connection recovery attempts. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute totalGlobalFailedRecoveries (gFailedRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts failed global and EBR connection recovery attempts. A connection recovery attempt fails if a rerouting connection segment cannot be established. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute totalGlobalPathOptimizations (tGPathOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful global and EBR path optimization attempts. A successful path optimization attempt results in a switch to a better route. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Aini Reroute totalOptimizationPasses (optPass)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts optimization passes at the interface. Both module and interface optimization passes are counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT AtmIf Vpt Aini Reroute Ov

| Common Verbs | Help<br>List<br>Display |

### GROUP AtmIf Vpt Aini Reroute Ov Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface. |

### ATTRIBUTE AtmIf Vpt Aini Reroute Ov protocol

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the rerouting protocols which are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on |

connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute.
***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values
localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsARtgPnniReroute (sameAs)

Default
sameAsARtgPnniReroute

## ATTRIBUTE AtmIf Vpt Aini Reroute Ov numOptAttempts

Access
Read and write

Description
This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the

connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Values — Decimal (0..15)
sameAsARtgPnniReroute (sameAs)

Default — sameAs

## ATTRIBUTE AtmIf Vpt Aini Reroute Ov moduleOptimizationConnections

Access — Read and write

Description — This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni Reroute* component.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute.
***none***: No connection segments are considered for path optimization.
***recoveredOnly***: Only connection segments which are foration. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
***allSubscribed***: All connection segments subscribed to path optimization are considered.

| | |
|---|---|
| Values | none<br>recoveredOnly<br>allSubscribed<br>sameAsARtgPnniReroute (sameAs) |
| Default | sameAsARtgPnniReroute |

### ATTRIBUTE AtmIf Vpt Aini Reroute Ov switchoverMechanism

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the mechanism used for switchover of a rerouted connection segment.<br><br>One of the following values can be specified:<br>***sameAsARtgPnniReroute***: The switchover mechanism is specified by the *ARtg Pnni Reroute switchoverMechanism* attribute.<br>***standard***: The mechanism described in the ATM Forum "Domain based Rerouting" specification is used for switchover. This value ensures interoperability with other vendors' equipment running ATM Forum "Domain based Rerouting".<br>***rcl***: The Reduced Cell Loss mechanism is used for switchover. RCL is a value-added Passport extension to the standard mechanism that allows faster switchover time. |
| Values | standard<br>rcl<br>sameAsARtgPnniReroute (sameAs) |
| Default | sameAsARtgPnniReroute |

### GROUP AtmIf Vpt Aini Reroute Ov LocalProvisioned (LProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for EBR and local rerouting protocols. |

### ATTRIBUTE AtmIf Vpt Aini Reroute Ov localConnectionRecoverySubscr (lConRec)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which connection segments on the interface request subscription to local connection recovery. This attribute only affects connection segments that request the local |

rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local connection recovery.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local connection recovery and EBR connection recovery. Only one will be granted.

One or more of the following values can be specified:
***sameAsARtgPnniReroute:*** If this value is set, the local connection recovery subscription rule is determined by the *ARtg Pnni Reroute localConnectionRecoverySubscr* attribute. This value takes precedence over any other values.
***svcSvp***: If this value is set, all SVC and SVP connection segments request subscription to local connection recovery.
***sourceSpvcSpvp***: If this value is set, all source SPVC and SPVP connection segments request subscription to local connection recovery.
***transitSpvcSpvp***: If this value is set, all transit SPVC and SPVP connection segments request subscription to local connection recovery.

Set of — sameAsARtgPnniReroute (sameAs)
svc
sourceSpvcSpvp (source)
transitSpvcSpvp (transit)

Default — (sameAsARtgPnniReroute)

## ATTRIBUTE AtmIf Vpt Aini Reroute Ov localPathOptimizationSubscr (lPathOpt)

Access — Read and write

Description — This attribute specifies which connection segments on the interface request subscription to local path optimization. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local path optimization.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local path optimization and EBR path optimization. Only one will be granted.

One or more of the following values can be specified:
***sameAsARtgPnniReroute***: If this value is set, the local path optimization subscription rule is determined by the *ARtg Pnni Reroute localPathOptimizationSubscr* attribute. This setting takes precedence over the any other values.
***svcSvp***: If this value is set, then all SVC and SVP connection segments request subscription to local path optimization.
***sourceSpvcSpvp***: If this value is set, then all source SPVC and SPVP connection segments request subscription to local path optimization.
***transitSpvcSpvp***: If this value is set, then all transit SPVC and SPVP connection segments request subscription to local path optimization.

Set of: sameAsARtgPnniReroute (sameAs)
svc
sourceSpvcSpvp (source)
transitSpvcSpvp (transit)

Default: (sameAsARtgPnniReroute)

## GROUP AtmIf Vpt Aini Reroute Ov GlobalProvisioned (GProv)

Properties: Provisioned

Description: This group contains the provisionable attributes for the global and EBR rerouting protocol.

## ATTRIBUTE AtmIf Vpt Aini Reroute Ov globalConnectionRecoverySubscr (gConRec)

Access: Read and write

Description: This attribute specifies which connection segments on the interface request subscription to global or EBR connection recovery. This attribute only affects connection segments that

request the global or EBR rerouting protocols. This attribute affects connection segments for a node that is a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***globalOnly*** protocols request subscription to global connection recovery.

Connection segments of the specified type(s) which request ***ebrOnly*** request subscription to EBR connection recovery.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local connection recovery and EBR connection recovery. Only one will be granted.

One or more of the following values can be specified:
***sameAsARtgPnniReroute***: If this value is set, the global or EBR connection recovery subscription rule is determined by the *ARtg Pnni Reroute globalConnectionRecoverySubscr* attribute.This setting takes precedence over any other values.
***svcSvp***: If this value is set, then all SVC and SVP connection segments request subscription to global or EBR connection recovery.
***sourceSpvcSpvp***: If this value is set, then all source SPVC and SPVP connection segments request subscription to global or EBR connection recovery.
***transitSpvcSpvp***: If this value is set, then all transit SPVC and SPVP connection segments request subscription to global or EBR connection recovery.

"GROUP AtmIf Vpt Vcc ConnectionInfo (ConnInfo)"
"GROUP AtmIf Vpt Vcc Status"
"GROUP AtmIf Vpt Vcc Statistics (Stats)"

Scope

Device

Description

*AtmIf/n Vpt/vpi VirtualChannelConnection/vci*
This component represents a virtual channel connection terminated by a *Virtual Path Terminator (VPT)*.

For *Vccs* beneath *Vpts*, the instance value defines the VCI value for this connection—for example, Vpt/16 Vcc/32 would define a connection with a VPI of 16, and a VCI of 32. The VPI value of the *Vcc* is inherited from the parent *Vpt*.

The VPI can be in the range of 0 to 4095 and the VCI can be in the range of 0 to 65535. Note that a *Vcc* instance of 0.0 is invalid as defined in the ATM Forum. Thus, the combination of *Vpt/0 Vcc/0* is also invalid.

## VERB TRACE AtmIf Vpt Vcc

Impact: Service

Description: *TRACE AtmIf/n Vpt/vpi Vcc/vci*
*TRACE -s -v -a -e AtmIf/n Vpt/vpi Vcc/vci*

This command traces the path of an intra-network segment of a connection. It displays the names of interface and connection components along this segment of a connection.

The Trace response for a *Vcc* does not show any hops of a connection which are conveyed on a path connection (VPC). In this case the Trace command only shows the *Vcc* hop points. Note however, that if the connection traverses a *Vcc* which resides beneath a *Vpt*, the *Vpt/vpi Vcc/vci* hierarchy is displayed in the trace results.

The options for the signaling trace are as follows:

-*s*: Selects the PNNI signaling call trace instead of the Passport proprietary OAM-based trace procedure. Option -*s* must be present if any one of options -*v*, -*a*, and -*e* are present. Otherwise, it defaults to the OAM-based trace.

-*v*: Requests that the VPI.VCI values be collected along the trace. This option is only valid when the -*s* option is present.

-*a*: Requests that the call reference/end point reference values be collected along the trace. This option is only valid when the -*s* option is present.

-*e*: Used on point-to-multipoint connections to specify the end

point reference value indicating which party to trace. If no *-e* option is used for a point-to-multipoint connection, the default traces the path with endpoint reference 0, which is the first party. This option is only valid when the *-s* option is present.

Only one connection trace is supported at a time. An error message is returned if a response from the network is not received within 30 seconds.

If the verb is issued with the *-s* option for the *Vpt/vpi Vcc/vci* values that are not active or were not created by signaling (for example, control channels), the command is refused

### VERB CLEAR AtmIf Vpt Vcc

| | |
|---|---|
| Impact | Service |
| Description | *CLEAR AtmIf/n Vpt/vpi Vcc/vci*<br>This command is used to clear a switched connection which is under a *Vpt*. |

### GROUP AtmIf Vpt Vcc OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE AtmIf Vpt Vcc adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE AtmIf Vpt Vcc operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE AtmIf Vpt Vcc usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP AtmIf Vpt Vcc Operational (Oper)

Properties
Operational

Description
This group contains operational information for a *Vcc*, *Vpc*, or *Vpt* component.

## ATTRIBUTE AtmIf Vpt Vcc connectionPointType (cpt)

Access
Read only

Description
This attribute reflects the role of the connection component at this interface.

A value of ***connectionEndPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are processed by the connection component.

A value of ***segmentEndPoint*** indicates that user cells and end-to-end OAM cells are relayed by the connection component, while segment OAM cells are processed by the connection component.

A value of ***connectingPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are relayed by the connection component.

A value of ***unknown*** indicates that the connection component is inactive.

Values
connectionEndPoint
segmentEndPoint

| | |
|---|---|
| | connectingPoint<br>unknown |
| Default | No default |

### GROUP AtmIf Vpt Vcc ConnectionInfo (ConnInfo)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational connection characteristics information for a *Vcc* component. |

### ATTRIBUTE AtmIf Vpt Vcc distributionType (distrbt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the way data is distributed in the connection.<br><br>A value of ***pointToPoint*** indicates this connection point is part of a point-to-point connection.<br><br>A value of ***pointToMultipoint*** indicates this connection point is part of a point-to-multipoint connection. |
| Values | pointToPoint<br>pointToMultipoint |
| Default | pointToPoint |

### ATTRIBUTE AtmIf Vpt Vcc numLeaves (nlvs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of destination leaves of the connection. If the *distributionType* is ***pointToPoint*** the value of this attribute is 0. |
| Values | Decimal (0..2147483647) |
| Default | 0 |

### ATTRIBUTE AtmIf Vpt Vcc callDirection (cdir)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the direction of the call setup request for an SVC.<br><br>A value of ***fromLink*** means that the call setup originated from the link.<br><br>A value of ***toLink*** means that the call setup was directed to the link.<br><br>For PVC connections, the value of this attribute is ***notApplicable.***<br><br>For SPVC connections, the value of this attribute is ***notApplicable*** for *Vccs* with the *SourcePVC* and *DestinationPVC* subcomponents.<br><br>For Signaling channels, the value of this attribute is ***notApplicable***. |
| Values | fromLink<br>toLink<br>notApplicable |
| Default | notApplicable |

### GROUP AtmIf Vpt Vcc Status

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational status information for a *Vcc*, *Vpc* or *Vpt* component. |

### ATTRIBUTE AtmIf Vpt Vcc operStatus (opStat)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the present operational status of the *Vcc*, *Vpc* or *Vpt* component. Its value is dependent upon the current state of the *segLinkSideLoopbackState* and *endToEndLoopbackState* attributes.<br><br>The value is ***end2endUp*** when the *endToEndLoopbackState* is ***good*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. |

The value is ***end2endDown*** when the *endToEndLoopbackState* is ***bad*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***.

The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***unknown*** and the *segLinkSideLoopbackState* is ***good***.

The value is ***localDown*** when *segLinkSideLoopbackState* is ***bad***.

The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***notApplicable*** and the *segLinkSideLoopbackState* is ***good***.

The value is ***unknown*** when the *endToEndLoopbackState* is either ***unknown*** or ***notApplicable*** and the *segLinkSideLoopbackState* is ***unknown***.

Values
unknown
end2endUp
end2endDown
localUpEnd2endUnknown
localDown

Default
No default

## ATTRIBUTE AtmIf Vpt Vcc localFailureCause

Access
Read only

Description
This attribute indicates the failure cause of the *Vcc*, *Vpc* or *Vpt* component. A value of ***noFailure*** indicates that there is currently no bandwidth related failure for this connection.

A value of ***portDown*** indicates that the interface corresponding to the parent *AtmIf* is down.

A value of ***localBwLoss*** indicates that the *AtmIf* has lost some, but not all bandwidth, and as a result, this connection has been released.

A value of ***notAdmitted*** indicates that this connection has failed to be admitted by the Connection Admission Control (CAC) algorithm.

A value of ***appNotRegistered*** indicates that there is no application registered to use this connection. This may be the case, for example when there is a *Vcc Test* application, but the test has not been started. Check the status of the application to determine why it is not functional.

A value of ***disabledByApp*** indicates that the application using this connection has requested that the connection be disabled. An example is a connection used by a trunk application where the trunk has timed out on an attempt to stage. Check the application to determine why it is not fully functional.

A value of ***bwReduced*** indicates that this connection is operating in a reduced bandwidth state. It is a bandwidth elastic connection which currently has been allocated less than the requested (equivalent) bandwidth.

A value of ***vpDown*** indicates that this connection has been notified of a fault detected at the associated VP-layer. A value of ***vpDown*** is applicable for *Vpt Vcc*s only.

Values

noFailure
localBwLoss
portDown
notAdmitted
appNotRegistered
disabledByApp
bwReduced
vpDown

Default

No default

## ATTRIBUTE AtmIf Vpt Vcc troubled

Access

Read only

Description

This attribute indicates whether or not the connection is in a troubled state. Connections become troubled because of OAM failures; when one of the attributes *segLinkSideLoopbackState*, *segSwitchSideLoopbackState*, *endToEndLoopbackState*, *aisState* (when receiving AIS cells only) or *rdiState* go bad, this attribute is set to ***yes***; otherwise it is set to ***no***.

Values

no
yes

Default

no

## ATTRIBUTE AtmIf Vpt Vcc segLinkSideLoopbackState (segLkLbkState)

Access

Read only

Description

This attribute contains the current state of the link-side segment loopback for this connection. Link-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the link (port). The value of this attribute is dependent upon the current setting of the *segLinkSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable).

The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint***.

The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***.

The value is ***good*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the segment link side loopback is working.

The value is ***bad*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the link side segment loopback is not working.

The value is ***unknown*** when the *segLinkSideLoopback* is ***off***.

The value is ***unknown*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback has not yet been determined.

The state of this attribute determines, in part, the value of the *operStatus* attribute**.**

Values

good
bad
unknown
notApplicable

## ATTRIBUTE AtmIf Vpt Vcc segSwitchSideLoopbackState (segSwLbkState)

Access

Read only

Description

This attribute contains the current state of the switch-side segment loopback for this connection. Switch-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the bus. The value of this attribute is dependent upon the current setting of the *segSwitchSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable).

The value is only applicable when the *connectionPointType* is a ***segmentEndPoint***. The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or ***connectionEndPoint***. The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***.

The value is ***good*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback is working.

The value is ***bad*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the switch side segment loopback is not working.

The value is ***unknown*** when the *segSwitchSideLoopback* is ***off***.

The value is ***unknown*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback has not been determined.

Values

good
bad
unknown
notApplicable

Default

No default

### ATTRIBUTE AtmIf Vpt Vcc endToEndLoopbackState (eeLbkState)

Access

Read only

Description

This attribute contains the current state of the end-to-end loopback for this connection. Its value is dependent upon the current setting of the *endToEndLoopback* provisionable attribute and the connection point type as specified by the *connectionPointType* attribute.

The value is only applicable when the *connectionPointType* is a ***connectionEndPoint***. The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or s***egmentEndPoint***. The value is ***notApplicable*** when the *distributionType* is a ***pointToMultipoint***.

The value is ***good*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is working.

The value is ***bad*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is not working.

The value is ***unknown*** when the *endToEndLoopback* is ***off***.

The value is ***unknown*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback status has not been determined.

The state of this attribute determines, in part, the value of the *operStatus* attribute.

Values

good
bad
unknown
notApplicable

Default

No default

## ATTRIBUTE AtmIf Vpt Vcc rxOamCellCongestionState (rxOamCongState)

Access

Read only

Description

This attribute contains the current state of the receive side OAM cell congestion for this connection. Its value reflects whether the rate of received OAM cells for this connection is below a specified threshold. The connection maintains a count of the number of OAM cells which are terminated per second. Once that count exceeds the specified threshold, extraction of all OAM cells for this connection is disabled for a period of one minute. This is a congestion management mechanism to prevent the processor from being overloaded with handling OAM cells for a particular connection. This mechanism ensures that tasks, such as trunks obtain enough processor cycles to remain in service, and are not adversely affected by excessive rate of OAM cells on a particular connection.

The value is ***good*** when the rate of received OAM cells is less than the allowed threshold.

The value is ***bad*** when the arrival rate has exceeded the allowed threshold. It remains ***bad*** for one minute, before returning to ***good*** again. During this timeout, extraction of all OAM cells is disabled for this connection. As a result, other loopback failure conditions may occur.

The value is ***unknown*** when the application has not yet begun to use this connection. An example is the *Test* component before a test has been started.

Each type of OAM cell is counted separately. The threshold for AIS cells is three cells per second. If more than three AIS cells are received within a one second interval, this attribute is set to ***bad***. The threshold for RDI cells and each loopback type is also three, but the threshold for trace cells is 250 per second.

The state of this attribute has no direct effect on the value of the *operStatus* attribute or on the number of troubled connections.

Values
good
bad
unknown
notApplicable

Default
No default

## ATTRIBUTE AtmIf Vpt Vcc aisState

Access
Read only

Description
This attribute contains the current state of the Alarm Indication Signal for this connection.

A value of ***good*** indicates that the connection's application is active and no alarm has occurred.

A value of ***bad*** indicates that the connection's application is active and an alarm has occurred.

A value of ***unknown*** indicates that the connection's application is inactive.

A value of ***notApplicable*** occurs when the *connectionPointType* is either a ***segmentEndPoint*** or a ***connectingPoint***.

Values
good
bad
unknown
notApplicable

Default
No default

### ATTRIBUTE AtmIf Vpt Vcc txCellDiscard (txcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of cells received from the backplane on this connection that have been discarded.<br><br>Discarded cells are not counted in the *txCell* attribute.<br><br>Cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled.<br><br>For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.<br><br>For *Vpt*s, this attribute provides an aggregated total of all *txCellDiscard* values for all connections associated with the *Vpt*. |

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values: Long Integer

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc txCellDiscardClp (txcdClp)

Access: Read only

Description: This attribute counts the number of cells received from the backplane on this connection with CLP=1 that have been discarded.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.

This count is included in the *txCellDiscard* attribute. Discarded cells are not counted in the *txCellClp* attribute.

Cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *txCellDiscardClp* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values: Long Integer

Default — No default

### ATTRIBUTE AtmIf Vpt Vcc txFrameDiscard (txfd)

Access — Read only

Description — This attribute counts the number of frames received from the backplane on this connection that have been discarded.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.

Frames are discarded due to congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection interface is disabled.

This count is independent of the *txCell* or *txCellDiscard* attribute.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is applicable only to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *txFrameDiscard* values for all connections associated with the *Vpt*.

Discards due to EPD, PPD, and W-RED for a standard *Vpt Vcc* are not included in this attribute. These discards are counted in the *Vcc*'s parent *Vpt txFrameDiscard* attribute.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values — Long Integer

Default — No default

## ATTRIBUTE AtmIf Vpt Vcc txFrameDiscardClp (txfdClp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discarded frames on this connection that were received from the backplane and composed of one or more CLP=1 cells.<br><br>For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.<br><br>Frames are discarded due to congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection interface is disabled.<br><br>This count is included in the *txFrameDiscard* attribute.<br><br>For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is applicable only to connections that segment frames into cells (AAL5 adaptation). | | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of cells that have been received from the interface on this connection.<br><br>For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this count does not include cells that have been discarded by the interface due to non-conformance with UPC.<br><br>The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc rxCellClp (rxClp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of cells that have been received from the interface on this connection with the CLP=1.<br><br>For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.<br><br>The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc rxCellDiscard (rxcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of cells received from the interface on this connection that have been discarded. This count is included in the *rxCell* attribute.<br><br>This count includes cells discarded due to non-conformance with UPC, cells which are part of a frame which has been discarded |

due to an AAL5 frame reassembly error, cells which are discarded due to congestion, or cells which are received while the next hop connection to which the traffic is directed across the backplane is down. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of the *Nrp* or *Rp* component.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that reassemble cells into frames (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this count does not include cells discarded due to non-conformance with UPC.

For *Vpt*s, this attribute provides an aggregated total of all *rxCellDiscard* values for all connections associated with the *Vpt*. Discards due to non-conformance with UPC at the VP layer, for a standard *Vpt Vcc*, are not included in this attribute. These discards are counted in the *Vcc*'s parent *Vpt rxCellDiscard* attribute.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values — Long Integer

Default — No default

## ATTRIBUTE AtmIf Vpt Vcc rxCellDiscardClp (rxcdClp)

Access — Read only

Description — This attribute counts the number of cells received from the interface on this connection with CLP=1 that have been discarded. This count is included in the *rxCell* and *rxCellDiscard* attributes.

This count includes cells discarded due to non-conformance with UPC, cells which are part of a frame which has been discarded due to an AAL5 frame reassembly error, cells which are discarded due to congestion, or cells which are received while the next hop connection to which the traffic is directed across the backplane is down. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of the *Nrp* or *Rp* component.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that reassemble cells into frames (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxCellDiscardClp* values for all connections associated with the *Vpt*. Discards due to non-conformance with UPC at the VP layer, for a standard *Vpt Vcc*, are not included in this attribute. These discards are counted in the *Vcc*'s parent *Vpt rxCellDiscardClp* attribute.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values — Long Integer

Default — No default

## ATTRIBUTE AtmIf Vpt Vcc rxFrameDiscard (rxfd)

Access — Read only

Description — This attribute counts the number of frames received from the interface on this connection that have been discarded. This count

is independent of the *rxCellDiscard* attribute.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.

This count includes frames discarded due to an AAL5 frame reassembly error, frames discarded due to early packet discard (EPD), frames discarded due to processor (CPU) congestion, and frames discarded due to insufficient frame memory. The amount of available frame memory is determined by the *Lp Eng Arc Ov* component.

This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxFrameDiscard* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values — Long Integer

Default — No default

## ATTRIBUTE AtmIf Vpt Vcc rxFrameDiscardClp (rxfdClp)

Access — Read only

Description — This attribute counts the number of discarded frames on this connection that were received from the interface and composed of one or more CLP1 cells. This count is included in the *rxFrameDiscard* attribute. It is independent of the *rxCellDiscard* attribute.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.

This count includes frames discarded due to an AAL5 frame reassembly error, frames discarded due to early packet discard (EPD), frames discarded due to processor (CPU) congestion, and frames discarded due to insufficient frame memory. The amount of available frame memory is determined by the *Lp Eng Arc Ov* component.

This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxFrameDiscardClp* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values — Long Integer

Default — No default

## ATTRIBUTE AtmIf Vpt Vcc rxUpcViolationOnEnforcer1 (rxEnforcer1)

Access — Read only

Description — This attribute counts the number of UPC violations observed by the Generic Cell Rate Algorithm (GCRA) Enforcer 1. This attribute is only applicable if UPC is enforced or monitored on the connection.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute is not applicable and is not displayed.

When the value of the *rxTrafficDescType* attribute for this

connection is 3, 4, 5, 6, 7, 8, or 9 (for UBR with MDCR connections) Enforcer 1 enforces conformance of traffic received from the interface to PCR CLP0+1.

When the value of the *rxTrafficDescType* attribute for this connection is 9 (for ABR connections), Enforcer 1 performs the Dynamic Generic Cell Rate Algorithm (DGCRA) used for the Available Bit Rate (ABR) service category.

If UPC is enforced all non-conforming cells are discarded by this enforcer. These discarded cells are included in the *rxCellDiscard* attribute.

For basic *Vpt*s, this attribute provides an aggregated total of all *rxUpcViolationOnEnforcer1* values for all *Vcc*s associated with the *Vpt*. This attribute is not applicable for standard *Vpt Vcc*s.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values: Long Integer

Units: cells

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc rxUpcViolationOnEnforcer2 (rxEnforcer2)

Access: Read only

Description: This attribute counts the number of UPC violations observed by the Generic Cell Rate Algorithm (GCRA) Enforcer 2. This attribute is only applicable if UPC is enforced or monitored on the connection.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute is not applicable and is not displayed.

This attribute is only applicable if the value of the *rxTrafficDescType* attribute for this connection is 4, 5, 6, 7, or 8.

When the value of the *rxTrafficDescType* attribute is 4, or 5**,** Enforcer 2 enforces conformance of traffic received from the interface to PCR CLP0.

When the value of the *rxTrafficDescType* attribute is 6**,** Enforcer 2 enforces conformance of traffic received from the interface to SCR CLP0+1.

When the value of the *rxTrafficDescType* attribute is 7, or 8, Enforcer 2 enforces conformance of traffic received from the interface to SCR CLP0.

If UPC is enforced, Enforcer 2 discards non-conforming cells for *rxTrafficDescType* values of 4, 6, and 7. It tags non-conforming cells for *rxTrafficDescType* values of 5, and 8. Discarded cells are counted in the rxCellDiscard attribute.

For basic *Vpt*s, this attribute provides an aggregated total of all *rxUpcViolationOnEnforcer2* values for all *Vcc*s associated with the *Vpt*. This attribute is not applicable for standard *Vpt Vcc*s.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values — Long Integer

Units — cells

Default — No default

## ATTRIBUTE AtmIf Vpt Vcc rxAal5FrameError (rxfer)

Access — Read only

Description — This attribute counts the number of frames received from the interface on this connection that have AAL5 length errors or AAL5 CRC errors.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed.

AAL5 length or CRC errors typically occur because of cell discards due to congestion, UPC, or due to corruption of data between the AAL5 segmentation and reassembly end points.

This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameError* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values: Long Integer

Default: No default

## ATTRIBUTE AtmIf Vpt Vcc rxAal5FrameAbort (rxfa)

Access: Read only

Description: This attribute counts the number of frames received from the interface on this connection that have the AAL5 length field set to zero.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed.

An AAL5 length of zero is an indication by the far end segmentation point, to this reassembly point, that the frame is to be discarded without reassembly. This mechanism is typically used by a segmentation point if it detects an error in a frame after some of the cells belonging to that frame have already been transmitted.

This attribute is applicable only to connections that reassemble

incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameAbort* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Values: Long Integer

Default: No default

## COMPONENT AtmIf Vpt Vcc VirtualChannelDescriptor (Vcd)

Groups: "GROUP AtmIf Vpt Vcc Vcd Loopback (Lbk)"
"GROUP AtmIf Vpt Vcc Vcd Accounting (Acct)"

Scope: Device

Description: *AtmIf/n Vcc/vpi.vci VirtualChannelDescriptor*,
*AtmIf/n Vpt/vpi Vcc/vci VirtualChannelDescriptor*
The *Vcd* component contains provisioning information about its parent *Vcc* component.

Subcomponents: "COMPONENT AtmIf Vpt Vcc Vcd TrafficManagement (Tm)"

Opt. Subcomp.: "COMPONENT AtmIf Vpt Vcc Vcd PerformanceMonitoring (Pm)"

Common Verbs:
- Help
- List
- Display

## GROUP AtmIf Vpt Vcc Vcd Loopback (Lbk)

Properties: Provisioned

Description: This group contains the provisionable loopback attributes for a *Vcc*, *Vpc*, or *Vpt* component.

Note that certain loopback requests may not be possible on a given connection. In such cases, the corresponding operational loopback attribute in the *Status* group of the *Vcc*, *Vpc*, or *Vpt* component indicates ***notApplicable*** and the requested loopback is not performed.

If loopbacks are provisioned to be on, and for any reason the segment or end-to-end OAM loopback cells are not relayed, the connection component becomes troubled, and user cell traffic may be discarded. If loopbacks are provisioned to be on, all of the nodes in the segment, and external networks which are in the end-to-end connection must relay the OAM loopback cells.

## ATTRIBUTE AtmIf Vpt Vcc Vcd segLinkSideLoopback (segLkLbk)

Access: Read and write

Description: This attribute specifies whether link-side segment loopback insertion should be performed on this connection.

A value of ***sameAsInterface*** means the link-side segment loopback insertion for the connection is based on the *segLinkSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has link-side segment loopback insertion turned on, then link-side segment loopback insertion is also on for the connection.

A value of ***on***, or ***off*** means link-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component.

Note that link-side segment loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint***. Link-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint***. In such cases, the operational *segLinkSideLoopbackState* attribute indicates ***notApplicable*** and link-side segment loopback insertion is not performed.

Link-side segment loopback insertion is always possible on a *Vpt*.

Values
on
off
sameAsInterface

Default
sameAsInterface

### ATTRIBUTE AtmIf Vpt Vcc Vcd segSwitchSideLoopback (segSwLbk)

Access
Read and write

Description
This attribute specifies whether switch-side segment loopback insertion should be performed on this connection.

A value of ***sameAsInterface*** means the switch-side segment loopback insertion for the connection is based on the *segSwitchSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has switch-side segment loopback insertion turned on, then switch-side segment loopback insertion is also on for the connection.

A value of ***on***, or ***off*** means switch-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component.

Note that switch-side segment loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint*** or ***connectionEndPoint***. Switch-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint*** In such cases, the operational *segSwitchSideLoopbackState* attribute indicates ***notApplicable*** and switch-side segment loopback insertion is not performed.

Switch-side segment loopback is never possible on a *Vpt*.

Values
on
off
sameAsInterface

Default
sameAsInterface

### ATTRIBUTE AtmIf Vpt Vcc Vcd endToEndLoopback (eeLbk)

Access
Read and write

Description

This attribute specifies whether end-to-end loopback insertion should be performed on this connection.

A value of ***sameAsInterface*** means the end-to-end loopback insertion for the connection is based on the *endToEndLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has end-to-end loopback insertion turned on, then end-to-end loopback insertion is also on for the connection.

A value of ***on***, or ***off*** means end-to-end loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component.

Note that end-to-end loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint***, or ***segmentEndPoint***. End-to-end loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint***. In such cases, the operational *endToEndLoopbackState* attribute indicates ***notApplicable*** and end-to-end loopback insertion is not performed.

End-to-end loopback insertion is always possible on a *Vpt*.

Values

sameAsInterface

## ATTRIBUTE AtmIf Vpt Vcc Vcd mCastConnectionType (connType)

Access

Read and write

Criticality

Component

Description

This attribute specifies if this *Vcc* or *Vpc* is part of point-to-point or point-to-multiPoint connection.

A value of ***pointToMultiPointRoot*** must be set when this *Vcc* has an *Msrc* or an *Mnrp* subcomponent, or this *Vpc* has an *Mnrp* subcomponent.

A value of ***pointToMultiPointLeaf*** must be set when this *Vcc* or *Vpc* has a *Nrp* subcomponent and its *nextHop* attribute is linked to a *Mnrp* component.

Otherwise a value of ***pointToPoint*** must be set.

Values: pointToPoint (ptp)
pointToMultipointRoot (pmpRoot)
pointToMultipointLeaf (pmpLeaf)

Default: pointToPoint

## GROUP AtmIf Vpt Vcc Vcd Accounting (Acct)

Properties: Provisioned

Description: This group contains the provisionable ATM accounting attributes for a *Vcc, Vpc,* or *Vpt* component.

## ATTRIBUTE AtmIf Vpt Vcc Vcd correlationTag (tag)

Access: Read and write

Description: This attribute specifies a unique identifier for each end of a PVC. It that may be used by downstream processing systems to correlate accounting records issued at different nodes in the network. The attribute can be up to 64 bytes long. If it is less than 64 bytes, it is zero filled on the right to create a 64 byte value. The resulting value is recorded in the attribute *callConnId* for this PVC's ATM accounting records.

If the value is a null string then this PVC does not have any accounting records generated for it.

Values: String (0..64, ASCII)

Default: ""

## COMPONENT AtmIf Vpt Vcc Vcd TrafficManagement (Tm)

Groups: "GROUP AtmIf Vpt Vcc Vcd Tm Provisioned (Prov)"

Scope: Device

Description: *AtmIf/n Vcc/vpi.vci Vcd TrafficManagement,*
*AtmIf/n Vpc/vci Vpd TrafficManagement,*

*AtmIf/n Vpt/vpi Vpd TrafficManagement,*
*AtmIf/n Vpt/vpi Vcc/vci Vcd TrafficManagement*
This component contains provisioned traffic management attributes of a connection. It is added automatically when a *Vcc, Vpc,* or *Vpt* is added in provisioning mode. It is a mandatory subcomponent of the *Vcd* or *Vpd* component.

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm atmServiceCategory (service)

Access Read and write

Criticality Component

Description This attribute specifies the ATM service category for both directions of the connection.

The value ***derivedFromBBC*** may only be used if the *Src* or *Dst* component is provisioned under this connection. Otherwise a specific ATM service category must be specified.

A value of ***derivedFromBBC*** means the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection.

A value other than ***derivedFromBBC*** means the value of this attribute is used to override the provisioned BBC Information Element parameters. In this case, the BBC attributes are not used.

The ***constantBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application.

The ***rtVariableBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by

CTD are assumed to be of significantly reduced value to the application. Real-time VBR service may support statistical multiplexing of real-time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non real-time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non real-time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

| | |
|---|---|
| Values | unspecifiedBitRate (ubr)<br>constantBitRate (cbr)<br>rtVariableBitRate (rtvbr)<br>nrtVariableBitRate (nrtvbr)<br>availableBitRate (abr)<br>derivedFromBBC (derived) |
| Default | unspecifiedBitRate |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm trafficShaping (trShaping)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

Description

This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface.

This attribute is ignored if the *atmServiceCategory* is ***availableBitRate***.

For ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, traffic shaping is not available, therefore this attribute is ignored.

A value of ***sameAsCa*** means traffic shaping for the connection is based on the value of the *trafficShaping* attribute of the connection's service category component under the *CA*. If the service category has *trafficShaping* set to ***enabled*** or ***inverseUpc***, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm*, *Vpc Tm*, or *Vpt Tm* components.

A value of ***disabled*** means traffic shaping for this connection is disabled regardless of the provisioning of the connection's service category component.

Values

disabled
sameAsCa

Default

sameAsCa

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm unshapedTransmitQueueing (unshap)

Access

Read and write

Criticality

Component

Description

This attribute specifies the transmit queuing method for this connection if it is unshaped. The two possible methods are per-VC queuing and common queuing. This attribute does not apply if the connection is shaped.

A value of ***sameAsCa*** means the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *CA*.

A value of ***common*** means transmit traffic on this unshaped connection is destined for the common queue.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute must have the value ***sameAsCa***.

This attribute is ignored in the following situations:
- if the connection has *trafficShaping* ***enabled*** or ***inverseUpc***, or
- if the *atmServiceCategory* is ***availableBitRate***, or
- if the *atmServiceCategory* is ***constantBitRate***, or
- for basic *Vpt*s and standard *Vpt Vcc*s.

Values
common
sameAsCa

Default
sameAsCa

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm weight

Access
Read and write

Criticality
Component

Description
This attribute specifies an override for the weight of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, and basic *Vpt*s.

A value of ***sameAsCa*** means the weight is determined by the *weightPolicy* attribute under the *CA* service category component for all but standard *Vpt Vcc*s. For standard *Vpt Vcc*s, the weight is determined by the *Vcc*'s service category, when the value is set to ***sameAsCa***.

A value from 1 to 4095 means that value is used for the fairness weight of this connection relative to other connections. For all but standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection,

compared to other connections in the same service category. For standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the *Vpt*.

A value of ***upToQueueLimit*** means the fairness weight is limited only by the *txQueueLimit*.

This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, and ***16pOC3PosAtm*** cards, the value ***upToQueueLimit*** is not permitted.

Values
Decimal (1..4095)
sameAsCa
upToQueueLimit

Default
sameAsCa

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm forceTagging (tagging)

Access
Read and write

Criticality
Component

Description
This attribute specifies whether force tagging of the CLP bit is enforced for cells of this connection.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, and for *Vpt*s, this attribute is not applicable and is ignored.

A value of ***sameAsCa*** means the force tagging functionality is determined by the *forceTagging* attribute under the *CA* service category component.

A value of ***enabled*** means force tagging is enabled. When this option is selected, the CLP bit is set to 1 for all cells on the

connection.

A value of ***disabled*** means force tagging is disabled. When this option is selected, the CLP bit is unchanged for cells on the connection.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction. In this case, cells which are tagged are counted in the *txCellClp* attribute.

Values
sameAsCa
enabled
disabled

Default
sameAsCa

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm usageParameterControl (upc)

Access
Read and write

Criticality
Component

Description
This attribute specifies whether this connection enables usage parameter control (UPC) when receiving traffic from the ATM interface.

The value ***sameAsCa*** means UPC for the connection is based on the value of the *usageParameterControl* attribute of the service category component under the *AtmIf CA*. If the service category has UPC ***enforced*** or ***monitored***, then UPC is enabled on the connection.

The value ***disabled*** means UPC for this connection is disabled regardless of the provisioning of the service category.

The value ***enforced*** means UPC for this connection is enforced regardless of the provisioning of the service category. When UPC is enforced, non-conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*.

The value ***monitored*** means UPC for this connection is

monitored regardless of the provisioning of the service category. When UPC is monitored, instead of the non-conforming cells being tagged or discarded, they are merely counted in the UPC violations counts and passed on unchanged.

Note that setting UPC to ***enforced*** or ***monitored*** may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc, Vpc,* and *Vpt* components.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported.

For ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, the values ***enforced***, and ***monitored***, are not supported.

Values
enforced
disabled
sameAsCa
monitored

Default
sameAsCa

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm bearerClassBbc (bcBbc)

Access
Read and write

Criticality
Component

Description
This attribute specifies the bearer capability. This attribute is only used for SPVC and SPVP connections. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory.* Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM

transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***) and timing requirements are user defined (that is, transparent to the network).When ***x*** is set the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class **vp** service is used to specify a transparent VP service. When the value of this attribute is vp, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except or VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP connections.

Values
a
c
x
vp
derivedFromServiceCategory

Default
derivedFromServiceCategory

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm transferCapabilityBbc (tcBbc)

Access
Read and write

Criticality
Component

Description
This attribute specifies the transfer capability for this connection. Uni 3.0/3.1 traffic type and end-to-end timing parameters are

mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

The value ***notApplicable*** specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation.
The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The value no indication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing.

The value yes for end-to-end timing indicates that end-to-end timing is required.

The value no for end-to-end timing indicates that end-to-end timing is not required.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm txWredThreshold

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the threshold for weighted random early detection (WRED). This threshold is calculated as a percentage of the early packet discard (EPD) threshold, which is 85% of the transmit queue length. When the value is ***25%***, WRED starts as soon as the queue is 25% of the way to the EPD threshold. When the value is ***50%***, WRED starts later, after the queue is 50% of the way to the EPD threshold. When the value is ***75%***, WRED starts only when the queue is 75% of the way to the EPD threshold.<br><br>This attribute is ignored if the value of the *txWredMode* or *txPacketWiseDiscard* attributes is ***disabled.***<br><br>For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored. |
| Values | Decimal (25; 50; 75) |
| Units | % |
| Default | 25 |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm clippingBbc (cBbc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the value for the clipping susceptibility parameter in the BBC Information Element. This attribute is only used for SPVC connections. It is one of the Broadband Bearer |

Capability attributes.

Clipping is an impairment in which the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.

Values
no
yes

Default
no

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm bestEffort

Access
Read and write

Criticality
Component

Description
This attribute specifies the value of the best effort parameter in the ATM Traffic Descriptor Information Element. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability attributes.

The value ***indicated*** implies that the quality of service for this connection is not guaranteed.

The value ***notIndicated*** implies that the quality of service for this connection is guaranteed.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Values
indicated
notIndicated
derivedFromServiceCategory (derived)

derivedFromServiceCategory

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm txPacketWiseDiscard (txpd)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the transmit data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s.<br><br>For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.<br><br>Packet-wise functions increase the “goodput” of the link. The transmit packet-wise functions are Early Packet Discard (EPD) and Partial Packet Discard (PPD).<br><br>EPD allows the connection to discard an entire frame once the transmit queue has reached the EPD threshold. EPD increases the “goodput” of a link, since discarding an entire frame means that some queue capacity is guarded for some other frame which is already partially transmitted. All cells of the frame are discarded from the Beginning of Message (BOM) cell up to and including the End of Message (EOM) cell.<br><br>PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.<br><br>For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the packet-wise discard functions are PPD and EPD. PPD is applicable at cell-transfer points. PPD is not applicable at frame-to-cell conversion points, and is not applicable for *Vpc*s. PPD is configured by this attribute. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded. EPD is automatically |

***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***16pOC3PosAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Both PPD and EPD are controlled by this attribute. This attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

A value of ***enabled*** means packet-wise discard functions are applied to transmit traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to transmit traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the backward direction. When this attribute is set to ***disabled***, backward frame discard is not requested in the SPVC call setup.

The transmit packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute.

Values

disabled
enabled

Default disabled

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm rxPacketWiseDiscard (rxpd)

Access Read and write

Criticality Component

Description This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the receive data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s.

For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.

Packet-wise functions increase the “goodput” of the link. The receive packet-wise function is Partial Packet Discard (PPD).

PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded, for example due to UPC. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD is available at all VCC connection points where UPC may be activated. PPD is not applicable for *Vpcs*. Packet-wise discards should only be enabled for connections carrying AAL5 segmentation traffic. Setting the value to ***enabled*** for any other traffic type may result in traffic being discarded. PPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-

segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

A value of ***enabled*** means packet-wise discard functions are applied to receive traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to receive traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the forward direction. When this attribute is set to ***disabled***, forward frame discard is not requested in the SPVC call setup.

For ***16pOC3PosAtm*** cards, the value of this attribute must be ***disabled***. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

The receive packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm rxPacketWiseDiscard* operational attribute.

| Values | disabled<br>enabled |
| Default | disabled |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm txWredMode

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the activation of weighted random early detection (WRED) functionality. WRED is considered a packet-wise discard function and as such applies only to AAL5 frame |

traffic.

WRED is applied in the transmit direction for this connection. WRED function should be enabled only for connections which are transferring TCP/IP traffic. WRED acts to prevent synchronization of multiple TCP/IP sources by randomly discarding a small percentage of frames when transmit queue congestion reaches the designated level. WRED may also be used to differentiate service on VCC's by preferentially discarding one VCC before another. Discards start at 0% of cells, when the queue is part-way to the Early Packet Discard (EPD) threshold, and rise to 100% of cells discarded at the EPD threshold. WRED discards all the cells in a frame.

A value of ***enabled*** means WRED is enabled for all applications linked to the given *Vcc*.

A value of ***perFlow*** means each TCP application has individual control over whether to enable or disable WRED.

If the value of the *txPacketWiseDiscard* attribute is ***disabled***, or if the value of this attribute is ***disabled***, WRED functionality is disabled.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, the value of this attribute must be ***disabled***.

If WRED is active, it is visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute.

This attribute is not applicable for *Vpt*s or *Vpt Vcc*s.

Values

disabled
enabled
perFlow

Default

disabled

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm abrConnectionType (abrType)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the type of ABR behavior which is to be enforced at this connection. This attribute is only applicable if the value of the *atmServiceCategory* attribute is ***availableBitRate***. If the value of the *atmServicecategory* attribute is not ***availableBitRate***, this attribute is ignored.<br><br>The value ***sameAsCa*** is used to request the default behavior as specified in the *CA Abr* component for this *Vcc*. Otherwise, this attribute overrides the default behavior.<br><br>The value ***virtualSourceDest*** is used to request that this connection point function as a virtual source/virtual destination.<br><br>The value ***sourceDest*** requires that this connection point function as a S/D for RM cells. S/D mode is automatically invoked at this connection point either if this is a connection end point, or if the next hop connection point is configured as ***nonAbrInterworking***.<br><br>The value ***nonAbrInterworking*** is used to request that this connection point function as an interworking between ABR and non-ABR service categories. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***.<br><br>The value ***abrSwitch*** is used to request ABR switch behavior for this connection point. The ABR switch behavior is first, to conform to ***virtualSourceDest*** or ***nonAbrInterworking*** setting on the next hop, and otherwise to implement ABR ER switch behavior.<br><br>For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the only allowable values are ***sameAsCa***, ***nonAbrInterworking*** or ***abrSwitch***. If ***abrSwitch*** is selected, EFCI marking behavior is implemented. |

For ***1pOC12SmLrAtm*** cards, the only allowable values are ***sameAsCa*** or ***abrSwitch.*** If ***abrSwitch*** is selected, EFCI marking behavior is implemented.

For ***16pOC3PosAtm*** cards, the only allowable value is ***sameAsCa***.

The actual ABR functionality which is in effect is visible in the *Vcc/Vpc/Vpt Tm abrConnectionType* operational attribute.

Values
abrSwitch
virtualSourceDest
sourceDest
nonAbrInterworking
sameAsCa

Default
sameAsCa

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm txTrafficDescParm (txTdp)

Access
Read and write

Criticality
Component

Description
This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute.

The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR, MCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.

When *txTrafficDescType* is 1 or 2, all of the parameters must be set to zero.

When *txTrafficDescType* is 3, parameter 1 represents the PCR for

CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This

result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 4 and parameter 5 represent are not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may be optionally zero.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate. When the *atmServiceCategory* is ***availableBitRate*** (ABR), the shaping rate is dynamically chosen, based on the ABR flow control mechanism, as a value between the MCR and the PCR or the requested shaping rate if applicable.

For *txTrafficDescType* 3, 4 and 5, the transmit traffic is shaped at the next available shaping rate less than the PCR.

For *txTrafficDescType* 6, 7 and 8 if linear traffic shaping is selected, the transmit traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

For *txTrafficDescType* 6, 7 and 8 if inverse-UPC traffic shaping is

selected, the transmit traffic is shaped at a variable rate which conforms to the PCR, SCR and MBS of the connection traffic descriptor.

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm rxTrafficDescParm (rxTdp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute is a vector of five traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. If the value of the *rxTrafficDescType* attribute is ***sameAsTx***, the values provisioned in this attribute are ignored. The traffic parameters for the receive direction are taken from the *txTrafficDescParm* attribute.<br><br>The values of peak cell rate (PCR), sustained cell rate (SCR), and Minimum Cell Rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. The value of CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for usage parameter control (UPC).<br><br>When *rxTrafficDescType* is 1 or 2, all of the parameters must be set to zero (unused).<br><br>When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused).<br><br>When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. |

When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameter 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

If the value of CDVT either in parameter 2 or in parameter 4 is zero, the CDVT is taken from the *CA* defaults for the particular *atmServiceCategory* of this connection.

Parameter 5 of the *rxTrafficDescParm* is always unused.

When *rxTrafficDescriptorType* is 3 through 8, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware. The *check prov* command detects such cases and generates an error message. If this happens, adjust the parameters until they fall within the supported limits.
To calculate the limits, use the following formulae:
I1 = 1,000,000,000 / PCR
L1 = CDVT * 1000
I2 = 1,000,000,000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is 6 through 8.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, I1 and I2 must be less than or equal to 335,523,840. I1 + L1 must be less than or equal to 1,342,156,800. I2 + L2 must be less than or equal to 1,342,156,800. If the values of I1, L1, I2 or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41,940,480 or
I2 > 41,940,480 or
I1 + L1 > 167,769,600 or
I2 + L2 > 167,769,600
then both I1 and I2 must be greater than 20,480.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, L2 must be less than or equal to 2,674,011,406.

For ***16pOC3PosAtm*** cards, L2 must be less than or equal to 17,179,869,180.

Groups: "GROUP AtmIf Vpt Vcc Vcd Tm Abr Provisioned (Prov)"

Scope: Device

Description: *AtmIf/n Vcc/vpi.vci Vcd Tm AvailableBitRate,*
*AtmIf/n Vpc/vci Vpd Tm AvailableBitRate,*
*AtmIf/n Vpt/vpi Vpd Tm AvailableBitRate,*
*AtmIf/n Vpt/vpi Vcc/vci Vcd Tm AvailableBitRate*
This component contains provisioned ABR-related attributes of a connection. It is an optional subcomponent of the *Vcd Tm* and *Vpd Tm* component. It is used to override DGCRA-related defaults in the *CA Abr* component. It contains the specific configuration for the ABR connection at this connection point. If this is the source of an SPVC connection, this component also contains the ABR parameters required for the SPVC call request.

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr transientBufferExposure (tbe)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the source to send during start-up periods, before the first Resource Management (RM) cell returns.<br><br>TBE divided by *fixedRoundTripTime* determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period.<br><br>TBE divided by *maxCellsPerRmCell* specifies the operational value of *forwardRmCellLimit*, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells.<br><br>This attribute is ignored under all conditions where the operational attribute *abrConnectionType* is set to ***erSwitch***. |
| Values | Decimal (0..16777215) |
| Units | cells |
| Default | 16777215 |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr fixedRoundTripTime (frtt)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back.<br><br>The value of *transientBufferExposure* divided by the value of FRTT (in seconds) determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period. |

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.

Values: Decimal (0..16700000)

Units: microsec

Default: 5000000

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr rateDecreaseFactor (rdf)

Access: Read and write

Criticality: Component

Description: This attribute specifies the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256.

RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Values: Decimal (0..15)
sameAsCa

Default: sameAsCa

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr rateIncreaseFactor (rif)

Access: Read and write

Criticality: Component

Description: This attribute specifies the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the provisioned

value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64.

RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

| | |
|---|---|
| Values | Decimal (0..15)<br>sameAsCa |
| Default | sameAsCa |

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr maxCellPerRmCell (nrm)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell.<br><br>A value of 2 is not recommended although it is permitted according to the ATM Forum standard. When this attribute is set to a value of 2, it is possible that only one forward and one backward RM cell are repeatedly transmitted, and all data traffic is queued up indefinitely.<br><br>This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***. |
| Values | Decimal (2; 4; 8; 16; 32; 64; 128; 256)<br>sameAsCa |
| Units | cells |

Default sameAsCa

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr maxTimeBetweenRmCells (trm)

Access Read and write

Criticality Component

Description This attribute specifies the TRM parameter for this connection.

TRM provides an lower bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least two other cells have been sent, then the next cell to be transmitted would be a forward RM cell.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

The provisioned value of 781 is signaled as TRM = 0, in the ABR Additional Parameters Information Element.
1563 is signaled as TRM = 1.
3125 is signaled as TRM = 2.
6250 is signaled as TRM = 3.
12500 is signaled as TRM = 4
25000 is signaled as TRM = 5.
50000 is signaled as TRM = 6.
100000 is signaled as TRM = 7.

Values Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000)
sameAsCa

Units microsec

Default sameAsCa

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr cutoffDecreaseFactor (cdf)

Access Read and write

Criticality Component

Description This attribute specifies the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is

non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero.

CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the CRM parameter, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

The value of CRM is indicated by the *forwardRmCellLimit* attribute.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.

Values — Decimal (0; 1; 2; 4; 8; 16; 32; 64)
sameAsCa

Default — sameAsCa

## ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr acrDecreaseTimeFactor (adtf)

Access — Read and write

Criticality — Component

Description — This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection.

ADTF is the maximum time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.

| | |
|---|---|
| Values | Decimal (0..1023)<br>sameAsCa |
| Units | centiseconds |
| Default | sameAsCa |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr dgcraMaximumDelay (dgcraMaxDelay)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies an upper bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward direction).<br><br>This upper bound may be approximated as the sum of the round trip fixed and propagation delays and the maximum queuing delays between the ABR source and this interface.<br><br>The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When there is a reduction in the Allowed Cell Rate (ACR), the policer waits for a correspondingly longer period of time before it enforces at the new cell rate.<br><br>The value of this attribute must not be less than the *dgcraMinimumDelay* attribute. |
| Values | Decimal (1..16700000)<br>sameAsCa |
| Units | microsec |
| Default | sameAsCa |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr dgcraMinimumDelay (dgcraMinDelay)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies a lower bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward connection).<br><br>This lower bound may be approximated as the sum of the round trip fixed and propagation delays between the ABR source and this interface.<br><br>The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A smaller value for this attribute implies a more lenient policer. When there is a increase in the Allowed Cell Rate (ACR), the policer waits for a correspondingly shorter period of time before it enforces at the new cell rate. |
| Values | Decimal (1..16700000)<br>sameAsCa |
| Units | microsec |
| Default | sameAsCa |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr farEndAcrDecreaseTimeFactor (feAdtf)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) of the far end ABR source. The value specified should be the same as the ADTF parameter at the far end of this ABR connection.<br><br>The value of this attribute is used in policing an ABR connection using the Dynamic Generic Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When the delay between two consecutive forward Resource Management (RM) cells received at this interface corresponds to a value greater than the value of this attribute, the policer begins to limit enforce the incoming traffic at the initial cell rate (ICR) of the far end, as specified by the *farEndInitialCellRate* attribute. |

| | |
|---|---|
| Values | Decimal (0..1023) |
| Units | centiseconds |
| Default | 50 |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Tm Abr farEndInitialCellRate (feIcr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the Initial Cell Rate (ICR) of the far end ABR source. The value specified should be the same as the ICR parameter at the far end of this ABR connection.<br><br>The value of this attribute is used in policing an ABR connection using the Dynamic Generic Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When the delay between two consecutive forward Resource Management (RM) cells received at this interface corresponds to a value greater than the *farEndAcrDecreaseTimeFactor* attribute, the policer begins to enforce the incoming traffic at the value of this attribute.<br><br>If this attribute is specified less than the MCR of the connection, then the MCR is used as the *feIcr*. If this attribute is more than the PCR of the connection, then PCR is used as the *feIcr*. |
| Values | Decimal (0..16777215) |
| Units | cell/s |
| Default | 0 |

### COMPONENT AtmIf Vpt Vcc Vcd PerformanceMonitoring (Pm)

| | |

## GROUP AtmIf Vpt Vcc Vcd Pm Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisioned attributes which specify Performance Monitoring (PM) measurements, namely, Availability Ratio (AR) and Cell Loss Ratio (CLR), and control modes for the connection. The values specified in this group override those specified by the *AtmIf Pm* component.

## ATTRIBUTE AtmIf Vpt Vcc Vcd Pm segSwitchSideMeasurement (segSwitchSide)

Access: Read and write

Description: This attribute specifies the set of Performance Monitoring (PM) measurements on the switch side configuration for the connection.

A value of ***sameAsInterface*** means that the measurements specified by the *segSwitchSideMeasurement* attribute of the *AtmIf Pm* component will be performed. No other values may be specified if ***sameAsInterface*** is selected. If the value is empty, no switch side PM measurements are done.

Set of:
availabilityRatio (ar)
cellLossRatio (clr)
sameAsInterface (sameAsIf)

Default: (sameAsInterface)

## ATTRIBUTE AtmIf Vpt Vcc Vcd Pm segLinkSideMeasurement (segLinkSide)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the set of Performance Monitoring (PM) measurements on the link side configuration for the connection.<br><br>A value of ***sameAsInterface*** means that the measurements specified by the *segLinkSideMeasurement* attribute of the *AtmIf Pm* component will be performed. No other values may be specified if ***sameAsInterface*** is selected. If the value is empty, no link side PM measurements are done. |
| Set of | availabilityRatio (ar)<br>cellLossRatio (clr)<br>sameAsInterface (sameAsIf) |
| Default | (sameAsInterface) |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Pm controlMode (mode)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the control mode of Performance Monitoring (PM) measurements for the connection.<br><br>A value of ***autoStart*** means that PM activation procedures will start when the provisioned data is activated.<br><br>A value of ***onDemand*** means that PM activation procedures will start when the operator issues the *Start* command. The PM measurements in this mode will continue until the operator issues the *Stop* command.<br><br>A value of ***sameAsInterface*** means that the behavior will be as specified by the *controlMode* attribute of the *AtmIf Pm* component. |
| Values | autoStart (auto)<br>onDemand (onDemand)<br>sameAsInterface (sameAsIf) |
| Default | sameAsInterface |

### ATTRIBUTE AtmIf Vpt Vcc Vcd Pm switchSideClrType (clrType)

| | |
|---|---|
| Access | Read and write |

Description

This attribute specifies how the Cell Loss Ratio (CLR) Performance Monitoring (PM) is measured on a switch-side configuration for the connection.

A value of ***complete*** indicates that egress discards at the segment end points are included in the CLR measurement as per ITU standards.

A value of ***partial*** indicates that egress discards do not contribute to the CLR measurement.

A value of ***sameAsInterface*** means that the behavior is as specified by the *switchSideClrType* attribute of the *AtmIf Pm* component.

Values

complete
partial
sameAsInterface (sameAsIf)

Default

sameAsInterface

## COMPONENT AtmIf Vpt Vcc Loop (Loop)

Scope

Device

Description

*AtmIf/n Vcc/vpi.vci Loop*
The *Loop* component configures an ATM connection so that cells received from the ATM interface are retransmitted back to the interface through that connection. The *Loop* component requires exclusive use of its parent *Vcc* or *Vpc* and cannot co-exist with other ATM service components (such as *Nep*, *Nrp*, and *Test*).

Common Verbs

## COMPONENT AtmIf Vpt Vcc NailedUpRelayPoint (Nrp)

Groups

"GROUP AtmIf Vpt Vcc Nrp Provisioned (Prov)"

Scope

Device

Description

*AtmIf/n Vcc/vpi.vci Nrp*
This component is used to establish a single hop of a nailed-up ATM Bearer Service (ABS) connection. By linking together two *Nrp*s within a module, the associated connections are configured to relay ATM cells to one another. The *Nrp* component requires exclusive use of its parent *Vcc* or *Vpc* and cannot co-exist with other ATM service components (such as *Nep*, *Test*, and *Loop*).

## GROUP AtmIf Vpt Vcc Nrp Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for the *Nrp* component.

## ATTRIBUTE AtmIf Vpt Vcc Nrp nextHop (nextHop)

Access: Read and write

Criticality: Component

Description: This attribute specifies the *Nrp* component with which this *Nrp* is associated. A sample value is *AtmIf/31 Vcc/0.32 Nrp*.

Values: Link (Service, nextHop)

Default: No default

## ATTRIBUTE AtmIf Vpt Vcc Nrp oamSegmentBoundary (sb)

Access: Read and write

Criticality: Component

Description: This attribute specifies the OAM segment boundary desired for a *Nrp* component. It affects the connection point type value visible in the parent component's *connectionPointType* attribute.

The desired OAM segment boundary can be specified directly as

***yes***, ***no*** or ***sameAsInterface***. If ***sameAsInterface*** is specified, the OAM segment boundary is same as the *oamSegmentBoundary* attribute of the associated *AtmIf* and the switch will set the *connectionPointType*, choosing ***segmentEndPoint*** for a segment-boundary ATM interface and ***connectingPoint*** for a non-segment-boundary ATM interface.

Values
no
yes
sameAsInterface

Default
sameAsInterface

## ATTRIBUTE AtmIf Vpt Vcc Nrp bandwidthElastic (bwElastic)

Access
Read and write

Criticality
Component

Description
This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced will be displayed in the *bandwidthReduction* attribute.

A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection will not be released. Currently, this attribute should only be set to ***yes*** for situations where this *Nrp* is functioning as a loopback on one side of an IMA link. There are no other situations where this setting is valid.

A value of ***no*** indicates that the bandwidth for this connection will not be reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority.*

Values
no
yes

| | |
|---|---|
| Default | no |

### ATTRIBUTE AtmIf Vpt Vcc Nrp overrideHoldingPriority (ohpri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the holding priority of this connection. Holding priority is used when there is an IMA group where some physical links have failed. Holding priority determines the order in which connections are released. 4 is the lowest holding priority and is released first. 0 is a higher priority and is released last. The value specified in this attribute will override whatever *holdingPriority* that has been provisioned at the *Vcd* (or *Vpd*). If the value is left at the default of ***noOverride***, the *holdingPriority* provisioned at the *Vcd* (or *Vpd*) will be used. |
| Values | 0<br>1<br>2<br>3<br>4<br>noOverride |
| Default | noOverride |

### COMPONENT AtmIf Vpt Vcc NailedUpEndPoint (Nep)

| | |
|---|---|
| Groups | "GROUP AtmIf Vpt Vcc Nep Provisioned (Prov)" |
| Scope | Device |
| Description | *AtmIf/n Vcc/vpi.vci Nep*<br>The *NailedUpEndPoint* component is used to link a VCC to an application that sends and receives frames using the connection. The *Nep* component requires exclusive use of its parent *Vcc* and |

cannot co-exist with other ATM service components (such as *Nrp*, *Test*, and *Loop*).

Common Verbs

## GROUP AtmIf Vpt Vcc Nep Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisionable attributes for the *Nep* component.

## ATTRIBUTE AtmIf Vpt Vcc Nep applicationName (appName)

Access: Read only

Description: This attribute specifies the application that sends and receives frames using the VCC. This attribute is set, for example, by provisioning the *Trunk AtmAccess AtmConnection* attribute. If it is properly configured, this attribute will show a value such as “Trk/22 AtmAccess”.

Values: Link (Service, atmConnection)

Default: No default

## COMPONENT AtmIf Vpt Vcc Test (Test)

Groups: "GROUP AtmIf Vpt Vcc Test OsiState (State)"
"GROUP AtmIf Vpt Vcc Test Setup (Setup)"
"GROUP AtmIf Vpt Vcc Test Results (Results)"

Scope: Device

Description: *AtmIf/n Vcc/vpi.vci Test*
The *Test* component allows test traffic to be sent over an ATM connection. It is used to verify the integrity of hardware carrying ATM traffic, and provides test capabilities similar to those provided by non-ATM port and line tests. The *Test* component requires exclusive use of its parent *Vcc* and cannot co-exist with

other ATM service components (such as *Nep*, *Nrp*, and *Loop*).

An ATM connection test circulates traffic through a VCC having a *Test* component at one end and the other end configured to loop back ATM cells. The *Test* component generates test frames, transforms them into ATM cells using AAL5 segmentation, and transmits them through the VCC; the returned cells are received by the *Test* component, reassembled back into frames, and the frames are consumed.

The test frames generated by the test are grouped into two independent streams.
1) The loading frame stream circulates a set of “loading frames” through the connection as rapidly as possible. The intent of this stream is to verify the operation of the connection under a controlled load.
2) The verification stream transmits a series of “verification frames” through the connection; as each frame is returned, the *Test* component verifies its contents and the next verification frame in the series is transmitted. The intent of this stream is to verify that frames are not being corrupted.
The test can be configured to send frames from either or both streams. The size and content of the test frames can also be controlled.

## VERB START AtmIf Vpt Vcc Test

Impact: Service

Description: *START AtmIf/n Vcc/vpi.vci Test*
This verb invokes an ATM connection test. It has no effect when the test is already running.

### VERB STOP AtmIf Vpt Vcc Test

| | |
|---|---|
| Impact | Service |
| Description | *STOP AtmIf/n Vcc/vpi.vci Test*<br>This verb stops an ATM connection test. It has no effect when the test is not running. |

### GROUP AtmIf Vpt Vcc Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE AtmIf Vpt Vcc Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE AtmIf Vpt Vcc Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE AtmIf Vpt Vcc Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP AtmIf Vpt Vcc Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes that govern the operation of an ATM connection test. These attributes cannot be changed while the test is running. |

## ATTRIBUTE AtmIf Vpt Vcc Test frmTypes (types)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the types of the test frames to be transmitted during the ATM connection test. It must contain at least one of the following:<br>***loading***: A set of “loading frames” is circulated over the link as rapidly as possible. This frame type should be selected when the test is intended to verify the operation of the connection under a specified load. These frames are not checked for bit errors.<br>***verification***: A single “verification frame” is transmitted over the link; when the frame is returned, its contents are verified and the next verification frame in the series is transmitted. This frame type should be selected when the test is intended to verify that frames are not being corrupted as they pass over the connection. |
| Set of | loading<br>verification |
| Default | (loading, verification) |

## ATTRIBUTE AtmIf Vpt Vcc Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test frames used in an ATM connection test. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

## ATTRIBUTE AtmIf Vpt Vcc Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the bit sequence used to fill the frames used in the ATM connection test. It must contain one of the following values:<br>***ccitt32kBitPattern***: a pseudo-random sequence of 32 Kbit is used<br>***ccitt8MBitPattern***: a pseudo-random sequence of 8Mbit is used<br>***customizedPattern***: the pattern defined in the *customizedPattern* attribute is used |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE AtmIf Vpt Vcc Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a 32 bit sequence to be used to fill frames when the *framePatternType* attribute is set to ***customizedPattern***. The default value gives a pattern of alternating 0 and 1 bits. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE AtmIf Vpt Vcc Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of minutes that the ATM connection test is allowed to run. The maximum allowed value permits the test to be run for up to 21 days. |
| Values | Decimal (1..30240) |
| Units | minutes |
| Default | 1 |

### ATTRIBUTE AtmIf Vpt Vcc Test bandwidthElastic (bwElastic)

| | |
|---|---|
| Access | Read and write |

Description

This attribute specifies whether the connection (*VCC*) should be configured with elastic bandwidth or not. Elastic bandwidth is of importance in conjunction with IMA links, where some links fail and the resulting bandwidth is less than the requested bandwidth for all connections. In that case, some connections may be reduced in bandwidth based on the setting of the *bwElastic* attribute.

If this attribute is set to ***yes***, the Test application signals to the connection that the bandwidth for this connection is elastic, and may be reduced in the case of IMA link failures. If the bandwidth is reduced, the rate of test cells which can be handled by the connection will also be reduced.

If this attribute is set to ***no***, the Test application signals to the connection that the bandwidth for this connection must be maintained at the requested level. If the connection cannot maintain the full bandwidth, the connection may be released (cleared) based on the holding priority of the connection.

Values

no
yes

Default

no

## ATTRIBUTE AtmIf Vpt Vcc Test overrideHoldingPriority (ohpri)

Access

Read and write

Description

This attribute specifies the override holding priority which should be signaled to the *VCC* connection at the start of the test. Holding priority is of importance in conjunction with IMA links, where some links fail and the resulting bandwidth is less than the requested bandwidth for all connections. In that case, some connections may be released based on the connection's holding priority.

***Zero*** (0) is the highest holding priority, and ***four*** (4) is the lowest priority. A setting of ***zero*** to ***four*** overrides whatever holding priority that has been configured at the connection (*VCC*). A setting of ***noOverride*** means that the connection should use its internally configured holding priority.

| | |
|---|---|
| Values | 0<br>1<br>2<br>3<br>4<br>noOverride |
| Default | noOverride |

### GROUP AtmIf Vpt Vcc Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes that show the result of an ATM connection test; if no test is running, the attribute group contains the results of the most recently completed test. The attributes of the *Results* group are reset to their initial values whenever a test is started or any attribute of the *Setup* group is set. |

### ATTRIBUTE AtmIf Vpt Vcc Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of minutes that the test has been running. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE AtmIf Vpt Vcc Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of minutes that the test will continue to run before stopping automatically. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE AtmIf Vpt Vcc Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the reason the test ended. It contains one of the following values.<br>***testTimeExpired***: the test ran for the specified duration<br>***stoppedByOperator***: a *STOP* command was issued<br>***neverStarted***: the test has not been started<br>***testRunning***: the test is currently running |
| Values | testTimeExpired<br>stoppedByOperator<br>neverStarted<br>testRunning |
| Default | neverStarted |

### ATTRIBUTE AtmIf Vpt Vcc Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of bytes sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of bytes received during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Test loadingFrmTx

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the number of loading frames sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Test loadingFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of loading frames received during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Test loadingFrmLost

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of loading frames that were lost during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Test verificationFrmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of verification frames sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Test verificationFrmRx

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the number of verification frames received during the test (including errored verification frames). The counter wraps to zero if it exceeds its maximum value of (2**64)-1.<br><br>Note that the number of verification frames lost during the test can be computed by the expression *verificationFrmTx - verificationFrmRx*. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Test verificationFrmBad

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of errored verification frames received during the test. A verification frame is considered to be errored if it contains a recognizable verification frame header, but does not match the transmitted frame bit for bit. (Thus, a verification frame that returns after the succeeding verification frame has been transmitted is considered to be errored.) The counter wraps to zero if it exceeds its maximum value of (2**64)-1.<br><br>Note that the number of correct verification frames received during the test can be computed by the expression *verificationFrmRx - verificationFrmBad*. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Test unrecognizableFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames received during the test which do not contain a valid loading frame header or verification frame header. The counter wraps to zero if it exceeds its maximum value of (2**64)-1. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Tm txQosClass (txQos)

Access Read only

Description This attribute indicates the quality of service for the calling to called direction for this connection. This is only applicable to Soft PVC and SVC connections.

Class 1 supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video).

Class 2 supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video).

Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class 0 is the unspecified QOS class; no objective is specified for the performance parameters.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Values
0
1
2
3
4
notApplicable

Default No default

### ATTRIBUTE AtmIf Vpt Vcc Tm txQueueLength (txQLen)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of cells in the transmit queue for this connection.<br><br>If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the length of the common queue which is used for this ATM service category.<br><br>If this connection has *unshapedTransmitQueueing* attribute displayed as ***fifo***, this attribute indicates the number of cells for this connection which are enqueued in a first-in-first-out queuing method for this ATM service category. This will only occur for connections on ATM IP cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***.<br><br>If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the length of the per-VC queue.<br><br>For ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute displays the current number of cells in the link class queue used by this connection to buffer its traffic.<br><br>This attribute does not apply to basic *Vpt*s. |
| Values | Decimal (0..512000) |
| Units | cells |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Tm txQueueCongestionState (txQCong)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the congestion state of the transmit queue for this connection.<br><br>If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the congestion state of the common queue. If this connection has |

*unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the congestion state of the per-VC queue.

The congestion state of a queue is indicated by a numeric value ranging from 0 to 3. When a queue is in a congested state x, only traffic with discard priority (DP) 0 to x are enqueued. Traffic with DP > x is discarded.

For example, if the congestion state is 3, there is no congestion and all traffic is enqueued. Likewise, when the congestion state is 0, there is maximum congestion and only traffic with DP=0 is enqueued on that queue.

For ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute displays the current congestion state of the link class queue used by this connection to buffer its traffic.

This attribute does not apply to basic *Vpt*s.

Values — Decimal (0..3)

Default — No default

## ATTRIBUTE AtmIf Vpt Vcc Tm holdingPriority (hpri)

Access — Read only

Description — This attribute indicates the actual holding priority in effect for this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. Some applications, for example *Vcc Test*, may override the provisioned holding priority.

A value of ***notApplicable*** is displayed when this is an elastic connection. Holding priority does not apply to bandwidth elastic connections.

Holding priority has no effect if the equivalent cell rate (ECR) for a connection is zero.

This attribute does not apply to *Vpt Vcc*s.

## ATTRIBUTE AtmIf Vpt Vcc Tm atmServiceCategory (service)

Access

Read only

Description

This attribute indicates the ATM service category used for traffic in both directions of the connection.

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to have significantly reduced value for the application.

The ***rtVariableBitRate*** service category is intended for real time

applications; that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non-real time applications, that is those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

| | |

| Values | unspecifiedBitRate (ubr)<br>constantBitRate (cbr)<br>rtVariableBitRate (rtVbr)<br>nrtVariableBitRate (nrtVbr)<br>availableBitRate (abr) |
| Default | No default |

## ATTRIBUTE AtmIf Vpt Vcc Tm trafficShaping (trShaping)

Access: Read only

Description: This attribute indicates the traffic shaping state of the connection.

A value of ***notApplicable*** indicates that traffic shaping is not applicable or not supported for this connection. This is the case:
- when the *txTrafficDescType* is 1 or 2.
- for standard *Vpt Vcc*s and basic *Vpt*s.
- for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, when the *atmServiceCategory* is ***constantBitRate***.

In these cases, the value of ***notApplicable*** is indicated regardless of whether traffic shaping is enabled or disabled in the provisioning data.

A value of ***disabled*** indicates that traffic shaping is applicable and supported for the type of connection but has been turned off in the provisioning data.

A value of ***linear*** or ***inverseUpc*** indicates that traffic shaping is applicable and supported for the type of connection and has been turned on in the provisioning data. This is the only case that indicates that traffic shaping is performed on the connection. In this case, the actual shaping rate is reflected in the *txTrafficDescParm* attribute, parameter number 4. A value of ***linear*** indicates that traffic is being shaped at the constant rate indicated in *txTrafficDescParm* 4. A value of ***inverseUpc*** indicates that the shaper strictly conforms to the requirements of a dual leaky bucket UPC enforcer. This value is indicated if traffic shaping is enabled, and the *txTrafficDescType* for this connection is 6, 7 or 8.

For ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, traffic shaping is not available, therefore this attribute is always ***disabled***.

Traffic shaping for connections with *atmServiceCategory* as ***availableBitRate*** (*txTrafficDescType* 9) depends upon the *abrConnectionType* attribute. If *abrConnectionType* is

***sourceDest*** or ***virtualSourceDest***, the value of this attribute is ***linear***. If *abrConnectionType* is ***erSwitch*** or ***efciSwitch***, this attribute is ***notApplicable***.

Values

disabled
linear
inverseUpc
notApplicable

Default

No default

## ATTRIBUTE AtmIf Vpt Vcc Tm bearerClassBbc (bcBbc)

Access

Read only

Description

This attribute indicates the bearer capability for this connection.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is displayed, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements.When ***c*** is displayed, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***cbr*** or ***vbr***), and timing requirements are user defined (that is, transparent to the network). When the value of this attribute is ***x***, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class vp service is used to indicate a transparent VP service when the user is requesting an ATM only service from the network. In this case, the network does not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except for VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently

by the network. This attribute value is only applicable to SPVP and SVP connections.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Values

a
c
x
vp
notApplicable

Default

No default

## ATTRIBUTE AtmIf Vpt Vcc Tm transferCapabilityBbc (tcBbc)

Access

Read only

Description

This attribute indicates the transfer capability for this connection. Uni 3.0/3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance, or in the case that the transfer capability in the call request was set to NoIndication.

The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The value NoIndication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing.

The value yes for end-to-end timing indicates that end-to-end timing is required for the connection.

The value no for end-to-end timing indicates that end-to-end timing is not required for the connection.

Values

### ATTRIBUTE AtmIf Vpt Vcc Tm clippingBbc (cBbc)

Access
Read only

Description
This attribute indicates the value of the clipping susceptibility parameter in the broadband bearer capability (BBC) Information Element.

Clipping is an impairment in which the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Values
no
yes
notApplicable

Default
No default

### ATTRIBUTE AtmIf Vpt Vcc Tm unshapedTransmitQueueing (unshap)

Access
Read only

Description

This attribute indicates the unshaped transmit queuing state of the connection.

A value of ***common*** indicates that transmit traffic is being enqueued onto the common transmit queue for this service category.
The *txQueueLength* attribute indicates the current length of the common transmit queue.

A value of ***fifo*** indicates that transmit traffic is being queued in a first-in-first-out basis for this service category. This is similar to ***common*** queuing, but the *txQueueLength* attribute indicates the number of cells in this connection queue. A value of ***fifo*** will only be indicated for connections on ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***.

A value of ***perVc*** indicates that transmit traffic is being enqueued onto a per-VC queue for this connection.

A value of ***notApplicable*** indicates that transmit traffic is being shaped for this connection, or that unshaped transmit queuing is not applicable for this type of connection. Transmit traffic for a shaped connection is enqueued onto a per-VC queue, but this attribute is only applicable for unshaped connections. Unshaped transmit queuing is not applicable for basic *Vpt*s.

Values

perVc
common
notApplicable
fifo

Default

No default

## ATTRIBUTE AtmIf Vpt Vcc Tm bestEffort

Access

Read only

Description

This attribute indicates value of best effort parameter in the ATM Traffic Descriptor Information Element.

The value ***indicated*** implies that the quality of service for this connection is not guaranteed.

The value ***notIndicated*** implies that the quality of service for this connection is guaranteed.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Values
indicated
notIndicated
notApplicable

Default
No default

### ATTRIBUTE AtmIf Vpt Vcc Tm forceTagging (tagging)

Access
Read only

Description
This attribute indicates the state of force tagging option for this connection. Force tagging refers to setting the CLP bit for all cells on a connection.

A value of ***enabled*** indicates that the CLP bit is being set to 1 for all cells in the transmit direction on this connection.

A value of ***disabled*** indicates that the CLP bit is unchanged for cells in the transmit direction on this connection. The value ***disabled*** is always displayed for *Vpt*s since forced tagging is applied on a per *Vpt Vcc* basis.

Values
disabled
enabled

Default
No default

### ATTRIBUTE AtmIf Vpt Vcc Tm weight

Access
Read only

Description
This attribute indicates the relative weight of this unshaped connection. Connections with a larger weight get a larger proportion of the link bandwidth or in the case of standard *Vpt Vcc*s, the *Vpt* bandwidth.

For all but standard *Vpt Vcc*s, the default connection weight is determined by the weight policy for a service category and the traffic descriptor for a connection. For standard *Vpt Vcc*s, the default connection weight is determined by the *Vcc*'s service category.

A value from 1 to 4095 indicates an actual weight. The value ***upToQueueLimit*** indicates that the weight of a connection is up to the transmit queue limit for this connection and is used for connections which have the value of the *unshapedTransmitQueueing* attribute displayed as ***fifo***.

This attribute has a displayed value of ***notApplicable*** in the following cases:
- This connection has the value of the *trafficShaping* attribute displayed as either ***linear*** or ***inverseUpc***.
- This connection has the value of the *trafficShaping* attribute displayed as ***disabled***, but the connection's service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc***.
- This connection has the value of the *unshapedTransmitQueueing* attribute displayed as ***common***.
- This is a basic *Vpt* connection.
- For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, since per-connection weight is not supported.

Values: Decimal (1..4095)
upToQueueLimit
notApplicable

Default: No default

## ATTRIBUTE AtmIf Vpt Vcc Tm usageParameterControl (upc)

Access: Read only

Description: This attribute indicates the UPC state of the connection.

A value of ***notApplicable*** indicates that UPC is not applicable or not supported for the connection. This is the case:
- when the connection's *rxTrafficDescType* is 1 or 2.

- for standard *Vpt Vcc*s and basic *Vpt*s.

A value of ***notApplicable*** is set regardless of whether UPC is disabled or enabled in provisioning data.

A value of ***disabled*** indicates that UPC is applicable and supported for the type of connection but has been turned off in the provisioning data.

A value of ***enforced*** indicates that UPC is actively checking conformance for the connection and is discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. On some ATM cards, the counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

A value of ***monitored*** indicates that UPC is actively checking conformance for the connection and counting the violations, but is not discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. The counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt. rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

If the *atmServiceCategory* for this connection is ***availableBitRate***, a value of ***enforced*** indicates that Dynamic Generic Cell Rate Algorithm (DGCRA) is active for the connection. The traffic descriptor parameters used for DGCRA enforcement are reflected in the *rxTrafficDescParm* of the connection.

Values

enforced
disabled
monitored
notApplicable

Packet-wise functions are not applicable to virtual path connections (VPCs) on these cards.<br><br>On all other ATM cards, all packet-wise discard functions also apply to virtual path connections (VPCs).<br><br>This attribute is not applicable for *Vpt*s. |
| Set of | ppd<br>epd<br>wred |
| Default | No default |

## ATTRIBUTE AtmIf Vpt Vcc Tm rxPacketWiseDiscard (rxpd)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the current set of packet-wise discard functions in effect in the receive data direction at this connection point.

A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.

A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, packet-wise functions are not applicable to virtual path connections (VPCs).

For ***16pOC3PosAtm*** cards, PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

On all other ATM cards, all packet-wise discard functions also apply to virtual path connections (VPCs).

This attribute is not applicable for *Vpt*s.

Set of

ppd
epd

Default

No default

## ATTRIBUTE AtmIf Vpt Vcc Tm bandwidthElastic (bwElastic)

Access

Read only

Description

This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested

bandwidth cannot be maintained. This attribute shows whether the application (for example, *Trunk*) running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced is displayed in the *bandwidthReduction* attribute.

A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection is not released.

A value of ***no*** indicates that the bandwidth for this connection is not reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority.*

Bandwidth elasticity has no effect for connections which have an equivalent cell rate (ECR) of zero.

This attribute is not applicable for *Vpt*s and *Vpt Vcc*s.

Values
no
yes

Default
No default

## ATTRIBUTE AtmIf Vpt Vcc Tm bandwidthReduction (bwReduction)

Access
Read only

Description
This attribute shows the amount by which the bandwidth has been reduced for this connection. This value is non-zero only for connections which have *bandwidthElastic* displayed as ***yes***, and which are also operating in a reduced bandwidth mode. This is typically the case for selected connections running over an IMA link. This attribute takes a value from 0 (no reduction) up to the ECR. For all connections which are running at their full allocated bandwidth, *bwReduction* has the value 0. Connections which have been reduced in allocated bandwidth have a positive number for this attribute. The *bwReduction* may be subtracted from the ECR (which is displayed as *txTrafficDescParm* 5) to determine the actual bandwidth allocated to this connection.

Values
Decimal (0..2147483647)

Units
cell/s

Default No default

## ATTRIBUTE AtmIf Vpt Vcc Tm abrConnectionType (abrType)

Access Read only

Description This attribute indicates the type of ABR behavior which is in effect at this connection. This attribute is only applicable if the *atmServiceCategory* attribute is ***availableBitRate***. If the *atmServiceCategory* attribute is not ***availableBitRate***, this attribute value is set to ***notApplicable***.

For ATM cards which do not support ABR connections, the possible values for this attribute are ***notApplicable***, ***efciSwitch***, or ***nonAbrInterworking***. In EFCI marking mode, the Explicit Forward Congestion Indication (EFCI) field in the data cell headers is used to indicate transmit queue congestion.

For ATM cards which do support ABR connections, if the *connectionPointType* is ***connectionEndPoint***, the value of this attribute is ***sourceDest***. In this mode, the ABR Source and Destination behavior is in effect at this connection. This attribute is also ***sourceDest*** in the case where the next hop connection is specified as ***nonAbrInterworking***. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of the *Nrp* or *Rp* component.

If the *connectionPointType* is not ***connectionEndPoint***, the value of this attribute depends upon the *abrConnectionType* provisioning and the card type to which the traffic is forwarded on the backplane. The default *abrConnectionType* is provisioned at the *CA Abr abrConnectionType* attribute, and may be overridden for a provisioned connection in the *Vcd Tm abrConnectionType* or *Vpd Tm abrConnectionType* attribute. If the *CA Abr abrConnectionType* attribute is ***virtualSourceDest*** at either one of the two connection points, and if both the connection points are defined on ATM cards which support ABR connections, virtual source and destination behavior is applied to the connection. In this instance, the attribute displays the value ***virtualSourceDest***.

This attribute has the value ***erSwitch*** if ABR explicit rate

functionality is in effect at this connection. In this mode, the switch may modify the Explicit Rate (ER) field of backward Resource Management (RM) cells to indicate the status of congestion at this connection point.

This attribute has the value ***nonAbrInterworking*** in the case where this connection point is functioning as an SPVC origin for an ABR connection where the link side of this connection is configured as a non-ABR ATM service category. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***.

Values

erSwitch
efciSwitch
virtualSourceDest
sourceDest
nonAbrInterworking
notApplicable

Default

No default

## ATTRIBUTE AtmIf Vpt Vcc Tm txTrafficDescParm (txTdp)

Access

Read only

Description

This attribute is a vector of five transmit traffic parameters whose mapping is defined by the *txTrafficDescType* attribute.

The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR), actual cell rate (ACR), explicit rate (ER), equivalent cell rate (ECR), and actual shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds.

When *txTrafficDescType* is 1 or 2, parameters 1 through 5 are unused.

In this description, PCR is the greater of either the PCR or the requested shaping rate (parameter 1 or parameter 5) specified in the *txTrafficDescParm* attribute under the *Vcd Tm* or *Vpd Tm* component.

When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 or 1 traffic; parameters 2 and 3 are unused.

When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard.

When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging.

When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, parameter 4 reflects the actual shaping rate in cell/s for this connection. For CQC-based ATM cards, the set of available shaping rates is based on the number of interfaces doing shaping (attribute *perVcQueueInterfaces*), and the *shapingScalingFactor* attribute of the *Arc Cqc Override* component. A rate of zero (0) indicates that shaping is not performed, or that the interface is down.

When *txTrafficDescType* is 9**,** parameter 1 represents the PCR; parameter 2 represents the Cell Delay Variation Toleration (CDVT); parameter 3 represents the Minimum Cell Rate (MCR); the meaning of parameter 4 depends upon the value of the *abrConnectionType* attribute. if *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, parameter 4 represents the Allowed Cell Rate (ACR); If *abrConnectionType* is ***erSwitch***,

parameter 4 represents the Explicit Rate (ER); and if *abrConnectionType* is ***efciSwitch***, parameter 4 reflects the actual shaping rate in cell/s for this connection.

When *txTrafficDescType* is 3, 4, 5, 6, 7, 8, or 9, parameter 5 reflects the equivalent cell rate in cell/s for this connection as determined by the Connection Admission Control (CAC) algorithm. The equivalent cell rate is useful in determining the admission characteristics of this connection.

## ATTRIBUTE AtmIf Vpt Vcc Tm txQueueThresholds (txQThresh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the queue limit and the discard thresholds for the transmit queue of this connection.<br><br>If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the thresholds of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the thresholds of the per-VC queue.<br><br>The first element indicates the queue limit. The provisioned value of the transmit queue limit is derived from the *txQueueLimit* attribute under the service category subcomponents of the *CA* component for the service category of this connection.<br><br>The second element is the threshold that marks the transition from congestion state 1 to congestion state 0. This is the threshold at which traffic with discard priority (DP) = 1 is discarded. This threshold is set at approximately 90 percent of the first parameter, the operational queue limit.<br><br>The third element is the threshold that marks the transition from congestion state 2 to congestion state 1. This is the threshold at |

which traffic with DP = 2 is discarded. This threshold is set at approximately 75 percent of the first parameter, the operational queue limit.

The fourth element is the threshold that marks the transition from congestion state 3 to congestion state 2. This is the threshold at which traffic with DP = 3 is discarded. This threshold is set at approximately 35 percent of the first parameter, the operational queue limit.

For ***1pOC48ChSmIrAtm***, and ***1pOC48SmSrPos*** cards, this attribute displays the thresholds of the link class queue used by this connection to buffer it traffic.

This attribute does not apply to basic *Vpt*s.

### ATTRIBUTE AtmIf Vpt Vcc Tm rxTrafficDescParm (rxTdp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. Cell delay variation tolerance (CDVT) is expressed in microseconds.<br><br>When *rxTrafficDescType* is 1 or 2, none of the parameters are used.<br><br>When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT.<br><br>When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for |

CLP equal to 0 traffic with cell discard; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents CDVT; parameter 3 represents the MCR; parameter 4 is not used.

If *upc* is ***disabled*** for this connection, the values of PCR, SCR, MBS and CDVT are the provisioned parameters.

If *upc* is ***enabled***, the values of PCR, SCR, MBS, and CDVT are exactly the values used by the usage parameter control hardware in policing the arriving traffic. These may vary slightly from the provisioned values due to granularity of the hardware. In the case where the PCR is equal to the SCR, the effective MBS is zero.

### ATTRIBUTE AtmIf Vpt Vcc Tm txQosParameters (tqp)

Access Read only

Description This attribute is a vector of three elements that indicate the quality of service parameters for the forward direction for this connection. This attribute is used for SPVC and SVC connections on a PNNI interface.

The ***cdv*** element indicates the acceptable peak-to-peak Cell Delay Variation (CDV) of real-time connections (CBR and rt-VBR).

The ***ctd*** element indicates the acceptable maximum Cell Transfer Delay (maxCtd) of real-time connections (CBR and rt-VBR).

The ***clr*** element indicates the acceptable Cell Loss Ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections.

## GROUP AtmIf Vpt Vcc Tm Abr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for connections using ABR service category. |

## ATTRIBUTE AtmIf Vpt Vcc Tm Abr initialCellRate (icr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period. |

For nailed-up connections, this attribute is determined by the provisioned value of the *initialCellRate* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

The ICR for a connection is a value between the MCR and the PCR. Furthermore, ICR has an upper bound determined by the *transientBufferExposure* divided by *fixedRoundTripTime*.

Values: Decimal (0..16777215)

Units: cell/s

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr transientBufferExposure (tbe)

Access: Read only

Description: This attribute indicates the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the resource to send during start-up periods, before the first Resource Management (RM) cell returns.

For nailed-up connections, this attribute is determined by the provisioned value of the *transientBufferExposure* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Values: Decimal (0..16777215)

Units: cells

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr fixedRoundTripTime (frtt)

Access: Read only

Description: This attribute indicates the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back.

For nailed-up connections, this attribute is determined by the

provisioned value of the *fixedRoundTripTime* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Values: Decimal (0..16700000)

Units: microsec

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr rateDecreaseFactor (rdf)

Access: Read only

Description: This attribute indicates the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256.

RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

For nailed-up connections, this attribute is determined by the provisioned value of the *rateDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Values: Decimal (0..15)

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr rateIncreaseFactor (rif)

Access: Read only

Description: This attribute indicates the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64.

RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR.

For nailed-up connections, this attribute is determined by the provisioned value of the *rateIncreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Values: Decimal (0..15)

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr maxCellPerRmCell (nrm)

Access: Read only

Description: This attribute indicates the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell.

For nailed-up connections, this attribute is determined by the provisioned value of the *maxCellsPerRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.

Values: Decimal (2; 4; 8; 16; 32; 64; 128; 256)

Units: cells

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr maxTimeBetweenRmCell (trm)

Access: Read only

Description: This attribute indicates the TRM parameter for this connection.

TRM provides an upper bound on the time interval between forward Resource Management (RM) cells for an ABR source.

Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least 2 other cells have been sent, the next cell to be transmitted would be a forward RM cell.

For nailed-up connections, this attribute is determined by the provisioned value of the *maxTimeBetweenRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.

Values: Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000)

Units: microsec

Default: No default

## ATTRIBUTE AtmIf Vpt Vcc Tm Abr cutoffDecreaseFactor (cdf)

Access: Read only

Description: This attribute indicates the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero.

CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the *forwardRmCellLimit* attribute, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

For nailed-up connections, this attribute is determined by the provisioned value of the *cutoffDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.

Values: Decimal (0; 1; 2; 4; 8; 16; 32; 64)

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr acrDecreaseTimeFactor (adtf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection.<br><br>ADTF is the time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*.<br><br>For nailed-up connections, this attribute is determined by the provisioned value of the *acrDecreaseTimeFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element. |
| Values | Decimal (0..1023) |
| Units | centiseconds |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr forwardRmCellLimit (crm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the CRM parameter for this connection.<br><br>CRM is the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.<br><br>The value of CRM is obtained as *transientBufferExposure* divided by *maxCellsPerRmCell*. |
| Values | Decimal (1; 3; 7; 15; 31; 63; 127; 255; 511; 1023; 2047; 4095) |
| Units | cells |

Default — No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr txRateChangeInfo (txrci)

Access — Read only

Description — This attribute indicates the rate change information put into the last forward Resource Management (RM) cell turned around as a backward-RM cell. For connections configured as an ABR Source or Destination, the turned around backward-RM cell is sent over the interface. For connections configured as an ABR Virtual Source or Virtual Destination, the turned around backward-RM cell is sent over the backplane.

Values — congestionIndicated
noIncreaseIndicated
explicitRateIndicated

Default — No default

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr acrRateChangeInfo (arci)

Access — Read only

Description — This attribute indicates the type of change in the Allowed Cell Rate (ACR) as a result of the information in the last backward Resource Management (B-RM) cell received from the interface.

This attribute value is only applicable when the *Vcc Tm* or *Vpc Tm abrConnectionType* attribute is ***sourceDest*** or ***VirtualSourceDest***. In all other cases, this attribute value is ***notApplicable***.

A value of ***noChange*** indicates that the rate did not change as a result of the last backward RM cell received.

A value of ***decreasedByRdf*** or ***increasedByRif*** indicates that the ACR was increased or decreased by the corresponding factor. This change is as a result of the CI or NI bit setting in the last backward RM cell, or an ADTF timeout.

A value of ***setToExplicitRate*** indicates that the ACR was set to the ER value in the last backward RM cell.

| | |
|---|---|
| Values | noChange<br>decreasedByRdf<br>increasedByRif<br>setToExplicitRate<br>notApplicable |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr txFwdRmCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of forward Resource Management (RM) cells sent over the interface since the last backward RM-cell was received from the interface. If the value of this attribute is greater than or equal to the value of *forwardRmCellLimit*, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor.*<br><br>This counter is reset to zero each time a backward-RM cell is received.<br><br>This counter does not wrap to zero if it reaches its maximum value of 4095 in order to indicate that no backward RM cell has been received. |
| Values | Decimal (0..4095) |
| Units | cells |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Tm Abr rxEfci

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the Explicit Forward Congestion Indication (EFCI) bit of the last data cell received from the interface.<br><br>When a forward Resource Management (RM) cell is turned around as a backward-RM cell, the Congestion Indication (CI) field of the backward-RM cell is set to 1, if the value of this attribute is ***indicated***. |

This attribute is set to ***notIndicated*** each time a backward-RM cell is transmitted.

## GROUP AtmIf Vpt Vcc Src Provisioned (Prov)

Properties
Provisioned

Description
This attribute group contains the provisionable attributes of the *SourcePvc* component.

### ATTRIBUTE AtmIf Vpt Vcc Src callingAddress

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute represents the calling address of the soft PVC. If it is<br>a null string, then the calling address is the address of the current interface (that is, where the soft PVC originates). |
| Values | String (0..20, Hex) |
| Default | "" |

### ATTRIBUTE AtmIf Vpt Vcc Src calledAddress

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute represents the called (remote) address of the soft PVC. |
| Values | String (20, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Src calledVpiVci

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute represents the remote VPI and VCI of the soft PVC. |
| Values | Integer Sequence (0..4095; 1..65535) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Src adminControl

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the initial state of the connection.<br><br>If this attribute is set to ***permLocked***, the connection initially remains down following activation.<br>Setting this attribute to ***unlocked*** causes the connection to be established when it is activated. |
| Values | permLocked<br>unlocked |
| Default | unlocked |

### ATTRIBUTE AtmIf Vpt Vcc Src aisGeneration (ais)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether OAM-AIS generation occurs on the connection towards this interface when the SPVC is down.<br><br>If this attribute is ***enabled***, OAM-AIS cells are generated for this SPVC when the SPVC is not up.<br><br>The only exception is that when the source SPVC attribute *adminControl* is set to ***permLocked***, OAM-AIS cells are not generated for the source SPVC.<br><br>If this attribute is set to ***disabled***, OAM-AIS cells are not generated. |
| Values | enabled<br>disabled |
| Default | disabled |

### GROUP AtmIf Vpt Vcc Src Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes associated with the *SrcPvp* or *SrcPvc* component. |

### ATTRIBUTE AtmIf Vpt Vcc Src retryCount

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the number of failed attempts to set up the soft PVP or soft PVC since the last time the connection failed. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE AtmIf Vpt Vcc Src lastFailureCauseCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.<br>The default value for this attribute is set to 0. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Src lastFailureDiagCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL. |
| Values | String (0..8, ASCII) |
| Default | No default |

### GROUP AtmIf Vpt Vcc Src OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state |

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE AtmIf Vpt Vcc Src adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE AtmIf Vpt Vcc Src operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE AtmIf Vpt Vcc Src usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### COMPONENT AtmIf Vpt Vcc Src ManualDtl (Mdtl)

Groups
"GROUP AtmIf Vpt Vcc Src Mdtl Provisioned (Prov)"
"GROUP AtmIf Vpt Vcc Src Mdtl Operational (Oper)"

Scope
Device

Description
*AtmIf/n Vcc/vpi.vci SrcPvc ManualDtl*
*AtmIf/n Vpc/vpi SrcPvp ManualDtl*
*AtmIf/n Vpt/vpi Vcc/vci SrcPvc ManualDtl*

This component represents the ability to specify the PNNI path on a per connection basis for provisioned SPVC and SPVP connections.

The addition or deletion of this component is critical to the parent

SPVC or SPVP. Changes to the attributes contained under this component are not critical.

### VERB REConnect AtmIf Vpt Vcc Src Mdtl

Impact: Service

Description:

*REConnect AtmIf/n Vcc/vpi.vci Src Mdtl*
*REConnect -primary AtmIf/n Vcc/vpi.vci Src Mdtl*
*REConnect -alternate AtmIf/n Vcc/vpi.vci Src Mdtl*
*REConnect -automatic AtmIf/n Vcc/vp.vci Src Mdtl*

This command is used to trigger a connection to attempt to connect using the requested path. By default, the primary path is used. Using the *Reconnect* command will result in service disruptions when a connection is moved to a new path.

### GROUP AtmIf Vpt Vcc Src Mdtl Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for the Manual DTL selection paths for provisioned connections.

The normal sequence for connection retry is:
First try to establish the connection using the *primaryPath*. If the connection is not successful and if the *alternatePath* has been provisioned, try to connect using the *alternatePath*. If the connection is still unsuccessful, use the PNNI routing protocol to generate the path.

### ATTRIBUTE AtmIf Vpt Vcc Src Mdtl primaryPath (priPath)

Access: Read and write

Description: This attribute specifies the name of the primary MDTL path. The value must match the instance value of one of the *Mdtl* components under *Artg Pnni*.

| | |
|---|---|
| Values | String (1..32, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Src Mdtl alternatePath (altPath)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the alternate MDTL path. The value must match the instance value of one of the *Mdtl* components under *Artg Pnni*. An empty string disables the alternate path. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc Src Mdtl automaticFallback (auto)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether PNNI routing is to be used to establish a connection if connection attempts using the primary and alternate paths fail. If the value is ***enable***, PNNI routing will be attempted; if the value is ***disable***, it will not. |
| Values | disable<br>enable |
| Default | enable |

### GROUP AtmIf Vpt Vcc Src Mdtl Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes associated with the *atmSrcMdtl* component |

### ATTRIBUTE AtmIf Vpt Vcc Src Mdtl currentPath (curPath)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current connection status of the MDTL connection.<br><br>A ***not connected*** status indicates that the connection is not established. The retry sequence did not succeed. The network |

operator can issue the *Reconnect* command to restart the retry sequence.
A ***primary*** status indicates that the connection is using the path specified by the *primaryPath* attribute.
An ***alternate*** status indicates that the connection is using the path specified by the *alternatePath* attribute.
An ***automatic*** status indicates that the connection is using the path generated by the PNNI routing protocol.
A ***waiting connection*** status indicates that the connection is in a retry phase.

Values
not connected
primary
alternate
automatic
waiting connection

Default
"not connected"

### ATTRIBUTE AtmIf Vpt Vcc Src Mdtl primaryPathFailCause (priPathFail)

Access
Read: All
Write: Illegal

Description
This attribute indicates the last failure cause code for the primary path. The value is reset to zero when trying to re-establish the connection.

Values
Decimal (0..255)

Default
No default

### ATTRIBUTE AtmIf Vpt Vcc Src Mdtl alternatePathFailCause (altPathFail)

Access
Read: All
Write: Illegal

Description
This attribute indicates the last failure cause code for the alternate path. The value is reset to zero when trying to re-establish the connection.

Values
Decimal (0..255)

No default

## COMPONENT AtmIf Vpt Vcc Src RerouteOverride (RerOv)

| | |
|---|---|
| Groups | "GROUP AtmIf Vpt Vcc Src RerOv Provisioned (Prov)" |
| Scope | Device |
| Description | *AtmIf/n Vcc/vpi.vci SrcPvc RerouteOverride*<br>*AtmIf/n Vpc/vpi SrcPvp RerouteOverride*<br>*AtmIf/n Vpt/vpi Vcc/vci SrcPvc RerouteOverride*<br>*FrAtm/n Dlci/x Siwf RerouteOverride*<br><br>This component represents the ability to override rerouting capability subscription options on a per connection basis for provisioned SPVC and SPVP connections.<br><br>The addition of this component and changes to the attributes contained in this component are critical to the parent SPVC or SPVP. However, the deletion of this component is not a critical change for the connection. If this component is deleted, the connection remains active with the last provisioned subscription options. Subscription is lost when the connection goes down and re-establishes. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## VERB OPTIMIZE AtmIf Vpt Vcc Src RerOv

Impact: Service

Description:

*OPTimize AtmIf/n Vcc/<vpi.vci> Src RerOv*
*OPTimize AtmIf/n Vpc/<vpi> Src RerOv*
*OPTimize AtmIf/n Vpt/<vpi> Vcc/<vci> Src RerOv*
*OPTimize FrAtm/n Dlci/x Siwf RerOv*

This command triggers path optimization for the connection segment. If the interface is already processing a path optimization request, then the *Optimize* command is cancelled.

Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

## GROUP AtmIf Vpt Vcc Src RerOv Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes related to rerouting subscription options for provisioned connections.

## ATTRIBUTE AtmIf Vpt Vcc Src RerOv protocol

Access: Read and write

Description: This attribute specifies the rerouting protocols which are requested by the connection segment. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

One of the following values can be specified:
***sameAsInterface***: The requested rerouting protocols are specified by the *protocol* attribute under the *Reroute Ov* component for the interface.
***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is

granted if the DTL terminator is provisioned with the Rerouting feature.
***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values
localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsInterface (sameAs)

Default

## ATTRIBUTE AtmIf Vpt Vcc Src RerOv localConnectionRecoverySubscr (lRecSub)

Access
Read and write

Description
This attribute specifies whether the connection segment requests subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

If the connection segment requests ***localGlobal*** or ***localOnly*** protocols, this attribute controls local connection recovery subscription.

If the connection segment requests ***localEbr***, this attribute controls the local connection recovery subscription. Only one will be granted.

One of the following values can be specified:
***sameAsInterface***: The subscription rule is determined by the *localConnectionRecoverySubscr* attribute under the *Reroute Ov* component for the interface. If the attribute specifies the

***sourceSpvcSpvp*** value, the connection segment requests subscription to local connection recovery, otherwise the connection segment does not request subscription.
***yes:*** The connection segment requests subscription to local connection recovery.
***no***: The connection segment does not request subscription to local connection recovery.

Values
no
yes
sameAsInterface (sameAs)

Default
sameAsInterface

## ATTRIBUTE AtmIf Vpt Vcc Src RerOv localPathOptimizationSubscr (lOptSub)

Access
Read and write

Description
This attribute specifies whether the connection segment requests subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

If the connection segment requests ***localGlobal*** or ***localOnly*** protocols, this attribute controls local path optimization subscription.

If the connection segment requests ***localEbr***, this attribute controls the local path optimization subscription. Only one will be granted.

One of the following values can be specified:
***sameAsInterface***: The subscription rule is determined by the *localPathOptimizationSubscr* attribute under the *Reroute Ov* component for the interface. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segment requests subscription to local path optimization, otherwise the connection segment does not request subscription.
***yes:*** The connection segment requests subscription to local path optimization.
***no***: The connection segment does not request subscription to local path optimization.

Values
no
yes
sameAsInterface (sameAs)

Default
sameAsInterface

### ATTRIBUTE AtmIf Vpt Vcc Src RerOv globalConnectionRecoverySubscr (gRecSub)

Access
Read and write

Description
This attribute specifies whether the connection segment requests subscription to global or EBR connection recovery. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute affects connection segments for a node that is a DTL originator.

If the connection segment requests ***ebrOnly***, this attribute controls EBR connection recovery subscription.

If the connection segment requests ***localEbr***, this attribute controls the EBR connection recovery subscription. Only one will be granted.

One of the following values can be specified:
***sameAsInterface***: The subscription rule is determined by the *globalConnectionRecoverySubscr* attribute under the *Reroute Ov* component for the interface. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segment requests subscription to global or EBR connection recovery, otherwise the connection segment does not request subscription.
***yes:*** The connection segment requests subscription to global or EBR connection recovery.
***no***: The connection segment does not request subscription to global or EBR connection recovery.

Values
no
yes
sameAsInterface (sameAs)

Default
sameAsInterface

### ATTRIBUTE AtmIf Vpt Vcc Src RerOv globalPathOptimizationSubscr (gOptSub)

Access
Read and write

Description

This attribute specifies whether the connection segment requests subscription to global or EBR path optimization. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute affects connection segments for a node that is a DTL originator.

If the connection segment requests ***ebrOnly***, this attribute controls EBR path optimization subscription.

If the connection segment requests ***localEbr***, this attribute controls the EBR path optimization subscription. Only one will be granted.

One of the following values can be specified:
***sameAsInterface***: The subscription rule is determined by the *globalPathOptimizationSubscr* attribute under the *Reroute Ov* component for the interface. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segment requests subscription to global or EBR path optimization, otherwise the connection segment does not request subscription.
***yes:*** The connection segment requests subscription to global or EBR path optimization.
***no***: The connection segment does not request subscription to global or EBR path optimization.

Properties Operational

Description This attribute group contains the operational attributes for the *DestinationPvc* component.

## ATTRIBUTE AtmIf Vpt Vcc Dst calledAddress

Access Read: All
Write: Illegal

Description This attribute represents the called address of the soft PVC.

Values String (20, Hex)

Default No default

## ATTRIBUTE AtmIf Vpt Vcc Dst callingAddress

Access Read: All
Write: Illegal

Description This attribute represents the remote address of the soft PVC. If the address in not known, then the value of this address is ***Unknown***.

Values String (7..40, ASCII)

Default No default

### ATTRIBUTE AtmIf Vpt Vcc Dst callingVpiVci

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute represents the remote VPI and VCI of the soft PVC. If the VPI and VCI values are not known, this attribute is set to ***Unknown***. |
| Values | String (7..9, ASCII) |
| Default | No default |

### GROUP AtmIf Vpt Vcc Dst OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE AtmIf Vpt Vcc Dst adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE AtmIf Vpt Vcc Dst operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE AtmIf Vpt Vcc Dst usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE AtmIf Vpt Vcc Mnrp oamSegmentBoundary (sb)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

Description

This attribute specifies the OAM segment boundary desired for a *Mnrp* component. It affects the connection point type value visible in the parent component's *connectionPointType* attribute. The desired OAM segment boundary can be specified directly as ***yes***, ***no*** or ***sameAsInterface***. If ***sameAsInterface*** is specified, the OAM segment boundary is same as the *oamSegmentBoundary* attribute of the associated *AtmIf* and the switch will set the *connectionPointType*, choosing ***segmentEndPoint*** for a segment-boundary ATM interface and ***connectingPoint*** for a non-segment-boundary ATM interface.

Values

no
yes
sameAsInterface

Default

sameAsInterface

## ATTRIBUTE AtmIf Vpt Vcc Mnrp bandwidthElastic (bwElastic)

Access

Read and write

Criticality

Component

Description

This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced will be displayed in the *bandwidthReduction* attribute.

A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection will not be released. Currently, this attribute should only be set to ***yes*** for situations where this *Mnrp* is functioning as a loopback on one side of an IMA link. There are no other situations where this setting is valid.

A value of ***no*** indicates that the bandwidth for this connection will not be reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority.*

| | |
|---|---|
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE AtmIf Vpt Vcc Mnrp overrideHoldingPriority (ohpri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the holding priority of this connection. Holding priority is used when there is an IMA group where some physical links have failed. Holding priority determines the order in which connections are released. 4 is the lowest holding priority and is released first. 0 is a higher priority and is released last. The value specified in this attribute will override whatever *holdingPriority* that has been provisioned at the *Vcd* (or *Vpd*). If the value is left at the default of ***noOverride***, the *holdingPriority* provisioned at the *Vcd* (or *Vpd*) will be used. |
| Values | 0<br>1<br>2<br>3<br>4<br>noOverride |
| Default | noOverride |

### ATTRIBUTE AtmIf Vpt Vcc Mnrp nextHop (nextHop)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the list of *Nrp* components with which this *Mnrp* is associated. A sample value is *AtmIf/31 Vcc/0.32 Nrp*. This attribute must be provisioned with at least one Nrp component under a compatible connection type. |
| List of | Link (Service, nextHop) |
| Default | No default |

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | String (55, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop pnniTraceContRefusalIndPresent (refusal)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop crankbackDestNodeIndPresent (dest)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop pnniCrankbackGapIndPresent (gap)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop crankBackCause (cause)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information.<br><br>This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure. |
| Values | Decimal (0..1000) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop blockedTransitType (type)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked transit type.<br><br>This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure. |
| Values | Succeeding end blocked<br>Blocked node<br>Blocked link |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop blockedNodeId (bNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked node ID during the call setup request. The blocked node ID identifies the logical node where the connection or party has been blocked.<br><br>This attribute is present when the *blockedTransitType* attribute is ***Blocked node.*** |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop blockedLinkPrecedingNodeId (pNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked link's preceding node ID during the call setup request. The blocked link's preceding node ID identifies the logical node preceding a link, where the |

connection or party has been blocked.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link***.

Values: String (22, Hex)

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop blockedLinkPortId (bPortId)

Access: Read: All
Write: Illegal

Criticality: Component

Description: This attribute indicates the blocked link's port identifier used for this connection during the call setup request. The blocked link's port identifier identifies a logical port of the blocked link's preceding node identifier.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop blockedLinkSucceedingNodeId (sNodeId)

Access: Read: All
Write: Illegal

Criticality: Component

Description: This attribute indicates the blocked link's succeeding node ID during the call setup request. The blocked link's succeeding node ID identifies the logical node succeeding a link where the connection or party has been blocked.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***

Values: String (22, Hex)

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop dstVpiVci

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the VPI.VCI values on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for ATM interfaces.<br><br>The VPI.VCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Integer Sequence (0..4095; 0..65535) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop dstDlci

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the DLCI value on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for FrAtm interfaces.<br><br>The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop dstCallReference (dcr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute indicates the call reference value on the destination side. This attribute only appears in the trace result for the trace destination node.<br><br>The call reference value is included in the trace when the *traceInfo* attribute sets the ***callRef*** value. |
| Values | Hex (H.0..H.ffffff) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop dstEndPointReference (depr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the end point call reference value on the destination side. This attribute only appears in the trace result for the trace destination node.<br><br>The call reference value is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc PTRecord Hop specifiedPath

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether this hop is the originator of this manually configured path. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | no<br>yes |
| Default | no |

## COMPONENT AtmIf Vpt Vcc PTRecord Hop VendorSpecificInfo (Vsi)

## GROUP AtmIf Vpt Vcc RerInfo Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes that indicate rerouting activities at the connection level.

## ATTRIBUTE AtmIf Vpt Vcc RerInfo lastOptimizationMetric (lOptMet)

Access: Read only

Description: This attribute indicates which optimization metric was last used to select a path for the connection segment.

Values:
cdv
maxCtd
aw

Default: No default

## GROUP AtmIf Vpt Vcc RerInfo EbrOperational (EOper)

Properties: Operational

Description: This group contains attributes that indicate the EBR rerouting characteristics of a connection segment.

This group is only present if the connection segment has been granted the EBR rerouting protocol.

### ATTRIBUTE AtmIf Vpt Vcc RerInfo ebrRecoverySubscribed (eRecSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to EBR connection recovery.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo ebrOptimizationSubscribed (eOptSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to EBR path optimization.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo ebrOptimizationMetricValue (eOptVal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the EBR optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo ebrOptimalMetricValue (eOptMetVal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the EBR optimization metric value of the connection's best path. It is initialized to the value collected during initial call establishment. It is set to the ***localOptimizationValue*** whenever a connection is optimized onto a path which has a better optimization value or when the number of optimization attempts is exhausted. It represents the segment of the connection between the rerouting and rendezvous nodes.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo ebrOptimizationState (eOptSt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current EBR optimization state of the connection segment.<br><br>One of the following values is indicated:<br>***optimal:*** This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value.<br>***recovered:*** This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment which is greater than the value specified by the optimal metric value.<br>***optimized:*** This value represents the state when the connection segment has moved to a path which is better than the recovered path but not as good as the optimal path.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |

| | |
|---|---|
| Values | optimal<br>recovered<br>optimized |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo ebrTimeOfLastRecovery (eTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the date and time of the last EBR connection recovery.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Time (DHMS) |
| Default | No default |

### GROUP AtmIf Vpt Vcc RerInfo LocalOperational (LOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes that indicate the local rerouting characteristics of a connection segment.<br><br>This group is only present if the connection segment has been granted the local rerouting protocol. |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo localRecoverySubscribed (lRecSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to local connection recovery.<br><br>This attribute is only present if the connection segment has been granted the local rerouting protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo localOptimizationSubscribed (lOptSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to local path optimization.<br><br>This attribute is only present if the connection segment has been granted the local rerouting protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo localOptimizationMetricValue (lOptVal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the local optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes. A value of ***undefined*** indicates that the local optimization metric value is undetermined.<br><br>This attribute is only present if the connection segment has been granted the local rerouting protocol. |
| Values | Decimal (0..4294967294)<br>undefined |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo localOptimalMetricValue (lOptMetVal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the local optimization metric value of the connection's best path. It is initialized to the value collected during initial call establishment. It is set to the ***localOptimizationValue*** whenever a connection is optimized onto a path which has a better optimization value or when the number of optimization attempts is exhausted. It represents the segment of the connection between the rerouting and rendezvous |

nodes.A value of ***undefined*** indicates that the local optimal optimization metric value is undetermined.

This attribute is only present if the connection segment has been granted the local rerouting protocol.

Values: Decimal (0..4294967294)
undefined

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc RerInfo localOptimizationState (lOptSt)

Access: Read only

Description: This attribute indicates the current local optimization state of the connection segment.

One of the following values is indicated:
***optimal:*** This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value.
***recovered:*** This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment which is greater than the value specified by the optimal metric value.
***optimized:*** This value represents the state when the connection segment has moved to a path which is better than the recovered path but not as good as the optimal path.

This attribute is only present if the connection segment has been granted the local rerouting protocol.

Values: optimal
recovered
optimized

Default: No default

### ATTRIBUTE AtmIf Vpt Vcc RerInfo localTimeOfLastRecovery (lTime)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the date and time of the last local connection recovery.<br><br>This attribute is only present if the connection segment has been granted the local rerouting protocol. |
| Values | Time (DHMS) |
| Default | No default |

### GROUP AtmIf Vpt Vcc RerInfo GlobalOperational (GOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes that indicate the global rerouting characteristics of a connection.<br><br>This group is only present if the connection segment has been granted the global rerouting protocol. |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo globalRecoverySubscribed (gRecSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to global connection recovery.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo globalOptimizationSubscribed (gOptSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to global path optimization.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |

| | |
|---|---|
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo globalOptimizationMetricValue (gOptVal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the global optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes. A value of ***undefined*** indicates that the global optimization metric value is undetermined.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | Decimal (0..4294967294)<br>undefined |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo globalOptimalMetricValue (gOptMetVal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the global optimization metric value of the connection's best path. It is initialized to the value collected during initial call establishment. It is set to the ***globalOptimizationValue*** whenever a connection is optimized onto a path which has a better optimization value or when the number of optimization attempts is exhausted. It represents the segment of the connection between the rerouting and rendezvous nodes.A value of ***undefined*** indicates that the global optimal optimization metric value is undetermined.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |

| | |
|---|---|

| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo globalOptimizationState (gOptSt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current global optimization state of the connection segment.<br><br>One of the following values is indicated:<br>***optimal:*** This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value.<br>***recovered:*** This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment which is greater than the value specified by the optimal metric value.<br>***optimized:*** This value represents the state when the connection segment has moved to a path which is better than the recovered path but not as good as the optimal path.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | optimal<br>recovered<br>optimized |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo globalTimeOfLastRecovery (gTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the date and time of the last global connection recovery.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |

| | |
|---|---|
| Values | Time (DHMS) |
| Default | No default |

### GROUP AtmIf Vpt Vcc RerInfo EbrStatistics (EStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics related to Ebr rerouting for the connection segment. |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo totalEbrConnectionRecoveries (eConnRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful EBR connection recovery attempts. The counter wraps to zero when the maximum value is exceeded.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo totalEbrPathOptimizations (ePathOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts successful EBR path optimization attempts. The counter wraps to zero when the maximum value is exceeded.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Vpt Vcc RerInfo totalEbrOptimizationAttempts (eOptAtt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of EBR path optimization attempts. The counter wraps to zero when the maximum value is exceeded. |

| | |
|---|---|
| | This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP AtmIf Vpt Vcc RerInfo LocalStatistics (LStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics related to local rerouting for the connection segment. |

| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT AtmIf EmissionPriority (Ep)

| | |
|---|---|
| Instance | Decimal (2..7) |
| Groups | "GROUP AtmIf Ep Provisioned (Prov)" |
| Scope | Device |
| Description | *AtmIf/n EmissionPriority/n*<br>This component controls the characteristics of an emission priority for an *AtmIf*. This component is optional for an *AtmIf*.<br><br>For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC48ChSmIrAtm*** cards, this component is not permitted.<br><br>For ***1pOC48SmSrPos*** cards, this component can not be provisioned, however, minimum bandwidth guarantees are supported using hardcoded values.<br><br>There are eight emission priorities (EP). EP 0 is the highest priority and EP 7 is the lowest priority. Normally, link bandwidth is allocated in strict precedence of emission priority. All traffic at EP 0 is transmitted on the link first. Then, when there is an unused cell opportunity, a cell from EP 1 is transmitted. When EP 0 and 1 have nothing to send, then EP 2 gets the transmit cell opportunities. Each emission priority 2 through 7 has a |

corresponding *Ep* component with instance number 2 through 7. Emission priorities 0 and 1 do not have corresponding *Ep* components since there is no configuration which is relevant for those EPs.

Traffic is associated with an EP in the following way. Each *Vcc* or *Vpc* has an associated *atmServiceCategory*. Under the *AtmIf* component there is a service category component which provides default characteristics for that service category. For example, *AtmIf*/n *CA Cbr*/0 defines the default characteristics for connections of the CBR service category. Each service category has an *emissionPriority* (*ep*) attribute, for example *AtmIf*/n *CA Cbr*/0 *ep*. The value provisioned in that *ep* attribute maps to the corresponding *Ep* component. If the value of the *AtmIf*/n *CA Cbr*/0 *ep* attribute is ***2***, the CBR service category is associated with *AtmIf*/n *Ep*/2.

EP 0 and EP 1 are in the absolute priority range. Traffic in the absolute priority range always gets first choice for a transmit cell opportunity. EP 2 through EP 7 are in the guaranteed bandwidth range. Traffic at EP 3 through EP 7, in the guaranteed bandwidth range, may achieve a priority which is different from the strict hierarchical priority, if a minimum bandwidth guarantee is provisioned for the *Ep*.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, EPs 5 and 6 are not supported.

For ***16pOC3PosAtm*** cards, EP 0 and EP 1 are in the absolute priority range while EP 2 through EP 7 are allocated link bandwidth using a conventional Weighted Fair Queue (WFQ) discipline. EP 2 through EP 7 have their service preference over one another determined by their minimum bandwidth guarantee. Link bandwidth is first allocated to EP 0 and EP 1 in absolute priority fashion. Any remaining bandwidth is distributed to EP 2 through EP 7 in proportion to the minimum bandwidth guarantee provisioned for the *Ep*. The default values of the *minimumBandwidthGuarantee* attribute for the *Ep* components emulate the strict precedence of emission priority.

## GROUP AtmIf Ep Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioned attributes which specify the behavior of an emission priority for the ATM interface. |

## ATTRIBUTE AtmIf Ep minimumBandwidthGuarantee (minBw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the minimum bandwidth guarantee associated with this *EmissionPriority.* A minimum bandwidth guarantee is designed to prevent starvation of traffic at this EP by traffic at higher EPs. Minimum bandwidth guarantees only operate for EPs within the guaranteed bandwidth range 2 through 7.<br><br>For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, EPs 5 and 6 are not supported.<br><br>For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the following description applies:<br><br>The minimum bandwidth guarantee specified is a percentage of the bandwidth which remains after all traffic at EP 0 and EP 1 is served. For example, if EP 0 and EP 1 traffic consumes 20% of the link bandwidth, the minimum bandwidth guarantee applies to |

the remaining 80% of the link bandwidth. A minimum bandwidth guarantee of 2% would actually result in this EP getting 2% of 80% for a total 1.6% of the link bandwidth. If this EP uses less than this link bandwidth, the extra opportunities are allocated to the other EPs in priority. Due to scheduling and cell arrival times, traffic at this EP may not necessarily achieve full utilization of its minimum bandwidth guarantee.

The value ***priority*** specifies that this *Ep* gets bandwidth based solely on the hierarchy of emission priorities. In this case, there is no minimum bandwidth guarantee.

For ***16pOC3PosAtm*** cards, the following description applies:

The minimum bandwidth guarantee specified is the proportion of the bandwidth which remains after all traffic at EP 0 and EP 1 is served. In other words, the bandwidth allocated to an EP is:
(bandwidth unused by EP 0 and 1) *
*minimumBandwidthGuarantee*
(the sum of the *minimumBandwidthGuarantee*s for all active EPs)

For example, if EP 0 and EP 1 traffic consumes 20% of the link bandwidth, the minimum bandwidth guarantee applies to the remaining 80% of the link bandwidth. Assume *Ep/2*, *Ep/3*, and *Ep/4* have a *minimumBandwidthGuarantee* of ***70***, ***20***, and ***10*** respectively.

If all EPs are actively sending traffic, then the bandwidth is allocated as follows:
- EP 2 = 80% * 70/(70+20+10) = 56% of the link bandwidth
- EP 3 = 80% * 20/(70+20+10) = 16% of the link bandwidth
- EP 4 = 80% * 10/(70+20+10) = 8% of the link bandwidth

If some time later EP 3 has no traffic to send, then its share of the bandwidth is allocated to EP 2 and EP 4 in proportion to their *minimumBandwidthGuarantee*s as follows:
- EP 2 = 80% * 70/(70+10) = 70% of the link bandwidth
- EP 4 = 80% * 10/(70+10) = 10% of the link bandwidth

If some time later only one out the EP 2, EP 3, and EP 4 has

traffic to send, then it would be allocated the entire 80% of the link bandwidth. Additionally, if both EP 0, and EP 1 have no traffic to send, the remaining active EP would be allocated 100% of the link bandwidth irrespective of the value of its *minimumBandwidthGuarantee* attribute.

The value ***priority*** emulates the strict precedence of emission priority by assigning default values to the *minimumBandwidthGuarantee* attribute. Depending on how many EPs are in use in the guaranteed bandwidth range 2 through 7, these default values change:
- For one EP, the value is ***100***.
- For two EPs, the values are ***99***, and ***1***.
- For three EPs, the values are ***90***, ***9***, and ***1***.
- For four EPs, the values are ***77***, ***18***, ***4***, and ***1***.

For all cards, when specifying a value for the *minimumBandwidthGuarantee* attribute, consider the effect on cell delay variation (CDV) of traffic which would normally be of higher priority. For example, if *RtVbr* service category traffic is assigned to *Ep*/2 and *Ubr* traffic is assigned on *Ep*/7 where *Ep*/7 has a *minimumBandwidthGuarantee* of ***25***, there can be a large impact on the CDV of the *RtVbr* traffic. Traffic of the *Cbr* or *RtVbr* service category which is sensitive to CDV, and is of known volume, can be assigned on EP 0 or EP 1 which are independent of the effects of minimum bandwidth guarantee.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC12SmLrAtm*** cards, the allowed values of this attribute are ***priority***, or a numeric value between ***1*** and ***48***.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, and ***16pOC3PosAtm*** cards, the allowed values of this attribute are ***priority***, or a numeric value between ***1*** and ***100***.

For all cards, the sum of the values of the *minimumBandwidthGuarantee* attribute for all *Ep*s under an *AtmIf* must not exceed 100%.

| | |
|---|---|
| Values | Decimal (1..100)<br>priority |
| Units | % |
| Default | priority |

## COMPONENT AtmIf PerformanceMonitoring (Pm)

| | |
|---|---|
| Groups | "GROUP AtmIf Pm Provisioned (Prov)" |
| Scope | Device |
| Description | *AtmIf/n PerformanceMonitoring*<br>This component provides the default Performance Monitoring (PM) measurements and control modes for all *AtmIf Vcc* and *AtmIf Vpc* connections on the ATM interface. For provisioned connections, PM is done only if a PM component is provisioned under the *Vcc Vcd* or *Vpc Vpd* component. For all switched connections, PM will be done as specified by this component subject to resource limits.<br><br>Only the following card types support Performance Monitoring: ***2pOC3SmAtm2, 2pOC3MmAtm2, 2pSTM1eAtm, 3pDS3Atm2, 3pE3Atm2, 32pDS1MsaMt, 32pDS1MsaSt, 32pE1MsaMt, 32pE1MsaSt, 32pDS1MsaMtp, 32pDS1MsaStp, 32pE1MsaMtp, 32pE1MsaStp, 32pDS1Msa, 32pE1Msa.*** |
| Common Verbs | Help<br>List<br>Display |

## GROUP AtmIf Pm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioned attributes which specify the default Performance Monitoring (PM) measurements, namely, Cell Loss Ratio (CLR) and Availability Ratio (AR), and control modes for all *AtmIf Vcc* and *AtmIf Vpc* connections on the ATM interface. |

### ATTRIBUTE AtmIf Pm segSwitchSideMeasurement (segSwitchSide)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default Performance Monitoring (PM) measurements on the switch side configuration for all *AtmIf Vcc* and *AtmIf Vpc* connections on the ATM interface. |
| Set of | availabilityRatio (ar)<br>cellLossRatio (clr) |
| Default | No default |

### ATTRIBUTE AtmIf Pm segLinkSideMeasurement (segLinkSide)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default Performance Monitoring (PM) measurements on the link side configuration for all *AtmIf Vcc* and *AtmIf Vpc* connections, on the ATM interface. |
| Set of | availabilityRatio (ar)<br>cellLossRatio (clr) |
| Default | No default |

### ATTRIBUTE AtmIf Pm controlMode (mode)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the default control mode of Performance Monitoring (PM) measurements for all *AtmIf Vcc* and *AtmIf Vpc* connections on the ATM interface.<br><br>***autoStart*** means Performance Monitoring (PM) measurements start when the provisioned data is activated.<br><br>***onDemand*** means PM measurements start when the operator issues the *Start* command. The PM measurements in this mode continue until the operator issues the *Stop* command. |
| Values | autoStart (auto)<br>onDemand (onDemand) |

Default autoStart

### ATTRIBUTE AtmIf Pm switchSideClrType (clrType)

Access Read and write

Description This attribute specifies how the Cell Loss Ratio (CLR) Performance Monitoring (PM) is measured on a switch side configuration for all *AtmIf Vcc* and *AtmIf Vpc* connections on the ATM interface.

***complete*** indicates that egress discards at the segment end points are included in the CLR measurement as per ITU standards.

***partial*** indicates that egress discards do not contribute to the CLR measurement.

Values complete
partial

Default complete

### COMPONENT AtmIf LinkTxUtilization (Ltu)

Groups "GROUP AtmIf Ltu Provisioned (Prov)"
"GROUP AtmIf Ltu Operational (Oper)"

Scope Device

Description *AtmIf/n LinkTxUtilization*
This component allows the users to specify whether alarms should be generated when the ATM link transmit utilization exceeds provisioned threshold *criticalTxUtilAlarmThreshold*.

The ATM link transmit utilization is calculated once per minute over the preceding one minute interval. The decision to set or clear an alarm is made at every sample period except the first 2 minutes right after the measurement starts.

When three consecutive measurements of the ATM link transmit utilization are above the provisioned threshold, a SET alarm is generated if there is no outstanding SET alarm.

When three consecutive measurements of the ATM link transmit

utilization are at or below the provisioned threshold, and there is an outstanding SET alarm, a CLEAR alarm is generated.

Common Verbs

## GROUP AtmIf Ltu Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisioned attributes to control ATM link transmit utilization alarms.

## ATTRIBUTE AtmIf Ltu criticalTxUtilAlarmThreshold (critThresh)

Access: Read and write

Description: This attribute specifies the critical alarm threshold for the ATM link transmit utilization.

A value of ***disabled*** means the ATM link transmit utilization is not measured and no alarms are generated.

A change from ***disabled*** to a numeric value resets the value of the *lastAlarmPeakTxUtilization* attribute to zero and starts the ATM link transmit utilization measurement.

When three consecutive samples of the ATM link transmit utilization, over the 3-minute sliding window, are above the provisioned threshold and there is no outstanding alarm, a critical alarm is generated. While the alarm is outstanding, the value of the *lastAlarmPeakTxUtilization* attribute indicates the peak sample of the ATM link transmit utilization.

When three consecutive samples of the ATM link transmit utilization, over the 3-minute sliding window, are at or below the provisioned threshold, any outstanding alarm is cleared. The value of the *lastAlarmPeakTxUtilization* attribute is not reset when the alarm is cleared.

A change from one numeric value to another restarts the ATM link transmit utilization measurement with a new 3-minute probation period. The value of the *lastAlarmPeakTxUtilization* attribute is not affected by this change.

A change from a numeric value to ***disabled*** causes any outstanding alarm to be cleared immediately. The value of the *lastAlarmPeakTxUtilization* attribute is not affected by this change.

Values: Decimal (1..99)
disabled

Units: %

Default: 80

## GROUP AtmIf Ltu Operational (Oper)

Properties: Operational

Description: This group of attributes contains statistics on the ATM link transmit utilization.

## ATTRIBUTE AtmIf Ltu lastAlarmPeakTxUtilization (lastAlarmPeakTxUtil)

Access: Read only

Description: This attribute indicates the peak value of the ATM link transmit utilization during the most recent (or current) period in which the transmit utilization alarm has been active. The value of this attribute is reset to zero when the ATM link transmit utilization measurement is initiated.

Values: Decimal (0..100)

Units: %

Default: No default

## COMPONENT AtmIf Aini

Groups: "GROUP AtmIf Aini Provisioned (Prov)"
"GROUP AtmIf Aini AccountingOptions (AcctOpt)"

| | |
|---|---|
| Scope | Device |
| Description | *AtmIf/n Aini*<br>This component represents an ATM Inter-Network Interface (AINI) signaling interface. If this component is provisioned, the *Uni*, *Iisp*, or *Pnni* component can not be provisioned under the same *AtmIf* component. If this component is deleted, then all associated *Vcc* components are deleted. |
| Subcomponents | "COMPONENT AtmIf Aini Signalling (Sig)" |
| Opt. Subcomp. | "COMPONENT AtmIf Aini CallingAddressScreening (CallingAScr)"<br>"COMPONENT AtmIf Aini CalledAddressScreening (CalledAScr)"<br>"COMPONENT AtmIf Aini PathTraceFilter (Ptf)"<br>"COMPONENT AtmIf Aini ServiceTrace (SrvTrace)"<br>"COMPONENT AtmIf Aini Reroute" |
| Dyn. Subcomp. | "COMPONENT AtmIf Aini PathTraceTestConnection (Ptt)" |
| Dyn. Subcomp. | "COMPONENT AtmIf Aini Address (Addr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP AtmIf Aini Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Aini* component. |

## ATTRIBUTE AtmIf Aini side

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute indicates which side the interface is, user or network. |
| Values | networkSide<br>userSide |
| Default | networkSide |

### ATTRIBUTE AtmIf Aini softPvpAndPvcRetryPeriod (sRetryPeriod)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time to wait between soft PVP or soft PVC call setup retries. The resolution is to the nearest 10 seconds. |
| Values | Decimal (20..999999) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE AtmIf Aini softPvpAndPvcHoldOffTime (sHoldOffTime)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how long to hold of retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value. |
| Values | Decimal (0; 50..20000) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE AtmIf Aini passAlongRequest

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies whether unrecognized messages and information elements with the pass along request set are accepted when received at the interface. If they are not allowed, then they are discarded and the procedures specified by the message or information element's action indicator field are followed. |
| Values | allowed<br>discarded |
| Default | allowed |

## GROUP AtmIf Aini AccountingOptions (AcctOpt)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for accounting. |

## ATTRIBUTE AtmIf Aini accountCollection (aco)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit***, or ***force***.<br><br>If the set of reasons is not empty then accounting records will be generated by this interface in the following situations:<br>- on a TODA changeover if TODA is enabled;<br>- every 12 hours (per connection) if TODA is disabled;<br>- on every call clear (a call record with final cell counts).<br><br>If none of the reasons is present, then accounting will be suppressed.<br><br>The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate. |
| Set of | bill<br>test<br>study<br>audit<br>force |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE AtmIf Aini accountConnectionType (act)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records.<br><br>If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***.<br><br>If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***. |
| Values | origTerm<br>intermediate |
| Default | intermediate |

### ATTRIBUTE AtmIf Aini accountClass (acl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator.<br><br>Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate. |
| Values | Decimal (0..255) |
| Default | 0 |

## ATTRIBUTE AtmIf Aini serviceExchange (sre)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator.<br><br>Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingDse* or *calledDse* as appropriate. |
| Values | Decimal (0..255) |
| Default | 0 |

## COMPONENT AtmIf Aini Signalling (Sig)

| | |
|---|---|
| Groups | "GROUP AtmIf Aini Sig Provisioned (Prov)"<br>"GROUP AtmIf Aini Sig OsiState (State)"<br>"GROUP AtmIf Aini Sig Operational (Oper)"<br>"GROUP AtmIf Aini Sig Statistics (Stats)" |
| Scope | Device |
| Description | *AtmIf/n Aini Signalling*<br>*AtmIf/n Iisp Signalling*<br>*AtmIf/n Uni Signalling*<br>*AtmIf/n Pnni Signalling*<br>*AtmIf/n Vpt/m Aini Signalling*<br>*AtmIf/n Vpt/m Iisp Signalling*<br>*AtmIf/n Vpt/m Uni Signalling*<br>*AtmIf/n Vpt/m Pnni Signalling*<br><br>This component represents the signaling entities for the interface. |
| Opt. Subcomp. | "COMPONENT AtmIf Aini Sig VirtualChannelDescriptor (Vcd)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP AtmIf Aini Sig Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the provisionable attributes for the *Signalling* component. |

## ATTRIBUTE AtmIf Aini Sig vci

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the signaling channel number. |
| Values | Decimal (0..65535) |
| Default | 5 |

## ATTRIBUTE AtmIf Aini Sig addressConversion

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed. |
| Values | none<br>nativeE164<br>nsap |
| Default | none |

### ATTRIBUTE AtmIf Aini Sig operatingMode

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces.<br>***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface. |
| Values | normal<br>provisionedOnly |
| Default | normal |

### GROUP AtmIf Aini Sig OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE AtmIf Aini Sig adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE AtmIf Aini Sig operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE AtmIf Aini Sig usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP AtmIf Aini Sig Operational (Oper)

Properties
Operational

Description
This attribute contains the operational attributes for the AtmSignalling component.

## ATTRIBUTE AtmIf Aini Sig lastTxCauseCode

Access
Read: All
Write: Illegal

Description
This attribute indicates the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.

Values
Decimal (0..255)

Default
No default

## ATTRIBUTE AtmIf Aini Sig lastTxDiagCode

Access
Read: All
Write: Illegal

Description
This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0.

Values
Hex (H.0..H.ff)

Default
No default

### ATTRIBUTE AtmIf Aini Sig lastRxCauseCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the cause code in the last received signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Sig lastRxDiagCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the diagnostic code in the last received signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0. |
| Values | Hex (H.0..H.ff) |
| Default | No default |

### GROUP AtmIf Aini Sig Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the statistics associated with the AtmSignalling component. |

### ATTRIBUTE AtmIf Aini Sig peakConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the high water mark of active point-to-point connections. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Sig successfulConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of switched point-to-point connections that were successfully established. The counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Sig failedConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of unsuccessful attempts to establish switched point-to-point connections. The counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Sig txPdus

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of transmitted signaling PDUs.The counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Sig rxPdus

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of received signaling PDUs.The counter wraps to 0 when the maximum value is exceeded. |

## GROUP AtmIf Aini Sig Vcd Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable traffic attributes for a control channel.

## ATTRIBUTE AtmIf Aini Sig Vcd trafficDescType (tdt)

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the type of traffic management which is applied to both the transmit and receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.

Values:
3
6
7
8

Default: 6

## ATTRIBUTE AtmIf Aini Sig Vcd atmServiceCategory (service)

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the ATM service category for both directions of the connection.

The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application.

The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Values

unspecifiedBitRate (ubr)
constantBitRate (cbr)
rtVariableBitRate (rtvbr)
nrtVariableBitRate (nrtvbr)

| | |
|---|---|
| Default | rtVariableBitRate |

### ATTRIBUTE AtmIf Aini Sig Vcd weight

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m.<br><br>This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs.<br><br>When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***.<br><br>When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT.<br><br>When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*. |
| Values | Decimal (1..4095)<br>sameAsCa<br>upToQueueLimit |

Default sameAsCa

### ATTRIBUTE AtmIf Aini Sig Vcd qosClass (qos)

Access Read and write

Criticality Component

Description This attribute specifies the quality of service for both the forward and backward direction for this connection.

Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video).

Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video).

Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values
0
1
2
3
4

Default 2

### ATTRIBUTE AtmIf Aini Sig Vcd trafficShaping (trShaping)

Access Read and write

Criticality Component

Description This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface.

When ***sameAsCa*** is selected, traffic shaping for this connection is

based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.

When ***disabled*** is selected, traffic shaping for this connection is disabled.

Values
disabled
sameAsCa

Default
disabled

## ATTRIBUTE AtmIf Aini Sig Vcd unshapedTransmitQueueing (unshap)

Access
Read and write

Criticality
Component

Description
This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute.

When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator.*

When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values
common
sameAsCa

| | |
|---|---|
| Default | sameAsCa |

### ATTRIBUTE AtmIf Aini Sig Vcd usageParameterControl (upc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface.<br><br>When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator.* If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component.<br><br>When ***disabled*** is selected, UPC for this connection is disabled.<br><br>The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used |
| Values | disabled<br>sameAsCa |
| Default | disabled |

### ATTRIBUTE AtmIf Aini Sig Vcd trafficDescParm (tdp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for |

connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.

When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1.

This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

| | |
|---|---|
| Vector of | Decimal (0..2147483647) |
| Index | Decimal (1..5) |

## COMPONENT AtmIf Aini Address (Addr)

| | |
|---|---|
| Instance | address [String (1..40, ASCII)]<br>addressType [primary<br>alternate<br>default] |
| Groups | "GROUP AtmIf Aini Addr Operational (Oper)" |
| Scope | Device |
| Description | *AtmIf/n Aini Address/address,type*<br>*AtmIf/n Iisp Address/address,type*<br>*AtmIf/n Uni Address/address,type*<br>*AtmIf/n Pnni Address/address,type*<br>*AtmIf/n Vpt/m Aini Address/address,type*<br>*AtmIf/n Vpt/m Iisp Address/address,type*<br>*AtmIf/n Vpt/m Uni Address/address,type*<br>*AtmIf/n Vpt/m Pnni Address/address,type* |

This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wildcard (‘?’), and a type. The type identifies whether the *Address* component is for a ***primary***, ***alternate***, ***registered***, or ***default*** address.

The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses registered through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses.Virtual interfaces do not have addresses of
type ***default***.

The wildcard is only valid for provisioned addresses. If the address is a single wildcard, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wildcard static address, then the choice is driven through a round robin algorithm.

The round robin algorithm tries the primary routes and then the alternate routes if none of the primary routes succeed.
If this node participates in a PNNI hierarchy, then a *PnniInfo* subcomponent can be provisioned under the *AtmAddress* component to specify the level to which this address will be advertised.

## GROUP AtmIf Aini Addr Operational (Oper)

Properties Operational

| | |
|---|---|
| Description | This attribute group contains the operational attributes for the *Address* component. |

### ATTRIBUTE AtmIf Aini Addr scope

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the scope of the ATM address, which is the highest level to which this address will be advertised in the PNNI hierarchy. If no *PnniInfo* subcomponent has been provisioned, then the scope will default to the level of this node in the PNNI hierarchy. If this node does not participate in a PNNI hierarchy, then this attribute will have the value of -1. |
| Values | Signed (-1..104) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Addr reachability (reach)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the address is internal or exterior. An internal reachable address is an address of a destination that is directly attached to the logical node advertising the address. An exterior reachable address is an address that can be reached through a PNNI routing domain, but which is not located in that PNNI routing domain. |
| Values | internal<br>exterior |
| Default | No default |

### COMPONENT AtmIf Aini Addr TerminateSPvpAndSPvc (TermSP)

| | |
|---|---|
| Scope | Device |
| Description | *AtmIf/n Aini Address/address,type TerminateSPvpAndSPvc*<br>*AtmIf/n Iisp Address/address,type TerminateSPvpAndSPvc*<br>*AtmIf/n Uni Address/address,type TerminateSPvpAndSPvc*<br>*AtmIf/n Pnni Address/address,type TerminateSPvpAndSPvc*<br>*AtmIf/n Vpt/m Aini Address/address,type TerminateSPvpAndSPvc* |

*AtmIf/n Vpt/m Iisp Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Vpt/m Uni Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Vpt/m Pnni Address/address,type TerminateSPvpAndSPvc*

The presence of this subcomponent indicates that SPvp and SPvc call setups terminate at this node if the destination address of the SPVP or SPVC matches the *Address* instance.

## COMPONENT AtmIf Aini PathTraceFilter (Ptf)

Groups
"GROUP AtmIf Aini Ptf Criteria"
"GROUP AtmIf Aini Ptf Operational (Oper)"
"GROUP AtmIf Aini Ptf RecordControl (Record)"

Scope
Device

Description

*AtmIf/n Aini PathTraceFilter*
*AtmIf/n Iisp PathTraceFilter*
*AtmIf/n Uni PathTraceFilter*
*AtmIf/n Pnni PathTraceFilter*
*AtmIf/n Vpt/vpi Aini PathTraceFilter*
*AtmIf/n Vpt/vpi Iisp PathTraceFilter*
*AtmIf/n Vpt/vpi Uni PathTraceFilter*
*AtmIf/n Vpt/vpi Pnni PathTraceFilter*

This component represents the path trace filtering capability on the ATM signaling interface. This capability allows the user to trace connections during the call setup phase against the criteria associated with this component. Only the connections that match all the criteria are traced.

When this component is provisioned, the network operator can control tracing activities by using the *Start*, *Stop*, and *Clear* verbs. When the *Start* verb is issued, the *traceTimeout* timer restarts. Once the timer times out, filtering stops and records are not removed. When the *Stop* verb is issued, the filter stops and the trace records are kept until the user clears them. When the *Clear* verb is issued, the trace records are cleared. When *AtmPathTraceFilter* component is deleted, all records are cleared.

Once the maximum specified by *maxTraceRecords* attribute under the *PathTraceFilter* component or *maxTraceRecords* attribute under the *Lp/n Eng PTrace* component has been reached, the oldest record is deleted.

The *AtmPathTraceFilter* component is not permitted to be added when the *Lp/n Eng PTrace Ov maxTraceRecords* attribute is set to zero.

This command is rejected on an active filter. |

### GROUP AtmIf Aini Ptf Criteria

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational criteria for the *PathTraceFilter* component. |

### ATTRIBUTE AtmIf Aini Ptf traceInfo (tInfo)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the trace information that is included in the trace records.<br><br>***crankBack***: Crankback information is included if the connection is cranked back during the connection setup phase. If the option is turned on, all attempted paths including the final one are recorded. If the option is turned off, only the information of the final path is recorded. If the connection fails to reach the destination, no path information is returned.<br><br>***connId***: Connection Identifier information is included.<br><br>***callRef***: For point-to-point connections, the call reference is included. For point-to-multipoint connections, the call reference and end point reference are both included.<br><br>Basic trace information, such as node and port identifiers, are always included. |
| Set of | crankBack<br>connId<br>callRef |
| Default | (crankBack, connId, callRef) |

### ATTRIBUTE AtmIf Aini Ptf calledPartyPrefix (cldPref)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies an NSAP address prefix, which is compared with the called party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced.<br><br>An empty string matches any address. |
| Values | String (0..20, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf callingPartyPrefix (clgPref)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies an NSAP address prefix, which is compared with the calling party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced.<br><br>An empty string matches any address. |
| Values | String (0..20, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf connectionType (type)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a connection type (SVC, SPVC, SVP, SPVP), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced. |
| Set of | svc<br>spvc<br>svp<br>spvp |
| Default | (svc, spvc, svp, spvp) |

### ATTRIBUTE AtmIf Aini Ptf connectionConfiguration (config)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a type of topology (point-to-point or point-to-multipoint), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced. |

| | |
|---|---|
| Set of | ptp<br>ptmp |
| Default | (ptp, ptmp) |

### ATTRIBUTE AtmIf Aini Ptf serviceCategory (svcCat)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the service categories, which is compared against the connection setup request. When the all criteria in the filter match successfully, the call is traced. |
| Set of | cbr<br>rtVbr<br>nrtVbr<br>ubr |
| Default | (cbr, rtVbr, nrtVbr, ubr) |

### GROUP AtmIf Aini Ptf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *PathTraceFilter* component. |

### ATTRIBUTE AtmIf Aini Ptf state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the filter.<br><br>***active***: Indicates the filter is active.<br><br>***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out. |

| | |
|---|---|
| Values | active<br>inactive |
| Default | inactive |

### ATTRIBUTE AtmIf Aini Ptf recordCount

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords*, which ever is less. |
| Values | Decimal (0..200) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf matchedConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of connections that match the criteria of this filter. |
| Values | Decimal (0..2147483647) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf elapsedTime

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of minutes that have elapsed since the start of the filter. |
| Values | Decimal (0..70560) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf timeRemaining

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of minutes remaining before the filter terminates itself. |
| Values | Decimal (0..70560) |
| Units | minutes |
| Default | No default |

### GROUP AtmIf Aini Ptf RecordControl (Record)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the record control of the *PathTraceFilter* component. |

### ATTRIBUTE AtmIf Aini Ptf traceTimeout

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available. |
| Values | Decimal (1..70560) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE AtmIf Aini Ptf maxTraceRecords (mRecords)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of records allowed to be stored with the filter.<br><br>Once the maximum has been reached, the oldest record is removed. |

| | |
|---|---|
| Values | Decimal (1..200) |
| Default | 2 |

## COMPONENT AtmIf Aini Ptf PathTraceRecord (PTRecord)

| | |
|---|---|
| Groups | "GROUP AtmIf Aini Ptf PTRecord Operational (Oper)" |
| Scope | Device |
| Description | *AtmIf/n Aini Ptf PTRecord*<br>*AtmIf/n Iisp Ptf PTRecord*<br>*AtmIf/n Uni Ptf PTRecord*<br>*AtmIf/n Pnni Ptf PTRecord*<br>*AtmIf/n Vpt/n Aini Ptf PTRecord*<br>*AtmIf/n Vpt/n Iisp Ptf PTRecord*<br>*AtmIf/n Vpt/n Uni Ptf PTRecord*<br>*AtmIf/n Vpt/n Pnni Ptf PTRecord*<br><br>This component represents the path trace record for the last failed connection against this filter. |
| Dyn. Subcomp. | "COMPONENT AtmIf Aini Ptf PTRecord Hop" |
| Common Verbs | Help<br>List<br>Display |

## GROUP AtmIf Aini Ptf PTRecord Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the path trace record component. |

## ATTRIBUTE AtmIf Aini Ptf PTRecord status

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the status of the trace. The string is one of the following:<br><br>***Completed normally****:* The trace completed normally. |

***Incomplete**:* Partial trace returned.

***Exceeded information element length limitations**:* The number of traced nodes exceeded the maximum number of hops.

***Exceeded message length limitations**:* The message length exceeded the maximum allowed size.

Values
Completed normally
Incomplete
Exceeded information element length limitations
Exceeded message length limitations

Default
No default

### ATTRIBUTE AtmIf Aini Ptf PTRecord timeStamp

Access
Read: All
Write: Illegal

Description
This attribute records the date and time of when the trace is completed.

Values
Time (DHMS)

Default
No default

### ATTRIBUTE AtmIf Aini Ptf PTRecord srcPortId

Access
Read: All
Write: Illegal

Description
This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.

Values
Decimal (1..4294967295)

Default
No default

### ATTRIBUTE AtmIf Aini Ptf PTRecord srcPortName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop. |
| Values | String (40, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord causeCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord diagCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL. |
| Values | String (0..8, ASCII) |

| | |
|---|---|
| Default | No default |

## COMPONENT AtmIf Aini Ptf PTRecord Hop

| | |
|---|---|
| Instance | Decimal (0..200) |
| Groups | "GROUP AtmIf Aini Ptf PTRecord Hop Operational (Oper)" |
| Scope | Device |
| Description | *AtmIf/n Aini Ptf PTRecord Hop/n*<br>*AtmIf/n Iisp Ptf PTRecord Hop/n*<br>*AtmIf/n Uni Ptf PTRecord Hop/n*<br>*AtmIf/n Pnni Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Aini Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Iisp Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Uni Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Pnni Ptf PTRecord Hop/n*<br>*AtmIf/n Vcc/x.y PTRecord Hop/n*<br>*AtmIf/n Vpc/n PTRecord Hop/n*<br>*AtmIf/n Vpt/n Vcc/x.y PTRecord Hop/n*<br><br>This component stores the result of a hop from a trace. An instance of this component is dynamically created for each hop in a trace record.<br><br>Depending on the hops, different attributes are present. |
| Dyn. Subcomp. | "COMPONENT AtmIf Aini Ptf PTRecord Hop VendorSpecificInfo (Vsi)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP AtmIf Aini Ptf PTRecord Hop Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the component *AtmPathTraceFilterRecordHop*. |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop ingressVpiVci (vpiVci)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the VPI.VCI values used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. This attribute is displayed for ATM interfaces only.<br><br>The VPI.VCI values are included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Integer Sequence (0..4095; 0..65535) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop ingressDlci (dlci)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the DLCI value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. This attribute is displayed for FrAtm interfaces only.<br><br>The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop ingressCallReference (callref)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the call reference value used for this hop on the ingress side. This is the ingress side with respect to the |

| | |
|---|---|
| | trace or setup message.<br><br>The call reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value |
| Values | Hex (H.0..H.ffffff) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop ingressEndPointReference (epref)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages.<br><br>The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop nodeId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the lowest level node ID traversed for this hop. |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop nodeName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the *nodeName* under the *ModuleData* component for this hop. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | String (12, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop portId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop portName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | String (55, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop pnniTraceContRefusalIndPresent (refusal)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop crankbackDestNodeIndPresent (dest)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop pnniCrankbackGapIndPresent (gap)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback. |

| | |
|---|---|
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop crankBackCause (cause)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information.<br><br>This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure. |
| Values | Decimal (0..1000) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop blockedTransitType (type)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked transit type.<br><br>This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure. |
| Values | Succeeding end blocked<br>Blocked node<br>Blocked link |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop blockedNodeId (bNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked node ID during the call setup request. The blocked node ID identifies the logical node where the connection or party has been blocked.<br><br>This attribute is present when the *blockedTransitType* attribute is ***Blocked node.*** |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop blockedLinkPrecedingNodeId (pNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked link's preceding node ID during the call setup request. The blocked link's preceding node ID identifies the logical node preceding a link, where the connection or party has been blocked.<br><br>This attribute is present when the *blockedTransitType* attribute is ***Blocked link***. |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop blockedLinkPortId (bPortId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked link's port identifier used for this connection during the call setup request. The blocked link's port identifier identifies a logical port of the blocked link's |

preceding node identifier.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop blockedLinkSucceedingNodeId (sNodeId)

Access: Read: All
Write: Illegal

Criticality: Component

Description: This attribute indicates the blocked link's succeeding node ID during the call setup request. The blocked link's succeeding node ID identifies the logical node succeeding a link where the connection or party has been blocked.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***

Values: String (22, Hex)

Default: No default

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop dstVpiVci

Access: Read: All
Write: Illegal

Criticality: Component

Description: This attribute indicates the VPI.VCI values on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for ATM interfaces.

The VPI.VCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value.

Values: Integer Sequence (0..4095; 0..65535)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop dstDlci

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the DLCI value on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for FrAtm interfaces.<br><br>The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop dstCallReference (dcr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the call reference value on the destination side. This attribute only appears in the trace result for the trace destination node.<br><br>The call reference value is included in the trace when the *traceInfo* attribute sets the ***callRef*** value. |
| Values | Hex (H.0..H.ffffff) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop dstEndPointReference (depr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute indicates the end point call reference value on the destination side. This attribute only appears in the trace result for the trace destination node.<br><br>The call reference value is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Ptf PTRecord Hop specifiedPath

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether this hop is the originator of this manually configured path. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | no<br>yes |
| Default | no |

### COMPONENT AtmIf Aini Ptf PTRecord Hop VendorSpecificInfo (Vsi)

| | |
|---|---|
| Instance | Decimal (0..10) |
| Groups | "GROUP AtmIf Aini Ptf PTRecord Hop Vsi Operational (Oper)" |
| Scope | Device |

*AtmIf/n Vpt/n Vcc/x.y PTRecord Hop/n VendorSpecificInfo/m*

This component stores the vendor specific information of a non-Passport node for a hop. An instance of this component is dynamically created for the vendor specific information group of a hop in a trace. Several instances of this component are created if the trace has several groups of vendor specific information.

All the trace information for a Passport node is stored in the *PTRecord Hop/** component.

## ATTRIBUTE AtmIf Aini Ptt fwdQosClass (fwdQos)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the quality of service for the forward direction for this connection.

Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video).

Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video).

Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer).

Class ***4*** supports a QOS that will meet Service Class D performance requirements (connectionless data transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

## ATTRIBUTE AtmIf Aini Ptt fwdQosParameters (fqp)

Access: Read and write

Description: This attribute is a vector of three elements that specify the quality of service parameters for the forward direction for this connection. This attribute is used for SPVC connections.

The ***cdv*** element specifies the acceptable peak-to-peak cell delay variation (CDV) of the real-time connections (CBR and rt-VBR). It is signaled through the extended QoS information element.

The ***ctd*** specifies the acceptable maximum cell transfer delay (maxCtd) of the real-time connections (CBR and rt-VBR). It is signaled through the end-to-end transit delay information element.

The ***clr*** specifies the acceptable cell loss ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections. It is signaled through the extended QoS information element.

Vector of: Decimal (0..2147483647)

Index:
cdv
ctd
clr

Default: (cdv: 16777215, ctd: 16777215, clr: 255)

## ATTRIBUTE AtmIf Aini Ptt txTrafficDescParm (txTdp)

Access
Read: All
Write: All

Description

This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled.

When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero.

When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR

for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3

represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

| Index | Decimal (1..5) |
| Default | ([5] 0) |

## ATTRIBUTE AtmIf Aini Ptt rxTrafficDescParm (rxTdp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in<br>cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC).<br><br>When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused). |

When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused).

When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

## COMPONENT AtmIf Aini ServiceTrace (SrvTrace)

| | |
|---|---|
| Groups | "GROUP AtmIf Aini SrvTrace Operational" |
| Scope | Application |

Description

*AtmIf/n [Vpt/m] Uni ServiceTrace*
*AtmIf/n [Vpt/m] Iisp ServiceTrace*
*AtmIf/n [Vpt/m] Pnni ServiceTrace*
*AtmIf/n [Vpt/m] Aini ServiceTrace*
The *ServiceTrace* component of the ATM service determines if the trace capability is allowed on this service. If it is not provisioned, then a service trace session cannot be started on this service.

Currently, the ATM Trace features only support ***frAtmTraceRcvr*** and ***atmTraceRcvr*** features, if the name of a X25 or FR receiver is set to the *receiver* attribute of this component, the *Start* command responses with a “Receiver Not Supported” message.

## VERB Start AtmIf Aini SrvTrace

Impact

Service

Description

*Start AtmIf/n [Vpt/m] Uni ServiceTrace*
*Start AtmIf/n [Vpt/m] Iisp ServiceTrace*
*Start AtmIf/n [Vpt/m] Pnni ServiceTrace*
*Start AtmIf/n [Vpt/m] Aini ServiceTrace*
This command starts a service trace session.

## VERB Stop AtmIf Aini SrvTrace

Impact

Service

Description

*Stop AtmIf/n [Vpt/m] Uni ServiceTrace*
*Stop AtmIf/n [Vpt/m] Iisp ServiceTrace*
*Stop AtmIf/n [Vpt/m] Pnni ServiceTrace*
*Stop AtmIf/n [Vpt/m] Aini ServiceTrace*
This command stops a service trace session.

## GROUP AtmIf Aini SrvTrace Operational

Properties

Operational

| | |
|---|---|
| Description | This group provides the operational attributes for the *SrvTrace* component. |

### ATTRIBUTE AtmIf Aini SrvTrace receiverName (rcvr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started. |
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Aini SrvTrace duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active. |
| Values | Decimal (0..9999) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE AtmIf Aini SrvTrace queueLimit

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately. |
| Values | Decimal (1..100) |
| Units | Kbyte |

| | |
|---|---|
| Default | 20 |

### ATTRIBUTE AtmIf Aini SrvTrace session

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active. |
| Values | The name of the component |
| Default | No default |

### COMPONENT AtmIf Aini Reroute

## VERB OPTIMIZE AtmIf Aini Reroute

| | |
|---|---|
| Impact | Service |
| Description | *Optimize [-all] AtmIf/n Uni outeouteouteouteouteoute*sBy default, only connection segsforation. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection.<br>The *-all* option causes all connection segments subscribed to path optimization to be considered.s |

## GROUP AtmIf Aini Reroute LocalOperational (LOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the local rerouting activities at the interface level. |

## ATTRIBUTE AtmIf Aini Reroute localSubscribedConnections (lsub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that are subscribed to one or more local rerouting capabilities. Note that a given connection segment is subscribed to either local rerouting capabilities capabilities, not both. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE AtmIf Aini Reroute localEligibleRecoveredCon (lerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered using local rerouting and are eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute localIneligibleRecoveredCon (lirc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered by local rerouting but are not eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute localLastRrCauseCode (lrrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last local rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute localPathsOptimized (lPathsOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the paths that were successfully optimized by local rerouting or EBR during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP AtmIf Aini Reroute GlobalOperational (GOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the global and EBR rerouting activities at the interface level. |

### ATTRIBUTE AtmIf Aini Reroute globalSubscribedConnections (gsub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that are subscribed to one or more global and EBR rerouting capabilities. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute globalEligibleRecoveredCon (gerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connections that have been recovered by global and EBR rerouting and are eligible for global or EBR path optimization. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute globalIneligibleRecoveredCon (girc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connections that have been recovered by global and EBR rerouting but are not eligible for global or EBR path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute globalLastRrCauseCode (grrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last global or EBR rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute globalPathsOptimized (gPathsOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the paths that were successfully optimized by global and EBR rerouting during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP AtmIf Aini Reroute Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the rerouting statistics for the interface. |

### ATTRIBUTE AtmIf Aini Reroute totalLocalConnectionRecoveries (tLConRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful local connection recovery attempts. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute totalLocalFailedRecoveries (lFailedRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts failed local connection recovery attempts. A connection recovery attempt fails if a rerouting connection segment can not be established. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute totalLocalPathOptimizations (tLPathOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful local path optimization attempts. A successful path optimization attempt results in a switch to a better route. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute totalGlobalConnectionRecoveries (tGConRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful global and EBR connection recovery attempts. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute totalGlobalFailedRecoveries (gFailedRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts failed global and EBR connection recovery attempts. A connection recovery attempt fails if a rerouting connection segment cannot be established. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute totalGlobalPathOptimizations (tGPathOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful global and EBR path optimization attempts. A successful path optimization attempt results in a switch to a better route. The counter wraps to zero when the maximum value is exceeded. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Aini Reroute totalOptimizationPasses (optPass)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts optimization passes at the interface. Both module and interface optimization passes are counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT AtmIf Aini Reroute Ov

| | |
|---|---|
| Groups | "GROUP AtmIf Aini Reroute Ov Provisioned (Prov)"<br>"GROUP AtmIf Aini Reroute Ov LocalProvisioned (LProv)"<br>"GROUP AtmIf Aini Reroute Ov GlobalProvisioned (GProv)" |
| Scope | Device |
| Description | *AtmIf/n Iisp Reroute Ov*<br>*AtmIf/n Aini Reroute Ov*<br>*AtmIf/n Uni Reroute Ov*<br>*AtmIf/n Vpt/vpi Iisp Reroute Ov*<br>*AtmIf/n Vpt/vpi Aini Reroute Ov*<br>*AtmIf/n Vpt/vpi Uni Reroute Ov*<br><br>This component represents the provisioning capabilities of the rerouting functionality for the ATM Signaling interface. |
| Common Verbs | Help<br>List<br>Display |

### GROUP AtmIf Aini Reroute Ov Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface. |

## ATTRIBUTE AtmIf Aini Reroute Ov protocol

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the rerouting protocols which are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.<br><br>One of the following values can be specified:<br>***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute.<br>***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.<br>***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.<br>***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.<br>***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.<br>***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature. |
| Values | localGlobal<br>localOnly<br>globalOnly<br>localEbr<br>ebrOnly<br>sameAsARtgPnniReroute (sameAs) |
| Default | sameAsARtgPnniReroute |

## ATTRIBUTE AtmIf Aini Reroute Ov numOptAttempts

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.<br><br>If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.<br><br>If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used. |
| Values | Decimal (0..15)<br>sameAsARtgPnniReroute (sameAs) |
| Default | sameAs |

## ATTRIBUTE AtmIf Aini Reroute Ov moduleOptimizationConnections

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni Reroute* component.<br><br>One of the following values can be specified:<br>***sameAsARtgPnniReroute***: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute. |

***none***: No connection segments are considered for path optimization.
***recoveredOnly***: Only connection segments which are foration. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
***allSubscribed***: All connection segments subscribed to path optimization are considered.

Values
none
recoveredOnly
allSubscribed
sameAsARtgPnniReroute (sameAs)

Default
sameAsARtgPnniReroute

## ATTRIBUTE AtmIf Aini Reroute Ov switchoverMechanism

Access
Read and write

Description
This attribute specifies the mechanism used for switchover of a rerouted connection segment.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The switchover mechanism is specified by the *ARtg Pnni Reroute switchoverMechanism* attribute.
***standard***: The mechanism described in the ATM Forum “Domain based Rerouting” specification is used for switchover. This value ensures interoperability with other vendors’ equipment running ATM Forum “Domain based Rerouting”.
***rcl***: The Reduced Cell Loss mechanism is used for switchover. RCL is a value-added Passport extension to the standard mechanism that allows faster switchover time.

Values
standard
rcl
sameAsARtgPnniReroute (sameAs)

Default
sameAsARtgPnniReroute

## GROUP AtmIf Aini Reroute Ov LocalProvisioned (LProv)

Properties
Provisioned

Description — This group contains the provisionable attributes for EBR and local rerouting protocols.

## ATTRIBUTE AtmIf Aini Reroute Ov localConnectionRecoverySubscr (lConRec)

Access — Read and write

Description — This attribute specifies which connection segments on the interface request subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local connection recovery.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local connection recovery and EBR connection recovery. Only one will be granted.

One or more of the following values can be specified:
***sameAsARtgPnniReroute:*** If this value is set, the local connection recovery subscription rule is determined by the *ARtg Pnni Reroute localConnectionRecoverySubscr* attribute. This value takes precedence over any other values.
***svcSvp***: If this value is set, all SVC and SVP connection segments request subscription to local connection recovery.
***sourceSpvcSpvp***: If this value is set, all source SPVC and SPVP connection segments request subscription to local connection recovery.
***transitSpvcSpvp***: If this value is set, all transit SPVC and SPVP connection segments request subscription to local connection recovery.

Set of — sameAsARtgPnniReroute (sameAs)
svc
sourceSpvcSpvp (source)
transitSpvcSpvp (transit)

Default — (sameAsARtgPnniReroute)

## ATTRIBUTE AtmIf Aini Reroute Ov localPathOptimizationSubscr (lPathOpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which connection segments on the interface request subscription to local path optimization. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.<br><br>Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local path optimization.<br><br>Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local path optimization and EBR path optimization. ## GROUP AtmIf Pnni Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the Pnni component. |

## ATTRIBUTE AtmIf Pnni softPvpAndPvcRetryPeriod

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute represents the time in seconds to wait between soft PVP or soft PVC call setup retries. The resolution is to the nearest 10 seconds. |
| Values | Decimal (20..999999) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE AtmIf Pnni softPvpAndPvcHoldOffTime (sHoldOffTime)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how long to hold off retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value. |
| Values | Decimal (0; 50..20000) |
| Units | msec |
| Default | 0 |

### GROUP AtmIf Pnni AdminWeights

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable administrative weights for the *Pnni* component. These weights will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion. |

### ATTRIBUTE AtmIf Pnni cbrWeight (cbrWt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Constant Bit Rate (CBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection. |
| Values | Decimal (1..16777215) |
| Default | 5040 |

### ATTRIBUTE AtmIf Pnni rtVbrWeight (rtVbrWt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Real-Time Variable Bit Rate (RT-VBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection. |
| Values | Decimal (1..16777215) |
| Default | 5040 |

### ATTRIBUTE AtmIf Pnni nrtVbrWeight (nrtVbrWt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Non Real-Time Variable Bit Rate (NRT-VBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection. |
| Values | Decimal (1..16777215) |
| Default | 5040 |

### ATTRIBUTE AtmIf Pnni ubrWeight (ubrWt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Unspecified Bit Rate (UBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the |

| | |
|---|---|
| | higher the value, the less desirable the link will be in path selection. |
| Values | Decimal (1..16777215) |
| Default | 5040 |

### GROUP AtmIf Pnni AccountingOptions (AcctOpt)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for accounting. |

### ATTRIBUTE AtmIf Pnni accountCollection (aco)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit***, or ***force***.<br><br>If the set of reasons is not empty then accounting records will be generated by this interface in the following situations:<br>- on a TODA changeover if TODA is enabled;<br>- every 12 hours (per connection) if TODA is disabled;<br>- on every call clear (a call record with final cell counts).<br><br>If none of the reasons is present, then accounting will be suppressed.<br><br>The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate. |
| Set of | bill<br>test<br>study<br>audit<br>force |
| Default | No default |

### ATTRIBUTE AtmIf Pnni accountConnectionType (act)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records.<br><br>If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***.<br><br>If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***. |
| Values | origTerm<br>intermediate |
| Default | intermediate |

### ATTRIBUTE AtmIf Pnni accountClass (acl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator.<br><br>Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE AtmIf Pnni serviceExchange (sre)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator.<br><br>Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingDse* or *calledDse* as appropriate. |
| Values | Decimal (0..255) |
| Default | 0 |

### GROUP AtmIf Pnni Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for a *Pnni* component. |

### ATTRIBUTE AtmIf Pnni portId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the port id of the PNNI interface, which is the parent *AtmIf*'s instance number. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP AtmIf Pnni Threshold

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the change threshold for the *Atmif Pnni* component. |

### ATTRIBUTE AtmIf Pnni avcrMt

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute, multiplied by the Maximum Cell Rate, specifies the minimum threshold used in the algorithms that determine significant change for average cell rate parameters for this |

interface. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni avcrMt*.

Values
Decimal (1..99)
sameAsPnni

Units
%

Default
sameAsPnni

### ATTRIBUTE AtmIf Pnni avcrPm

Access
Read: All
Write: All

Description
This attribute multiplied by the current Available Cell Rate (AvCr) specifies the threshold used in the algorithms that determine significant change for AvCR parameters for this interface. If the resulting threshold is lower than the AvCr, the minimum threshold (*Atmif pnni avcrMt*) is used.

Increasing the value of the attribute increases the range of insignificance and reduces the amount of PTSP flooding due to changes in resource availability. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni avcrPm*.

Values
Decimal (1..99)
sameAsPnni

Units
%

Default
sameAsPnni

### GROUP AtmIf Pnni TraceProv (Trace)

Properties
Provisioned

Description
This group contains the provisionable trace attributes for the Pnni component.

### ATTRIBUTE AtmIf Pnni traceDestination (tDst)

Access
Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies if this node is a trace destination. A PNNI interface may be a trace destination interface. By default, it's not. If an operator wants to trace only until this PNNI interface, this interface can be set to trace destination by setting this attribute. |
| Values | no<br>yes |
| Default | no |

## COMPONENT AtmIf Pnni Signalling (Sig)

| | |
|---|---|
| Groups | "GROUP AtmIf Pnni Sig Provisioned (Prov)"<br>"GROUP AtmIf Pnni Sig OsiState (State)"<br>"GROUP AtmIf Pnni Sig Operational (Oper)"<br>"GROUP AtmIf Pnni Sig Statistics (Stats)" |
| Scope | Device |
| Description | *AtmIf/n Aini Signalling*<br>*AtmIf/n Iisp Signalling*<br>*AtmIf/n Uni Signalling*<br>*AtmIf/n Pnni Signalling*<br>*AtmIf/n Vpt/m Aini Signalling*<br>*AtmIf/n Vpt/m Iisp Signalling*<br>*AtmIf/n Vpt/m Uni Signalling*<br>*AtmIf/n Vpt/m Pnni Signalling*<br><br>This component represents the signaling entities for the interface. |
| Opt. Subcomp. | "COMPONENT AtmIf Pnni Sig VirtualChannelDescriptor (Vcd)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP AtmIf Pnni Sig Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the provisionable attributes for the *Signalling* component. |

### ATTRIBUTE AtmIf Pnni Sig vci

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the signaling channel number. |
| Values | Decimal (0..65535) |
| Default | 5 |

### ATTRIBUTE AtmIf Pnni Sig addressConversion

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed. |
| Values | none<br>nativeE164<br>nsap |
| Default | none |

### ATTRIBUTE AtmIf Pnni Sig operatingMode

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs |

are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces.
***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.

Values: normal
provisionedOnly

Default: normal

## GROUP AtmIf Pnni Sig OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE AtmIf Pnni Sig adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE AtmIf Pnni Sig operationalState (osiOper)

| | |
|---|---|
| Access | Read only |

| Default | disabled |

### ATTRIBUTE AtmIf Pnni Sig usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP AtmIf Pnni Sig Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute contains the operational attributes for the AtmSignalling component. |

## ATTRIBUTE AtmIf Pnni Sig lastTxCauseCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. |
| Values | Decimal (0..255) |
| Default | No default |

## ATTRIBUTE AtmIf Pnni Sig lastTxDiagCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0. |
| Values | Hex (H.0..H.ff) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Sig lastRxCauseCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the cause code in the last received signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Sig lastRxDiagCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the diagnostic code in the last received signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0. |
| Values | Hex (H.0..H.ff) |
| Default | No default |

### GROUP AtmIf Pnni Sig Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the statistics associated with the AtmSignalling component. |

### ATTRIBUTE AtmIf Pnni Sig peakConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the high water mark of active point-to-point connections. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Sig successfulConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of switched point-to-point connections that were successfully established. The counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Sig failedConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of unsuccessful attempts to establish switched point-to-point connections. The counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Sig txPdus

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of transmitted signaling PDUs.The counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Sig rxPdus

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of received signaling PDUs.The counter wraps to 0 when the maximum value is exceeded. |

## GROUP Atmlf Pnni Sig Vcd Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable traffic attributes for a control channel.

## ATTRIBUTE Atmlf Pnni Sig Vcd trafficDescType (tdt)

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the type of traffic management which is applied to both the transmit and receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.

Values:
3
6
7
8

Default: 6

## ATTRIBUTE Atmlf Pnni Sig Vcd atmServiceCategory (service)

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the ATM service category for both directions of the connection.

The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application.

The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Values

unspecifiedBitRate (ubr)
constantBitRate (cbr)
rtVariableBitRate (rtvbr)
nrtVariableBitRate (nrtvbr)

| | |
|---|---|
| Default | rtVariableBitRate |

### ATTRIBUTE AtmIf Pnni Sig Vcd weight

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m.<br><br>This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs.<br><br>When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***.<br><br>When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT.<br><br>When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*. |
| Values | Decimal (1..4095)<br>sameAsCa<br>upToQueueLimit |

Default sameAsCa

### ATTRIBUTE AtmIf Pnni Sig Vcd qosClass (qos)

Access Read and write

Criticality Component

Description This attribute specifies the quality of service for both the forward and backward direction for this connection.

Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video).

Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video).

Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values
0
1
2
3
4

Default 2

### ATTRIBUTE AtmIf Pnni Sig Vcd trafficShaping (trShaping)

Access Read and write

Criticality Component

Description This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface.

When ***sameAsCa*** is selected, traffic shaping for this connection is

based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.

When ***disabled*** is selected, traffic shaping for this connection is disabled.

Values
disabled
sameAsCa

Default
disabled

## ATTRIBUTE AtmIf Pnni Sig Vcd unshapedTransmitQueueing (unshap)

Access
Read and write

Criticality
Component

Description
This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute.

When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator.*

When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values
common
sameAsCa

| | |
|---|---|
| Default | sameAsCa |

### ATTRIBUTE AtmIf Pnni Sig Vcd usageParameterControl (upc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface.<br><br>When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator.* If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component.<br><br>When ***disabled*** is selected, UPC for this connection is disabled.<br><br>The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used |
| Values | disabled<br>sameAsCa |
| Default | disabled |

### ATTRIBUTE AtmIf Pnni Sig Vcd trafficDescParm (tdp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for |

connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.

When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1.

This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

| | |

## GROUP AtmIf Pnni Rcc Provisioned (Prov)

Properties Provisioned

Description This group contains the generic provisionable attributes of an *Rcc* component.

## ATTRIBUTE AtmIf Pnni Rcc vci

Access Read: All
Write: All

Criticality Component

Description This attribute specifies the VCI for the Routing Control Channel (RCC). The value should not be changed from the default of 18 unless absolutely necessary. If a different VCI is specified, ensure that the RCC at the far end is provisioned to use the same VCI, otherwise the RCC will not come up.

Values Decimal (0..65535)

Default 18

## ATTRIBUTE AtmIf Pnni Rcc aggregationToken

Access Read: All
Write: All

Description This attribute specifies the aggregation token for this interface at the local end of the link. The aggregation tokens at both ends are use to form the *derivedAggregationToken* for the link. The aggregation token controls how links are aggregated together. Except for the lowest level nodes, links between two logical

| | |
|---|---|
| | nodes are aggregated together if they have the same aggregation token. Link aggregation is not done at the lowest level node, except in the degenerate node situation, where the lowest level node is a neighbor to an LGN. The value is ignored for links having a type value of ***unknown*** or ***lowestLevelHorizLink***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP AtmIf Pnni Rcc HelloParms (HlParms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable Hello protocol parameters for an *Rcc* component. |

### ATTRIBUTE AtmIf Pnni Rcc helloHoldDown (hhd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the rate at which this node sends out Hello packets. It specifies the default minimum length of time between successive Hellos used by routing control channels on this node. A provisioning check is made to ensure that this value cannot be greater than *helloInterval*.<br><br>A value of 0 specifies that the value provisioned for the *helloHoldDown* attribute of the *ARtg Pnni* component should be used. |
| Values | Decimal (0.0..65535.0) |
| Units | seconds |
| Default | 0.0 |

### ATTRIBUTE AtmIf Pnni Rcc helloInterval (hli)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies the default duration of the Hello Timer for routing control channels on this node. Every *helloInterval* seconds, this node sends out a Hello packet to the neighbor node, subject to the *helloHoldDown* timer having expired at least once since the last Hello packet was sent.<br>A provisioning check is made to ensure that this value cannot be less than *helloHoldDown*.<br><br>A value of 0 specifies that the value provisioned for the *helloInterval* attribute of the *ARtg Pnni* component should be used. |
| Values | Decimal (0..65535) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE AtmIf Pnni Rcc helloInactivityFactor (hif)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the number of Hello intervals allowed to pass without receiving a Hello from a neighbor, before an attempt is made to stage the RCC to that neighbor. The hello inactivity timer is enabled when the *helloState* is one of ***oneWayInside***, ***twoWayInside***, ***oneWayOutside***, ***twoWayOutside*** or ***commonOutside***.<br><br>A value of 0 specifies that the value provisioned for the *helloInactivityFactor* attribute of the *ARtg Pnni* component should be used. |
| Values | Decimal (0..65535) |
| Default | 0 |

### GROUP AtmIf Pnni Rcc OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE AtmIf Pnni Rcc adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

## ATTRIBUTE AtmIf Pnni Rcc operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE AtmIf Pnni Rcc usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP AtmIf Pnni Rcc Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for an *Rcc* component.

### ATTRIBUTE AtmIf Pnni Rcc type

Access: Read: All
Write: Illegal

Description

This attribute indicates the role of this link in the PNNI hierarchy. The following values are possible:

***unknown***: the Hello protocol has not yet determined the role of the link.

***lowestLevelHorizLink***: the link is a horizontal link between two lowest level nodes.

***lowestLevelOutsideLink***: the link is an outside link between two border nodes.

***horizontalLinkToLgn***: the link is a horizontal link to a Logical Group Node (LGN).

***uplink***: the link is a uplink to a higher level LGN.

Values

unknown
lowestLevelHorizLink
lowestLevelOutsideLink
horizontalLinkToLGN
uplink

Default

No default

## ATTRIBUTE AtmIf Pnni Rcc negotiatedVersion

Access

Read: All
Write: Illegal

Description

This attribute indicates the PNNI version negotiated with the neighbor node.

Values

unsupported
version1point0

Default

No default

## ATTRIBUTE AtmIf Pnni Rcc helloState

Access

Read: All
Write: Illegal

Description

This attribute indicates the state of the Hello protocol exchange over this link. The following are the possible values for this attribute:

***down***: the link is down. No PNNI routing packets are sent or received over such a link. This is the initial state of the Hello Finite State Machine, and can also be reached when lower-level protocols have indicated that the link is not usable.

***attempt***: no Hello packets or Hello packets, with mismatched information, have been received recently from the neighbor. Attempts are made to contact the neighbor node by sending out Hello packets every *helloInterval* seconds.

***oneWayInside***: Hello packets have been recently received from the neighbor and it has been established that both nodes are members of the same peer group, but the remote node ID and remote port ID in the neighbor's Hello packets were set to zero. A Hello packet is sent to the neighbor and the Hello timer is restarted.

***twoWayInsid***e: Bidirectional communication over this link between this node and the neighbor node has been achieved.

***oneWayOutside***: Hello packets have been recently received from the neighbor and it has been established that both nodes are members of a different peer group, but the remote node ID and remote port ID in the neighbor's Hello packets were set to zero.

***twoWayOutside***: Hello packetss have recently been received from the neighbor indicating that the neighbor node belongs to a different peer group. The correct remote node ID and remote port ID fields were included in the Hello packet, but the nodal hierarchy list did not include any common peer group. This state can also be reached if a hierarchy mismatch occurs while in the ***commonOutside*** state.

***commonOutside***: A common level of the routing hierarchy has been found, in addition to achieving full bi-directional communication between the two nodes.

| | |
|---|---|
| Values | notApplicable<br>down<br>attempt<br>oneWayInside<br>twoWayInside<br>oneWayOutside<br>twoWayOutside<br>commonOutside |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Rcc remoteNodeId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the node id at the far end of the link. |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Rcc remotePortId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the PortID of the neighboring node, which is an unsigned integer of 32 bits. When the remote end of a PNNI physical link is terminated by a Passport, the first 16 bits of the hex encoded format represent the *AtmIf* instance of the PNNI link of the remote node, the next 12 bits correspond to the VPI of the PNNI link and the last 4 bits are unspecified(that is, it provide no value for physical interpretation). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Rcc derivedAggregationToken

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the derived aggregation token value used on this link.<br>The algorithm for computing the value of the derived aggregation token is:<br>1. If neighbors exchange identical values of the configured aggregation token, that value is the derived aggregation token value.<br>2. If the configured aggregation token value of one neighbor is zero (default), and that of the other neighbor is non-zero, the non-zero value is the derived aggregation token value.<br>3. If the configured aggregation token values of the neighbors are different and both non-zero, the derived aggregation token value is zero.<br>The attribute is not displayed for links having a type value of ***unknown*** or ***lowestLevelHorizLink***. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Rcc remoteNodeName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the node name and the hierarchy level for the node at the far end of the link.<br><br>A typical value for this attribute has the following form: ***OBELIX@96***.<br><br>Here, ***OBELIX*** is the node name and ***96*** is the hierarchy level for the upnode. The **@** symbol is used to separate the node name from the hierarchy level in the display.<br><br>This attribute is left blank if the far end is a non-Passport node. |
| Values | String (1..16, ASCII) |
| Default | No default |

## ATTRIBUTE AtmIf Pnni Rcc remoteInterfaceName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the interface name of the node at the far end of the link.<br><br>When the far end of the link is a Passport node, this attribute's value can take one of the following forms:<br>(a) ***AtmIf/<1-4095>*** - If the far end is an Atm Interface.<br>(b) ***AtmIf/<1-4095> Vpt/<1-4095>*** - If the far end is a VPT interface.<br>(c) Values ***0-4294967295*** - If the link is a logical link.<br><br>This attribute will remain blank if the far end is a non-Passport node. |
| Values | String (0..19, ASCII) |
| Default | No default |

## GROUP AtmIf Pnni Rcc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes for an *Rcc* component. |

## ATTRIBUTE AtmIf Pnni Rcc helloPacketsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of Hello packets received across this RCC, including bad and mismatched Hello packets. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Rcc helloPacketsTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of Hello packets transmitted across this RCC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Rcc mismatchedHelloPacketsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of mismatched Hello packets received over this RCC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Rcc badHelloPacketsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of bad Hello packets received over this RCC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT AtmIf Pnni Rcc VirtualChannelDescriptor (Vcd)

| | |
|---|---|
| Groups | "GROUP AtmIf Pnni Rcc Vcd Provisioned (Prov)" |
| Scope | Device |
| Description | *AtmIf/n Uni Sig VirtualChannelDescriptor*<br>*AtmIf/n Uni Ilmi VirtualChannelDescriptor* |

*AtmIf/n Aini Sig VirtualChannelDescriptor*
*AtmIf/n Iisp Sig VirtualChannelDescriptor*
*AtmIf/n Pnni Sig VirtualChannelDescriptor*
*AtmIf/n Pnni Rcc VirtualChannelDescriptor*
*AtmIf/n Vpt/m Uni Sig VirtualChannelDescriptor*
*AtmIf/n Vpt/m Aini Sig VirtualChannelDescriptor*
*AtmIf/n Vpt/m Iisp Sig VirtualChannelDescriptor*
*AtmIf/n Vpt/m Pnni Sig VirtualChannelDescriptor*
*AtmIf/n Vpt/m Pnni Rcc VirtualChannelDescriptor*

This component contains the provisionable traffic parameters for a control channel (Sig, *Ilmi* or *Rcc* component).

## GROUP AtmIf Pnni Rcc Vcd Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable traffic attributes for a control channel.

## ATTRIBUTE AtmIf Pnni Rcc Vcd trafficDescType (tdt)

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the type of traffic management which is applied to both the transmit and receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.

Values:
3
6
7
8

Default 6

## ATTRIBUTE AtmIf Pnni Rcc Vcd atmServiceCategory (service)

Access Read: All
Write: All

Criticality Component

Description This attribute specifies the ATM service category for both directions of the connection.

The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application.

The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR

service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Values
unspecifiedBitRate (ubr)
constantBitRate (cbr)
rtVariableBitRate (rtvbr)
nrtVariableBitRate (nrtvbr)

Default
rtVariableBitRate

## ATTRIBUTE AtmIf Pnni Rcc Vcd weight

Access
Read and write

Criticality
Component

Description
This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m.

This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs.

When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***.

When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the

same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT.

When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.

Values
Decimal (1..4095)
sameAsCa
upToQueueLimit

Default
sameAsCa

## ATTRIBUTE AtmIf Pnni Rcc Vcd qosClass (qos)

Access
Read and write

Criticality
Component

Description
This attribute specifies the quality of service for both the forward and backward direction for this connection.

Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video).

Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video).

Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values
0
1
2
3
4

Default 2

### ATTRIBUTE AtmIf Pnni Rcc Vcd trafficShaping (trShaping)

Access Read and write

Criticality Component

Description This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface.

When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.

When ***disabled*** is selected, traffic shaping for this connection is disabled.

Values disabled
sameAsCa

Default disabled

### ATTRIBUTE AtmIf Pnni Rcc Vcd unshapedTransmitQueueing (unshap)

Access Read and write

Criticality Component

Description This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute.

When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service

category component under the *ConnectionAdministrator.*

When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values
common
sameAsCa

Default
sameAsCa

## ATTRIBUTE AtmIf Pnni Rcc Vcd usageParameterControl (upc)

Access
Read and write

Criticality
Component

Description
This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface.

When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator.* If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component.

When ***disabled*** is selected, UPC for this connection is disabled.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values
disabled
sameAsCa

Default
disabled

## ATTRIBUTE AtmIf Pnni Rcc Vcd trafficDescParm (tdp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.<br><br>When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.<br><br>When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.<br><br>When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and |

parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

| | |

## GROUP AtmIf Pnni Addr Operational (Oper)

Properties Operational

Description This attribute group contains the operational attributes for the *Address* component.

## ATTRIBUTE AtmIf Pnni Addr scope

Access Read: All
Write: Illegal

Description This attribute indicates the scope of the ATM address, which is the highest level to which this address will be advertised in the PNNI hierarchy. If no *PnniInfo* subcomponent has been provisioned, then the scope will default to the level of this node in the PNNI hierarchy. If this node does not participate in a PNNI hierarchy, then this attribute will have the value of -1.

Values Signed (-1..104)

Default No default

## ATTRIBUTE AtmIf Pnni Addr reachability (reach)

Access Read: All
Write: Illegal

Description — This attribute indicates whether the address is internal or exterior. An internal reachable address is an address of a destination that is directly attached to the logical node advertising the address. An exterior reachable address is an address that can be reached through a PNNI routing domain, but which is not located in that PNNI routing domain.

Values — internal
exterior

Default — No default

## COMPONENT AtmIf Pnni Addr TerminateSPvpAndSPvc (TermSP)

Scope — Device

Description — *AtmIf/n Aini Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Iisp Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Uni Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Pnni Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Vpt/m Aini Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Vpt/m Iisp Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Vpt/m Uni Address/address,type TerminateSPvpAndSPvc*
*AtmIf/n Vpt/m Pnni Address/address,type TerminateSPvpAndSPvc*

The presence of this subcomponent indicates that SPvp and SPvc call setups terminate at this node if the destination address of the SPVP or SPVC matches the *Address* instance.

## VERB START AtmIf Pnni Ptf

Impact: Service

Description:

*START AtmIf/n Aini PathTraceFilter*
*START AtmIf/n Iisp PathTraceFilter*
*START AtmIf/n Uni PathTraceFilter*
*START AtmIf/n Pnni PathTraceFilter*
*START AtmIf/n Vpt/vpi Aini PathTraceFilter*
*START AtmIf/n Vpt/vpi Iisp PathTraceFilter*
*START AtmIf/n Vpt/vpi Uni PathTraceFilter*
*START AtmIf/n Vpt/vpi Pnni PathTraceFilter*

This command starts the path tracing based on the specified filtering criteria.

When the command is issued, the *traceTimeout* timer is reset.

## VERB STOP AtmIf Pnni Ptf

Impact: Service

Description:

*STOP AtmIf/n Aini PathTraceFilter*
*STOP AtmIf/n Iisp PathTraceFilter*
*STOP AtmIf/n Uni PathTraceFilter*
*STOP AtmIf/n Pnni PathTraceFilter*
*STOP AtmIf/n Vpt/vpi Aini PathTraceFilter*
*STOP AtmIf/n Vpt/vpi Iisp PathTraceFilter*
*STOP AtmIf/n Vpt/vpi Uni PathTraceFilter*
*STOP AtmIf/n Vpt/vpi Pnni PathTraceFilter*

This command causes the filter to stop, but keeps the trace records.

## VERB CLEAR AtmIf Pnni Ptf

### ATTRIBUTE AtmIf Pnni Ptf state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the filter.<br><br>***active***: Indicates the filter is active.<br><br>***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out. |
| Values | active<br>inactive |
| Default | inactive |

### ATTRIBUTE AtmIf Pnni Ptf recordCount

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords*, which ever is less. |

| | |
|---|---|
| Values | Decimal (0..200) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf matchedConnections

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of connections that match the criteria of this filter. |
| Values | Decimal (0..2147483647) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf elapsedTime

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of minutes that have elapsed since the start of the filter. |
| Values | Decimal (0..70560) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf timeRemaining

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of minutes remaining before the filter terminates itself. |
| Values | Decimal (0..70560) |
| Units | minutes |
| Default | No default |

### GROUP AtmIf Pnni Ptf RecordControl (Record)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational attributes for the record control of the *PathTraceFilter* component. |

### ATTRIBUTE AtmIf Pnni Ptf traceTimeout

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available. |
| Values | Decimal (1..70560) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE AtmIf Pnni Ptf maxTraceRecords (mRecords)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of records allowed to be stored with the filter.<br><br>Once the maximum has been reached, the oldest record is removed. |
| Values | Decimal (1..200) |
| Default | 2 |

### COMPONENT AtmIf Pnni Ptf PathTraceRecord (PTRecord)

| | |
|---|---|
| Groups | "GROUP AtmIf Pnni Ptf PTRecord Operational (Oper)" |
| Scope | Device |
| Description | *AtmIf/n Aini Ptf PTRecord*<br>*AtmIf/n Iisp Ptf PTRecord*<br>*AtmIf/n Uni Ptf PTRecord*<br>*AtmIf/n Pnni Ptf PTRecord*<br>*AtmIf/n Vpt/n Aini Ptf PTRecord*<br>*AtmIf/n Vpt/n Iisp Ptf PTRecord*<br>*AtmIf/n Vpt/n Uni Ptf PTRecord* |

*AtmIf/n Vpt/n Pnni Ptf PTRecord*

This component represents the path trace record for the last failed connection against this filter.

Dyn. Subcomp. "COMPONENT AtmIf Pnni Ptf PTRecord Hop"

## GROUP AtmIf Pnni Ptf PTRecord Operational (Oper)

Properties Operational

Description This group contains the operational attributes for the path trace record component.

## ATTRIBUTE AtmIf Pnni Ptf PTRecord status

Access
Read: All
Write: Illegal

Description This attribute indicates the status of the trace. The string is one of the following:

***Completed normally****:* The trace completed normally.

***Incomplete****:* Partial trace returned.

***Exceeded information element length limitations****:* The number of traced nodes exceeded the maximum number of hops.

***Exceeded message length limitations****:* The message length exceeded the maximum allowed size.

Values
Completed normally
Incomplete
Exceeded information element length limitations
Exceeded message length limitations

Default No default

### ATTRIBUTE AtmIf Pnni Ptf PTRecord timeStamp

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute records the date and time of when the trace is completed. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord srcPortId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop. |
| Values | Decimal (1..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord srcPortName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop. |
| Values | String (40, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord causeCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord diagCode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL. |
| Values | String (0..8, ASCII) |
| Default | No default |

### COMPONENT AtmIf Pnni Ptf PTRecord Hop

| | |
|---|---|
| Instance | Decimal (0..200) |
| Groups | "GROUP AtmIf Pnni Ptf PTRecord Hop Operational (Oper)" |
| Scope | Device |
| Description | *AtmIf/n Aini Ptf PTRecord Hop/n*<br>*AtmIf/n Iisp Ptf PTRecord Hop/n*<br>*AtmIf/n Uni Ptf PTRecord Hop/n*<br>*AtmIf/n Pnni Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Aini Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Iisp Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Uni Ptf PTRecord Hop/n*<br>*AtmIf/n Vpt/n Pnni Ptf PTRecord Hop/n*<br>*AtmIf/n Vcc/x.y PTRecord Hop/n* |

*AtmIf/n Vpc/n PTRecord Hop/n*
*AtmIf/n Vpt/n Vcc/x.y PTRecord Hop/n*

This component stores the result of a hop from a trace. An instance of this component is dynamically created for each hop in a trace record.

Depending on the hops, different attributes are present.

| Criticality | Component |
| Description | This attribute indicates the DLCI value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. This attribute is displayed for FrAtm interfaces only.<br><br>The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop ingressCallReference (callref)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the call reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message.<br><br>The call reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value |
| Values | Hex (H.0..H.ffffff) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop ingressEndPointReference (epref)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. |

| | |
|---|---|
| | The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop nodeId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the lowest level node ID traversed for this hop. |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop nodeName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the *nodeName* under the *ModuleData* component for this hop. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | String (12, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop portId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop portName

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. Only Passport nodes provide this information by including it in the Vendor Specific group. |
| Values | String (55, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop pnniTraceContRefusalIndPresent (refusal)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop crankbackDestNodeIndPresent (dest)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator |

| | |
|---|---|
| | indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop pnniCrankbackGapIndPresent (gap)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback. |
| Values | absent<br>present |
| Default | absent |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop crankBackCause (cause)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information.<br><br>This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure. |
| Values | Decimal (0..1000) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop blockedTransitType (type)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked transit type.<br><br>This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure. |
| Values | Succeeding end blocked<br>Blocked node<br>Blocked link |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop blockedNodeId (bNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked node ID during the call setup request. The blocked node ID identifies the logical node where the connection or party has been blocked.<br><br>This attribute is present when the *blockedTransitType* attribute is ***Blocked node.*** |
| Values | String (22, Hex) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop blockedLinkPrecedingNodeId (pNodeId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Criticality | Component |
| Description | This attribute indicates the blocked link's preceding node ID during the call setup request. The blocked link's preceding node ID identifies the logical node preceding a link, where the |

connection or party has been blocked.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link***.

Values: String (22, Hex)

Default: No default

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop blockedLinkPortId (bPortId)

Access: Read: All
Write: Illegal

Criticality: Component

Description: This attribute indicates the blocked link's port identifier used for this connection during the call setup request. The blocked link's port identifier identifies a logical port of the blocked link's preceding node identifier.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop blockedLinkSucceedingNodeId (sNodeId)

Access: Read: All
Write: Illegal

Criticality: Component

Description: This attribute indicates the blocked link's succeeding node ID during the call setup request. The blocked link's succeeding node ID identifies the logical node succeeding a link where the connection or party has been blocked.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***

Values: String (22, Hex)

Default: No default

### ATTRIBUTE AtmIf Pnni Ptf PTRecord Hop dstVpiVci

| | |

### COMPONENT AtmIf Pnni PathTraceTestConnection (Ptt)

| | |
|---|---|
| Groups | "GROUP AtmIf Pnni Ptt Operational (Oper)" |
| Scope | Device |
| Description | *AtmIf/n Aini PathTraceTestConnection*<br>*AtmIf/n Iisp PathTraceTestConnection*<br>*AtmIf/n Uni PathTraceTestConnection*<br>*AtmIf/n Pnni PathTraceTestConnection*<br>*AtmIf/n Vpt/vpi Aini PathTraceTestConnection*<br>*AtmIf/n Vpt/vpi Iisp PathTraceTestConnection*<br>*AtmIf/n Vpt/vpi Uni PathTraceTestConnection*<br>*AtmIf/n Vpt/vpi Pnni PathTraceTestConnection* |

This component provides the capability to control the Path Trace Test Connection. A test connection is one way to find the logical nodes and ports that a connection traverses to a destination interface.

The *Trace* verb is used to initiate the test connection. The test connection is always released once it reaches the trace destination. The test connection responds with the trace results collected during a complete or partial trace.

## VERB TRACE AtmIf Pnni Ptt

Impact: Passive

Description:

*TRACE AtmIf/n Aini AtmPathTraceTest*
*TRACE AtmIf/n Iisp AtmPathTraceTest*
*TRACE AtmIf/n Uni AtmPathTraceTest*
*TRACE AtmIf/n Pnni AtmPathTraceTest*
*TRACE AtmIf/n Vpt/vpi Aini AtmPathTraceTest*
*TRACE AtmIf/n Vpt/vpi Iisp AtmPathTraceTest*
*TRACE AtmIf/n Vpt/vpi Uni AtmPathTraceTest*
*TRACE AtmIf/n Vpt/vpi Pnni AtmPathTraceTest*

This command is used to initiate a Path Trace Test Connection and then responds with a list of logical nodes and ports from the trace source node to the trace destination node.

Only one *Trace* command is allowed at a time per signaling interface. If the test connection times out, the command fails.

## GROUP AtmIf Pnni Ptt Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *AtmPathTraceTest* component.

## ATTRIBUTE AtmIf Pnni Ptt traceCrankback

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute controls what trace information the trace records include. If the option is turned on, all attempted paths are recorded including the final one. If the option is turned off, only the information of the final path is recorded. If the connection fails to reached the destination, no path information is returned. |
| Values | no<br>yes |
| Default | no |

## ATTRIBUTE AtmIf Pnni Ptt txTrafficDescType (txTdt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the type of traffic management applied to the transmit direction, as defined by the ATM Forum. The *txTrafficDescType* determines the number and meaning of the parameters in the *txTrafficDescParm* attribute. |
| Values | 1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9 |
| Default | 1 |

## ATTRIBUTE AtmIf Pnni Ptt rxTrafficDescType (rxTdt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the type of traffic management, which is applied to the receive direction of this connection, as defined in |

the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute

When ***sameAsTx*** is selected, the *rxTrafficDescType* and the *rxTrafficDescParm* are taken from the transmit values.

Values
1
2
3
4
5
6
7
8
9
sameAsTx

Default
sameAsTx

## ATTRIBUTE AtmIf Pnni Ptt atmServiceCategory (service)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the ATM service category for both directions of the connection.

If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection.

If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used.

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications.

The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS.

The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.

Values
unspecifiedBitRate (ubr)
constantBitRate (cbr)
rtVariableBitRate (rtvbr)
nrtVariableBitRate (nrtvbr)
derivedFromBBC (derived)

Default
unspecifiedBitRate

## ATTRIBUTE AtmIf Pnni Ptt fwdQosClass (fwdQos)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the quality of service for the forward direction for this connection.

Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video).

Class ***2*** supports a QOS that will meet Service Class B

performance requirements (variable bit rate audio and video).

Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer).

Class ***4*** supports a QOS that will meet Service Class D performance requirements (connectionless data transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values
0
1
2
3
4

Default
0

## ATTRIBUTE AtmIf Pnni Ptt bwdQosClass (bwdQos)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the quality of service for the backward direction for this connection.

Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video).

Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video).

Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer).

Class ***4*** supports a QOS that will meet Service Class D performance requirements (connectionless data transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is

specified for the performance parameters.

The ***sameAsFwd*** selection sets the backward quality of service to be the same as the forward quality of service.

Values
0
1
2
3
4
sameAsFwd

Default
sameAsFwd

## ATTRIBUTE AtmIf Pnni Ptt bearerClassBbc (bcBbc)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an

ATM only service. The network inter-working function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocols.

Values
a
c
x
derivedFromServiceCategory

Default
derivedFromServiceCategory

### ATTRIBUTE AtmIf Pnni Ptt transferCapabilityBbc (tcBbc)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the transfer capability for this connection. UNI 3.0/3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
***0***: NoIndication, NoIndication
***1***: NoIndication, yes
***2***: NoIndication, no
***5***: CBR, yes
***8***: VBR, NoIndication
***9***: VBR, yes
***10***: VBR, no

***NotApplicable*** specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to the traffic offered on services such

as packetized audio and video, or data.

The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing.

The value ***yes*** for end-to-end timing indicates that end-to-end timing is required.

The value ***no*** for end-to-end timing indicates that end-to-end timing is not required.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory.* Either, this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

## ATTRIBUTE AtmIf Pnni Ptt clippingBbc (cBbc)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the value for the clipping susceptibility parameter in the BBC IE. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability attributes.

Clipping is an impairment where the first fraction of a second of information to be transferred is lost. It occurs after a call is

answered and before an associated connection is switched through.

Values
no
yes

Default
no

## ATTRIBUTE AtmIf Pnni Ptt bestEffort

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the value of the best effort parameter in the ATM Traffic Descriptor IE. It is one of the Broadband Bearer Capability attributes.

The value ***indicated*** implies that the quality of service for this connection is not guaranteed.

The value ***notIndicated*** implies that the quality of service for this connection is guaranteed.

The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection, is derived from the value of the *atmServiceCategory.* Either this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Values
indicated
notIndicated
derivedFromServiceCategory (derived)

Default
derivedFromServiceCategory

## ATTRIBUTE AtmIf Pnni Ptt testCalledAddress

Access

### ATTRIBUTE AtmIf Pnni Ptt txTrafficDescParm (txTdp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled.<br><br>When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero.<br><br>When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.<br><br>When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR |

for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and

parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

Vector of: Decimal (0..2147483647)

Index: Decimal (1..5)

Default: ([5] 0)

## ATTRIBUTE AtmIf Pnni Ptt rxTrafficDescParm (rxTdp)

Access: Read: All
Write: All

Description: This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The

values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in
cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC).

When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused).

When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused).

When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for

CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

### GROUP AtmIf Pnni Reroute LocalOperational (LOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the local rerouting activities at the interface level. |

### ATTRIBUTE AtmIf Pnni Reroute localSubscribedConnections (lsub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that are subscribed to one or more local rerouting capabilities. Note that a given connection segment is subscribed to either local rerouting capabilities capabilities, not both. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Reroute localEligibleRecoveredCon (lerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered using local rerouting and are eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Reroute localIneligibleRecoveredCon (lirc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered by local rerouting but are not eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Reroute localLastRrCauseCode (lrrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last local rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni Reroute localPathsOptimized (lPathsOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the paths that were successfully optimized by local rerouting or EBR during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP AtmIf Pnni Reroute GlobalOperational (GOper)

| | |

ebrOnly
sameAsARtgPnniReroute (sameAs)

Default
sameAsARtgPnniReroute

## ATTRIBUTE AtmIf Pnni Reroute Ov numOptAttempts

Access
Read and write

Description
This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Values
Decimal (0..15)
sameAsARtgPnniReroute (sameAs)

Default
sameAs

## ATTRIBUTE AtmIf Pnni Reroute Ov moduleOptimizationConnections

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni Reroute* component.<br><br>One of the following values can be specified:<br>***sameAsARtgPnniReroute***: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute.<br>***none***: No connection segments are considered for path optimization.<br>***recoveredOnly***: Only connection segments which are foration. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection<br>***allSubscribed***: All connection segments subscribed to path optimization are considered. |

## GROUP AtmIf Pnni Reroute Ov LocalProvisioned (LProv)

Properties
Provisioned

Description
This group contains the provisionable attributes for EBR and local rerouting protocols.

## ATTRIBUTE AtmIf Pnni Reroute Ov localConnectionRecoverySubscr (lConRec)

Access
Read and write

Description
This attribute specifies which connection segments on the interface request subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local connection recovery.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local connection recovery and EBR connection recovery. Only one will be granted.

One or more of the following values can be specified:
***sameAsARtgPnniReroute:*** If this value is set, the local connection recovery subscription rule is determined by the *ARtg Pnni Reroute localConnectionRecoverySubscr* attribute. This value takes precedence over any other values.
***svcSvp***: If this value is set, all SVC and SVP connection segments request subscription to local connection recovery.
***sourceSpvcSpvp***: If this value is set, all source SPVC and SPVP

connection segments request subscription to local connection recovery.
***transitSpvcSpvp***: If this value is set, all transit SPVC and SPVP connection segments request subscription to local connection recovery.

Set of: sameAsARtgPnniReroute (sameAs)
svc
sourceSpvcSpvp (source)
transitSpvcSpvp (transit)

Default: (sameAsARtgPnniReroute)

## ATTRIBUTE AtmIf Pnni Reroute Ov localPathOptimizationSubscr (lPathOpt)

Access: Read and write

Description: This attribute specifies which connection segments on the interface request subscription to local path optimization. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local path optimization.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local path optimization and EBR path optimization. Only one will be granted.

One or more of the following values can be specified:
***sameAsARtgPnniReroute***: If this value is set, the local path optimization subscription rule is determined by the *ARtg Pnni Reroute localPathOptimizationSubscr* attribute. This setting takes precedence over the any other values.
***svcSvp***: If this value is set, then all SVC and SVP connection segments request subscription to local path optimization.
***sourceSpvcSpvp***: If this value is set, then all source SPVC and SPVP connection segments request subscription to local path optimization.
***transitSpvcSpvp***: If this value is set, then all transit SPVC and

SPVP connection segments request subscription to local path optimization.

Set of
sameAsARtgPnniReroute (sameAs)
svc
sourceSpvcSpvp (source)
transitSpvcSpvp (transit)

Default (sameAsARtgPnniReroute)

## GROUP AtmIf Pnni Reroute Ov GlobalProvisioned (GProv)

Properties Provisioned

Description This group contains the provisionable attributes for the global and EBR rerouting protocol.

## ATTRIBUTE AtmIf Pnni Reroute Ov globalConnectionRecoverySubscr (gConRec)

Access Read and write

Description This attribute specifies which connection segments on the interface request subscription to global or EBR connection recovery. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute affects connection segments for a node that is a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***globalOnly*** protocols request subscription to global connection recovery.

Connection segments of the specified type(s) which request ***ebrOnly*** request subscription to EBR connection recovery.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to both local connection recovery and EBR connection recovery. Only one will be granted.

One or more of the following values can be specified:
***sameAsARtgPnniReroute***: If this value is set, the global or EBR connection recovery subscription rule is determined by the *ARtg Pnni Reroute globalConnectionRecoverySubscr* attribute.This setting takes precedence over any other values.
***svcSvp***: If this value is set, then all SVC and SVP connection

segments request subscription to global or EBR connection recovery.
***sourceSpvcSpvp***: If this value is set, then all source SPVC and SPVP connection segments request subscription to global or EBR connection recovery.
***transitSpvcSpvp***: If this value is set, then all transit SPVC and SPVP connection segments request subscription to global or EBR connection recovery.

## COMPONENT AtmIf Pnni ServiceTrace (SrvTrace)

Groups
"GROUP AtmIf Pnni SrvTrace Operational"

Scope
Application

Description
*AtmIf/n [Vpt/m] Uni ServiceTrace*
*AtmIf/n [Vpt/m] Iisp ServiceTrace*
*AtmIf/n [Vpt/m] Pnni ServiceTrace*
*AtmIf/n [Vpt/m] Aini ServiceTrace*
The *ServiceTrace* component of the ATM service determines if the trace capability is allowed on this service. If it is not provisioned, then a service trace session cannot be started on this service.

Currently, the ATM Trace features only support ***frAtmTraceRcvr*** and ***atmTraceRcvr*** features, if the name of a X25 or FR receiver is set to the *receiver* attribute of this component, the *Start* command responses with a “Receiver Not Supported” message.

### GROUP AtmIf Pnni SrvTrace Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *SrvTrace* component. |

### ATTRIBUTE AtmIf Pnni SrvTrace receiverName (rcvr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started. |
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE AtmIf Pnni SrvTrace duration

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active. |
| Values | Decimal (0..9999) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE AtmIf Pnni SrvTrace queueLimit

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately. |
| Values | Decimal (1..100) |
| Units | Kbyte |
| Default | 20 |

### ATTRIBUTE AtmIf Pnni SrvTrace session

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active. |
| Values | The name of the component |
| Default | No default |

### GROUP AtmMpe CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE AtmMpe customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of |

| | |
|---|---|
| | any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP AtmMpe IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE AtmMpe ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE AtmMpe ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP AtmMpe Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisioned attributes for the *AtmMpe* component. |

### ATTRIBUTE AtmMpe maxTransmissionUnit (mtu)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute sets the size of the largest datagram which can be sent on the interface. This includes the size of the Logical Link Control header (if applicable) as well as the protocol data unit. |
| Values | Decimal (256..9188) |
| Units | octets |
| Default | 9188 |

### ATTRIBUTE AtmMpe encapType (etype)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the RFC-1483 encapsulation type to be used for the *AtmConnections* under this *AtmMpe*.<br><br>Specifying ***llcEncap*** allows multiplexing of multiple protocols over the *VCCs*. The protocol of the carried PDU will be identified by an IEEE 802.2 Logical Link Control header. If Inverse ARP is to be carried over a VCC, ***llcEncap*** must be used. If the *Stp* component exists under the *AtmMpe*, ***llcEncap*** must be used.<br><br>Specifying ***ipVcEncap*** indicates that all the VCCs (that is, *AtmConnection*s) under an *AtmMpe* component will use VC-based multiplexing and will carry IP PDUs only.<br><br>Specifying ***llcBridgeEncap*** indicates that the VCC (that is, the *AtmConnection*) under an *AtmMpe* component will use the bridged Ethernet encapsulation format specified in RFC-1483. Note that when setting the *encapType* attribute to ***llcBridgeEncap***, the *maxTransmissionUnit* must be set within the ***[256 .. 1524]*** range. |

| | |
|---|---|
| Values | llcEncap<br>ipVcEncap<br>llcBridgeEncap |
| Default | llcEncap |

### ATTRIBUTE AtmMpe ilsForwarder

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *IlsForwarder* component this *AtmMpe* component is using. |
| Values | Link (Service, linkToTrafficSource) |
| Default | No default |

### GROUP AtmMpe MediaProvisioned (MediaProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *AtmMpe* component.<br>// This group is excluded from the InwRtrAtmMpe component. |

### ATTRIBUTE AtmMpe linkToProtocolPort

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains a protocol port component name. The attribute associates an *AtmMpe* application with a protocol port. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP AtmMpe OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state |

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE AtmMpe adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE AtmMpe operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available

for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE AtmMpe usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP AtmMpe OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE AtmMpe snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable

to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

## COMPONENT AtmMpe AtmConnection (Ac)

Instance
Decimal (1..255)

Groups
"GROUP AtmMpe Ac Provisioned (Prov)"
"GROUP AtmMpe Ac OsiState (State)"
"GROUP AtmMpe Ac Operational (Oper)"
"GROUP AtmMpe Ac Statistics (Stats)"
"GROUP AtmMpe Ac IpIfLink"

Scope
Application

Description
*AtmMpe/n AtmConnection/n*
*Rtr/<string> Interface/<ipaddr> AtmMpe AtmConnection/n*
This component represents a virtual channel through which internetworking frames will be transported using rfc1483 encapsulation. The *AtmConnection* component contains OSI state information, frame based statistics, and the linkage to an ATM virtual channel connection. This component's instance value is used by higher-layer protocols when referring to a specific ATM connection.

## GROUP AtmMpe Ac Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *AtmConnection* component. |

## ATTRIBUTE AtmMpe Ac atmConnection (link)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ATM nailed up endpoint, *AtmIf/n Vcc/vpi.vci Nep*, that this connection is associated with. It must not be provisioned for an SPVC connection. |
| Values | Link (Service, applicationName) |
| Default | No default |

## ATTRIBUTE AtmMpe Ac ipCos

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP connection class of the *AtmConnection*. This value is used to distinguish the connection from others for the purpose of IP forwarding and IP accounting. IP connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between IP routers.<br><br>If an IP packet is forwarded to a *ProtocolPort* or *Interface* configured to use more than one *AtmConnection*, then one of the connections is selected for transmitting the packet. The selection is made according to the connection class assigned to the packet.<br><br>An explanation of how an IP packet is assigned a connection class is found in the description of the *connectionClass* operational attribute of the *DifferentiatedServicesDomain PerHopBehavior* component, and in the description of *Vr Ip CosPolicyGroup* component. |

Modifying this attribute will reset the *AtmConnection*.

The remainder of this description applies only to an *AtmConnection* used by a *VirtualRouter ProtocolPort* and not to an *AtmConnection* used by a *Router Interface* or *VpnRouteForwarder Interface* component.

If the d*iffServAssignment* attribute of either the *Ip* or *IpPort* is set, then *ipCos* and *ipDscp* are codependent. The *ipCos* value must be equal to the *connectionClass* value of the *Virtual Router DiffServDomain PerHopBehavior* subcomponent whose instance value is equal to the *ipDscp* value. See the description of the *ipDscp* attribute for more information.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial CoS value assigned to an IP packet received on the *AtmConnection*. See the description of *Vr Ip CosPolicyGroup* for more information.

Values: Decimal (0..3)

Default: 0

## ATTRIBUTE AtmMpe Ac ipDscp

Access: Read and write

Criticality: Component

Description: This attribute specifies the value marked into the Differentiated Services Code Point (DSCP) field of an IP packet received at an *IpPort* over the *AtmConnection*. This DSCP marking is applied only if one of the following conditions is true:

1) the *IpPort* is linked by its *diffServAssignment* attribute to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, or

2) the *Ip* is linked by its *diffServAssignment* attribute to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode*

attribute of the *IngressServices* subcomponent is set to ***link***, and the *IpPort* does not have the *diffServAssignment* attribute set.

If one of theseconditions is true, then the *ipDscp* value must match a *Virtual Router DifferentiatedServicesDomain PerHopBehavior* subcomponent instance value. See the description of *Vr Ip DifferentiatedServices* interface configuration for more information.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipDscp* must be set to ***na***.

This attribute is not applicable to an *AtmConnection* associated with a *Router Interface* or *VpnRouteForwarder Interface* component.

Modifying this attribute will reset the *AtmConnection*.

### ATTRIBUTE AtmMpe Ac mplsSignaling (mplsSig)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies whether this AtmMpe Ac is dedicated for MPLS signaling (LDP or CR-LDP), or shared between MPLS and IP.<br>If the value is ***dedicated***, the *Ac* is dedicated for MPLS signaling; the route is not found in IP ARP. If the value is ***shared***, the *Ac* is accessible by IP.<br>The checking of this provisionable attribute is done through semantic checking. The attribute takes on the value ***shared*** by default, and can only be ***dedicated*** if there are more than one *Ac* under the *AtmMpe*. |
| Values | shared<br>dedicated |
| Default | shared |

### GROUP AtmMpe Ac OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE AtmMpe Ac adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component. |

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE AtmMpe Ac operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

## ATTRIBUTE AtmMpe Ac usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP AtmMpe Ac Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *AtmConnection* component. |

## ATTRIBUTE AtmMpe Ac speed

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the approximate bit rate for the connection. The bit rate is determined from the cell rate provisioned for the *Vcc* linked to this connection. The cell rate is multiplied by 53 bytes per cell and 8 bits per byte to obtain the bit rate. The *ifSpeed* of the entry in the ifTable corresponding to the *AtmMpe* component is the lowest speed of all the connections associated with the *AtmMpe* component.<br><br>This attribute is always equal to 0 for an SPVC. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |

| | |
|---|---|
| Default | No default |

### GROUP AtmMpe Ac Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the frame based statistics maintained for the *AtmConnection* component. For cell based statistics, see the *Vcc* component. |

### ATTRIBUTE AtmMpe Ac outPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets sent on this connection. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmMpe Ac outOctets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of octets sent on this connection. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmMpe Ac outDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets which were supposed to be sent on this connection but were discarded due to congestion or the connection being down. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmMpe Ac inPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets received on this connection. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmMpe Ac inOctets

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the total number of octets received on this connection. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmMpe Ac inUnknownProtos

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets received on this connection which were discarded because they contained an unknown or unsupported protocol (includes packets received for protocols not currently bound to the associated *ProtocolPort* component). This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE AtmMpe Ac inErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets received on the connection which contained errors preventing them from being delivered to a higher-layer protocol (includes short frames). This |

counter will wrap around to 0 when it exceeds its maximum count.

Values: Decimal (0..4294967295)

Default: No default

### GROUP AtmMpe Ac IpIfLink

Properties: Provisioned

Description: This group contains the link between this component and an *IpLogicalInterface*.

### ATTRIBUTE AtmMpe Ac linkToIpLogicalInterface (ipIf)

Access: Read and write

Description:

// Description to be changed... This attribute is check for Rtr and // Vrf to ensure it is blank.
This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ipAddress*, that this connection is associated with.

When set, the value of this attribute must be consistent with the *linkToPrototocolPort* attribute value of the parent *AtmMpe* component. That is, they must both point to the same *PrototocolPort* component.

Values: Link (Service, linkToMediaConnection)

Default: No default

### COMPONENT AtmMpe Ac SourcePvc (SrcPvc)

Groups: "GROUP AtmMpe Ac SrcPvc Provisioned (Prov)"
"GROUP AtmMpe Ac SrcPvc Operational (Oper)"

Scope: Application

Description: *AtmMpe/n AtmConnection/m SrcPvc*
This component contains addressing and control information used by the calling SPVC endpoint to set up an SPVC connection

to a remote called SPVC endpoint. An *Stp* component must exist under the *Ac* component if a *SrcPvc* component exists.

Subcomponents "COMPONENT AtmMpe Ac SrcPvc TrafficManagement (Tm)"

Common Verbs

DELete

### VERB Clear (Clr) AtmMpe Ac SrcPvc

Impact Service

Description *Clear AtmMpe/n Ac/m SrcPvc*
This command tears down the active SPVC connection under the *Ac* component. Each '*softPvcRetryPeriod*' the SPVC will attempt to re-establish.

If there is no active SPVC, the clear command has no effect.

### GROUP AtmMpe Ac SrcPvc Provisioned (Prov)

Properties Provisioned

Description This attribute group contains the provisionable attributes of the *SourcePvc* component.

### ATTRIBUTE AtmMpe Ac SrcPvc remoteAddress (raddr)

Access Read: All
Write: All

Criticality Component

Description This attribute specifies the NSAP address of the called SPVC endpoint (this must be a remote *AtmMpe* component).

Values String (20, Hex)

Default No default

### ATTRIBUTE AtmMpe Ac SrcPvc remoteConnectionIdentifier (rci)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the remote connection identifier of the SPVC. It is provisioned with the *Ac* instance of the *AtmMpe Ac* component at the called SPVC endpoint. |
| Values | Decimal (1..255) |
| Default | 1 |

### GROUP AtmMpe Ac SrcPvc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes associated with the *SrvPvc* component. |

### ATTRIBUTE AtmMpe Ac SrcPvc state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the status of the connection. |
| Values | active<br>inactive |
| Default | No default |

### ATTRIBUTE AtmMpe Ac SrcPvc retryCount (retry)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of failed connection attempts. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE AtmMpe Ac SrcPvc lastClearCause (cause)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the last clear cause signalled by the connection due to a release. It is updated only if the clear request comes from the subnet or the call is rejected locally by the VC.<br><br>The set of possible values and their meaning can be found in the ATM Forum Private Network-Network Interface Specification Version 1.0, Section 6.4.5.19. |
| Values | Decimal (0..255) |
| Default | No default |

## COMPONENT AtmMpe Ac SrcPvc TrafficManagement (Tm)

| | |
|---|---|
| Groups | "GROUP AtmMpe Ac SrcPvc Tm Provisioned (Prov)" |
| Scope | Application |
| Description | *AtmMpe/n AtmConnection/m SrcPvc Tm*<br>This component contains ATM QoS information used by the calling endpoint of an SPVC connection to request a particular QoS from ATM. |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## GROUP AtmMpe Ac SrcPvc Tm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the provisionable attributes of the *TrafficManagement* component. |

### ATTRIBUTE AtmMpe Ac SrcPvc Tm atmServiceCategory (service)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the desired ATM service category for this connection. |
| Values | unspecifiedBitRate (ubr)<br>rtVariableBitRate (rtvbr)<br>nrtVariableBitRate (nrtvbr)<br>constantBitRate (cbr) |
| Default | unspecifiedBitRate |

### ATTRIBUTE AtmMpe Ac SrcPvc Tm peakCellRate (pcr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the desired peak cell rate (PCR) in both directions for this connection. Refer to NTP 241-5701-705 for more information on ATM Traffic Management. |
| Values | Decimal (0..2147483647) |
| Default | 0 |

### COMPONENT AtmMpe Ac DestinationPvc (DstPvc)

| | |
|---|---|
| Groups | "GROUP AtmMpe Ac DstPvc Operational (Oper)" |
| Scope | Application |
| Description | *AtmMpe/n AtmConnection/m DstPvc*<br>The *DestinationPvc* component represents the called endpoint of an SPVC connection. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### VERB Clear (Clr) AtmMpe Ac DstPvc

| | |
|---|---|
| Impact | Service |
| Description | *Clear AtmMpe/n Ac/m DstPvc*<br>This command tears down the active SPVC connection under the *Ac* component. Each '*softPvcRetryPeriod*' the SPVC will attempt to re-establish.<br><br>If there is no active SPVC, the clear command has no effect. |

### GROUP AtmMpe Ac DstPvc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *DstPvc* component. |

### ATTRIBUTE AtmMpe Ac DstPvc state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the status of the connection. |
| Values | active<br>inactive |
| Default | No default |

### ATTRIBUTE AtmMpe Ac DstPvc remoteAddress (raddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the NSAP address of the remote (calling) endpoint. If a connection is not established, *remoteAddress* is an ***empty string***. |
| Values | String (0..20, Hex) |
| Default | "" |

### ATTRIBUTE AtmMpe Ac DstPvc remoteConnectionIdentifier (rci)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the remote connection idenditifier of the remote (calling) SPVC endpoint (that is, the *Ac* instance of the remote *AtmMpe Ac* component). If the connection is not established, the *remoteConnectionIdentifier* is an ***empty string***. |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE AtmMpe Ac DstPvc lastClearCause (cause)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the last clear cause signalled by the connection due to a release. It is updated only if the clear request comes from the subnet or the call is rejected locally by the VC.<br><br>The set of possible values and their meaning can be found in the ATM Forum Private Network-Network Interface Specification Version 1.0, Section 6.4.5.19. |
| Values | Decimal (0..255) |
| Default | No default |

### COMPONENT AtmMpe Ac AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP AtmMpe Ac AtmCon Operational (Oper)" |
| Scope | Device |

| | |
|---|---|
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP AtmMpe Ac AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE AtmMpe Ac AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

### COMPONENT AtmMpe SpvcTerminationPoint (Stp)

| | |
|---|---|
| Groups | "GROUP AtmMpe Stp Provisioned (Prov)"<br>"GROUP AtmMpe Stp Operational (Oper)" |
| Scope | Application |
| Description | *AtmMpe/n SpvcTerminationPoint*<br>This component specifies the local NSAP address and the *softPvcRetryPeriod* for this application. Its presence identifies an *AtmMpe* component that contains one or more SPVC connections. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP AtmMpe Stp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the provisionable attributes of the *SpvcTerminationPoint* component. |

## ATTRIBUTE AtmMpe Stp localAddress (laddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the NSAP address of this *AtmMpe* component. The default is an empty string. If no NSAP address is provisioned, a default NSAP address is provided. To view the generated default address refer to the *opLocalAddress* attribute under this component after the *act prov* command is excuted. |
| Values | String (0..20, Hex) |
| Default | No default |

## ATTRIBUTE AtmMpe Stp softPvcRetryPeriod (retry)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the interval at which an SPVC connection attempts re-establishment after a failure. The *softPvcRetryPeriod* applies to all connections managed by the parent *AtmMpe* component. |
| Values | Decimal (10..3600) |

| | |
|---|---|
| Units | seconds |
| Default | 20 |

## GROUP AtmMpe Stp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes associated with the *SpvcTerminationPoint* component. |

## ATTRIBUTE AtmMpe Stp opLocalAddress (addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the NSAP address of this *AtmMpe* component. The value is the same as the provisioned *laddr*. If the *laddr* is not provisioned, the value of *addr* is automatically generated by the software. |
| Values | String (0..20, Hex) |
| Default | "" |

## GROUP Btds CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE Btds customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. |

| | |
|---|---|
| | An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Btds IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Btds ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Btds ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Btds OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Btds snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Btds OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Btds adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Btds operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

## ATTRIBUTE Btds usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Btds availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Btds proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Btds controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

| | |
|---|---|
| | The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Btds alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. |

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Btds standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Btds unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Btds Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes related to a *Btds*. |

### ATTRIBUTE Btds serviceFailureReason

| | |
|---|---|
| Access | Read: Passive<br>Write: Illegal |
| Description | This attribute indicates the result of end to end negotiation with the remote end across the subnet.<br><br>If *serviceFailureReason* is ***undetermined***, this *Btds* has not performed end to end negotiation with the remote end, and may or may not be up. *serviceFailureReason* is ***undetermined*** if this *Btds* just became enabled, if there is not enough available bandwidth to perform negotiation or if the remote end cannot perform negotiation with this *Btds*.<br>If *serviceFailureReason* is ***none***, end to end negotiation passed.<br>If *serviceFailureReason* is ***mismatchedService***, end to end negotiation failed because the remote end service is not a *Btds*.<br>If *serviceFailureReason* is ***mismatchedTimeSlotAlignment***, end |

to end negotiation failed because the local *Btds Framer timeSlotAlignment* does not match the remote *Btds Framer timeSlotAlignment*.
If *serviceFailureReason* is ***mismatchedCallDiscriminator***, the local *Btds* call discrimination subcomponents (*Btds Mcdn* and *Btds Dpnss1*) do not match the remote *Btds* call discrimination subcomponents.
If *serviceFailureReason* is ***compDecodeFailed***, end to end negotiation failed because the information received from the remote end was not recognized as valid data.

## COMPONENT Btds Framer (Framer)

Groups
"GROUP Btds Framer Provisioned (Prov)"
"GROUP Btds Framer ChannelOptions (Channel)"
"GROUP Btds Framer OsiState (State)"
"GROUP Btds Framer Statistics (Stats)"

"COLLECTED STATS BitTransparentDataService Framer"

Scope
Application

Description
*Btds/n Framer*
The Framer component controls link layer framing for application components sending and receiving data on a link interface. It is also through Framer, that an application component is associated with a specific hardware link interface.

The Framer component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes which are associated with specific hardware components (such as V35/n or DS1/n). The Framer component also provides a provisionable attribute which binds the

application component to a specific hardware component. The Framer component contains operational attributes for link interface datapath statistics (such as frame counts).

Display

## GROUP Btds Framer Provisioned (Prov)

Properties: Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE Btds Framer interfaceName

Access: Read and write

Criticality: Process

Description

This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values: Link (Hardware, applicationFramerName)

Default: No default

## GROUP Btds Framer ChannelOptions (Channel)

Properties: Provisioned

Description: This group contains attributes defining the framing of data on the link interface or n*64kbps channel.

### ATTRIBUTE Btds Framer protocol

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the ingress frames suppressed by this *Btds*.<br>If *protocol* is ***none***, this *Btds* does not suppress any ingress frames.<br>If *protocol* is ***hdlc***, this *Btds* suppresses ingress frames where each byte is an identical non-inverted hdlc idle pattern, but only after two or more consecutive frames meet this description.<br>If *protocol* is ***nrziHdlc***, this *Btds* suppresses ingress frames where each byte is an identical NRZI encoded hdlc idle pattern, but only after two or more consecutive frames meet this description.<br>If *protocol* is ***universal***, this *Btds* suppresses ingress frames where each 16-bit word is identical, but only after a provisionable number of consecutive frames meet this description. The number of consecutive frames is determined by *numOfIdleBytesToMonitor*.<br>Note that the number of idle bytes suppressed at the ingress side does not necessarily equal the number of idle bytes generated at the egress side.<br><br>It is a semantic check warning if *protocol* is ***hdlc***, ***nrziHdlc*** or ***universal*** and this *Btds* is running on a ***1pE1Mvp***, ***1pDS1Mvp*** or ***1pTTC2mMvp*** card. |
| Values | none<br>hdlc<br>nrziHdlc<br>universal |
| Default | none |

### ATTRIBUTE Btds Framer numOfIdleBytesToMonitor

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of consecutive repeated ingress 16-bit words this *Btds* must encounter before suppressing |

| | |
|---|---|
| | universal ingress idle frames. This attribute is only used if *protocol* is ***universal***. *numOfIdleBytesToMonitor* should be larger than the largest frame size that can be sent into this *Btds*. |
| Values | Decimal (0..32000) |
| Default | 0 |

### ATTRIBUTE Btds Framer idlePattern

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies how to fill a local egress frame when the remote *Btds* suppressed an ingress frame. |
| Values | Hex (H.0..H.ff) |
| Units | Hex |
| Default | H.ff |

### ATTRIBUTE Btds Framer timeSlotAlignment (tsa)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the time slot alignment of this *Btds*. With time slot alignment, data sent out on a particular time slot to a link is received on the same time slot. A value of unaligned specifies the regular Btds application. A value of frameAligned enables frame aligned Btds. When framed aligned Btds is specified, only one channel may be provisioned since only one fraction of N x 64 kbit/s is presently available.<br><br>timeSlotAlignment can not be set to frameAligned unless this Btds is running on a ***DS1V***, ***E1V***, ***1pDS1V*** or ***1pE1V*** card *timeSlotAlignment* must have the same value at both ends of a *Btds*. If *timeSlotAlignment* does not have the same value at both ends of a *Btds*, the *Btds* will be out of service. In this case, *Btds serviceFailureReason* is ***mismatchedTimeSlotAlignment***. |

| | |
|---|---|
| Values | unaligned<br>frameAligned |
| Default | unaligned |

### ATTRIBUTE Btds Framer insertedOutputDelay

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute defines the amount of added output delay to compensate for cross network delay variations. Cross network delay variations is a function of the network topology. Setting this attribute will allow the Btds service to deal with cross network delay variations.<br>This attribute provides for delay in addition to the elastic buffer. Total egress delay is approximately the insertedOutputDelay plus the elastic buffer. The elastic buffer is the packetization timex5 cells in the buffer. Packetization time per cell is calculated by taking the inverse of [linespeed(kbits/sec) x (byte/8bits) x (1/cellsize (bytes))]. This value is msec.The value for insertedOutputDelay should be increased if the frmUnderRuns is increasing and frmLostInNetwork is not increasing. |
| Values | Decimal (0..50) |
| Units | msec |
| Default | 12 |

### ATTRIBUTE Btds Framer btdsCellSize

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute allows selection of larger BTDS cell sizes. Larger BTDS cell sizes improve efficiency but increase the minimum egress queue delay. If the associated channel is using less than 5 *timeslots* (320 kbits/sec), the default *btdsCellSize* will be used. Setting *btdsCellSize* to **84** is only allowed on DS1 and E1 FPs. |
| Values | 44<br>84 |

| | |
|---|---|
| Units | bytes |
| Default | 44 |

### GROUP Btds Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Btds Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Btds Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Btds Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Btds Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a Framer component. |

## ATTRIBUTE Btds Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the link interface by Framer.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Btds Framer suppressedFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames dropped at the interface due to the idle pattern being detected.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Btds Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted to the link interface by Framer.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Btds Framer lrcErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames received from the network with LRC errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Framer frmLostInNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which the service knows it did not receive from the network although they were sent in to the network from the far end.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Framer frmUnderRuns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that a frame was needed but was not available because it had been delayed too long in the network.<br>This error may occur repeatedly if the interface clocks at the two access points to the network are operating at different rates.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Framer frmDumped

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which have been dumped because the local interface output queue grew too large. This can occur if the clock rate on the local interface is faster than the clock rate on the remote interface and there are no silence periods to absorb the difference.<br>This count wraps to zero after reaching its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COLLECTED STATS BitTransparentDataService Framer

| | |
|---|---|
| Description | The statistics record generated by the BitTransparentDataService Framer component. |

### ATTRIBUTE Btds Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Btds Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Btds Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE Btds Framer txFrames

| | |
|---|---|
| Description | This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE Btds Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |

| | |
|---|---|
| Values | Decimal (0..100) |

### COMPONENT Btds PermanentLogicalConnection (Plc)

| | |
|---|---|
| Groups | "GROUP Btds Plc Provisioning (Prov)" |
| Scope | Application |
| Description | *Btds/n PLC*<br>This is the description of the PLC Component for the Btds service.. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Btds Plc Provisioning (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all provisionable attributes for a permanent logical connection. Note that all of the attributes are valid and provisionable on both ends of a connection. However with the exception of *remoteName*, all operational attributes are derived from the originating end provisioning, which may be either end unless *remoteName* is not provisioned on one end. |

### ATTRIBUTE Btds Plc remoteName (rName)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s remote end point's address in the format of a Passport component name. The syntax of a component is:<br>"em/node type/instance". For an alternative representation of end point's addresses, see *addressToCall* and l*ocalAddress PLC* attributes. When using Passport component name representation, end points are identified using a node name and a service name. As an example, the end point component for a third Btds service on node MoonBase is: "*EM/MoonBase BTDS/3*". If the *remoteName* is provisioned, it must match the name of the remote end or the connection will not be established even if the remote |

| | |
|---|---|
| | end is provisioned correctly. If no *remoteName* is provisioned, then this *LC* will accept connections from any other remote *LC* and it will not originate calls. Connections establish faster and are unique if both ends are provisioned with *remoteName*. *RemoteName* should be used when the remote end of the connection resides within the same topology region. If it resides in a different topology region, then *addressToCall* and *localAddress PLC* attributes should be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*.<br>These strings are case insensitive, but the complete component name must be input. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Btds Plc setupPriority (spri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | 2 |

### ATTRIBUTE Btds Plc holdingPriority (hpri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute gives the priority that a path holds once it is established. Zero(0) is the highest priority and four(4) is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | 2 |

### ATTRIBUTE Btds Plc requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the bandwidth (in bits per second) reserved by a path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that Transmit at this end represents Receive at the remote end. Note that when the values do not correspond the originating end of the connection determines the value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE Btds Plc requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the bandwidth (in bits per second) reserved by a path on each of trunks of its route. This attribute represents |

| | |
|---|---|
| | the bandwidth for traffic incoming from the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE Btds Plc requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the type of traffic transmitted over the path. There are eight(8) possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five(5) other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType****,*** will be candidates for this connection. |
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3) |

| | |
|---|---|
| | trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | video |

### ATTRIBUTE Btds Plc permittedTrunkTypes (pttyp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute lists up to eight(8) types of trunk that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six(6) remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | (terrestrial, satellite, trunkType1, trunkType2, trunkType3) |

### ATTRIBUTE Btds Plc requiredSecurity (rsec)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.* |

| | |
|---|---|
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Btds Plc requiredCustomerParm (rcparm)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the allowed customer defined parameter of the trunks on the route. Its value, a number from zero to seven, is chosen by network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path. |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Btds Plc pathAttributeToMinimize (pamin)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a selected route is the sum of the trunk delay metric for all trunks included in the route. |
| Values | cost<br>delay |
| Default | cost |

### ATTRIBUTE Btds Plc maximumAcceptableCost (maxCost)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute indicates an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done for any minimization criterion. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*. |
| Values | Decimal (0..65535) |
| Default | 1280 |

### ATTRIBUTE Btds Plc maximumAcceptableDelay (maxDelay)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates an upper bound on the delay of a route, which is the sum of the delay of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512-byte packet. Remember, that the trunk during its staging measures a *measuredRoundTripDelay.* This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512-byte packet is used to perform the measurement.<br>If for any trunk the half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection.<br>While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay.* |
| Values | Decimal (0..100000) |

| | |
|---|---|
| Units | msec |
| Default | 100000 |

### ATTRIBUTE Btds Plc emissionPriority (epri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. *EmissionPriority* of Zero(0) indicates the highest emission priority, while two (2) indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher). |
| Values | Decimal (0..2) |
| Default | 0 |

### ATTRIBUTE Btds Plc discardPriority (dpri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the importance of the packets on the path. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority* (numerically) are discarded after packets with a higher *discardPriority* (numerically). |
| Values | Decimal (1..3) |
| Default | 1 |

### ATTRIBUTE Btds Plc pathType (pType)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies if the path for this PLC is determined automatically or by static provisioning. The default (***normal***) is to |

automatically choose a route with Route Selection. ***Normal*** *pathTypes* require less provisioning and can dynamically handle path failures. The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).
The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.

Values
normal
manual
forced

Default
normal

## ATTRIBUTE Btds Plc pathFailureAction (pfa)

Access
Read and write

Criticality
Process

Description
This attribute is used to specify whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

| | |
|---|---|
| | All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends. |
| Values | reRoutePath<br>disconnectConnection |
| Default | reRoutePath |

### ATTRIBUTE Btds Plc bumpPreference (bpref)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute controls when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *holdingPriority* in order to acquire its bandwidth and be established. By default, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. A connection may be set to always bump in order to find the best route it may have. |
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | bumpWhenNecessary |

### ATTRIBUTE Btds Plc optimization (opt)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval. |

| | |
|---|---|
| Values | disabled<br>enabled |
| Default | enabled |

### ATTRIBUTE Btds Plc addressToCall (addrToCall)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s remote end point's address in the format of a NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. For an alternative representation of end point's addresses, see *remoteName* attribute. If the *addressToCall* is provisioned, it must match *localAddress* provisioned on the remote end or the connection will not be established. Connections establish faster and are unique if both ends are provisioned with *addressToCall*. *AddressToCall* must be used when the remote end of the connection resides in different topology region. If it resides in the same topology region, then *remoteName* may be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Btds Plc localAddress (localAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s end point address in the format of an NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. *LocalAddress* must share a prefix with MOD nodePrefix or one of MOD alternatePorsPrefixes for this node, otherwise PORS will not be able to route calls to this service. *LocalAddress* is used in conjunction with *addressToCall*. That is, the end responsible for originating calls must have *addressToCall* provisioned, while the |

| | |
|---|---|
| | end responsible for terminating calls must have *localAddress* provisioned. In such a case, *addressToCall* on the originating end must match exactly the *localAddress* of the terminating end. Note that both ends may be originating and terminating at the same time. That is, both ends may have *addressToCall* and *localAddress* provisioned as long as *addressToCall* and *localAddress* on different ends are identical. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Btds Plc maximumAcceptableGatewayCost (maxGateCost)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates an upper bound on the gateway cost metric of a route, which is the sum of the gateway cost metrics of all gateway links on the route. It has the same semantics as the *maximumAcceptableCost* except that gateway cost metrics are used instead of trunk cost metrics. Gateway cost metrics are provisioned under *Trunk Address* component of a gateway link specifying a gateway costs of reaching an address through the link. |
| Values | Decimal (0..65535) |
| Default | 2048 |

### ATTRIBUTE Btds Plc manualPath (mpath)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is optional and specifies the sequence of trunks to be used as the route for the path, thus bypassing PORS' automatic route selection. If the path fails the validation, no other path can be selected[1]. This attribute should only be used in special cases since the route selection algorithm is able to find and maintain the best routes. A related path attribute, the *pathType*, determines if this route will be used as a manual or forced path type. |

As an example, the trunk component name for the third trunk on node MoonBase is "*EM/MoonBase Trk/3*". Note that only the first end of the trunk that the packet would encounter is provisioned. These strings are case insensitive but the complete component name must be input.

Note 1: the trunk designation must be a 3-letter form, e.g., 'trk'. Note 2: only the outbound trunks component names are used to provision the ***manualPath***.

Note 3: It is recommended to have two independent routes specified for a manual path by specifying a different ***manualPath*** (non-symmetric) for each end. In this case, there is no way to select which route will be used (first up wins) but if one path is torn down due to a failure then the other ***manualPath*** may be used to reroute the path.

| | |
|---|---|
| Vector of | String (0..40, ASCII) |
| Index | Decimal (0..9) |
| Default | ([10] "") |

## COMPONENT Btds LogicalConnection (LCo)

| | |
|---|---|
| Groups | "GROUP Btds LCo PathData"<br>"GROUP Btds LCo Statisitics (Stats)" |
| Scope | Application |
| Description | ...*Lc*<br>This component contains all of the operation attributes for a Path Oriented Logical Connection. |
| Common Verbs | Help<br>List<br>Display |

### VERB RERoute Btds LCo

| | |
|---|---|
| Impact | Service |
| Description | RERoute ..Lc<br>This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified.<br>This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively.<br><br>When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path.<br><br>If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent. |

### GROUP Btds LCo PathData

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all operational attributes for the path oriented LCo. |

### ATTRIBUTE Btds LCo state

| | |
|---|---|
| Access | Read only |
| Description | This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal |

operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.

Values
pathDown
selectingRoute
connecting
pathUp
pathDownRetrying

Default
No default

### ATTRIBUTE Btds LCo overrideRemoteName (orn)

Access
Read: All
Write: All

Description
If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.

Values
String (0..40, ASCII)

Default
""

### ATTRIBUTE Btds LCo end

Access
Read only

Description
This attribute identifies whether this is the calling or called end of the path.

Values
calling
called

Default
No default

### ATTRIBUTE Btds LCo costMetric (cost)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Btds LCo delayMetric (delay)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Btds LCo roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond.<br>For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic.<br>For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip |

| | |
|---|---|
| | delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC.<br>When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond. |
| Values | Decimal (0..200000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Btds LCo setupPriority (spri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Btds LCo holdingPriority (hpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Btds LCo requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Btds LCo requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Btds LCo requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType***,** will be candidates for this connection. |

| | |
|---|---|
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | No default |

### ATTRIBUTE Btds LCo permittedTrunkTypes (pttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | No default |

### ATTRIBUTE Btds LCo requiredSecurity (rsec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* |

attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.*

Values Decimal (0..7)

Default No default

### ATTRIBUTE Btds LCo requiredCustomerParameter (rcparm)

Access Read only

Description This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.

Values Decimal (0..7)

Default No default

### ATTRIBUTE Btds LCo emissionPriority (epri)

Access Read only

Description This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).

Values Decimal (0..2)

Default No default

### ATTRIBUTE Btds LCo discardPriority (dpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically). |
| Values | Decimal (1..3) |
| Default | No default |

### ATTRIBUTE Btds LCo pathType (pType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).<br><br>The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself. |
| Values | normal<br>manual<br>forced |
| Default | No default |

### ATTRIBUTE Btds LCo retryCount (rcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology.<br>This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Btds LCo pathFailureCount (pfcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Btds LCo reasonForNoRoute (rnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason |

***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

### ATTRIBUTE Btds LCo lastTearDownReason

Access

Read only

Description

This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:
***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up.
***normalShutDown*** - This path has gone down due to normal call termination.
***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.

***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
***trunkCardFailure***- A trunk FP card has failed along the path.
***accessCardFailure***- The FP on which the peer access service was running has failed.
***operatorForced***- The path has terminated due to the operator locking a trunk along the path.
***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
***networkCongestion*** - The path has failed due to control information being lost and not recoverable.
***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name.
***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid.
***unknownReason*** - The failure was not resolved.
***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled.
***remoteNameMismatch*** - The remote end has alarmed and rejected this setup due to remoteName provisioning.
***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.
***reconnectFromFarEnd*** - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.

***bumped*** - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
***optimized*** - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
***trunkOrFarEndDidNotSupportMode*** - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

### ATTRIBUTE Btds LCo pathFailureAction

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.<br>With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.<br><br>All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends |
| Values | reRoutePath<br>disconnectConnection |
| Default | No default |

### ATTRIBUTE Btds LCo bumpPreference (bpref)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority*. A connection may also always bump in order to obtain the best route. |

| | |
|---|---|
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | No default |

### ATTRIBUTE Btds LCo optimization (opt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval. |
| Values | disabled<br>enabled |
| Default | No default |

### ATTRIBUTE Btds LCo pathUpDateTime

| | |
|---|---|
| Access | Read: Service<br>Write: Illegal |
| Description | This is the time stamp when the current path was established or reestablished. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Btds LCo path

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the trunk component names over which the path has been instantiated and the remote end point name terminating the path. |
| List of | String (0..40, ASCII) |
| List Size | 21 |

| | |
|---|---|
| Default | No default |

### GROUP Btds LCo Statisitics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics attributes for the path oriented LCo. |

### ATTRIBUTE Btds LCo pktsToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets transmitted to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Btds LCo bytesToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Btds LCo pktsFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote LCo via the network. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Btds LCo bytesFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the remote LCo via the network. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

## COMPONENT Btds Dpnss1

| | |
|---|---|
| Groups | "GROUP Btds Dpnss1 Provisioned (Prov)"<br>"GROUP Btds Dpnss1 PriTimeSlotOpModes (Pri)"<br>"GROUP Btds Dpnss1 VdcdStatistics (Vdcd)"<br>"GROUP Btds Dpnss1 FrameStatistics (Frames)"<br>"GROUP Btds Dpnss1 HdlcStatistics (Hdlc)" |
| Scope | Application |
| Description | *Btds/n Dpnss1*<br>The *Dpnss1* component handles Digital Private Network Signaling System No1 (DPNSS 1) messages for the purpose of voice/data call discrimination. Discrimination between a voice call and a data call causes adjustment of the *VoiceService* operational mode.<br>A single instance of *Dpnss1* component can be provisioned under a *Btds/*n component.<br><br>The operational mode of any *VoiceService* provisioned within one Primary Rate Interface (PRI) is controlled by the same *Dpnss1* component.<br><br>To perform call discrimination, both ends of a *Btds* connection require the same call discrimination subcomponent (*Mcdn* or *Dpnss1*). *Btds serviceFailureReason* is ***mismatchedCallDiscriminator*** if the ends of a *Btds* connection have different call discrimination subcomponents. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Btds Dpnss1 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attribute for the *Dpnss1* component to handle DPNSS 1 messages. |

### ATTRIBUTE Btds Dpnss1 timeslotsX (x)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains the list of timeslots that are provisioned X for call collision resolution. A timeslot not provisioned as X is assumed to be Y. |
| Set of | Decimal (1..31) |
| Default | No default |

### GROUP Btds Dpnss1 PriTimeSlotOpModes (Pri)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains replicated attribute which displays operational mode of time slots. |

### ATTRIBUTE Btds Dpnss1 timeSlotOpMode (tSlot)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the operational mode of every time slot which is serviced by a voice service.<br>The value ***idle*** means that the time slot is not used to service a call, hence the concerned voice service's bandwidth in the Passport subnet is available for other uses.<br>The value ***voice*** means that a phone call is in progress. All provisioned voice service's value added features have been activated (features such as voice compression, silence suppression, echo cancellation).<br>The value ***data*** means that a data call is in progress. All provisioned voice service's value added features have been de-activated, so that a clear 64 kbit/sec data connection is provided across the Passport subnet. |
| Values | idle<br>voice<br>data |
| Replication | Decimal (1..31) |

| | |
|---|---|
| Default | No default |

### GROUP Btds Dpnss1 VdcdStatistics (Vdcd)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes which count the protocol messages indicating changes to operational modes of *VoiceServices*. |

### ATTRIBUTE Btds Dpnss1 newVoiceCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of messages indicating beginning of establishment of a voice call.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 newDataCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of messages indicating beginning of establishment of a data call.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 voiceToData

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of messages indicating a change of a call operational mode from voice transmission to data transmission.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 dataToVoice

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of messages indicating a change of a call operational mode from data transmission to voice transmission.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 callClears

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of CCS messages indicating the end of a call.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Btds Dpnss1 FrameStatistics (Frames)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes which count layer 2 frames potentially significant for voice/data call discrimination. See also the description of *HdlcStatistics* group. |

### ATTRIBUTE Btds Dpnss1 frmProcessed

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of valid layer 2 frames containing an Information Field with a protocol message. Changes to operational mode of a *VoiceService* are triggered only by a subset of processed frames. Many frames refer to the call progress and are ignored from the standpoint of voice/data call discrimination.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 frmInvalid

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of invalid layer 2 frames<br>For DPNSS 1, a frames is counted as invalid if<br>- it is shorter than 3 octets or longer than 48 octets (excluding two octets of Cyclic Redundancy Check), or<br>- it has an invalid bit combination in the Address Field, or<br>- the Control Field is inconsistent with the Address Field, or<br>- the type of data is invalid, or<br>- it relates to time slot 0.<br>For MCDN, a frame is counted as invalid if<br>- it is shorter than 4 or longer than 264 octets (excluding two octets of Cyclic Redundancy Check), or<br>- it has an invalid bit combination in the Address Field, or<br>- it has missing or incorrect mandatory information elements.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Btds Dpnss1 HdlcStatistics (Hdlc)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes which count the signaling frame events. |

### ATTRIBUTE Btds Dpnss1 frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of all hdlc frames, correct or not, received from the PRI.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame receptions aborted before completion, due to incoming frame format errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received with CRC errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received that were non octet aligned.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Dpnss1 overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received for which overruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Btds Dpnss1 largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of received frames which were longer than 1024 octets.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT Btds Mcdn

| | |
|---|---|
| Groups | "GROUP Btds Mcdn Provisioned (Prov)"<br>"GROUP Btds Mcdn PriTimeSlotOpModes (Pri)"<br>"GROUP Btds Mcdn VdcdStatistics (Vdcd)"<br>"GROUP Btds Mcdn FrameStatistics (Frames)"<br>"GROUP Btds Mcdn HdlcStatistics (Hdlc)" |
| Scope | Application |
| Description | *Btds/n Mcdn*<br>The *Mcdn* component handles MCDN protocol, or Meridian 1 ISDN Primary Rate Interface, messages for the purpose of voice/data call discrimination. Discrimination between a voice call and a data call causes adjustment of the *VoiceService* operational mode.<br>A single instance of *Mcdn* component can be provisioned under a *Btds/*n component.<br>The operational mode of any *VoiceService* provisioned within one Primary Rate Interface (PRI) is controlled by the same *Mcdn* component.<br><br>To perform call discrimination, both ends of a *Btds* connection require the same call discrimination subcomponent (*Mcdn* or *Dpnss1*). *Btds serviceFailureReason* is ***mismatchedCallDiscriminator*** if the ends of a *Btds* connection have different call discrimination subcomponents. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Btds Mcdn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute for the *Mcdn* component. |

### ATTRIBUTE Btds Mcdn adjPbxSide

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the provisioning related to call collision resolution. Its value must be that same as in the adjacent PBX, at the other end of the PRI. To provision the call collision resolution in Nortel's SL1 and Meridian 1 PBXs, the network operator responds to the prompt SIDE by entering either MAS or SLAV. So if the SLAV was entered, then the *adjPbxSide* has to be provisioned ***slave***. |
| Values | slave<br>master |
| Default | slave |

### GROUP Btds Mcdn PriTimeSlotOpModes (Pri)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains replicated attribute which displays operational mode of time slots. |

### ATTRIBUTE Btds Mcdn timeSlotOpMode (tSlot)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the operational mode of every time slot which is serviced by a voice service.<br>The value ***idle*** means that the time slot is not used to service a call, hence the concerned voice service's bandwidth in the Passport subnet is available for other uses.<br>The value ***voice*** means that a phone call is in progress. All provisioned voice service's value added features have been activated (features such as voice compression, silence suppression, echo cancellation).<br>The value ***data*** means that a data call is in progress. All provisioned voice service's value added features have been de-activated, so that a clear 64 kbit/sec data connection is provided across the Passport subnet. |
| Values | idle<br>voice<br>data |
| Replication | Decimal (1..31) |
| Default | No default |

## GROUP Btds Mcdn VdcdStatistics (Vdcd)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes which count the protocol messages indicating changes to operational modes of *VoiceServices*. |

## ATTRIBUTE Btds Mcdn newVoiceCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of messages indicating beginning of establishment of a voice call.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Btds Mcdn newDataCalls

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of messages indicating beginning of establishment of a data call.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Mcdn voiceToData

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of messages indicating a change of a call operational mode from voice transmission to data transmission.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Mcdn dataToVoice

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of messages indicating a change of a call operational mode from data transmission to voice transmission.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Mcdn callClears

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of CCS messages indicating the end of a call.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## GROUP Btds Mcdn FrameStatistics (Frames)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes which count layer 2 frames potentially significant for voice/data call discrimination. See also the description of *HdlcStatistics* group. |

## ATTRIBUTE Btds Mcdn frmProcessed

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of valid layer 2 frames containing an Information Field with a protocol message. Changes to operational mode of a *VoiceService* are triggered only by a subset of processed frames. Many frames refer to the call progress and are ignored from the standpoint of voice/data call discrimination.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Btds Mcdn frmInvalid

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of invalid layer 2 frames<br>For DPNSS 1, a frames is counted as invalid if<br>- it is shorter than 3 octets or longer than 48 octets (excluding two octets of Cyclic Redundancy Check), or<br>- it has an invalid bit combination in the Address Field, or<br>- the Control Field is inconsistent with the Address Field, or<br>- the type of data is invalid, or<br>- it relates to time slot 0.<br>For MCDN, a frame is counted as invalid if<br>- it is shorter than 4 or longer than 264 octets (excluding two octets of Cyclic Redundancy Check), or<br>- it has an invalid bit combination in the Address Field, or<br>- it has missing or incorrect mandatory information elements.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### GROUP Btds Mcdn HdlcStatistics (Hdlc)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes which count the signaling frame events. |

### ATTRIBUTE Btds Mcdn frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of all hdlc frames, correct or not, received from the PRI.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Mcdn aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame receptions aborted before completion, due to incoming frame format errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Mcdn crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received with CRC errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Mcdn nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received that were non octet aligned.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Mcdn overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received for which overruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Btds Mcdn largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of received frames which were longer than 1024 octets.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

# COMPONENT ClusterBridge (CB)

| | |
|---|---|
| Groups | "GROUP CB IfEntryProv (IfEntry)"<br>"GROUP CB MediaProv (Mp)"<br>"GROUP CB Operational (Oper)"<br>"GROUP CB OsiState (State)"<br>"GROUP CB OperationalStatus (OperStatus)" |
| Scope | Application |
| Description | *ClusterBridge*<br>The ClusterBridge component represents one ClusterBridge application. It allows a set of bridged ports to be treated as one routed port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP CB IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

## ATTRIBUTE CB ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE CB ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP CB MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the media base component. |

### ATTRIBUTE CB linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP CB Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the operational attibutes which are specific to the ClusterBridge component. |

### ATTRIBUTE CB macAddress (addr)

| | |
|---|---|
| Access | Read only |
| Description | The medium access controller (MAC) address is an address that is only recognized by one station on the attached bus. This address is automatically assigned by the system. |
| Values | String (6, Hex) |
| Default | No default |

### GROUP CB OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE CB adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it |

is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE CB operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE CB usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

| | |
|---|---|
| | The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP CB OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE CB snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

# COMPONENT Collector (Col)

| | |
|---|---|
| Instance | accounting (acc)<br>alarm (ala)<br>log<br>debug (deb)<br>scn<br>trap<br>stats<br>rtStats (rts)<br>applicationSpecific (appl) |
| Groups | "GROUP Col Provisioned (Prov)"<br>"GROUP Col Statistics (Stats)" |

"COLLECTED STATS Collector"

| | |
|---|---|
| Scope | Device |
| Description | *Collector/<dataType>*<br>There is a *Collector* for each data stream. It is a permanent component that resides on the active CP. Its main function is to coordinate the collection of data from all its *Agent* subcomponents and distribute that data to the downstream applications which have requested it (for example, one or more *Session*s or its *Spooler* subcomponent). It also coordinates the time-of-day accounting (TODA) schedules and spooled statistics probes. |

| | |
|---|---|
| Subcomponents | "COMPONENT Col Spooler (Sp)" |
| Dyn. Subcomp. | "COMPONENT Col Agent (Ag)" |
| Common Verbs | Help<br>List<br>Display<br>Add |

### GROUP Col Provisioned (Prov)

Properties: Provisioned

Description

This group specifies all of the provisioning data for a DCS *Collector.*

### ATTRIBUTE Col collectionTimes (times)

Access: Read and write

Description

This attribute specifies the scheduled times at which data should be collected. Only accounting applications need the capability to generate data in this way. Setting this attribute for other streams has no effect.

The user can enter the times in any order and duplicates are prevented at data entry. There is a limit of 24 entries, which is imposed at semantic check time. The collection times are triggered in chronological order. A semantic check error is issued if any 2 entries are less than 1 hour apart or if any 2 entries are more than 12 hours apart (which implies that if any entries are provided, there must be at least 2 entries).

Note that by default (that is, in the absence of a provisioned schedule), a Virtual Circuit (VC) starts its own 12-hour accounting timer. If any collection times are provisioned here, then the Time-Of-Day-Accounting (TODA) method is used in

| | |
|---|---|
| | place of 12-hour accounting. This is applicable to both Switched VCs and Permanent VCs. |
| List of | Time (HM) |
| List Size | 24 |
| Default | No default |

### ATTRIBUTE Col peakWaterMarkInterval (peak)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the length of the accounting peak water mark interval. It is at least one minute and at most 15 minutes long. An accounting peak water mark within a given accounting interval is the accounting count which occurred during a peak water mark interval with the highest traffic. Peak water marks are used to determine traffic bursts. If no value is provisioned for this attribute, a value of 5 minutes is assumed. Peak water mark is only measured if the attribute *collectionTimes* in *Collector/ account* is provisioned. |
| List of | Decimal (1..15) |
| Units | minutes |
| List Size | 1 |
| Default | No default |

### GROUP Col Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group specifies the statistics operational attributes of the DCS *Collector, Agent* and *Spooler* components. |

### ATTRIBUTE Col currentQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This gauge contains the current number of records held by this DCS component. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Col recordsRx

| | |
|---|---|
| Access | Read only |
| Description | This counter contains the cumulative number of records received by a DCS component, from applications that send data to it, since the processor last restarted.<br><br>This counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Col recordsDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This is the cumulative number of records discarded by this DCS component since the processor last restarted.<br><br>This counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS Collector

| | |
|---|---|
| Description | The statistics record generated by the Collector component. |

### ATTRIBUTE Col oldDateTime

| | |
|---|---|
| Description | This attribute shows the old date/time immediately prior to the time change. |
| Values | Time (DHMS) |

### ATTRIBUTE Col newDateTime

| | |
|---|---|
| Description | This attribute shows the new date/time immediately after the time change. |
| Values | Time (DHMS) |

## COMPONENT Col Spooler (Sp)

| | |
|---|---|
| Groups | "GROUP Col Sp Provisioned (Prov)"<br>"GROUP Col Sp OsiState (State)"<br>"GROUP Col Sp Operational (Oper)"<br>"GROUP Col Sp Statistics (Stats)" |
| Scope | Device |
| Description | *Col/<dataType> Spooler*<br>A *Spooler* is a required subcomponent of the *Collector* and also resides on the active CP, managing all the spooling of a particular type of data.<br>*Spooler* for the applicationSpecific stream manages multiple files. |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## VERB Newfile Col Sp

| | |
|---|---|
| Impact | Service |
| Description | *Newfile Col/<datatype> Sp*<br>This command causes the *Spooler* to open a new file to continue spooling. Typically, this is done because the user wants to retrieve the latest set of records for this type of data. If the new file can be opened, the existing spooling file is closed and moved into the standard “closed” disk directory; otherwise, the existing file is not closed and it remains in the directory containing the open spooling files.<br><br>This command operates on all opened files being used in the applicationSpecific stream.<br><br>The command succeeds if the new file can be opened; otherwise, the command fails. As long as the file system is available, spooling can continue in the existing open file. Of course, any time the file system is unavailable, spooling stops. |

## GROUP Col Sp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group specifies all of the provisioning data for a DCS *Spooler.* |

## ATTRIBUTE Col Sp spooling (spool)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not this type of data is spooled to the disk. If set to ***off***, it is roughly equivalent to Locking the *Spooler* (except this will survive processor restarts).<br><br>The following defaults are used:<br>- alarm: on<br>- accounting: on<br>- log: on<br>- debug: off<br>- scn: on<br>- trap: off (see Note below)<br>- stats: on<br>- rtStats: off (see Note below)<br>- applicationSpecific: on<br><br>Note that SNMP Traps and rtStats cannot be spooled. A semantic check prevents the user from setting the value to ***on*** for the trap stream. |
| Values | on<br>off |
| Default | No default |

## ATTRIBUTE Col Sp maximumNumberOfFiles (maxFile)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of files that should be kept on the disk in the directory containing the closed files of this type. The value 0 is defined to mean “unlimited”.<br><br>A different default for each type of *Spooler* is defined as follows: |

- alarm: 30
- accounting: 200
- debug: 2
- log: 10
- scn: 10
- trap: 2 (this value is meaningless and is ignored)
- stats: 200
- rtStats: 2 (this value is meaningless and is ignored)
- applicationSpecific: 200

Values: Decimal (0..200)

Default: No default

### GROUP Col Sp OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Col Sp adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Col Sp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Col Sp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in

use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Col Sp availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot

operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Col Sp proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Col Sp controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Col Sp alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Col Sp standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Col Sp unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Col Sp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes specific to a DCS *Spooler.* |

### ATTRIBUTE Col Sp spoolingFileNames

| | |
|---|---|
| Access | Read only |
| Description | When *spooling* is ***on***, this attribute contains the names of the open files into which data is currently being spooled. When *spooling* is ***off***, the value of this attribute is the empty list. |
| List of | String (0..128, ASCII) |
| Default | No default |

### GROUP Col Sp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group specifies the statistics operational attributes of the DCS *Collector, Agent* and *Spooler* components. |

### ATTRIBUTE Col Sp currentQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This gauge contains the current number of records held by this DCS component. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Col Sp recordsRx

| | |
|---|---|
| Access | Read only |
| Description | This counter contains the cumulative number of records received by a DCS component, from applications that send data to it, since the processor last restarted.<br><br>This counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Col Sp recordsDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This is the cumulative number of records discarded by this DCS component since the processor last restarted.<br><br>This counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Col Agent (Ag)

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Col Ag Statistics (Stats)"<br>"GROUP Col Ag AgentStatistics (AgentStats)" |
| Scope | Device |

| | |
|---|---|
| Description | *Col/<dataType> Agent/<cardNumber>*<br>A DCS *Agent* is an operational subcomponent of a *Collector*. One *Agent* instance exists for each *Card* that is running as active or standby. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Col Ag Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group specifies the statistics operational attributes of the DCS *Collector, Agent* and *Spooler* components. |

### ATTRIBUTE Col Ag currentQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This gauge contains the current number of records held by this DCS component. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Col Ag recordsRx

| | |
|---|---|
| Access | Read only |
| Description | This counter contains the cumulative number of records received by a DCS component, from applications that send data to it, since the processor last restarted.<br><br>This counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Col Ag recordsDiscarded

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This is the cumulative number of records discarded by this DCS component since the processor last restarted.<br><br>This counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Col Ag AgentStatistics (AgentStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes specific to the DCS *Agent* components. |

### ATTRIBUTE Col Ag recordsNotGenerated

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the records of a particular event type on this *Card* that could not be generated by some application due to some problem such as insufficient resources. One cannot tell exactly which event could not be generated, nor which application instance tried to generate it, but when this count increases, it is an indicator that some re-engineering may be required and will provide some idea as to why a record is missing.<br><br>This counter wraps to 0 when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

# COMPONENT CallRedirectionServer (Crs)

| | |
|---|---|
| Groups | "GROUP Crs Provisioned (Prov)"<br>"GROUP Crs OsiState (State)"<br>"GROUP Crs Statistics (Stat)" |
| Scope | Network |
| Description | *CallRedirectionServer*<br>The *CallRedirectionServer* component provides a set of alternate destinations for an original address. The alternate destination could be DPRS routing information (that is, RID/MID) or up to seven addresses. |
| Opt. Subcomp. | "COMPONENT Crs PrimaryAddress (PAddr)"<br>"COMPONENT Crs AlternateRid (AltRid)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Crs Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | The *Provisioned* group contains provisionable attributes of the *CallRedirectionServer* component. |

### ATTRIBUTE Crs logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the logical processor on which the call redirection server process is to run. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### GROUP Crs OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Crs adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Crs operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Crs usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Crs Statistics (Stat)

| | |
|---|---|
| Properties | Operational |
| Description | The *Statistics* operational group defines the statistics associated with the *CallRedirectionServer* component. |

### ATTRIBUTE Crs totalAddresses

| | |
|---|---|
| Access | Read only |
| Description | The *totalAddresses* attribute indicates the number of *PrimaryAddress* components associated with the *CallRedirectionServer* component. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs requestsReceived (reqRx)

| | |
|---|---|
| Access | Read only |
| Description | The *requestsReceived* attribute counts the number of redirection requests received by the *CallRedirectionServer* component. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs primaryMatches (pMatch)

| | |
|---|---|
| Access | Read only |
| Description | The *primaryMatches* attribute counts the Call Redirection Server attempts to find a matching *PrimaryAddress* where the lookup attempt was successful. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Crs secAddressListExhausted (sAddrEx)

| | |
|---|---|
| Access | Read only |
| Description | The *secAddressListExhausted* attribute counts the Call Redirection Server attempts to find a *SecondaryAddress* component given a *PrimaryAddress* component where the lookup attempt resulted in the exhaustion of the secondary redirection list. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs maxAddrLenExceeded (maxAddrExc)

| | |
|---|---|
| Access | Read only |
| Description | The *maxAddrLenExceeded* attribute counts how often the concatenation of the secondary address and the suffix digits from the original called address have exceeded the maximum of 15 digits.<br>The suffix digits can be determined by removing the primary address digits from the front of the original called address.<br>If appending the suffix digits to a secondary address causes the resulting address to exceed 15 digits, this secondary member is skipped and the next secondary member is tried. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs secRidMidUnsuccessful (sRidMidUnsuc)

| | |
|---|---|
| Access | Read only |
| Description | The *secRidMidUnsuccessful* attribute counts the number of RID/MID redirections resulting in the destination address not being reached. This situation could occur when the destination address does not exist on the specified module or the specified module could not be reached. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs secAddrUnsuccessful (sAddrUnsuc)

| | |
|---|---|
| Access | Read only |
| Description | The *secAddrUnsuccessful* attribute counts the number of Address redirections resulting in the destination user not being reached. This situation could occur when the destination user line is disabled, the destination address does not exist on the specified module, or the specified module could not be reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs ridRedirected (ridRed)

| | |
|---|---|
| Access | Read only |
| Description | The *ridRedirected* attribute counts requests received by the Call Redirection Server resulting in the request being redirected to another RID specified by the *AlternateRid* component. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs ridMidRedirected (ridMidRed)

| | |
|---|---|
| Access | Read only |
| Description | The *ridMidRedirected* attribute counts requests received by the Call Redirection Server resulting in the request being redirected to another RID/MID specified by the *SecondaryRidMid* component. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs addressRedirected (addrRed)

| | |
|---|---|
| Access | Read only |
| Description | The *addressRedirected* attribute counts requests received by the Call Redirection Server resulting in the request being redirected to another Address specified by the *SecondaryAddress* component. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Crs altRidUnsuccessful (aRidUnsuc)

| | |
|---|---|
| Access | Read only |
| Description | The *altRidUnsuccessful* attribute counts the number of RID redirections resulting in the destination address not being reached. This situation could occur when the alternate RID cannot be reached, the module hosting the destination address is isolated, or the port associated with the secondary address is unavailable at the alternate RID. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Crs PrimaryAddress (PAddr)

| | |
|---|---|
| Instance | String (1..17, NativeAddressWith15DigitX121) |
| Scope | Network |
| Description | *Crs PrimaryAddress*/<address><br>The *PrimaryAddress* component defines a primary address for which a list of alternate destinations are specified. This primary address has either a secondary RID/MID destination or up to seven secondary addresses associated with it.<br>A primary address matches the original destination address if, beginning with the most significant digit, all digits are identical and the primary address is less than or equal to the original destination address in length. The “best match” is the longest such primary address. |

The PrimaryAddress component instance value takes the form: x.<X.121 address> or e.<E.164 address>

## GROUP Crs PAddr SRidMid RidMidProv

Properties Provisioned

Description The *SecRidMidProv* group defines the secondary RID/MID pair associated with a specific primary address.

## ATTRIBUTE Crs PAddr SRidMid routingId (rid)

Access Read and write

| | |
|---|---|
| Description | This attribute specifies a group of one or more interconnected nodes (called a subnet) to which the primary address is redirected. |
| Values | Decimal (1..126) |
| Default | No default |

### ATTRIBUTE Crs PAddr SRidMid moduleId (mid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a Passport node to which the primary address is redirected. |
| Values | Decimal (1..1909) |
| Default | No default |

### COMPONENT Crs PAddr SecondaryAddress (SAddr)

| | |
|---|---|
| Instance | Decimal (1..7) |
| Groups | "GROUP Crs PAddr SAddr SecAddrProv" |
| Scope | Network |
| Description | Crs Paddr/<address> SecondaryAddress/n<br>The SecondaryAddress component identifies an alternate destination address. Address redirection allows the call redirection server to effectively override the original destination address and forward the call to a different destination within the Passport network. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Crs PAddr SAddr SecAddrProv

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | The *SecAddrProv* group defines one of the secondary addresses associated with a specific primary address. |

### ATTRIBUTE Crs PAddr SAddr address (addr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a secondary address to which the primary address is redirected.<br>The *address* attribute includes the Numbering Plan Indicator (NPI) and the digits which form a unique identifier of the customer interface. The address may belong to the X.121 or E.164 addressing plan. Address digits are selected and assigned by network operators.<br>The *address* attribute takes the form:<br>x.<X.121 address> or e.<E.164 address> |
| Values | String (1..17, NativeAddressWith15DigitX121) |
| Default | No default |

### COMPONENT Crs AlternateRid (AltRid)

| | |
|---|---|
| Groups | "GROUP Crs AltRid AltRidProv" |
| Scope | Network |
| Description | *Crs AlternateRid*<br>The *AlternateRid* component defines the routing identifier value that is used as the alternate DPRS routing information when routing to the RID specified by the Call Router (CR) is unsuccessful. This component should only be provisioned as a temporary measure.When activated the RID redirection feature as significant impact on the normal redirection operation, since RID redirection is always attempted first.<br>One of the possible application of this feature being RID splitting, the *AlternateRid* component should be deleted as soon as all module have been migrated from their original RID and the Call Router (CR) throughout the network have been updated with the new RID information. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Crs AltRid AltRidProv

| | |
|---|---|

# COMPONENT CallRouter (CR)

| | |
|---|---|
| Scope | Network |
| Description | CallRouter<br>This component performs the call routing function. It is a database containing prefix-DNAs. Unlike the DNAs under the NumberingPlanIndicator component which are only local DNAs, the DNAs under this component can refer to local DNAs and DNAs resident on other Passport modules. This component represents a database that is used to translate a DNA in a call setup packet into a ModuleId or a RoutingId so that the call setup packet can be routed to the correct Passport module within the subnet or to the correct Passport subnet. This call router can only be used for a Passport only network. This call router only provides service when there is no CSRM attached to the Passport subnet. If a CSRM is connected to the subnet, the CSRM will provide the call routing service. |
| Opt. Subcomp. | "COMPONENT CR NumberingPlanId (Npi)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## COMPONENT CR NumberingPlanId (Npi)

| | |
|---|---|
| Instance | x121<br>e164 |
| Groups | "GROUP CR Npi Statistics (Stats)" |

| | |
|---|---|
| Scope | Network |
| Description | CallRouter NumberingPlanId/<x121,e164><br>This component collects all the prefix DNAs provisioned for a particular numbering plan indicator. There are two numbering plans allowed, E.164 and X.121. |
| Opt. Subcomp. | "COMPONENT CR Npi DataNetworkAddress (Dna)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP CR Npi Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes contains the statistics kept for a particular numbering plan indicator. |

## ATTRIBUTE CR Npi totalDnas

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the total number of prefix-DNAs provisioned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE CR Npi callsRouted

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the total number of call setup packets routed. When the counter reaches the maximum, it wraps back to zero. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE CR Npi callsFailed

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the total number of call setup packets that failed to route. This could be caused by the MID or RID being unreachable or by the DNA failing to translate to a MID or RID. Check the prefix-DNA provisioning data and the DNAs associated to the endpoints of the connection. When the counter reaches the maximum, it wraps back to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT CR Npi DataNetworkAddress (Dna)

| | |
|---|---|
| Instance | BCD (1..15, Wildcarded) |
| Groups | "GROUP CR Npi Dna Provisioned (Prov)" |
| Scope | Network |
| Description | Cr Npi/<x121,e164> Dna/<BCD(1..15, WILDCARDED)><br>This subcomponent represents a prefix-DNA in the numbering plan. The instance value must be 1 to 15 digits each of value 0 through 9 or wildcard.Wild digits may be used so that the digit position specified by the wild digit is ignored when making a routing decision. This will reduce the number of prefix-DNAs needed to properly route the calls. The wild digit is represented by “?”. Wildcarding inconsistencies can not exist. If a prefix-DNA already exists in the database with a specific digit in position 3, new prefix-DNAs may not be added with a wildcard in position 3. Similarly, if the prefix-DNA already exists with a wildcard in a particular position, a similar prefix-DNA cannot be added with a specific digit in the same position. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP CR Npi Dna Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes represents what the prefix-DNA maps to. |

## ATTRIBUTE CR Npi Dna routingId

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute identifies the routingId that the prefix-DNA maps to. If the value is set to zero, then the routingId is not used. Note that at least one and only one of the attributes in this group must be set to a non-zero value. |
| Values | Decimal (0..126) |
| Default | 0 |

## ATTRIBUTE CR Npi Dna moduleId

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute contains the module identifier value that the DNA maps to. If the value is set to zero, then the moduleId is not used. Note that at least one and only one of the attributes in this group must be set to a non-zero value. |
| Values | Decimal (0..1909) |
| Default | 0 |

# COMPONENT DataSignallingChannel (DataSigChan)

| | |
|---|---|
| Instance | Decimal (1..255) |
| Groups | "GROUP DataSigChan Provisioned (Prov)"<br>"GROUP DataSigChan CustomerIdentifierData (CidData)"<br>"GROUP DataSigChan IfEntryProv (IfEntry)"<br>"GROUP DataSigChan OsiState (State)"<br>"GROUP DataSigChan OperationalStatus (OperStatus)" |
| Scope | Application |
| Description | *DataSignallingChannel/n*<br>The *DataSignallingChannel* component defines the operational characteristics of the connection to the external ISDN PRI equipment. A *DataSignallingChannel* must be provisioned for each D-Channel. |

| | |
|---|---|
| Subcomponents | "COMPONENT DataSigChan CallControl (Cc)" |
| Opt. Subcomp. | "COMPONENT DataSigChan TS014 (TS014)"<br>"COMPONENT DataSigChan Etsi (Etsi)"<br>"COMPONENT DataSigChan JapanIns (Ins)"<br>"COMPONENT DataSigChan NationalIsdn2 (Ni2)"<br>"COMPONENT DataSigChan Nis (Nis)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP DataSigChan Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents the provisionable attributes of a *DataSigChan*. |

## ATTRIBUTE DataSigChan commentText

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the name of the customer that is using this *DataSigChan*. Typical use of this attribute is to store customer name. |
| Values | String (0..40, ASCII) |
| Default | No default |

## GROUP DataSigChan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE DataSigChan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP DataSigChan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE DataSigChan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE DataSigChan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP DataSigChan OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE DataSigChan adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users |

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE DataSigChan operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE DataSigChan usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP DataSigChan OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE DataSigChan snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### COMPONENT DataSigChan CallControl (Cc)

Groups
"GROUP DataSigChan Cc Statistics (Stats)"

Scope
Application

| | |
|---|---|
| Description | *DataSigChan/n CallControl*<br>*This component defines the Call Control parameters and displays the statistics of the D-channel.* |
| Subcomponents | "COMPONENT DataSigChan Cc ChannelGroup (Cg)" |
| Opt. Subcomp. | "COMPONENT DataSigChan Cc Trace (Tr)" |
| Dyn. Subcomp. | "COMPONENT DataSigChan Cc Bchannel (Bch)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP DataSigChan Cc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics of the CallControl |

## ATTRIBUTE DataSigChan Cc totalValidInCalls (ic)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of incoming calls (with valid mandatory IE contents and received in a valid ISDN state) from the interface. This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE DataSigChan Cc successfullInCalls (isc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of successfull valid incoming calls from the interface. Unsuccessful calls include those that have disallowed Capability (BC, LLC), screening indicator, or calling party number, and calls that are rejected due to requested channel busy. This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE DataSigChan Cc inInvalidCapability (iicap)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of valid incoming calls rejected due to an unsupported service capability, such as Information Transfer Rate, Class of Service, Protocol Standard. This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Cc inInvalidScreen (iis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of valid incoming calls rejected due to a screening indicator value not provisioned in the channel group's screeningIndicator attribute. This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Cc inInvalidCgpn (iicgpn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of valid incoming calls rejected due to the calling party number not beeing provisioned in any *channelGroup component of this call control. This counter wraps to zero after reaching its maximum value.* |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Cc inChannelBusy (icb)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of valid incoming calls rejected due to no available B-Channels. This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Cc lastClearCause (lcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Q931 clear cause of the last valid call that is rejected or cleared. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE DataSigChan Cc lastClearedCallingPartyNumber (lccgpn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the calling party number of the last valid call that is rejected or cleared. |
| Values | BCD (1..14) |
| Default | No default |

### COMPONENT DataSigChan Cc ChannelGroup (Cg)

| | |
|---|---|
| Instance | Decimal (1..31) |
| Groups | "GROUP DataSigChan Cc Cg CustomerIdentifierData (CidData)"<br>"GROUP DataSigChan Cc Cg Provisioned (Prov)"<br>"GROUP DataSigChan Cc Cg Statistics (Stats)" |
| Scope | Application |
| Description | *DataSigChan/n Cc ChannelGroup/n*<br>A ChannelGroup defines the call allocation parameters and the channel list for a subgroup of users. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT DataSigChan Cc Cg CallingPartyNumber (Cgpn)" |
| Dyn. Subcomp. | "COMPONENT DataSigChan Cc Cg Bchannel (Bch)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP DataSigChan Cc Cg CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE DataSigChan Cc Cg customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP DataSigChan Cc Cg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the call admission parameters applied to the group of B-Channels. |

### ATTRIBUTE DataSigChan Cc Cg commentText

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the name of the customer that is using this *ChannelGroup. Typical use of this attribute is to store customer name.* |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE DataSigChan Cc Cg screeningIndicator (si)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the acceptable set of screening modes. The screening mode is carried by the Calling Party Number information element (IE) of the B-Channel request packet. There are four types of mode:<br>upns - User provided, not screened<br>upvp - User provided, verified and passed<br>upvf - User provided, verified and failed<br>np - Network provided<br>When a call is received with a screening indicator not provisioned in the list, the call is cleared. |
| Set of | upns<br>upvp<br>upvf<br>np |
| Default | (upvp, np) |

### ATTRIBUTE DataSigChan Cc Cg channelAssignmentOrder (cao)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the order (ascending or descending) in which the B-Channels are allocated. This attribute is used only when it is not signalled in the call setup message. |
| Values | ascending<br>descending |
| Default | ascending |

### ATTRIBUTE DataSigChan Cc Cg channelList (cl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains the list of B-Channel numbers forming the channel group. At least one channel must be specified. |
| Set of | Decimal (1..31) |
| Default | No default |

### GROUP DataSigChan Cc Cg Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics for a *ChannelGroup* |

### ATTRIBUTE DataSigChan Cc Cg totalInCalls (tic)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of incoming calls (with valid mandatory IE contents and received in a valid ISDN state) from the interface for this *channelGroup. This counter wraps to zero after reaching its maximum value.* |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Cc Cg successfullInCalls (sic)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of valid incoming calls for this *channelGroup. This counter wraps to zero after reaching its maximum value.* |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Cc Cg rejectedNoChanAvail (rnca)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of rejected call because no channel were available under the selected channel group. This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Cc Cg idleChannelCount (icc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the number of B-channels in the channel group that are in idle state. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE DataSigChan Cc Cg busyChannelCount (bcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the number of B-Channels in this channel group that are in busy state. |
| Values | Decimal (0..255) |
| Default | 0 |

### COMPONENT DataSigChan Cc Cg CallingPartyNumber (Cgpn)

| | |
|---|---|
| Instance | BCD (1..14) |
| Scope | Application |

| | |
|---|---|
| Description | *DataIsdn/n Cc Cg/n Cgpn/n*<br>*This component identifies the acceptable calling party number by its instance number, which can consist up to a maximum of 14 decimal digits. These are the numbers that are allowed to use the channels of this ChannelGroup.* |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## COMPONENT DataSigChan Cc Cg Bchannel (Bch)

| | |
|---|---|
| Instance | Decimal (1..31) |
| Groups | "GROUP DataSigChan Cc Cg Bch BchannelOpData (BchanOpData)" |
| Scope | Application |
| Description | *DataSigChan/n Cc Bchannel/n*<br>*DataSigChan/n Cc Cg/n Bchannel/n*<br>*This component identifies the B-channels associated with a CallControl or a ChannelGroup.* |
| Common Verbs | Help<br>List<br>Display |

## GROUP DataSigChan Cc Cg Bch BchannelOpData (BchanOpData)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data of a B-Channel. |

## ATTRIBUTE DataSigChan Cc Cg Bch state

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the B-channel. A B-channel is in idle state when it is available for a call. The busy state indicate that the B-channel is presently in use. The disabled state means |

| | |
|---|---|
| | that the access service is not enabled because it is locked or the port is down. The state noProtocolProvisioned means that the call control did not yet received the registration for this B-channel. |
| Values | idle<br>busy<br>disabled<br>noProtocolProvisioned |
| Default | No default |

### ATTRIBUTE DataSigChan Cc Cg Bch callingPartyNumber (cgpn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the calling party number of the last valid call request for this channel. |
| Values | BCD (1..14) |
| Default | No default |

### ATTRIBUTE DataSigChan Cc Cg Bch lastQ931ClearCause (cause)

| | |
|---|---|
| Access | Read only |
| Description | The clear cause of the last call on this B-channel. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE DataSigChan Cc Cg Bch runningApplication (app)

| | |
|---|---|
| Access | Read only |
| Description | The name of the application running on this B-channel. |
| Values | String (0..20, ASCII) |
| Default | "" |

### ATTRIBUTE DataSigChan Cc Cg Bch callRefNumber (cref)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the call reference number for this B-channel. The call reference value is assigned by the originating |

side of the call and remains fixed for the lifetime of a call (except in the case of call suspension).

Values: Decimal (0..65535)

Default: No default

## COMPONENT DataSigChan Cc Trace (Tr)

Scope: Application

Description: *DataIsdn/n CallControl Trace*
*This component defines the Call Control trace component for the dataIsdn. It consists of the Pri/n subcomponent.*

Dyn. Subcomp.: "COMPONENT DataSigChan Cc Tr Pri"

Common Verbs:
- Help
- List
- Display
- Add
- DELete

## COMPONENT DataSigChan Cc Tr Pri

Instance: Decimal (0..3)

Scope: Application

Description: *DataIsdn/n CallControl Trace Pri/n*
*The component displays the class data members of the isdn Pri/n class.*

Dyn. Subcomp.: "COMPONENT DataSigChan Cc Tr Pri Bch"

Common Verbs:
- Help
- List
- Display

## COMPONENT DataSigChan Cc Tr Pri Bch

Instance: Decimal (1..31)

Scope: Application

| | |
|---|---|
| Description | *DataIsdn/n CallControl Trace Pri/n Bch/m*<br>The component displays the class data members of the isdn Pri/n Bch/m class. |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT DataSigChan Cc Bchannel (Bch)

| | |
|---|---|
| Instance | Decimal (1..31) |
| Groups | "GROUP DataSigChan Cc Bch BchannelOpData (BchanOpData)" |
| Scope | Application |
| Description | *DataSigChan/n Cc Bchannel/n*<br>*DataSigChan/n Cc Cg/n Bchannel/n*<br>*This component identifies the B-channels associated with a CallControl or a ChannelGroup.* |
| Common Verbs | Help<br>List<br>Display |

## GROUP DataSigChan Cc Bch BchannelOpData (BchanOpData)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data of a B-Channel. |

## ATTRIBUTE DataSigChan Cc Bch state

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the B-channel. A B-channel is in idle state when it is available for a call. The busy state indicate that the B-channel is presently in use. The disabled state means that the access service is not enabled because it is locked or the port is down. The state noProtocolProvisioned means that the call control did not yet received the registration for this B-channel. |

| | |
|---|---|
| Values | idle<br>busy<br>disabled<br>noProtocolProvisioned |
| Default | No default |

### ATTRIBUTE DataSigChan Cc Bch callingPartyNumber (cgpn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the calling party number of the last valid call request for this channel. |
| Values | BCD (1..14) |
| Default | No default |

### ATTRIBUTE DataSigChan Cc Bch lastQ931ClearCause (cause)

| | |
|---|---|
| Access | Read only |
| Description | The clear cause of the last call on this B-channel. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE DataSigChan Cc Bch runningApplication (app)

| | |
|---|---|
| Access | Read only |
| Description | The name of the application running on this B-channel. |
| Values | String (0..20, ASCII) |
| Default | "" |

### ATTRIBUTE DataSigChan Cc Bch callRefNumber (cref)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the call reference number for this B-channel. The call reference value is assigned by the originating side of the call and remains fixed for the lifetime of a call (except in the case of call suspension). |

| | |
|---|---|
| Values | Decimal (0..65535) |
| Default | No default |

## GROUP DataSigChan TS014 Tools

Properties
Operational

Description
This group contains a series of operational attributes which turn on and off several kinds of tracing.

## ATTRIBUTE DataSigChan TS014 tracing

Access
Read: All
Write: All

Description
This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the agentQueue attribute in Col/debug must be greater than 0 and a Telnet NMIS session must list the debug stream in in its data streams (ex. set nmis telnet session/1 dataStreams debug). Different types of tracing can be enabled simultaneously.
Note that tracing consumes additional CPU resources and will

slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically reenabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages.

Types of tracing include:
***protocolErrors*** - get details of any protocol errors which are occuring. Protocol errors are also reported in summary form as alarms.
***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).
***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.
***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.
***portHex*** - Messages in hex format being sent and received on the link.

### GROUP DataSigChan Ins Tools

| | |
|---|---|
| Properties | Operational |
| Description | This group contains a series of operational attributes which turn on and off several kinds of tracing. |

### ATTRIBUTE DataSigChan Ins tracing

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug |

stream. To see the messages the agentQueue attribute in Col/debug must be greater than 0 and a Telnet NMIS session must list the debug stream in in its data streams (ex. set nmis telnet session/1 dataStreams debug). Different types of tracing can be enabled simultaneously.
Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically reenabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages.

Types of tracing include:
***protocolErrors*** - get details of any protocol errors which are occuring. Protocol errors are also reported in summary form as alarms.
***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).
***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.
***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.
***portHex*** - Messages in hex format being sent and received on the link.

|---|---|
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE DataSigChan Ins Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP DataSigChan Ins Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE DataSigChan Ins Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is |

administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE DataSigChan Ins Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE DataSigChan Ins Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP DataSigChan Ins Framer Statistics (Stats)

### ATTRIBUTE DataSigChan Ni2 Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors. This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Ni2 Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames that were non octet aligned.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Ni2 Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Ni2 Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Ni2 Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received which were too large. The frame was longer than 500 bytes.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Ni2 Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE DataSigChan Ni2 Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE DataSigChan Ni2 Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

## COLLECTED STATS DataSignallingChannel NationalIsdn2 Framer

| | |
|---|---|
| Description | The statistics record generated by the DataSignallingChannel NationalIsdn2 Framer component. |

### ATTRIBUTE DataSigChan Ni2 Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE DataSigChan Ni2 Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE DataSigChan Ni2 Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE DataSigChan Ni2 Framer txFrames

| | |
|---|---|
| Description | This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE DataSigChan Ni2 Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |
| Values | Decimal (0..100) |

### COMPONENT DataSigChan Nis (Nis)

### GROUP DataSigChan Nis Layer2Options (L2)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents the provisionable Layer 2 attributes of the Q931 CCITT protocol. |

### ATTRIBUTE DataSigChan Nis t23

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the layer2 enable request timer. |

| | |
|---|---|
| Values | Decimal (1..15) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE DataSigChan Nis t200

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum time between a layer 2 frame and its acknowledgement |
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 2 |

### ATTRIBUTE DataSigChan Nis n200

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of re-transmissions of a layer2 frame. |
| Values | Decimal (1..8) |
| Default | 3 |

### ATTRIBUTE DataSigChan Nis t203

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum time that a no layer 2 traffic situation can last. Expiry triggers a check on whether the far end is a live. |

| | |
|---|---|
| Values | Decimal (2..40) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE DataSigChan Nis n201

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of octets in an information field. |
| Values | Decimal (4..260) |
| Units | octets |
| Default | 260 |

### ATTRIBUTE DataSigChan Nis circuitSwitchedK

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of frames for B channel use. |
| Values | Decimal (1..632) |
| Default | 7 |

### GROUP DataSigChan Nis Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the general options of the d-channel signalling link. |

### ATTRIBUTE DataSigChan Nis layer2HdlcMode

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether the layer 2 HDLC interface is the network or user side of the connection. |
| Values | network<br>user |
| Default | user |

### GROUP DataSigChan Nis Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the signalling protocol. |

### ATTRIBUTE DataSigChan Nis activeChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of currently active channels. This includes data and voice channels. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE DataSigChan Nis peakActiveChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of channels that have been active on this signalling channel during the last polling period. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE DataSigChan Nis dChanStatus (dCh)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of the D-channel.<br>***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX.<br>***establishing*** means that the signalling channel is attempting to stage the layer 2.<br>***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX.<br>***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state then it is waiting for a restart acknowledgement from the PBX.<br>***inService*** means that the resources for processing calls are available.<br>***restarting*** means that the resources for call processing are being rei-initialized. |
| Values | outOfService<br>establishing<br>established<br>enabling<br>inService<br>restarting |
| Default | No default |

### GROUP DataSigChan Nis Tools

| | |
|---|---|
| Properties | Operational |
| Description | This group contains a series of operational attributes which turn on and off several kinds of tracing. |

### ATTRIBUTE DataSigChan Nis tracing

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug |

stream. To see the messages the agentQueue attribute in Col/debug must be greater than 0 and a Telnet NMIS session must list the debug stream in in its data streams (ex. set nmis telnet session/1 dataStreams debug). Different types of tracing can be enabled simultaneously.
Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically reenabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages.

Types of tracing include:
***protocolErrors*** - get details of any protocol errors which are occuring. Protocol errors are also reported in summary form as alarms.
***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).
***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.
***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.
***portHex*** - Messages in hex format being sent and received on the link.

## COMPONENT DataSigChan Nis Framer (Framer)

Groups "GROUP DataSigChan Nis Framer Provisioned (Prov)"
"GROUP DataSigChan Nis Framer OsiState (State)"
"GROUP DataSigChan Nis Framer Statistics (Stats)"

"COLLECTED STATS DataSignallingChannel Nis Framer"

Scope Application

Description

*DataSigChan/n ts014 Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

The e1/ds1 port number of the physical channel linked to the *Framer* component is restricted to 0-3 for all FP including MSA32.

Display

## GROUP DataSigChan Nis Framer Provisioned (Prov)

Properties Provisioned

| | |
|---|---|
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE DataSigChan Nis Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP DataSigChan Nis Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE DataSigChan Nis Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is |

administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE DataSigChan Nis Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE DataSigChan Nis Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP DataSigChan Nis Framer Statistics (Stats)

Properties: Operational

Description: This group contains the operational statistics data for a Framer component.

### ATTRIBUTE DataSigChan Nis Framer aborts

Access: Read only

Description: This attribute counts the total number of aborts received. This count wraps to zero after reaching its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE DataSigChan Nis Framer crcErrors

Access: Read only

Description: This attribute counts the total number of frames with CRC errors. This count wraps to zero after reaching its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE DataSigChan Nis Framer lrcErrors

Access: Read only

Description: This attribute counts the total number of frames with LRC errors. This count wraps to zero after reaching its maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Nis Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames that were non octet aligned.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Nis Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Nis Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Nis Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received which were too large. The frame was longer than 500 bytes.<br>This count wraps to zero after reaching its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DataSigChan Nis Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE DataSigChan Nis Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE DataSigChan Nis Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

## COLLECTED STATS DataSignallingChannel Nis Framer

| | |
|---|---|
| Description | The statistics record generated by the DataSignallingChannel Nis Framer component. |

### ATTRIBUTE DataSigChan Nis Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE DataSigChan Nis Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE DataSigChan Nis Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE DataSigChan Nis Framer txFrames

| | |
|---|---|
| Description | This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE DataSigChan Nis Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |
| Values | Decimal (0..100) |

|---|---|
| Instance | Decimal (1..14) |
| Groups | "GROUP Dcl Provisioned (Prov)"<br>"GROUP Dcl OsiState (State)"<br>"GROUP Dcl Operational (Oper)"<br>"GROUP Dcl Statistics (Stats)" |
| Scope | Application |
| Description | *DcmeLink/n*<br>This component defines the characteristics of a connection to an International Switching Centre (ISC). A *DcmeLink* is a collection of 64 kbit/s channels on the same physical E1 interface. There is one *DcmeLink* per physical link. |
| Subcomponents | "COMPONENT Dcl DataNetworkAddress (Dna)"<br>"COMPONENT Dcl Framer (Framer)" |
| Opt. Subcomp. | "COMPONENT Dcl VoiceService (Vs)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Dcl Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes of a *DcmeLink*. |

### ATTRIBUTE Dcl commentText (cTxt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | Use of this attribute is at the discretion of the system administrator. Typically, it specifies the name of the customer that is using this *DcmeLink*. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Dcl remoteNpi (rnpi)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the Numbering Plan Indicator used for the *remoteDna* attribute of this *DcmeLink*. |
| Values | x121<br>e164 |
| Default | e164 |

### ATTRIBUTE Dcl remoteDna (rdna)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the Data Network Address (DNA) of the remote *DcmeLink*. This is the DNA of the peer *DcmeLink* to which the *DcmeLink* component establishes its Logical Connection (LC). |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Dcl dcme

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the *Dcme* component that this *DcmeLink* belongs to. |
| Values | Link (Service, dcmeLinks) |
| Default | No default |

### ATTRIBUTE Dcl idlePattern

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies an *idlePattern* in the channel received from the E1 interface, which is required to determine if the channel is active or not.<br>When the end of the *idlePattern* is detected it indicates the start of a new speech call.<br>When this *idlePattern* is detected it indicates the end of a speech call.<br>When changing this attribute make sure that the *alternateIdlePattern* signal is set correctly. |
| Values | Hex (H.0..H.ff) |
| Units | Hex |
| Default | H.d5 |

### ATTRIBUTE Dcl alternateIdlePattern

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies an *alternateIdlePattern* in the channel received from the E1 interface, after the end of a 64kbit/s call. |

The value of this attribute should be different than the value of the *idlePattern* attribute only if the ISC is programmed for Even/Odd Bit Inversion (EBI/OBI). This is only the case when the ISC is performing A to Mu or Mu to A Law conversion.
When the end of the *alternateIdlePattern* is detected it indicates the start of a new speech call.

Values: Hex (H.0..H.ff)

Units: Hex

Default: H.d5

### GROUP Dcl OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Dcl adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Dcl operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Dcl usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Dcl Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *DcmeLink* component. |

### ATTRIBUTE Dcl activeSpeechCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of speech calls that are currently in progress on this *DcmeLink*. |
| Values | Decimal (0..30) |
| Default | 0 |

### ATTRIBUTE Dcl active3kHzCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of audio 3.1 kHz calls that are currently in progress on this *DcmeLink*. |
| Values | Decimal (0..30) |
| Default | 0 |

### ATTRIBUTE Dcl active64kCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of unrestricted 64 kbit/s calls that are currently in progress on this *DcmeLink*. |
| Values | Decimal (0..30) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Dcl receivedTrmSignal

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last TRM signal received from the ISC.<br>The received TRM signal can be one of:<br>***Invalid (xxx)***: this signal should never be received,<br>***Switching Centre normal (101)***: this signal is always transmitted by the ISC when there is no other signal to be sent,<br>***Maintenance release ack(110)***: this signal is transmitted by the ISC if it accepts the maintenance release request,<br>***Dcme clear of traffic***: this signal is transmitted by the ISC if it has accepted the maintenance release request signal and now informs the DCME when all circuits are idle, |
| Values | None(000)<br>Invalid (001)<br>Invalid (010)<br>Invalid (011)<br>Invalid (100)<br>Switching Centre normal (101)<br>Maintenance release ack (110)<br>Dcme clear of traffic (111) |
| Default | No default |

### ATTRIBUTE Dcl transmittedTrmSignal

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last TRM signal transmitted to the ISC.<br>The transmitted TRM signal can be one of:<br>***Dcme normal (100)***: , this signal is always transmitted by the DCME when there is no other signal to be sent,<br>***No 64 kbit/s capacity (101)***: this signal is transmitted by the DCME when it is not able to handle new 64 kbit/s call requests,<br>***Maintenance release request(110)***: this signal is transmitted by the DCME when the DCME is to be removed from the service for maintenance, |

***No capacity available (111)*** this signal is transmitted by the DCME when there is bearer capacity available to set up new 3.1 kHz audio or speech calls,

Values
None(000)
Dcme normal(100)
No 64 kbit/s capacity (101)
Maintenance release request (110)
No capacity available (111)

Default
No default

Operational

Description
This group contains statistics for the *DcmeLink* component.

## ATTRIBUTE Dcl totalSpeechCalls

Access
Read: All
Write: Illegal

Description
This attribute counts the total number of speech calls that have been handled by this *DcmeLink*, including rejected calls.
This counter wraps to zero when it exceeds its maximum.

Values
Decimal (0..4294967295)

Default
0

## ATTRIBUTE Dcl total3kHzCalls

Access
Read: All
Write: Illegal

Description
This attribute counts the total number of audio 3.1 kHz calls that have been handled by this *DcmeLink*, including rejected calls.
This counter wraps to zero when it exceeds its maximum.

Values
Decimal (0..4294967295)

Default
0

### ATTRIBUTE Dcl total64kCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of unrestricted 64 kbit/s calls that have been handled by this *DcmeLink*, including rejected calls.<br>This counter wraps to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dcl rejectedSpeechCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of speech calls that have been rejected by this *DcmeLink* because there was no preestablished LC available.<br>This counter wraps to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dcl rejected3kHzCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of audio 3.1 KHz calls that have been rejected by this *DcmeLink* because there was no preestablished LC available.<br>This counter wraps to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dcl rejected64kCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total number of unrestricted 64 kbit/s calls that have been rejected by this *DcmeLink*.<br>This counter wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dcl invalidTrmSignals

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of invalid TRM/Maintenance signals received from the ISC by this *DcmeLink*. The most probable cause of an invalid TRM/Maintenance signal is an invalid ISC provisioning or a transmission error.<br>The invalid bit settings are 000, 001, 010, 011, 100.<br>This counter wraps to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Dcl DataNetworkAddress (Dna)

| | |
|---|---|
| Groups | "GROUP Dcl Dna Address" |
| Scope | Network |
| Description | *DcmeLink/n DataNetworkAddress*<br>This is the description of the DCME link *Dna* component. It includes the attributes which apply to all connections established between *DcmeLink* and its peer *DcmeLink*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Dcl Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | The *Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 |

attributes. The string of address digits is complemented by the type of address or Npi. These attributes are used to interpret the format of the address digits.

### ATTRIBUTE Dcl Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. An address may belong to the X.121 or E.164 numbering plans. X.121 is used in packet switched data networks. |
| Values | x121<br>e164 |
| Default | e164 |

### ATTRIBUTE Dcl Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | The *Dna* attribute contains digits which form a unique identifier of the customer interface. It can be compared (approximation only) to a telephone number where each phone number identifies a unique telephone set. *Dna* digits are selected and assigned by network operators. |
| Values | BCD (1..15) |
| Default | No default |

### COMPONENT Dcl Framer (Framer)

| | |
|---|---|
| Groups | "GROUP Dcl Framer Provisioned (Prov)"<br>"GROUP Dcl Framer OsiState (State)" |
| Scope | Application |
| Description | *DcmeLink/n Framer*<br>The *Framer* component controls link layer framing for application components sending and receiving data on the link interface to the ISC. It is also through the *Framer* that an |

application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as CRC and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Common Verbs

Help
List
Display

## GROUP Dcl Framer Provisioned (Prov)

Properties: Provisioned

Description: This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE Dcl Framer interfaceName

Access: Read and write

Criticality: Process

Description: This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values: Link (Hardware, applicationFramerName)

Default: No default

## GROUP Dcl Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Dcl Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Dcl Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dcl Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### COMPONENT Dcl VoiceService (Vs)

Instance
Decimal (1..31)

Groups
"GROUP Dcl Vs Provisioned (Prov)"
"GROUP Dcl Vs Operational (Oper)"
"GROUP Dcl Vs Statistics (Stats)"
"GROUP Dcl Vs OsiState (State)"

| | |
|---|---|
| Scope | Application |
| Description | *DcmeLink/n DcmeVoiceService/n*<br>The *DcmeVoiceService* component defines the operational characteristics of the connection to a International Switching Centre (ISC). One instance of this component is required for each channel (that is, timeslot) which is part of the *DcmeLink*. |
| Subcomponents | "COMPONENT Dcl Vs Framer (Framer)" |
| Dyn. Subcomp. | "COMPONENT Dcl Vs LogicalConnection (LCo)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Dcl Vs Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of a *DcmeVs* component. |

## ATTRIBUTE Dcl Vs vsType

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the type of calls offered by this *DcmeVs*. If the value ***permanent64kVs*** is selected the 64 kbit/s call is established on the channel associated with this *DcmeVs* upon system activation. If this call is cleared due to the subnet failure it is reestablished again by the DcmeLink. If the value ***dynamicVs*** is selected this channel can be used to establish user selected calls. |
| Values | dynamicVs<br>permanent64kVs |

| | |
|---|---|
| Default | dynamicVs |

### GROUP Dcl Vs Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *DcmeVoiceService* component. |

### ATTRIBUTE Dcl Vs status

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current status of the channel.<br>***idle*** means that there is no call currently active on this channel.<br>***seized*** means that the channel has currently an active call. |
| Values | idle<br>seized |
| Default | No default |

### ATTRIBUTE Dcl Vs callType (ct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the type of call that this channel is currently carrying. If no call is active, then it displays the value for the last call. |
| Values | none<br>speech<br>3.1 kHz<br>64 kbit/s |
| Default | No default |

### ATTRIBUTE Dcl Vs receivedAbBits

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the most recently received AB bits. |

| | |
|---|---|
| Values | None (00)<br>Normal service available (01)<br>3.1 kHz request (10)<br>64 kbit/s request (11) |
| Default | No default |

### ATTRIBUTE Dcl Vs transmittedAbBits

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the AB bits currently being transmitted. |
| Values | None(00)<br>Normal service available (01)<br>Special service ack (10)<br>Channel out of service (11) |
| Default | No default |

### GROUP Dcl Vs Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *DcmeVoiceService* component. |

### ATTRIBUTE Dcl Vs totalCalls (tc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the call attempts processed on this channel (in both directions). This count includes both successful and unsuccessful calls.<br>The value wraps when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dcl Vs totalCallSeconds (tcs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total number of seconds that this channel is handling a call. This is regardless of whether the call is successful or not. In other words, this is the amount of time that the channel is not in the idle state.<br>The value wraps when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Dcl Vs invalidAbBits

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of invalid AB bits signals received from the ISC on this channel. The invalid bit setting is 00.<br>This counter wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Dcl Vs OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Dcl Vs adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively |

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Dcl Vs operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Dcl Vs usageState (osiUsage)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## COMPONENT Dcl Vs Framer (Framer)

| | |
|---|---|
| Groups | "GROUP Dcl Vs Framer Provisioned (Prov)"<br>"GROUP Dcl Vs Framer OsiState (State)"<br>"GROUP Dcl Vs Framer Statistics (Stats)"<br>"GROUP Dcl Vs Framer Operational (Oper)"<br>"GROUP Dcl Vs Framer Negotiation (Neg)" |
| Scope | Device |
| Description | *Vsr/n Svs/n Framer*<br>The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface. The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *E1* or *DS1*).<br>The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component. |

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts).

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dcl Vs Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Dcl Vs Framer Statistics (Stats)

Properties
Operational

Description
This group contains the operational statistics data for a Framer component.

### ATTRIBUTE Dcl Vs Framer totalCells

Access
Read only

Description
This attribute counts the total number of cells received from the interface.
Each cell contains 44 bytes of data from the DS0 channel. Since a DS0 provides data at 64 kbit/s, each cell contains 5.5 ms of audio data.

| | |
|---|---|
| | This data flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer audioCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of cells containing audio data received from the interface while the channel was seized. A CCS channel is always considered to be seized. Audio data includes cells containing voice as well modem audio, but not silence.<br>A cell contains 44 bytes of data from the DS0 channel(5.5 ms).<br>This flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer silenceCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of cells containing silence data received from the interface which was not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the operation of the silence suppression feature or for CAS channels when the ABCD signalling bits go idle.<br>A cell contains 44 bytes of data from the DS0 channel(5.5 ms).<br>This flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the network with LRC errors. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer frmLostInNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which the service knows it did not receive from the network although they were sent in to the network from the far end. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer frmUnderRuns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that a frame was needed but was not available because it had been delayed too long in the network.<br>This error may occur repeatedly if the interface clocks at the two access points to the network are operating at different rates. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer frmDumped

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which have been dumped because the output queue grew too large. This can occur if the clock rate on the incoming interface is faster than the clock rate on the outgoing interface and there are no silence periods to |

| | |
|---|---|
| | absorb the difference, or when a compression rate change occurs. This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer faxRelayCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of fax relay cells sent to the network.<br><br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer modemFaxCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of cells containing modem data received from the interface while the channel was seized. A CCS channel is always considered to be seized. Cells are considered to be modem data if a constant energy level above -25 dBmO is detected for more than 900 ms. An energy level below -36 dBmO for more than 650 ms is required to detect that the modem is no longer present.<br>A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer faxIdleCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of cells containing silent fax data received from the interface which were not forwarded |

into the network, thus saving bandwidth. A channel may go into silence due to the silence Suppression feature or for CAS channels when the ABCD signalling bits go idle.

A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel.

This counter wraps to zero after reaching its maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer frmToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames sent to the network at each encoding rate. Fax relay cells are not included. |

### ATTRIBUTE Dcl Vs Framer tptStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current status of the tandem pass through algorithm. If *tptStatus* is ***operating,*** the tandem pass through algorithm is cutting through a voice switch. If *tptStatus* is ***monitoring***, *negotiatedTandemPassThrough* is ***enabled***, but the tandem pass through algorithm is not cutting through a voice switch. If *tptStatus* is ***disabled***, *negotiatedTandemPassThrough* is ***disabled***. |
| Values | operating<br>monitoring<br>disabled |
| Default | No default |

## GROUP Dcl Vs Framer Negotiation (Neg)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes indicating the results of voice networking end to end negotiation. |

## ATTRIBUTE Dcl Vs Framer negotiatedSilenceSuppression (nSilenceSuppression)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the result of negotiating silence suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp silenceSuppression*.<br><br>If *negotiatedSilenceSuppression* is ***off***, silence suppression is never performed.<br>If *negotiatedSilenceSuppression* is ***on***, silence suppression is always performed.<br>If *negotiatedSilenceSuppression* is ***congested***, silence suppression is performed only when the network is congested.<br>If *negotiatedSilenceSuppression* is ***slow***, silence suppression begins after 10 to 20 seconds without any speech or audio being detected.<br>If *negotiatedSilenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are applied. |
| Values | off<br>on<br>congested<br>slow<br>slowAndCongested |
| Default | No default |

## ATTRIBUTE Dcl Vs Framer negotiatedFisG711G726 (nFisG711G726)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the result of negotiating G.711/G.726 fax idle suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp faxIdleSuppressionG711G726*. |

| | |

### ATTRIBUTE Dcl Vs Framer negotiatedDtmfRegeneration (nDtmfRegeneration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the result of negotiating DTMF regeneration with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp dtmfRegeneration*.<br><br>If *negotiatedDtmfRegeneration* is ***on***, DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is generated before being sent to the link.<br><br>If *negotiatedDtmfRegeneration* is ***off***, DTMF tones are transported transparently. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Dcl Vs Framer negotiatedV17AsG711G726 (nV17AsG711G726)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates how this *SwitchedVoiceService* negotiates with V.17 fax machines, as determined by negotiation with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp v17EncodedAsG711G726*.<br><br>If *negotiatedV17AsG711G726* is ***no,*** V.17 fax machines are instructed to use V.29, and V.29 fax traffic sent by fax machines is demodulated and encoded using fax relay.<br><br>If *negotiatedV17AsG711G726* is ***yes***, V.17 fax machines are permitted to use V.17 and V.17 fax traffic sent by fax machines is |

encoded using G.711 or G.726, at the rates given in *negotiatedRates*.

Values
yes
no

Default
No default

### ATTRIBUTE Dcl Vs Framer negotiatedTandemPassThrough (nTpt)

Access
Read only

Description
This attribute indicates the result of negotiating tandem pass through with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp tandemPassThrough*.

Values
enabled
disabled

Default
No default

### ATTRIBUTE Dcl Vs Framer negotiatedEncoding (nEncoding)

Access
Read and write

Description
This attribute indicates the results of negotiating audio call encodings for ***voice***, ***modemFax*** and ***fax*** traffic with the remote end across the subnet. The parameters used for negotiating with the remote end are provisioned in *Vncs Vp voiceEncodingChoice* and *Vncs Vp modemFaxEncodingChoice*.

***voice*** traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ***modemFax*** traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. ***fax*** traffic is all traffic after a fax preamble but before speech or call release.

***g711*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 is the negotiated encoding.
***g726*** indicates that Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 is the negotiated encoding.
***g711G726*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 and Adaptive Differential Pulse Code

Modulation (ADPCM) defined by ITU-T G.726 are both negotiated encodings. If *negotiatedEncoding* is ***g711G726***, the actual encoding performed can be either G.711 or G.726, depending on network congestion.
***g728*** indicates that Low Delay Coded Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.728 is the negotiated encoding.
***g729*** indicates that Conjunctive Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.729 is the negotiated encoding.
***v29V27Relay*** indicates that fax relay using ITU-T V.29 or ITU-T V.27 is the negotiated encoding.
***v17V29V27Relay*** indicates that fax relay using ITU-T V.17, ITU-T V.29, or ITU-T V.27 is the negotiated encoding.

If all negotiated encodings are ***none***, the negotiation of audio call encodings is not complete.

### VERB RERoute Dcl Vs LCo

| | |
|---|---|
| Impact | Service |
| Description | RERoute ..Lc<br>This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified.<br>This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively.<br><br>When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path.<br><br>If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent. |

### GROUP Dcl Vs LCo PathData

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all operational attributes for the path oriented LCo. |

### ATTRIBUTE Dcl Vs LCo state

| | |
|---|---|
| Access | Read only |
| Description | This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal |

operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.

Values
pathDown
selectingRoute
connecting
pathUp
pathDownRetrying

Default
No default

### ATTRIBUTE Dcl Vs LCo overrideRemoteName (orn)

Access
Read: All
Write: All

Description
If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.

Values
String (0..40, ASCII)

Default
""

### ATTRIBUTE Dcl Vs LCo end

Access
Read only

Description
This attribute identifies whether this is the calling or called end of the path.

Values
calling
called

Default
No default

### ATTRIBUTE Dcl Vs LCo costMetric (cost)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo delayMetric (delay)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond.<br>For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic.<br>For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip |

| | |
|---|---|
| | delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC.<br>When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond. |
| Values | Decimal (0..200000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo setupPriority (spri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo holdingPriority (hpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType***,** will be candidates for this connection. |

| | |
|---|---|
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo permittedTrunkTypes (pttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo requiredSecurity (rsec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* |

attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.*

Values: Decimal (0..7)

Default: No default

### ATTRIBUTE Dcl Vs LCo requiredCustomerParameter (rcparm)

Access: Read only

Description: This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.

Values: Decimal (0..7)

Default: No default

### ATTRIBUTE Dcl Vs LCo emissionPriority (epri)

Access: Read only

Description: This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).

Values: Decimal (0..2)

Default: No default

### ATTRIBUTE Dcl Vs LCo discardPriority (dpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically). |
| Values | Decimal (1..3) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo pathType (pType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).<br><br>The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself. |
| Values | normal<br>manual<br>forced |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo retryCount (rcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology.<br>This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo pathFailureCount (pfcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo reasonForNoRoute (rnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason |

***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

### ATTRIBUTE Dcl Vs LCo lastTearDownReason

Access

Read only

Description

This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:
***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up.
***normalShutDown*** - This path has gone down due to normal call termination.
***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.

***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
***trunkCardFailure***- A trunk FP card has failed along the path.
***accessCardFailure***- The FP on which the peer access service was running has failed.
***operatorForced***- The path has terminated due to the operator locking a trunk along the path.
***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
***networkCongestion*** - The path has failed due to control information being lost and not recoverable.
***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name.
***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid.
***unknownReason*** - The failure was not resolved.
***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled.
***remoteNameMismatch*** - The remote end has alarmed and rejected this setup due to remoteName provisioning.
***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.
***reconnectFromFarEnd*** - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.

***bumped*** - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
***optimized*** - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
***trunkOrFarEndDidNotSupportMode*** - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

### ATTRIBUTE Dcl Vs LCo pathFailureAction

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.<br>With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.<br><br>All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends |
| Values | reRoutePath<br>disconnectConnection |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo bumpPreference (bpref)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority*. A connection may also always bump in order to obtain the best route. |

| | |
|---|---|
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo optimization (opt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval. |
| Values | disabled<br>enabled |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo pathUpDateTime

| | |
|---|---|
| Access | Read: Service<br>Write: Illegal |
| Description | This is the time stamp when the current path was established or reestablished. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo path

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the trunk component names over which the path has been instantiated and the remote end point name terminating the path. |
| List of | String (0..40, ASCII) |
| List Size | 21 |

| | |
|---|---|
| Default | No default |

### GROUP Dcl Vs LCo Statisitics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics attributes for the path oriented LCo. |

### ATTRIBUTE Dcl Vs LCo pktsToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets transmitted to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo bytesToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo pktsFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote LCo via the network. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dcl Vs LCo bytesFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the remote LCo via the network. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

| Description | *Dcme/n*<br>This component defines the common characteristics of a set of connections to an International Switching Centre (ISC) equipment. |
| Subcomponents | "COMPONENT Dcme Profile" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Dcme Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of a *Dcme* component. |

## ATTRIBUTE Dcme commentText (cTxt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | Use of this attribute is at the discretion of the system administrator. Typically, it specifies the name of the customer that is using this *Dcme*. |
| Values | String (0..40, ASCII) |
| Default | "" |

## ATTRIBUTE Dcme preestablishedConnections (pCon)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of Logical Connections (LC) preestablished between each *DcmeLink* associated with this *Dcme* and its remote peer, that are established beyond those that are required to carry established connections. Those are the standby LCs to be used for the subsequent user speech or audio 3.1 kHz calls. This attribute should be set to the number of speech and audio 3.1 kHz calls expected in a typical burst of calls received from the ISC on one *DcmeLink*. |
| Values | Decimal (1..30) |
| Default | 5 |

## ATTRIBUTE Dcme trmThreshold (tThresh)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute is used to determine when the *DcmeLink* may be unable to handle incoming calls from the ISC. If the Dcme fails to replenish the number of preestablished connections the “No trunk(s) available for 3.1 kHz audio or speech” TRM signal is sent to the ISC. |
| Values | Decimal (0..30) |
| Default | 1 |

### ATTRIBUTE Dcme trmSignalChangeInterval (tScl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a minimum time interval between TRM signal change from “No trunk(s) available for 3.1 kHz audio or speech” or “No 64 kbit/s capacity available” to “DCME normal” signal. |
| Values | Decimal (10..300) |
| Units | seconds |
| Default | 20 |

### ATTRIBUTE Dcme speechAlarmThreshold (sat)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how many normal speech calls can be rejected by one *dcmeLink* within the *alarmTimeInterval* time before a SET alarm is generated. This alarm is cleared when the number of rejected speech calls is less than *speechAlarmThreshold* in a subsequent interval.<br>If the value is 0 the rejected speech calls are not monitored. |
| Values | Decimal (0..1000) |
| Default | 0 |

### ATTRIBUTE Dcme audio3kHzAlarmThreshold (aat)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how many audio 3.1 kHz calls can be rejected by one *dcmeLink* within the *alarmTimeInterval* time before a SET alarm is generated. This alarm is cleared when the number of rejected audio 3.1 kHz calls is less than *audio3kHzAlarmThreshold* in a subsequent interval.<br>If the value is 0 the rejected audio 3.1 kHz calls are not monitored. |

| | |
|---|---|
| Values | Decimal (0..1000) |
| Default | 0 |

### ATTRIBUTE Dcme unrestricted64kAlarmThreshold (uat)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how many unrestricted 64 kbit/s calls can be rejected by one *dcmeLink* within the *alarmTimeInterval* time before a SET alarm is generated. This alarm is cleared when the number of rejected unrestricted 64 kbit/s calls is less than *unrestricted64kAlarmThreshold* in a subsequent interval.<br>If the value is 0 the rejected unrestricted 64 kbit/s calls are not monitored. |
| Values | Decimal (0..1000) |
| Default | 0 |

### ATTRIBUTE Dcme alarmTimeInterval (ati)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time interval within which the rejected speech calls, audio 3.1 kHz calls, and unrestricted 64 kbit/s calls are monitored. It is used in the conjunction with the *speechAlarmThreshold*, *audio3kHzAlarmThreshold*, and *unrestricted64kAlarmThreshold* attributes. |
| Values | Decimal (0..120) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Dcme maxUnrestricted64kCalls (umax)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the maximum number of simultaneous dynamic unrestricted 64 kbit/s calls that can be established. A value of 0 means that no dynamic unrestricted 64 kbit/s calls can be established. |
| Values | Decimal (0..420) |
| Default | 420 |

### ATTRIBUTE Dcme dcmeLinks (dLinks)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies all of the *DcmeLink*s which are associated with this *Dcme*. There can be up to 14 *DcmeLinks* associated with one *Dcme*. |
| List of | Link (Service, dcme) |
| List Size | 14 |
| Default | No default |

### GROUP Dcme OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Dcme adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Dcme operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dcme usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Dcme Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Dcme* component. |

### ATTRIBUTE Dcme activeDcmeLinks

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates all of the *DcmeLink* components that are currently active and have registered with this *Dcme*. |
| List of | The name of the component |
| List Size | 14 |
| Default | No default |

### GROUP Dcme Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics maintained by this *Dcme*. |

### ATTRIBUTE Dcme trm64kNotAvailable

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total number of times the TRM signal was changed to the “No 64 kbit/s capacity available” signal. This counter wraps to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dcme trmSpeechNotAvailable

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times the TRM signal was<br>changed to the “No trunk(s) available for 3.1 kHz audio or speech” signal.<br>This counter wraps to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Dcme Profile

| | |
|---|---|
| Groups | "GROUP Dcme Profile LogicalConnectionOptions (LCOps)"<br>"GROUP Dcme Profile FramerOptions (FrOps)" |
| Scope | Application |
| Description | *Dcme/n DcmeProfile*<br>This component defines the ISC interface characteristics of the *Dcme* component. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Dcme Profile LogicalConnectionOptions (LCOps)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes used in setting up Switched Logical Connections (SLC) over the network using the Path |

Oriented Routing System (PORS) between two peer *DcmeLink* components.

### ATTRIBUTE Dcme Profile setupPriority (spri)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | 2 |

### ATTRIBUTE Dcme Profile holdingPriority (hpri)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the priority that a path holds once it is established. Zero is the highest priority and four is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | 2 |

## ATTRIBUTE Dcme Profile bumpPreference (bpref)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *setupPriority* in order to acquire its bandwidth and be established. If *bumpPreference* is ***bumpWhenNecessary***, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. If *bumpPreference* is ***bumpToObtainBestRoute,*** bumping occurs in order to use the best available route it may have. |
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | bumpWhenNecessary |

## ATTRIBUTE Dcme Profile requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection. |

| | |
|---|---|
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | voice |

### ATTRIBUTE Dcme Profile permittedTrunkTypes (pttyp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies up to eight types of trunks that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types are defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS chooses only trunks whose *trunkType*s are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | (terrestrial, satellite, trunkType1, trunkType2, trunkType3) |

### ATTRIBUTE Dcme Profile requiredSecurity (rsec)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.* |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Dcme Profile requiredCustomerParm (rcparm)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the allowed customer defined parameter of the trunks on the route. The value of *requiredCustomerParm* ranges from 0 to 7. The meaning of each value is specific to a particular network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path. |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Dcme Profile pathAttributeToMinimize (pamin)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. |

The delay of a selected route is the sum of the trunk delay metrics for all trunks included in the route.

Values
cost
delay

Default
cost

### ATTRIBUTE Dcme Profile maximumAcceptableCost (maxCost)

Access
Read: All
Write: All

Criticality
Process

Description
This attribute specifies an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done for any minimization criterion. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.

Values
Decimal (0..65535)

Default
1280

### ATTRIBUTE Dcme Profile maximumAcceptableDelay (maxDelay)

Access
Read: All
Write: All

Criticality
Process

Description
This attribute specifies an upper bound on the delay of a route, which is the sum of the delays of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512-byte packet. During its staging, a trunk measures a *measuredRoundTripDelay*. This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database.

| | |
|---|---|
| | The value includes emission, propagation, and queuing delays. A 512-byte packet is used to perform the measurement.<br>If for any trunk the half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection.<br>While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay.* |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | 100000 |

### ATTRIBUTE Dcme Profile emissionPriority (epri)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the urgency with which packets on the path are emitted by the trunks on the route. An *emissionPriority* of 0 indicates the highest emission priority, while 2 indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets with a lower *emissionPriority* (or numerically higher). |
| Values | Decimal (0..2) |
| Default | 0 |

### ATTRIBUTE Dcme Profile discardPriority (dpri)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the importance of the packets on the path. A *discardPriority* of 1 is used for paths carrying the most important traffic, and three is used for paths carrying the least |

important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).

Values: Decimal (1..3)

Default: 1

### ATTRIBUTE Dcme Profile pathFailureAction (pfa)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies whether the application can tolerate momentary interruption of a path while a new path is selected. If *pathFailureAction* is ***disconnectConnection***, the application is informed as soon as possible about a failure by disconnection. If *pathFailureAction* is ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails, the application is informed of the failure.
If *pathFailureAction* is ***reRoutePath***, the *LCo* may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.
All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option has the desired effect that the path is rerouted without complete disconnection at both ends.

Values: reRoutePath
disconnectConnection

Default: reRoutePath

### ATTRIBUTE Dcme Profile optimization (opt)

Access: Read: All
Write: All

Criticality: Process

| | |
|---|---|
| Description | This attribute specifies whether this connection should attempt to optimize its path when requested by the *Rtg Pors* component. Every path is optimal when it is established, but as network traffic patterns and configurations change this path may no longer be optimal. The PORS connection manager on a module requests circuits to optimize at the *optimizationInterval*. |
| Values | disabled<br>enabled |
| Default | enabled |

## GROUP Dcme Profile FramerOptions (FrOps)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes which define how audio data will be carried across the Passport network. |

## ATTRIBUTE Dcme Profile voiceEncoding

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the encoding of voice traffic.<br><br>A *voiceEncoding* setting of ***g711G726*** specifies that either pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726 is used to encode voice traffic. The actual encoding performed depends on congestion in the network and the settings of *minVoiceG711G726Rate* and *maxVoiceG711G726Rate*. If *voiceEncoding* is ***g711G726***, the bit rate of voice traffic can change during a call due to congestion in the network. In this case, the minimum and maximum rates that can occur during a call are specified by *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* respectively. If *voiceEncoding* is ***g711G726***, *minVoiceG711G726Rate* is ***64*** and *maxVoiceG711G726Rate* is ***64***, G.711 (PCM) encoding is always performed on voice traffic on this channel and all voice traffic is carried uncompressed at 64 kbit/s. |

A *voiceEncoding* setting of ***g728at16*** specifies that the Low Delay Coded Excited Linear Predictive Coder (LD-CELP) algorithm defined by ITU-T G.728 is always performed on voice traffic. If *voiceEncoding* is ***g728at16***, the bit rate of all voice traffic is fixed at 16 kbit/s. The *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* attributes do not apply if *voiceEncoding* is ***g728at16***.

A *voiceEncoding* setting of ***g729at8*** indicates that the Conjugated Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) algorithm defined by ITU-T G.729 is always performed on voice traffic. If *voiceEncoding* is ***g729at8***, the bit rate of all voice traffic is fixed at 8 kbit/s. The *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* attributes do not apply if *voiceEncoding* is ***g729at8***.

Values
g711G726
g728at16
g729at8

Default
g728at16

### ATTRIBUTE Dcme Profile maxVoiceG711G726Rate (maxVoiceBitRate)

Access
Read and write

Criticality
Process

Description
This attribute specifies the maximum possible bit rate (minimum possible compression rate) during a voice call on this channel when *voiceEncoding* is ***g711G726***. It applies only to voice traffic, not modem or fax traffic. It also applies only if *voiceEncoding* is ***g711G726***.

If *voiceEncoding* is ***g711G726***, the bit rate of voice traffic can change during a call due to congestion in the network. In this case, the minimum and maximum rates that can occur during a call are specified by *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* respectively. If *voiceEncoding* is ***g711G726***, *minVoiceG711G726Rate* is ***64*** and *maxVoiceG711G726Rate* is ***64***, the G.711 (PCM) algorithm is always performed on voice traffic on this channel and all voice traffic is carried uncompressed at 64 kbit/s.

| | |
|---|---|
| Values | 64<br>32<br>24 |
| Units | kbit/s |
| Default | 64 |

### ATTRIBUTE Dcme Profile minVoiceG711G726Rate (minVoiceBitRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the minimum possible bit rate (maximum possible compression rate) during a voice call on this channel when *voiceEncoding* is ***g711G726***. It applies only to voice traffic, not modem or fax traffic. It also applies only if *voiceEncoding* is ***g711G726***.<br><br>If *voiceEncoding* is ***g711G726***, the bit rate of voice traffic can change during a call due to congestion in the network. In this case, the minimum and maximum rates that can occur during a call are specified by *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* respectively. If *voiceEncoding* is ***g711G726***, *minVoiceG711G726Rate* is ***64*** and *maxVoiceG711G726Rate* is ***64***, the G.711 (PCM) algorithm is always performed on voice traffic on this channel and all voice traffic is carried uncompressed at 64 kbit/s. |
| Values | 64<br>32<br>24 |
| Units | kbit/s |
| Default | 64 |

### ATTRIBUTE Dcme Profile voiceTrafficOptimization

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies how to optimize voice traffic. If *voiceTrafficOptimization* is ***bandwidth***, voice traffic is optimized to preserve bandwidth. If *voiceTrafficOptimization* is ***delay***, voice traffic is optimized to minimize delay. |
| Values | bandwidth<br>delay |
| Default | bandwidth |

### ATTRIBUTE Dcme Profile silenceSuppression

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies when silence suppression is performed. It applies to both voice and modem calls.<br>If *silenceSuppression* is ***off***, silence suppression is never performed.<br>If *silenceSuppression* is ***on***, silence suppression is always performed.<br>If *silenceSuppression* is ***congested***, silence suppression is performed only when the network is congested.<br>If *silenceSuppression* is ***slow***, silence suppression begins after 10 to 20 seconds without any detected speech or modem traffic.<br>If *silenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are applied. |
| Values | off<br>on<br>congested<br>slow<br>slowAndCongested |
| Default | on |

### ATTRIBUTE Dcme Profile silenceSuppressionFactor

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the expected savings (percent reduction) in required bandwidth if silence suppression is used. If silence suppression is used, the bandwidth required for the connection will be lower than if silence suppression is not used. However, the routing system will not be aware of the unused bandwidth unless that bandwidth is specified by this attribute.<br>If the value specified for the expected savings is too low, then some bandwidth made available by the use of silence suppression will be wasted. If the value specified for the expected savings is too high, then some connections may fail to set up because the routing system will over-calculate the amount of bandwidth available.<br>The effectiveness of silence suppression can be influenced by language related speech patterns. |
| Values | Decimal (0..60) |
| Units | % |
| Default | 40 |

### ATTRIBUTE Dcme Profile echoCancellation

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether echo cancellation is performed on calls using this profile as specified by ITU-T G.165. It applies mainly to voice traffic. Echo cancellation is usually (but not always) disabled during modem and fax calls. If *echoCancellation* is ***on***, the traffic that is echo cancelled is determined by ITU-T G.165. |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Dcme Profile modemFaxEncoding (faxEncoding)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies how modem and fax traffic is encoded. Modem and fax traffic are identified by an inband 2100 Hz tone. Prior to the detection of a 2100 Hz tone, all traffic is handled according to *voiceEncoding*.<br><br>If *modemFaxEncoding* is ***useVoiceEncoding***, 2100 Hz tones are not detected on the channel. In this case, the channel does not differentiate between modem and fax traffic and voice traffic. All traffic is handled according to *voiceEncoding*. If *voiceEncoding* is ***g728at16*** or ***g729at8***, modem and fax calls will not work.<br><br>If a 2100 Hz tone is detected and *modemFaxEncoding* is ***g711G726***, all subsequent traffic during a call is encoded using pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726. When the 2100 Hz tone is detected, traffic is initially encoded at the rate specified by *maxModemFaxG711G726Rate*. For the duration of the call, the bit rate can change due to network congestion. In this case, the minimum and maximum rates that can occur during the call are specified by *minModemFaxG711G726Rate* and *maxModemFaxG711G726Rate* respectively.<br><br>If a 2100 Hz tone is detected and *modemFaxEncoding* is ***faxRelayG711G726***, encoding switches to G.711 or G.726 at the rate specified in *maxModemFaxG711G726Rate*, exactly as it does if *modemFaxEncoding* is ***g711G726***. Until a fax preamble is detected, the rate may fluctuate between *maxModemFaxG711G726Rate* and *minModemFaxG711G726Rate* due to network congestion, exactly as it does if *modemFaxEncoding* is ***g711G726***. If a fax preamble is detected, all subsequent traffic during a call is demodulated and sent through the network as cells at the base rate of the sending machine. Supported demodulation methods are V.29 (up to 9.6 kbit/s) and V.27 (up to 4.8 kbit/s). The |

modulation and demodulation of fax traffic is called “fax relay”.

If a 2100 Hz tone is detected and *modemFaxEncoding* is ***faxRelayOnly***, this channel does not wait for a fax preamble to switch to “fax relay”. Instead, “fax relay” is entered immediately. If *modemFaxEncoding* is ***faxRelayOnly***, modem calls do not work on this *Dcme*. Therefore, this setting is only appropriate if modem calls are not made on the channel.

The ***faxRelay*** feature is required to set *modemFaxEncoding* to ***faxRelayG711G726*** or ***faxRelayOnly***.

*modemFaxEncoding* must have the same value at both ends of a *Dcme*. If *modemFaxEncoding* is not provisioned with the same values at both ends of a *Dcme*, the *Dcme* will not be able to carry the modem and fax traffic successfully.

Values
g711G726
faxRelayOnly
faxRelayG711G726
useVoiceEncoding

Default
faxRelayOnly

### ATTRIBUTE Dcme Profile maxModemFaxG711G726Rate (maxModemBitRate)

Access
Read: Passive
Write: Service

Criticality
Process

Description
This attribute specifies the maximum possible bit rate (minimum possible compression rate) during a modem call on this channel. It also specifies the maximum possible bit rate (minimum possible compression rate) during a fax call on this channel, but only if *faxEncoding* is ***g711G726***. *maxModemFaxG711G726Rate* always applies to modem traffic, and never applies to voice traffic. If *faxEncoding* is ***g711G726***, maxModemFaxG711G726Rate also applies to fax traffic. If *faxEncoding* is ***faxRelay***, *maxModemFaxG711G726Rate* does not apply to fax traffic.
Rates can change during a call due to congestion in the network.

| | |
|---|---|
| Values | 64<br>32 |
| Units | kbit/s |
| Default | 64 |

### ATTRIBUTE Dcme Profile minModemFaxG711G726Rate (minModemBitRate)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the minimum possible bit rate (maximum possible compression rate) during a modem call on this channel. It also specifies the minimum possible bit rate (maximum possible compression rate) during a fax call on this channel, but only if *faxEncoding* is ***g711G726***. *minModemFaxG711G726Rate* always applies to modem traffic, and never applies to voice traffic. If *faxEncoding* is ***g711G726***, *minModemFaxG711G726Rate* also applies to fax traffic. If *faxEncoding* is ***faxRelay***, *minModemFaxG711G726Rate* does not apply to fax traffic.<br>Rates can change during a call due to congestion in the network. |
| Values | 64<br>32 |
| Units | kbit/s |
| Default | 64 |

### ATTRIBUTE Dcme Profile faxIdleSuppressionG711G726

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies whether fax idle suppression is performed on fax traffic on calls using this profile. It only applies to fax traffic, not voice or modem traffic. It also only applies if fax traffic is carried using G.711 or G.726. |

| | |
|---|---|
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Dcme Profile insertedOutputDelay

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the amount of added output delay used to compensate for cross network delay variations. It applies to voice, modem and fax traffic. It is required to add output delay so that the statistical variation in the transit time of cells crossing the network does not cause gaps in speech. Backbone networks where high priority traffic consumes a high percentage of trunk bandwidth will require a higher *insertedOutputDelay* to compensate for the greater cell delay variation (CDV). |
| Values | 5<br>15<br>22<br>30<br>35<br>40<br>45<br>50<br>75<br>100<br>125<br>150 |
| Units | msec |
| Default | 22 |

### ATTRIBUTE Dcme Profile ingressAudioGain

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the gain in dB that is applied to data coming from outside the network before it is transferred across the network. It applies to voice, modem and fax traffic. For example, ingress gain is applied to audio data coming from a PBX. If *ingressAudioGain* is negative, a loss is applied.<br><br>*ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in a network to ensure that the signal level from any point in the network to any other point is correct. |
| Values | Signed (-12..12) |
| Units | dB |
| Default | 0 |

### ATTRIBUTE Dcme Profile egressAudioGain

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the gain in dB that is applied to data leaving the network on this route. It applies to voice, modem and fax traffic. For example, egress gain is applied to audio data going to a PBX. If *egressAudioGain* is negative, a loss is applied.<br><br>*ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in the network to ensure that the signal level from any point in the network to any other point is correct. |
| Values | Signed (-12..12) |
| Units | dB |
| Default | 0 |

## ATTRIBUTE Dcme Profile speechHangoverTime

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the time after the end of speech before silence suppression starts. It applies only to voice traffic.<br><br>Higher values of *speechHangoverTime* reduce undesirable clipping but increase bandwidth usage. |
| Values | Decimal (10..500) |
| Units | msec |
| Default | 150 |

## ATTRIBUTE Dcme Profile comfortNoiseCap

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the maximum level at which comfort noise is generated. The comfort noise is limited by *comfortNoiseCap* before *egressAudioGain* is applied. The default value of ***-40*** dBm0 equates to the maximum level of comfort noise available and effectively disables the *comfortNoiseCap*. |
| Values | Signed (-78; -65; -60; -54; -52; -50; -48; -46; -44; -42; -40) |
| Units | dBm0 |
| Default | -40 |

## ATTRIBUTE Dcme Profile modemFaxSpeechDiscrim (fsd)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies whether this *Dcme* differentiates between modemFax traffic and speech. If *modemFaxSpeechDiscrim* is ***on*** and a false 2100 Hz tone is detected, any *Vs* under this *Dcme* reverts to speech mode when speech is detected. |
| Values | on<br>off |
| Default | on |

### ATTRIBUTE Dcme Profile v17EncodedAsG711G726

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies how services using this *Profile* negotiate with V.17 fax machines. This attribute is not used unless the ***modemFaxEncoding***, defined in this *Profile*, is ***faxRelayG711G726***<br><br>If *v17EncodedAsG711G726* is ***no,*** V.17 fax machines are instructed to use V.29 and V.29 fax traffic sent by fax machines is demodulated and encoded using fax relay.<br><br>If *v17EncodedAsG711G726* is ***yes***, V.17 fax machines are permitted to use V.17 and V.17 fax traffic sent by fax machines is encoded using G.711 or G.726. The actual encoding performed depends on the *minModemFaxG711G726Rate* and *maxModemFaxG711G726Rate*, available in this *Profile*. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Dcme Profile dtmfRegeneration (detGen)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the DTMF regeneration parameter used during negotiation with the remote end across the subnet. |

| | |
|---|---|
| | If *dtmfRegeneration* is ***on***, it is desired that DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is desired to be generated before being sent to the link.<br><br>If *dtmfRegeneration* is ***off***, it is desired that DTMF tones are transported transparently as audio. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Dcme Profile maxFaxRelayRate

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the maximum desired fax relay rate. This attribute only applies if *modemFaxEncoding* is ***faxRelayOnly*** or ***faxRelayG711G726***. |
| Values | Decimal (2.4; 4.8; 7.2; 9.6; 12.0; 14.4) |
| Units | kbit/s |
| Default | 14.4 |

# COMPONENT DualLpEquipmentProtection (Dlep)

| | |
|---|---|
| Instance | Decimal (0..7) |
| Groups | "GROUP Dlep CustomerIdentifierData (CidData)"<br>"GROUP Dlep Provisioned (Prov)"<br>"GROUP Dlep OsiState (State)"<br>"GROUP Dlep Operational (Op)" |
| Scope | Device |
| Description | *DualLpEquipmentProtection/n*<br><br>This component provides the sparing capabilities for electrical ports and server-type applications when using a dual *LP* sparing model. An example of when you would use this component is when you have electrical and optical ports on the same FP. In this situation, *Dlep* is used as the parent component for the spared electrical ports, rather than the *LP/#*. |
| Opt. Subcomp. | "COMPONENT Dlep DS1"<br>"COMPONENT Dlep VoiceServicesProcessor (Vsp)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Dlep CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Dlep customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Dlep Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *DualLpEquipmentProtection* component. |

### ATTRIBUTE Dlep mainLp

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies one of the *Lp*s of an *Lp* pair. A value must be provided for this attribute, and an *Lp* may only be associated |

| | |
|---|---|
| | with one *Dlep* component. Each of the *Lp*s must link to only one card, that is, *spareCard* is not allowed to be set on either *Lp*. Each *Lp* must have the same *LogicalProcessorType*. The *cardType* attribute must be identical for both cards. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Dlep spareLp

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies one of the *Lp*s of an *Lp* pair. A value must be provided for this attribute, and an *Lp* may only be associated with one *Dlep* component. Each of the *Lp*s must link to only one card, that is, *spareCard* is not allowed to be set on either *Lp*. Each *Lp* must have the same *LogicalProcessorType*. The *cardType* attribute must be identical for both cards. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Dlep linkToApplications

| | |
|---|---|
| Access | Read only |
| Description | This attribute allows server-type applications to link themselves to the *Dlep* component, and be spared between the *mainLp* attribute and the *spareLp attribute*. |
| List of | Link |
| List Size | 256 |
| Default | No default |

### GROUP Dlep OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each |

attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Dlep adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Dlep operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dlep usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Dlep availabilityStatus (osiAvail)

Access
Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is

one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Dlep proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn’t initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has

not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Dlep controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but

tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Dlep alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Dlep standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the

role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Dlep unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Dlep Operational (Op)

Properties
Operational

Description
This group contains the operational attribute for the *DualLpEquipmentProtection* component.

### ATTRIBUTE Dlep activeLp

Access
Read only

Description
This attribute identifies which *Lp* is currently providing service..

Values
The name of the component

| | |
|---|---|
| Default | No default |

## COMPONENT Dlep DS1

| | |
|---|---|
| Instance | Decimal (0..7) |
| Groups | "GROUP Dlep DS1 Provisioned (Prov)"<br>"GROUP Dlep DS1 CustomerIdentifierData (CidData)"<br>"GROUP Dlep DS1 AdminInfo (AdminInfo)"<br>"GROUP Dlep DS1 IfEntryProv (IfEntry)"<br>"GROUP Dlep DS1 OperationalStatus (OperStatus)"<br>"GROUP Dlep DS1 OsiState (State)"<br>"GROUP Dlep DS1 Operational (Oper)"<br>"GROUP Dlep DS1 Statistics (Stats)" |
| Scope | Application |
| Description | *Lp/n DS1/n*<br>The *DS1* component controls and monitors a DS1 port on a Function Processor. The number of ports supported depends on the type of card, and is usually encoded in the *Shelf Card/n cardType*, for example 4pDS1Aal1: 4 port. The lowest instance value is always ***0***.<br><br>Multi-Service cards have an instance range 0..31, except that instance values 30 and 31 are not available for an “ATM UNI port”. (A DS1 “ATM UNI port” is a *DS1* component with a single *Chan* whose *applicationFramerName* attribute is linked to an *AtmIf* component.)<br><br>The instance number of a *DS1* “ATM UNI port” must not be the same as the instance number of an *IMA* group under the same *Lp*. |

## GROUP Dlep DS1 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for a DS1 component. |

## ATTRIBUTE Dlep DS1 lineType (lineType)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the framing of the DS1 line.<br>***d4*** defines a framing pattern of 12 frames per multiframe.<br>***esf*** defines a framing pattern of 24 frames per multiframe.<br>***d4Cas*** defines a framing pattern of 12 frames per multiframe with channel associated signalling.<br>***esfCas*** defines a framing pattern of 24 frames per multiframe with channel associated signalling.<br>***unframed*** defines an unknown framing pattern for clear channels.<br><br>For cell-based cards only the default option ***esf*** is permitted. |
| Values | d4<br>esf<br>d4Cas |

| | |
|---|---|
| | esfCas<br>unframed |
| Default | esf |

### ATTRIBUTE Dlep DS1 zeroCoding (zeroCoding)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute defines the zero encoding on the DS1 line.<br>***bit7Stuffing*** sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8.<br>***b8zs*** substitutes a pattern of bipolar violations if more than 7 zeros in a row are to be transported.<br>***ami*** specifies Alternate Mark Inversion, in which successive marks (ones) alternate between positive and negative polarity voltage signals, and spaces (zeros) are sent as a zero amplitude signal.<br>When *zeroCoding* is set to ***ami*** and l*ineType* is set to ***d4***, it is recommended that *raiAlarmType* be set to ***SBit*** in order to avoid possible mimic RAI alarm.<br><br>For cell-based cards, only the default value ***b8zs*** is permitted.<br><br>The value *ami* should be used with caution. If the ones density of the traffic is not sufficiently high, the DS1 will lose clock synchronization. |
| Values | bit7Stuffing<br>b8zs<br>ami |
| Default | b8zs |

### ATTRIBUTE Dlep DS1 clockingSource (clockingSource)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the source of the transmit clock for the DS1 line. |

When ***local*** is selected, the crystal on the port generates the clocking for the line.

When ***line*** is selected, the port synchronizes to the clock from the facility.

When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP.

When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***.

When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network.

When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network.

A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured***

If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pDS1Atm*** card, which it defaults to ***local***.

On a ***3pDS1Atm*** card all ports must have the same value, and be either ***local*** or ***module***.

***otherPort*** is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards.
On ***4DS1Aal1*** cards either:

all four ports' *clockingSource* values must be ***local*** OR
all four ports' *clockingSource* values must be ***module*** OR
one port's *clockingSource* value must be ***line*** and the other three

must be ***otherPort***. A port can only have ***srtsMode*** selected if the other ports are ***module*** or ***srtsMode***.

Values
local
line
module
otherPort
srtsMode
adaptiveMode

Default
No default

### ATTRIBUTE Dlep DS1 raiAlarmType (raiType)

Access
Read and write

Description
This attribute defines the method of sending a RAI (Remote Alarm Indication) alarm on a DS1 line.
When ***SBit*** is selected, RAI alarm is sent by setting the S bit in frame 12.
When ***Bit2*** is selected, RAI alarm is sent by setting bit 2 in all timeslots to 0.
When ***fdl*** is selected, RAI alarm is sent by a repeating pattern of 00 hex and FF hex on the FDL link.
Note that for *lineType* of ***d4***, only the SBit and the Bit2 methods are applicable. Whereas for *lineType* of ***esf***, only the Bit2 and the ***fdl*** methods are applicable.
***SBit*** method is recommended if *lineType* is set to ***d4*** and *zeroCoding* is set to ***ami***. This will help to avoid potential mimic RAI alarm when 1's density is too low in the data transmitted.
For cell-based cards, only the default value ***fdl*** is permitted.

Values
sBit
bit2
fdl

Default
fdl

### ATTRIBUTE Dlep DS1 lineLength (lineLength)

Access
Read and write

Description
This attribute defines the line length (in feet) for equalization calculations for the DS1 line. The value ranges between 0-655.

For ***8pDS1Atm*** cards the actual value used for equalization is rounded up to the nearest 110 feet; for all other card types the actual value used is rounded to the nearest 50 feet.

Values: Decimal (0..655)

Default: 0

### GROUP Dlep DS1 CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE Dlep DS1 customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP Dlep DS1 AdminInfo (AdminInfo)

Properties: Provisioned

| | |
|---|---|
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Dlep DS1 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Dlep DS1 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Dlep DS1 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Dlep DS1 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Dlep DS1 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Dlep DS1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Dlep DS1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Dlep DS1 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific |

information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Dlep DS1 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Dlep DS1 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dlep DS1 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Dlep DS1 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Dlep DS1 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Dlep DS1 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Dlep DS1 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms

may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Dlep DS1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Dlep DS1 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Dlep DS1 Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for a component in a digital hierarchy interface.

### ATTRIBUTE Dlep DS1 losAlarm (losAlarm)

Access
Read only

Description
This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect

is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOS alarm state.
The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Dlep DS1 rxAisAlarm (rxAisAlarm)

Access
Read only

Description
This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's density of at least 99.9% is present for a time T, where 3 ms ≤ T ≤ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Values
on
off

Default off

### ATTRIBUTE Dlep DS1 lofAlarm (lofAlarm)

Access Read only

Description This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Values on
off

Default off

### ATTRIBUTE Dlep DS1 rxRaiAlarm (rxRaiAlarm)

Access Read only

Description This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**, and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time).
The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

Values
on
off

Default
off

### ATTRIBUTE Dlep DS1 txAisAlarm (txAisAlarm)

Access
Read only

Description
This attribute displays whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the port is in a locked state.

Values
on
off

Default
off

### ATTRIBUTE Dlep DS1 txRaiAlarm (txRaiAlarm)

Access
Read only

Description
This attribute displays whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the port detects a LOF alarm condition (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: RAI is transmitted when the port detects a LOS, LOF, or AIS condition).

Values
on
off

Default
off

### GROUP Dlep DS1 Statistics (Stats)

Properties
Operational

Description
This group contains the common statistical data for a component in a digital hierarchy interface.

### ATTRIBUTE Dlep DS1 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds since the port component was activated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds that the port has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored framing second occurs when a second with one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | The total number of seconds that the interface is in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 bpvErrors (bpvErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of Bipolar Violations. A bipolar violation is an error in the alternate mark inversion pattern (AMI) on the line. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |
| Description | If the interface is a DS1 line, it is the current count of CRC-6 errors. These will only be counted when the lineType is ESF. If the interface is an E1 line, it is the total number of CRC-4 errors. These will only be counted when crc4Mode is on. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of frame errors. A frame error is an error in the framing bits |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 losStateChanges (losChanges)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line lost signal. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Dlep DS1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. This attribute is incremented for ports on the voice cards (for example the 1pDS1V and the 1pE1V function processors) only. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Dlep DS1 Channel (Chan)

| | |
|---|---|
| Instance | Decimal (0..24) |
| Groups | "GROUP Dlep DS1 Chan Provisioned (Prov)"<br>"GROUP Dlep DS1 Chan CustomerIdentifierData (CidData)"<br>"GROUP Dlep DS1 Chan IfEntryProv (IfEntry)"<br>"GROUP Dlep DS1 Chan OperationalStatus (OperStatus)"<br>"GROUP Dlep DS1 Chan OsiState (State)"<br>"GROUP Dlep DS1 Chan Operational (Oper)"<br>"GROUP Dlep DS1 Chan AdminInfo (AdminInfo)" |
| Scope | Application |

| | |
|---|---|
| Description | *Channel*<br>The *Channel* component is configured to control a group of timeslots that form a fractional group on a DS1 or E1 port. Cell-based cards allow only one channel per port, and this is automatically provisioned with all available timeslots. Similarly, the ***1pDS3C*** card type only allows one channel per port, and this is automatically provisioned with all available timeslots. |
| Opt. Subcomp. | "COMPONENT Dlep DS1 Chan AtmCell (Cell)"<br>"COMPONENT Dlep DS1 Chan TrunkConditioning (Tc)" |
| Dyn. Subcomp. | "COMPONENT Dlep DS1 Chan Test (Test)" |

## GROUP Dlep DS1 Chan Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisional data for a *Channel* component. |

## ATTRIBUTE Dlep DS1 Chan timeslots (ts)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component.<br><br>For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function. |

| | |
|---|---|
| Set of | none<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15<br>16<br>17<br>18<br>19<br>20<br>21<br>22<br>23<br>24<br>25<br>26<br>27<br>28<br>29<br>30<br>31 |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan timeslotDataRate (dataRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.<br><br>When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.<br><br>When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.<br><br>On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.<br><br>One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes. |
| Values | 56k<br>doNotOverride |
| Default | doNotOverride |

### ATTRIBUTE Dlep DS1 Chan applicationFramerName

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute defines the link to the software stack. It defines which application is running on top of this hardware component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Dlep DS1 Chan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Dlep DS1 Chan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Dlep DS1 Chan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Dlep DS1 Chan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Dlep DS1 Chan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Dlep DS1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Dlep DS1 Chan snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational |

packets can be passed.

Values
up
down
testing

Default
up

### GROUP Dlep DS1 Chan OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Dlep DS1 Chan adminState (osiAdmin)

Access
Read only

Description
This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Dlep DS1 Chan operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dlep DS1 Chan usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

### ATTRIBUTE Dlep DS1 Chan availabilityStatus (osiAvail)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be

applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Dlep DS1 Chan proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is |

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Dlep DS1 Chan standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

## ATTRIBUTE Dlep DS1 Chan unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

| | |
|---|---|
| Default | false |

### GROUP Dlep DS1 Chan Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Channel* component. |

### ATTRIBUTE Dlep DS1 Chan actualChannelSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the measured link speed of the *Channel* component. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### GROUP Dlep DS1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Dlep DS1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

## COMPONENT Dlep DS1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Dlep DS1 Chan Test OsiState (State)"<br>"GROUP Dlep DS1 Chan Test Setup (Setup)"<br>"GROUP Dlep DS1 Chan Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

## VERB START Dlep DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

## VERB STOP Dlep DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

## GROUP Dlep DS1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Dlep DS1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Dlep DS1 Chan Test operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Dlep DS1 Chan Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Dlep DS1 Chan Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Dlep DS1 Chan Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error |

rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

### ATTRIBUTE Dlep DS1 Chan Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Dlep DS1 Chan Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Dlep DS1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Dlep DS1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Dlep DS1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Dlep DS1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |

Default 1.00

## GROUP Dlep DS1 Chan Test Results (Results)

Properties Operational

Description This group contains all the statistics related attributes of the *Test* component.

## ATTRIBUTE Dlep DS1 Chan Test causeOfTermination

Access Read only

Description This attribute indicates either the status of the test or the cause of the test's termination:

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission

errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Dlep DS1 Chan Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Dlep DS1 Chan Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Dlep DS1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Dlep DS1 Chan Cell Provisioned (Prov)"<br>"GROUP Dlep DS1 Chan Cell Operational (Oper)"<br>"GROUP Dlep DS1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Dlep DS1 Chan Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

## ATTRIBUTE Dlep DS1 Chan Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

## ATTRIBUTE Dlep DS1 Chan Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment |

which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Values
off
on

Default
No default

### ATTRIBUTE Dlep DS1 Chan Cell correctSingleBitHeaderErrors

Access
Read and write

Description
This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values
off
on

Default
off

### ATTRIBUTE Dlep DS1 Chan Cell clearDelay (clear)

Access
Read and write

Description
This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.

This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Dlep DS1 Chan Cell hecSampleInterval (hSample)

Access: Read and write

Description: This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Dlep DS1 Chan Cell hecErrorLimit (hLimit)

Access: Read and write

Description: This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm

is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Dlep DS1 Chan Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..50)

Units: msec

Default: No default

### ATTRIBUTE Dlep DS1 Chan Cell hecErrorIntervalLimit (hIntLimit)

Access: Read and write

Description: This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the

number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..25)

Default: 1

## GROUP Dlep DS1 Chan Cell Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes for the *AtmCell* component.

## ATTRIBUTE Dlep DS1 Chan Cell lcdAlarm (lcd)

Access: Read only

Description: This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the

*AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values
on
off

Default
off

## GROUP Dlep DS1 Chan Cell Statistics (Stats)

Properties
Operational

Description
This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE Dlep DS1 Chan Cell uncorrectableHeaderErrors (ucErr)

Access
Read only

Description
This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Values
Decimal (0..4294967295)

Default
0

## ATTRIBUTE Dlep DS1 Chan Cell sevErroredSec (ses)

Access
Read only

Description
This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect

HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Dlep DS1 Chan Cell receiveCellUtilization (rxutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Dlep DS1 Chan Cell transmitCellUtilization (txutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

| | |
|---|---|
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Dlep DS1 Chan Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Dlep DS1 Chan TrunkConditioning (Tc)

| | |
|---|---|
| Groups | "GROUP Dlep DS1 Chan Tc Provisioned (Prov)"<br>"GROUP Dlep DS1 Chan Tc Operational (Op)" |
| Scope | Device |
| Description | *Lp/n Ds1/n Chan/n Tc*<br>*Lp/n E1/n Chan/n Tc*<br>*Lp/n Ds3/n Ds1/n Chan/n Tc*<br>*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*<br>*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*<br>*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*<br>*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*<br><br>The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.<br><br>Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also |

substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

## GROUP Dlep DS1 Chan Tc Provisioned (Prov)

Properties: Provisioned

Description: This group contains all specific provisioning data for a *Tc* component.

## ATTRIBUTE Dlep DS1 Chan Tc replacementData (data)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.<br><br>The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:<br>DS1 MUX Out Of Service Code = 0x1A<br>E1 MUX Out Of Service Code = 0xFF<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.<br><br>On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***. |
| Values | Hex (H.0..H.ff) |
| Units | Hex |
| Default | No default |

### ATTRIBUTE Dlep DS1 Chan Tc signalOneDuration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.<br><br>If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.<br><br>The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 0 |

## ATTRIBUTE Dlep DS1 Chan Tc noServiceResponse (resp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:<br><br>***autoConfigure*** - automatically configure the channels response.<br>***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.<br>***ais*** - transmit AIS in the egress direction.<br>***noResponse*** - no response is sent in the egress direction.<br><br>A value of ***autoConfigure*** will result in TC being transmitted for all card types. |
| Values | autoConfigure<br>tc<br>ais<br>noResponse |
| Default | autoConfigure |

## ATTRIBUTE Dlep DS1 Chan Tc signalOne (sigOne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |

| | |
|---|---|
| Default | (1, 1, 1, 1) |

### ATTRIBUTE Dlep DS1 Chan Tc signalTwo (sigTwo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### GROUP Dlep DS1 Chan Tc Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all specific operational data for a *Tc* component. |

### ATTRIBUTE Dlep DS1 Chan Tc ingressConditioning (inCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the ATM network.<br><br>When trunk conditioning is being locally generated towards the ATM network, *ingressConditioning* is set to ***on.***<br><br>When trunk conditioning is not being locally generated towards the ATM network, *ingressConditioning* is set to ***off***.<br><br>Trunk conditioning is transmitted towards the ATM network |

under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

Values
off
on

Default
off

### ATTRIBUTE Dlep DS1 Chan Tc egressConditioning (egCon)

Access
Read only

Description
This attribute indicates the status of locally generated trunk conditioning towards the PDH line.

When trunk conditioning is being locally generated towards the PDH line, *egressConditioning* is set to ***on.***

When trunk conditioning is not being locally generated towards the PDH line, *egressConditioning* is set to ***off***.

Trunk conditioning is transmitted towards the PDH line under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

Values
off
on

Default
off

### COMPONENT Dlep DS1 Test (Test)

Groups
"GROUP Dlep DS1 Test OsiState (State)"
"GROUP Dlep DS1 Test Setup (Setup)"
"GROUP Dlep DS1 Test Results (Results)"

| | |
|---|---|
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Dlep DS1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Dlep DS1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Dlep DS1 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Dlep DS1 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively |

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Dlep DS1 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dlep DS1 Test usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Dlep DS1 Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Dlep DS1 Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Dlep DS1 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed. |

***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

### ATTRIBUTE Dlep DS1 Test frmSize (size)

Access

Read and write

| | |
|---|---|
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Dlep DS1 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Dlep DS1 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Dlep DS1 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Dlep DS1 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Dlep DS1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

## GROUP Dlep DS1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

## ATTRIBUTE Dlep DS1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.<br><br>a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. |

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Dlep DS1 Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Dlep DS1 Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Dlep DS1 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep DS1 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Dlep DS1 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Dlep DS1 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### GROUP Dlep Vsp Provisioned (Op)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioning data for the *Vsp* Component. |

### ATTRIBUTE Dlep Vsp linkToApplication (lta)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies a service link to an *Nsta* component that defines the application services available in the VSP card. |
| Values | Link (Service, linkToServer) |
| Default | No default |

### GROUP Dlep Vsp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Dlep Vsp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Dlep Vsp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dlep Vsp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### COMPONENT Dlep Vsp ProcessingModule (PModule)

Instance
Decimal (1..24)

Groups
"GROUP Dlep Vsp PModule Provisioned (Prov)"
"GROUP Dlep Vsp PModule OsiState (State)"
"GROUP Dlep Vsp PModule Operational (Oper)"

Scope
Device

Description
*Lp/n Vsp ProcessingModule/n*
*Dlep/n Vsp ProcessingModule/n*

A *ProcessingModule* (*PModule*) component instance represents a distinct physical processing module on a Voice Services Processor (VSP) FP.

Each *PModule* instance is uniquely identified by a number that corresponds to a specific physical location on the VSP FP.

Dyn. Subcomp. "COMPONENT Dlep Vsp PModule ProcessingBlock (PBlock)"

## GROUP Dlep Vsp PModule Provisioned (Prov)

Properties Provisioned

Description This group contains provisioning data for a *ProcessingModule*.

## ATTRIBUTE Dlep Vsp PModule moduleType (modType)

Access Read and write

Criticality Process

Description This attribute specifies the type of processing module expected for this *ProcessingModule* instance.

A value of ***vpm*** refers to a processing module instance that is capable of processing voice, voiceband data, and data.
A value of ***spm*** refers to a processing module instance that is capable of processing signaling, and hosting a media or signaling gateway.
A value of ***none*** refers to a processing module instance that is unavailable for use.

Values

none
vpm
spm

Default none

## GROUP Dlep Vsp PModule OsiState (State)

Properties Operational

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Dlep Vsp PModule adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Dlep Vsp PModule operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dlep Vsp PModule usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Dlep Vsp PModule Operational (Oper)

Properties
Operational

Description
This group indicates operational information for a *ProcessingModule*.

### ATTRIBUTE Dlep Vsp PModule insertedModuleType (insModType)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the type of processing module currently present in the physical position on a Voice Services Processor FP.<br><br>A value of ***vpm*** indicates the presence of a processing module capable of processing voice, voiceband data, and data.<br>A value of ***spm*** indicates the presence of a processing module capable of processing signaling, and hosting a media or signaling gateway.<br>A value of ***none*** indicates that no processing module is present.<br>A value of ***unknown*** indicates the presence of a processing module with capabilities not known by the software. |
| Values | none<br>unknown<br>vpm<br>spm |
| Default | No default |

### ATTRIBUTE Dlep Vsp PModule productCode (prc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the product engineering code and release of the *ProcessingModule*. |
| Values | String (0..12, ASCII) |
| Default | No default |

### ATTRIBUTE Dlep Vsp PModule failureCause (failCause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason why the physical processing module has failed.<br>The various failure causes are:<br>***none*** - There is no failure.<br>***cannotLoadFirmware*** - A module has been detected, but the firmware load operation failed.<br>***failedDiagnostics*** - The diagnostics cycle has completed and an error has been detected within the module.<br>***mismatched*** - The *insertedModuleType* of the *PModule* does not match its provisioned *moduleType*. |

***connectivityFailed*** - The test cycle has run and an error has been detected on one of the *PBlock*s within the *PModule*.
***notResponding*** - One of the *PBlock*s within the *PModule* is not responding.

Values
none
cannotLoadFirmware
failedDiagnostics
mismatched
connectivityFailed
notResponding

Default
none

## COMPONENT Dlep Vsp PModule ProcessingBlock (PBlock)

Instance
Decimal (1..2)

Groups
"GROUP Dlep Vsp PModule PBlock Operational (Oper)"
"GROUP Dlep Vsp PModule PBlock Utilization (Util)"

Scope
Device

Description
*Lp/n Vsp PModule/n ProcessingBlock/n*
*Dlep/n Vsp PModule/n ProcessingBlock/n*

This dynamic component represents a block of Data Processors within a *ProcessingModule*.

The Processing Block is the smallest unit on the Voice Services Processor (VSP) FP on which different Data Processing software algorithms may be executed, or on which diagnostics may be performed.

## GROUP Dlep Vsp PModule PBlock Operational (Oper)

Properties
Operational

| | |
|---|---|
| Description | This group contains status information about the *ProcessingBlock* component. |

### ATTRIBUTE Dlep Vsp PModule PBlock serviceList (servList)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the components that have resources allocated on this *ProcessingBlock* component.<br><br>This attribute is not displayed if the *Shelf Card cardType* attribute is set to ***2pOc3ChSmIrVsp3***. |
| List of | The name of the component |
| Default | No default |

### GROUP Dlep Vsp PModule PBlock Utilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains information about processing utilization of this *PBlock* component.<br><br>This group is filtered if the *modType* attribute of the parent *PModule* component is not set to ***spm***, or on the ***12mVspAal*** card. |

### ATTRIBUTE Dlep Vsp PModule PBlock timeInterval

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time period for which the average, minimum, and maximum utilization values are calculated.<br><br>If the associated *Vsp* component is locked this attribute will be reset to ***0***.<br><br>This attribute is reset to ***0*** every 15 minutes. |
| Values | Decimal (0..14) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Dlep Vsp PModule PBlock cpuUtil

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the approximate processing utilization of this *PBlock* component. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Dlep Vsp PModule PBlock cpuUtilAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Dlep Vsp PModule PBlock cpuUtilAvgMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Dlep Vsp PModule PBlock cpuUtilAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute. |

| | |
|---|---|
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

## COMPONENT Dlep Vsp Test (Test)

| | |
|---|---|
| Groups | "GROUP Dlep Vsp Test OsiState (State)"<br>"GROUP Dlep Vsp Test Setup (Setup)"<br>"GROUP Dlep Vsp Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

## VERB START Dlep Vsp Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

## VERB STOP Dlep Vsp Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

## GROUP Dlep Vsp Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Dlep Vsp Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Dlep Vsp Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dlep Vsp Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Dlep Vsp Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Dlep Vsp Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

## ATTRIBUTE Dlep Vsp Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).<br>***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).<br>Note that not all test types are not supported by all function processors. |
| Values | card<br>manual<br>localLoop<br>remoteLoop<br>externalLoop<br>payloadLoop<br>remoteLoopThisTrib<br>v54RemoteLoop<br>pn127RemoteLoop<br>lineBIP8Error |

| | |
|---|---|
| | sectionBIP8Error<br>pathBIP8Error<br>pathBIP2Error |
| Default | card |

### ATTRIBUTE Dlep Vsp Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Dlep Vsp Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Dlep Vsp Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |

| | |
|---|---|
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Dlep Vsp Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Dlep Vsp Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Dlep Vsp Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that |

the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.

Values: Decimal (0.00..30240.00)

Units: minutes

Default: 1.00

## GROUP Dlep Vsp Test Results (Results)

Properties: Operational

Description: This group contains all the statistics related attributes of the *Test* component.

## ATTRIBUTE Dlep Vsp Test causeOfTermination

Access: Read only

Description: This attribute indicates either the status of the test or the cause of the test's termination:

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have

been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Dlep Vsp Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost |

| | |
|---|---|
| | frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Dlep Vsp Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Dlep Vsp Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Dlep Vsp Ethernet1000BaseSX (GigE)

| | |
|---|---|
| Instance | Decimal (0..1) |
| Groups | "GROUP Dlep Vsp GigE OsiState (State)"<br>"GROUP Dlep Vsp GigE Eth1000Operational (Oper)"<br>"GROUP Dlep Vsp GigE Eth1000Statistics (Stats)" |

| | |
|---|---|
| Scope | Device |
| Description | *Lp/n Vsp GigE/n*<br><br>This component monitors and provides access to statistical measurements of the *VspEth1000BaseSX* ports on the card, when the ***vspIpGigE*** or the ***vgpIpG729GigE*** feature is provisioned.<br><br>Two *VspEth1000BaseSX* ports are supported on the ***2pGeMmSrVsp3*** Function Processor. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Dlep Vsp GigE OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Dlep Vsp GigE adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users |

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Dlep Vsp GigE operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Dlep Vsp GigE usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Dlep Vsp GigE Eth1000Operational (Oper)

Properties
Operational

Description
This group contains the port operational attributes of the *VspEth1000BaseSX* component.

### ATTRIBUTE Dlep Vsp GigE macAddress (macAdd)

Access
Read only

Description
This attribute indicates the medium access controller address. The value of this attribute will be assigned by the system. The medium access controller address is displayed in canonical format.

Values
String (6, Dashed Hex)

Default
No default

### ATTRIBUTE Dlep Vsp GigE autoNegotiationStatus (negStatus)

Access
Read only

Description
This attribute indicates the status of the auto negotiation at the physical level.

Possible values are:

***succeeded*** – auto-negotiation has completed successfully.

***failed*** – auto-negotiation has failed to negotiate a compatible set of capabilities.

***inProgress*** – auto-negotiation is currently in progress.

***disabled*** – the port has detected that the far end does not support auto-negotiation.

Values
succeeded
failed
inProgress
disabled

Default
No default

### ATTRIBUTE Dlep Vsp GigE ingressFlowControlStatus (ingFcStatus)

Access
Read only

Description
This attribute indicates whether the ingress flow control has been successfully negotiated with the link partner.

Possible values are:

***enabled*** - this state will generate pause frames when internal congestion is detected.

***disabled*** - in this state, no pause frames are generated. In addition, there is a risk that the received packets may be discarded due to lack of internal resources.

Values
enabled
disabled

Default
No default

### ATTRIBUTE Dlep Vsp GigE lossofSyncAlarm (syncAlarm)

Access
Read only

Description
This attribute indicates whether the loss of synchronization alarm is ***on*** or ***off***.

Possible values are:

***on*** - the alarm is set.

***off*** - the alarm is clear.

Values
on
off

Default
No default

### ATTRIBUTE Dlep Vsp GigE autoNegIncompleteAlarm (negAlarm)

Access
Read only

Description
This attribute indicates whether the auto-negotiation incomplete alarm is ***on*** or ***off***.

Possible values are:

***on*** - the alarm is set.

***off*** - the alarm is clear.

Values
on
off

Default
No default

### ATTRIBUTE Dlep Vsp GigE remoteFaultIndicationAlarm (remFaultAlarm)

Access
Read only

Description
This attribute indicates whether the remote fault indication alarm is ***on*** or ***off***.

Possible values are:

***on*** - the alarm is set.

***off*** - the alarm is clear.

Values
on
off

Default
No default

### GROUP Dlep Vsp GigE Eth1000Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics for the *VspEth1000BaseSX* component. |

### ATTRIBUTE Dlep Vsp GigE framesTransmittedOk (frmTxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames that were transmitted without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE framesReceivedOk (frmRxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were received without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE octetsTransmittedOk (octetsTxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets that were transmitted without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE octetsReceivedOk (octetsRxOk)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the octets that were received without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE pauseFramesTransmitted (txPause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the pause medium access controller control frames transmitted. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE pauseFramesReceived (rxPause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the pause medium access controller control frames received. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE undersizeFrames (underFrm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames that were received but were less than the minimum size (64 bytes). This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE framesTooLong (longFrm)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the frames that were received but were greater than the maximum size. The count includes frames which have a bad frame check sequence. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE frameCheckSequenceErrors (fcsErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received that were an integral number of octets in length and did not pass the FCS check. This count does not include frames received that were too long or too short. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE symbolErrors (symErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the times a valid length frame was received and had at least one occurance of a data reception or symbol error. This counter increments once per valid Carrier Event as defined by the specification IEEE 802.3 - 2000 edition. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE broadcastFramesReceivedOk (bcastRxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the valid broadcast frames received without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Dlep Vsp GigE discardedFrames (discFrm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the valid frames discarded because of a lack of resources available to receive them. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

# COMPONENT DnsAgent (DnsAg)

| | |
|---|---|
| Instance | virtualRouter (vr) [String (1..8, ASCII)]<br>dnsNum [Decimal (1..15)] |
| Groups | "GROUP DnsAg Provisioned (Prov)"<br>"GROUP DnsAg Statistics (Stats)"<br>"GROUP DnsAg WlcCustomCounters (WlcCustomCntr)"<br>"GROUP DnsAg OsiState (State)" |
| Scope | Application |
| Description | *DnsAgent/<vr>,n*<br><br>This component represents a Domain Name System (DNS) Agent for a particular Virtual Router (VR). |
| Subcomponents | "COMPONENT DnsAg MemoryPoolManager (Mpm)" |
| Dyn. Subcomp. | "COMPONENT DnsAg CacheEntry (CacheEnt)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP DnsAg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes to set up the links to other components (for example, *SessionManagement*, *Port*) and to set the Name Server Internet Protocol (IP) addresses. |

### ATTRIBUTE DnsAg linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor that the *DnsAgent* and its subcomponents are provisioned on. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE DnsAg maxDynamicEntries (maxDyEnt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of dynamic entries supported by the *DnsAgent* cache table. Decrease in the cache size will be effective only in the next restart.<br>The current cache usage can be obtained from the attribute *currentCacheUsage*. |
| Values | Decimal (0..500) |
| Default | 1 |

### ATTRIBUTE DnsAg linkToPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP Address and the UDP port number that the DnsAgent associates with.<br>Changing this value causes the outstanding transactions to be affected. |
| Values | Link (Service, linkToApplication) |
| Default | No default |

### ATTRIBUTE DnsAg serverAddresses (servAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the IP addresses of the Domain Name System (DNS) Name Server, which this Server queries as necessary. If this attribute is empty then only static entries are used. |
| List of | IP address |
| List Size | 4 |
| Default | No default |

### ATTRIBUTE DnsAg linkToDnsClient (lToCl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Application using a *DnsAgent*. This is to ensure that the *DnsAgent* is linked to the same Virtual Router (VR). |
| List of | Link (Service, linkToDnsAgent) |
| List Size | 1 |
| Default | No default |

### GROUP DnsAg Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *DnsAgent*. |

### ATTRIBUTE DnsAg currentCacheUsage (curCacUs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current cache usage for this instance of *DnsAgent*.<br><br>The maximum value is provisioned in the attribute *maxCacheEntries*. |
| Values | Decimal (0..100) |
| Units | % |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE DnsAg clientQueries (clQue)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the queries received by this *DnsAgent* from the GPRS applications. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg cacheHits

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the successful Domain Name System (DNS) queries for which a Logical Name was found in the *DnsAgent* cache. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg serverQueries (servQue)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the queries sent by this *DnsAgent* to the Name Server because the requested name was not in the cache. The value indicates only the initial queries sent. Retries are not counted. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg serverPendingQueries (servPendQue)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the current outstanding queries of this *DnsAgent*. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg serverQueryTimeouts (servQueTouts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the failed Domain Name System (DNS) queries sent, that did not receive a response within the time provisioned in the *retryTimer* (defined in *Sgsn DnsAgent*). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg serverQuerySuccesses (servQueSuc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the successful Domain Name System (DNS) queries to which a valid IP address was received from the Name Server, using only dynamic resolution. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg serverQueriesNameNotFound (servQueNnf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the failed Domain Name System (DNS) queries. This can be due any of the following errors:<br>Format error - The Name server was unable to interpret the query.<br>Name error - Domain name referenced in the query does not exist.<br>Not implemented error - The Name server does not support the requested kind of query.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg serverQueryFailures (servQueFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the failed Domain Name System (DNS) queries due to a failure in the Name Server itself or due to some network error.<br>Query failures can result from a connection problem, failure in the Server node, or a lower layer failure indication such as port unreachable.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg cachePurges (cachePurg)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the entries that were purged from the Domain Name System (DNS) cache table. Entries are purged when an entry needs to be added to the cache and the cache is full. The least recently accessed dynamic entry is the one that is purged. Static entries are never purged. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### GROUP DnsAg WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE DnsAg customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP DnsAg OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE DnsAg adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE DnsAg operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE DnsAg usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE DnsAg availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of: initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

### ATTRIBUTE DnsAg controlStatus (osiCntrl)

Access: Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE DnsAg alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE DnsAg standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values: hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

### ATTRIBUTE DnsAg unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values: false
true

Default: false

### COMPONENT DnsAg CacheEntry (CacheEnt)

Instance: String (1..253, ASCII)

| | |
|---|---|
| Groups | "GROUP DnsAg CacheEnt Operational (Oper)"<br>"GROUP DnsAg CacheEnt WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *DnsAg/<vr>,n CacheEntry/<logicalName>*<br><br>This component represents an entry in the Logical Name-IP Address mapping table for the Serving GPRS Support Node (SGSN). |
| Dyn. Subcomp. | "COMPONENT DnsAg CacheEnt AddressInfo (Addr)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP DnsAg CacheEnt Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the Logical Name-Internet Protocol (IP) mapping table on a particular *GprsSubscriberControl (Gsc)*. |

## ATTRIBUTE DnsAg CacheEnt entryType (type)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether this entry is a static entry (provisioned in the *Sgsn DnsAg StaticCacheEntry* component) or a dynamic entry. |
| Values | static<br>dynamic |
| Default | No default |

## ATTRIBUTE DnsAg CacheEnt lastUpdateTime (tUpdate)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the time that this entry was updated. If the *entryType* is ***static***, the value indicates the time this entry was created. If the *entryType* is ***dynamic***, the value is the time of the most recent update by the Name Server. |
| Values | Time (HMS) |
| Default | No default |

### ATTRIBUTE DnsAg CacheEnt mappedIpAddr (ipAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Internet Protocol (IP) addresses associated with a given Logical Name. The order of the addresses is not important and success queries of the Logical Name returns the IP addresses in a round robin fashion. |
| List of | IP address |
| List Size | 10 |
| Default | No default |

### GROUP DnsAg CacheEnt WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE DnsAg CacheEnt customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg CacheEnt customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg CacheEnt customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT DnsAg CacheEnt AddressInfo (Addr)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP DnsAg CacheEnt Addr Operational (Oper)"<br>"GROUP DnsAg CacheEnt Addr WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *DnsAg/<vr>,n CacheEnt/<logicalName> AddressInfo/<ipAddr>* |

This component represents the address specific information in a cache entry.

Common Verbs

Display

## GROUP DnsAg CacheEnt Addr Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes to define the *AddressInfo*.

## ATTRIBUTE DnsAg CacheEnt Addr ttl

Access: Read: All
Write: Illegal

Description: This attribute indicates the Time To Live (TTL) value received from the Domain Name System (DNS) Server in a DNS query response. This address is removed from the *CacheEntry ttl* seconds after the *lastUpdateTime*.
For static mapping, the *ttl* value is ***infinity***. The IP address with a negative *ttl* value is discarded from the query response received from the Name Server while the IP address with a ***0*** *ttl* value is sent to the application and then discarded.

Values: Decimal (0..2147483647)
infinity (inf)

Units: seconds

Default: No default

## GROUP DnsAg CacheEnt Addr WlcCustomCounters (WlcCustomCntr)

Properties: Operational

Description: This group contains the spare counters that can be dynamically patched.

### ATTRIBUTE DnsAg CacheEnt Addr customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg CacheEnt Addr customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DnsAg CacheEnt Addr customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT DnsAg MemoryPoolManager (Mpm)

| | |
|---|---|
| Scope | Application |

| | |
|---|---|
| Description | *Gsc/n MemoryPoolManager*<br>*Gsd/n MemoryPoolManager*<br>*Gtl/n MemoryPoolManager*<br>*DnsAgent/<vr>,n MemoryPoolManager*<br><br>This component represents the memory resources of a given GPRS application that are managed as pools of objects. |
| Dyn. Subcomp. | "COMPONENT DnsAg Mpm MemoryPoolClient (Mpc)" |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT DnsAg Mpm MemoryPoolClient (Mpc)

# COMPONENT DpnGateway (DpnGate)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP DpnGate IfEntryProv (IfEntry)"<br>"GROUP DpnGate Provisioned (Prov)"<br>"GROUP DpnGate Overrides"<br>"GROUP DpnGate OsiState (State)"<br>"GROUP DpnGate OperationalStatus (OperStatus)"<br>"GROUP DpnGate Operational (Oper)"<br>"GROUP DpnGate Transport"<br>"GROUP DpnGate Statistics (Stats)" |

"COLLECTED STATS DpnGateway"

| | |
|---|---|
| Scope | Network |
| Description | *DpnGateway/n*<br>The *DpnGateway* component provides a Passport to DPN-100 connection. It controls a protocol stack associated with a logical port on a Functional Processor providing a connection to a DPN-100 Utp Trunk or NetworkLink. The underlying link protocol may be provided by either *Utp* or *FrAccess*. A maximum of 256 instances of *DpnGateway* may be provisioned on a module. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT DpnGate Utp"<br>"COMPONENT DpnGate FrAccess" |
| Dyn. Subcomp. | "COMPONENT DpnGate ForwardingStatistics (FwdStats)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>Unlock |

## VERB LOCK DpnGate

| | |
|---|---|
| Impact | Service |
| Description | *Lock [-force][-forever] <component name>*<br>This verb will cause the specified component to no longer providing service and enter the OSI ***locked*** administrative state. In some cases, locking a component causes all its subcomponents to shut down also.<br><br>**Options:**<br>*-force*<br>If this option is present, service to current clients is terminated and the ***locked*** state is entered immediately. Without this option, *Lock* behaves as described above.<br>*-forever*<br>If this option is present, then after service to current clients is terminated and the ***locked*** state is entered, an unlock command is required to get the service into the ***unlocked*** state. Without this option, the service automatically returns to the ***unlocked*** state after five minutes. |

## GROUP DpnGate IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE DpnGate ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE DpnGate ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP DpnGate Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of provisionable attributes provide parameters used by *DpnGateway* for staging. |

### ATTRIBUTE DpnGate expectedRemoteNamsId (expectedRemote)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected Nams Identifier of the module to which this *DpnGateway* is connected. The *DpnGateway* end points exchange their Nams Identifiers through the *DpnGateway*'s staging protocol. The staged value is validated and the *remoteValidationAction* will be executed for those values |

| | |
|---|---|
| | not matching the value supplied for this attribute.<br>If this value is zero, then the comparison is always successful. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE DpnGate remoteValidationAction (validation)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the action to be taken if there is a mismatch between the provisioned value and the value received from the remote end, in cases where the *expectedRemoteNamsId* is non-zero. If this attribute is provisioned to ***continue*** then upon an unsucessful validation staging continues, otherwise, if ***disable*** is set then the *DpnGateway* does not continue to stage but, attempts to stage again after a one minute time out.<br>All unsuccessful validation when *expectedRemoteNamsId* has been set result in the generation of an alarm. |
| Values | continue<br>disable |
| Default | continue |

### ATTRIBUTE DpnGate linkType (type)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the type of network link. If this attribute is provisioned to ***dedicated*** then the link is a dedicated network link to a DPN module. If this attribute is provisioned to ***dialIn*** then the link is connected to the DPN module through a public telephone network, on a dial line. |
| Values | dedicated<br>dialIn |
| Default | dedicated |

### GROUP DpnGate Overrides

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | Theses attribute comprise the set of provisionable override parameters supported by both the *Trunk* and *DpnGateway* components. The attributes are used when reporting operational attributes (used for metric calculations) to the routing system. |

### ATTRIBUTE DpnGate overrideTransmitSpeed (ots)

| | |
|---|---|
| Access | Read and write |
| Description | This is the overridden value of link speed (bit/s) that, if staged successfully with the remote, is reported to the routing system for metric calculations. A zero indicates that an override value has not been provided and that only the measured value will be reported to the routing system.<br>If this value is changed on a *Trunk* or *DpnGateway* that is enabled, the LOCK and UNLOCK commands must be issued to the component to restage the override with the remote. |
| Values | Decimal (0; 1000..4294967295) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE DpnGate overrideRoundTripDelay (ortd)

| | |
|---|---|
| Access | Read and write |
| Description | This is the overridden value of link delay (ms) that, if staged successfully with the remote, is reported to the routing system for metric calculations. A zero indicates that an override value has not been provided and that only the measured value will be reported to the routing system.<br>If this value is changed on a *Trunk* or *DpnGateway* that is enabled, the LOCK and UNLOCK commands must be issued to the component to restage the override with the remote. |
| Values | Decimal (0.0..1500.0) |
| Units | msec |
| Default | 0.0 |

## GROUP DpnGate OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE DpnGate adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE DpnGate operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE DpnGate usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE DpnGate availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE DpnGate proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)

### ATTRIBUTE DpnGate controlStatus (osiCntrl)

Access
Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE DpnGate alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE DpnGate standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE DpnGate unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP DpnGate OperationalStatus (OperStatus)

Properties
Operational

| | |
|---|---|
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE DpnGate snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP DpnGate Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes contain the operational information associated with this *DpnGateway* and the remote to which it has it staged. |

### ATTRIBUTE DpnGate remoteComponentName (remote)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Component Name of the remote DPN-100 Utp Trunk or NetworkLink supplied by the staging protocol. It is in the format *PM/n PE/n PI/n PO/n* where *PM* is the remote module Nams Identifier, *PE* is the remote module Processor Element that is staged with, *PI* is the remote module Peripheral Interface card associated with the *PE*, and *PO* is the remote module Port (physical or virtual) on the *PI* that the physical line is connected to. |
| Values | String (1..26, ASCII) |
| Default | No default |

### ATTRIBUTE DpnGate remoteNamsMnemonic (remoteNams)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Nams Mnemonic of the remote DPN-100 Module supplied by the staging protocol. It can be used as a parameter to *Rtg Dpn* for displaying all *DpnGateway* that are connect to the same module. |
| Values | String (1..12, ASCII) |
| Default | No default |

### ATTRIBUTE DpnGate linkMode (mode)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the *DpnGateway* is a ***Trunk*** connected to a DPN-100 RM or a ***NetworkLink*** connected to a DPN-100 AM. |
| Values | trunk<br>networkLink<br>unknown |
| Default | No default |

### ATTRIBUTE DpnGate activateReason (reason)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason the *DpnGateway* has been activated by the remote end. The value corresponds to the link type of the DPN end. It is always ***unknown*** until the link comes into service. If this attribute is set to ***dedicated***, the DPN is a dedicated network link. If this attribute is set to ***dnl***, the DPN end is a dial network link, meaning a network link which is connected through a dial-up service. If this attribute is set to ***dbnl***, the DPN end is dial backup network link, activated because the main network link is out of service. If this attribute is set to ***bwod***, the DPN end is a bandwidth on demand link, activated because extra bandwidth is required. If the attribute is set to ***unknown***, the link is either not currently in use, or the DPN end has an unrecognized link type. |

| | |
|---|---|
| Values | dedicated<br>dnl<br>dbnl<br>dialIn<br>bwod<br>unknown |
| Default | unknown |

## GROUP DpnGate Transport

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes contains the set of operational parameters measured and maintained by both the *Trunk* and *DpnGateway* components. |

## ATTRIBUTE DpnGate measuredSpeedToIf (spd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current “transmittable” bandwidth of the underlying facility.<br>For a *Trunk* with a *Unack* subcomponent, and a *DpnGateway* with a *Utp* subcomponent, if a serial port is used, the value is the measured transmit speed of the port; if a channelized port (E1/DS1) is used, the value is the measured transmit speed of the *Channel*.<br>For a *Trunk* with an *AtmAccess* subcomponent, the value is calculated by converting the VCC transmit cell rate to an equivalent bit rate. The VCC transmit cell rate is determined based on the *vccReportingBw* attribute of the *Trunk AtmAccess* component. If *vccReportingBw* has a value of ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***no***, the peak cell rate (PCR) of the VCC, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, is used. If *vccReportingBw* has a value of ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***yes***, the minimum of the PCR, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, and the current cell rate (CCR) of the VCC is used. If *vccReportingBw* has a value of ***acr***, the best measurement of the actual cell rate (ACR) of the VCC is used, which is the minimum of the PCR, the CCR and the actual shaping rate (ASR).<br>For a *Trunk* with an *MplsAccess* subcomponent, the value is the |

| | |
|---|---|
| | transmit bandwidth reserved on the MPLS transport *Lsp*.<br>For a *DpnGateway* with a *FrAccess* subcomponent, the value indicates the *committedInformationRate* of *FrAccess FrMuxSetup*.<br>A value of zero is displayed when the underlying facility is disabled or the current “transmittable” bandwidth is unknown. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE DpnGate maxTxUnit (mtu)

| | |
|---|---|
| Access | Read only |
| Description | This is the maximum transmission unit (byte size) that is supported by the *Trunk* or *DpnGateway* component. This size includes the data and routing headers. A value of zero indicates the MTU has not yet been determined. |
| Values | Decimal (0..65535) |
| Units | bytes |
| Default | 0 |

### ATTRIBUTE DpnGate measuredRoundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the measured Round Trip Delay (msec) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. The value includes emission, propagation, and queuing delays. A 512 byte data packet is used to perform the measurement. A value of zero is displayed when the link is disabled or the measured Round Trip Delay is unknown. |
| Values | Decimal (0.0..1500.0) |
| Units | msec |
| Default | 0.0 |

## GROUP DpnGate Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes contains statistics collected by the *DpnGateway* component. |

## ATTRIBUTE DpnGate pktFromIf (pkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote module. This counter wraps around to zero when the maximum value is reached. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE DpnGate trunkPktFromIf (trk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal trunk protocol packets received from the remote module. These packets are forwarded to the *DpnGateway* component. This counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE DpnGate trunkPktToIf (trkti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal trunk protocol packets transmitted to the remote module. This counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE DpnGate discardUnforward (disc)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of packets received from the remote module that have been discarded. This counter wraps around to zero when the maximum value is reached. Two main reasons that cause this counter to increment are: the remote protocol is not compatible to the local protocol stack or, the packet cannot be forwarded due to either a recent loss of connectivity or due to congestion. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE DpnGate discardTrunkPktFromIf (discTrk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal trunk protocol packets received from the remote module that have been discarded. This counter wraps around to zero when the maximum value is reached. The two main reasons that cause this counter to increment is if the DpnGateway is unsynchronized with DPN-100 and if the remote protocol is not the same version as the local protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DpnGate stagingAttempts (statt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that the staging protocol has attempted to stage with the remote module. This counter wraps around to zero when the maximum value is reached. The main reason for this counter to increment is that the local hardware is up but the local protocol cannot stage with the remote protocol due to a faulty connection. If the value is zero, then the local hardware has never enabled successfully. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DpnGate discardTrunkPktToIf (discTrkti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal trunk protocol packets that have been discarded before being transmitted to the remote module. This counter wraps around to zero when the maximum value is reached. The main reason that causes this counter to increment is that the DpnGateway can not get sufficient resources to create an internal trunk protocol packet. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS DpnGateway

| | |
|---|---|
| Description | The statistics record generated by the DpnGateway component. |

### ATTRIBUTE DpnGate remoteComponentName (remote)

| | |
|---|---|
| Description | This attribute is the component name of the remote end which it has supplied through the *Trunk* or *DpnGateway* staging protocol. |
| Values | String (1..26, ASCII) |

### ATTRIBUTE DpnGate measuredSpeedToIfMax

| | |
|---|---|
| Description | This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE DpnGate measuredSpeedToIfMin

| | |
|---|---|
| Description | This is the minimum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for any part of the interval or the measured speed is unknown. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE DpnGate measuredSpeedToIfCurrent

| | |
|---|---|
| Description | This is the current measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled or the measured speed is unknown. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE DpnGate measuredRoundTripDelayMax

| | |
|---|---|
| Description | This is the maximum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for the whole interval or the delay is unknown. |
| Values | Decimal (0..1500) |

### ATTRIBUTE DpnGate measuredRoundTripDelayMin

| | |
|---|---|
| Description | This is the minimum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for any part of the interval or the delay is unknown. |
| Values | Decimal (0..1500) |

### ATTRIBUTE DpnGate measuredRoundTripDelayCurrent

| | |
|---|---|
| Description | This is the measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled or the delay is unknown. |
| Values | Decimal (0..1500) |

### ATTRIBUTE DpnGate fwdPktFromIf (fwdPkt)

| | |
|---|---|
| Description | This attribute counts the number of forwarding packets received on the *Trunk* or *DpnGateway* in the last statistics collection interval. |
| Values | Long Integer |

### ATTRIBUTE DpnGate fwdDiscUnforwardFromIf (fwdDisc)

| | |
|---|---|
| Description | This attribute counts the number of forwarding packets discarded by the *Trunk* or *DpnGateway* in the last statistics collection interval. |
| Values | Long Integer |

### ATTRIBUTE DpnGate fwdOctetFromIf (fwdOctet)

| | |
|---|---|
| Description | This attribute counts the number of forwarding bytes received on the *Trunk* or *DpnGateway* in the last statistics collection interval. |
| Values | Long Integer |

### COMPONENT DpnGate Utp

| | |
|---|---|
| Groups | "GROUP DpnGate Utp Provisioned (Prov)"<br>"GROUP DpnGate Utp OsiState (State)"<br>"GROUP DpnGate Utp Operational (Op)"<br>"GROUP DpnGate Utp Statistics (Stats)" |
| Scope | Network |
| Description | *DpnGateway/n Utp*<br>The *Utp* component provides the Utp Level2 link protocol, an acknowledged protocol that provides selective retransmission of frames. A *Framer* subcomponent is automatically added providing the underlying HDLC framing and associated hardware that the *Utp* component will use. |
| Subcomponents | "COMPONENT DpnGate Utp Framer" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP DpnGate Utp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group of provisionable attributes contains the parameters used by *Unacknowledged*, *Utp*, and *FrAccess* for monitoring link quality. |

### ATTRIBUTE DpnGate Utp maximumErroredInterval

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval time over which the error threshold (as specified by *receiveErrorSensitivity)* must be continuously exceeded before the *Unacknowledged*, *Utp*, or *FrAccess* component can be degraded. Once the error interval count exceeds the provisioned value, the *Unacknowledged*, *Utp*, or *FrAccess* component issues an alarm indicating that link quality has degraded, and it disables its parent component. The exception to this is a value of zero, the default, which indicates that the mechanism is completely disabled. |
| Values | Decimal (0; 1..15) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE DpnGate Utp receiveErrorSensitivity

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the allowable error rate beyond which the *Unacknowledged*, *Utp*, or *FrAccess* component can be degraded if it persists for a duration longer than the *maximumErrorInterval*. The threshold is expressed as a percentage of number of errored frames in the last interval per number of frames received in the last interval. The exception to this is a value of zero, which indicates that the mechanism is completely disabled. The configurable values are:<br>0 = the mechanism is completely disabled<br>1 = 1/(2**1)<br>2 = 1/(2**2)<br>3 = 1/(2**3)<br>:<br>10 = 1/(2**10) |
| Values | Decimal (0; 1..10) |

| | |
|---|---|
| Default | 3 |

### GROUP DpnGate Utp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE DpnGate Utp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE DpnGate Utp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE DpnGate Utp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE DpnGate Utp availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE DpnGate Utp proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of: initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

## ATTRIBUTE DpnGate Utp controlStatus (osiCntrl)

Access: Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE DpnGate Utp alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE DpnGate Utp standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values: hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

### ATTRIBUTE DpnGate Utp unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values: false
true

Default: false

### GROUP DpnGate Utp Operational (Op)

Properties: Operational

| | |
|---|---|
| Description | This group of attributes contains the set of UTP operational parameters measured and maintained by this component. |

### ATTRIBUTE DpnGate Utp roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This is the measured Round Trip Delay (ms) discovered with the remote through the UTP staging protocol. The value includes emission, propagation, and queuing delays. A 2 byte control frame is used to perform the measurement. A value of zero is displayed when the link is disabled or the measured Round Trip Delay is unknown. |
| Values | Decimal (0..1500) |
| Units | msec |
| Default | No default |

### GROUP DpnGate Utp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes contains the set of Utp frame counters collected by this component. |

### ATTRIBUTE DpnGate Utp discardBadFromIf (discfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of received frames discarded by the *Utp* component. UTP discards any received frame that is unknown to its protocol. This counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE DpnGate Utp discardExcessToIf (discti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of transmitted frames discarded by the *Utp* component. Transmitted frames are discarded if the wait |

for transmission queue is congested. This counter wraps around to zero when the maximum value is reached.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE DpnGate Utp frmRexmtToIf (rexmt)

Access Read only

Description This attribute is the number of frames retransmitted by the *Utp* component. This counter wraps around to zero when the maximum value is reached.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE DpnGate Utp areYouThereModeEntries (ayt)

Access Read only

Description This attribute is the number of times the *Utp* component entered the AreYouThere mode. UTP enters this mode whenever the acknowledgment for the last transmitted frame has not been received within a certain time interval. In this mode UTP verifies that the remote end is still active. If so, it will retransmit all frames that were waiting to be acknowledged. This counter wraps around to zero when the maximum value is reached.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE DpnGate Utp windowClosures (closures)

Access Read only

Description This attribute is the number of times the *Utp* component closed its frame window. The frame window determines the maximum number of unacknowledged frames allowed. Typically, the frame window closes when the remote end cannot keep up with the frame arrival rate. This counter wraps around to zero when the maximum value is reached.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT DpnGate Utp Framer

| | |
|---|---|
| Groups | "GROUP DpnGate Utp Framer Provisioned (Prov)"<br>"GROUP DpnGate Utp Framer LinkOptions (Link)"<br>"GROUP DpnGate Utp Framer OsiState (State)"<br>"GROUP DpnGate Utp Framer Statistics (Stats)"<br>"GROUP DpnGate Utp Framer LinkUtilization (Util)"<br>"GROUP DpnGate Utp Framer LinkUtilThreshold (UtilThreshold)" |

"COLLECTED STATS DpnGateway Utp Framer"

| | |
|---|---|
| Scope | Device |
| Description | *Trunk/n Utp Framer*<br><br>The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.<br><br>The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.<br><br>The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts). |
| Common Verbs | Help<br>List<br>Display |

### GROUP DpnGate Utp Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE DpnGate Utp Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP DpnGate Utp Framer LinkOptions (Link)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes defining the framing of data on the link interface. |

### ATTRIBUTE DpnGate Utp Framer framingType

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute defines the type of framing on the link. |
| Values | hdlc |
| Default | hdlc |

### ATTRIBUTE DpnGate Utp Framer dataInversion

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed.<br><br>This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density.<br><br>Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE DpnGate Utp Framer frameCrcType

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of CRC used.<br><br>The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used. |
| Values | crc16<br>crc32<br>noCrc |
| Default | crc16 |

### ATTRIBUTE DpnGate Utp Framer flagsBetweenFrames

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the number of flags that are inserted between frames sent to the link interface. |

| | |
|---|---|
| Values | Decimal (1..16) |
| Default | 1 |

### GROUP DpnGate Utp Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE DpnGate Utp Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE DpnGate Utp Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE DpnGate Utp Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP DpnGate Utp Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a UTP Framer component. |

## ATTRIBUTE DpnGate Utp Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE DpnGate Utp Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE DpnGate Utp Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE DpnGate Utp Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received which were too large. The frame exceeded the maximumFrameLengthLimit provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer frmModeErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer outOfSequenceFrm

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of out of sequence frames in interrupting mode that have been received from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer repeatedFrm

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of repeated frames (frames with the same sequence number) in interrupting mode that have been received from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE DpnGate Utp Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE DpnGate Utp Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### GROUP DpnGate Utp Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE DpnGate Utp Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer highPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the interrupting data traffic sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with a Transfer Priority (TP) of 11 and/or Emission Priority of 1. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |

| | |
|---|---|
| Units | % |
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE DpnGate Utp Framer highPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the interrupting data traffic received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with a Transfer Priority (TP) of 11 and/or Emission Priority of 1. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### GROUP DpnGate Utp Framer LinkUtilThreshold (UtilThreshold)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data required to set the link utilization alarm thresholds. All thresholds are percentages which can take on any value in the range of 0% through 100%. The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the minor |

alarm threshold is less than the other thresholds and that the major alarm threshold is less than the critical alarm threshold.

### ATTRIBUTE DpnGate Utp Framer minorLinkUtilAlarmThreshold (minor)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the threshold value which defines when a minor alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.<br>The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the minor alarm threshold is less than the other thresholds. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 75 |

### ATTRIBUTE DpnGate Utp Framer majorLinkUtilAlarmThreshold (major)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the threshold value which defines when a major alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.<br>The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the major alarm threshold is greater than the minor threshold and less than the critical threshold. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 85 |

### ATTRIBUTE DpnGate Utp Framer criticalLinkUtilAlarmThreshold (critical)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the threshold value which defines when a critical alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.<br>The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the critical alarm threshold is greater than the other thresholds. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 95 |

### ATTRIBUTE DpnGate Utp Framer linkUtilAlarmStatus (status)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides control of the generation of link utilization alarms. If the value is ***disabled***, none of the alarms are generated (this is equivalent to setting all of the thresholds to 100%). If the value is ***enabled***, the individual thresholds are handled. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## COLLECTED STATS DpnGateway Utp Framer

| | |
|---|---|
| Description | The statistics record generated by the DpnGateway Utp Framer component. |

### ATTRIBUTE DpnGate Utp Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE DpnGate Utp Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE DpnGate Utp Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE DpnGate Utp Framer txFrames

| | |
|---|---|
| Description | This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE DpnGate Utp Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |
| Values | Decimal (0..100) |

## COMPONENT DpnGate ForwardingStatistics (FwdStats)

| | |
|---|---|
| Groups | "GROUP DpnGate FwdStats Operational (Oper)" |
| Scope | Application |
| Description | *Trunk/n ForwardingStatistics*<br>This is a dynamic subcomponent of a *Trunk* or *DpnGateway* which appears when packet forwarding traffic is used over the *Trunk* or *DpnGateway*. It contains statistics associated with packet forwarding traffic for *Trunks* and *DpnGateways*. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### GROUP DpnGate FwdStats Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This operational group counts the *Trunk* or *DpnGateway* packet forwarding traffic statistics for operator console display. |

### ATTRIBUTE DpnGate FwdStats fwdPktFromIf (fwdPkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of forwarding packets received by the *Trunk* or *DpnGateway.* This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE DpnGate FwdStats fwdDiscUnforwardFromIf (fwdDisc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of forwarding packets discarded by the *Trunk* or *DpnGateway.* This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE DpnGate FwdStats fwdOctetFromIf (fwdOctet)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of forwarding bytes received by the *Trunk* or *DpnGateway.* This counter wraps around to zero when the maximum value is exceeded. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

## COMPONENT DpnGate FrAccess

| | |
|---|---|
| Groups | "GROUP DpnGate FrAccess Provisioned (Prov)"<br>"GROUP DpnGate FrAccess OsiState (State)"<br>"GROUP DpnGate FrAccess Operational (Op)"<br>"GROUP DpnGate FrAccess Statistics (Stats)" |
| Scope | Network |
| Description | *DpnGate/n FrAccess*<br>This component provides Layer 2 trunking protocol, to be used by *DpnGateway* running over *FrMux* frame relay interface. |
| Subcomponents | "COMPONENT DpnGate FrAccess FrMuxSetup" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP DpnGate FrAccess Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of provisionable attributes contains the parameters used by *Unacknowledged*, *Utp*, and *FrAccess* for monitoring link quality. |

## ATTRIBUTE DpnGate FrAccess maximumErroredInterval

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval time over which the error threshold (as specified by *receiveErrorSensitivity)* must be continuously exceeded before the *Unacknowledged*, *Utp*, or *FrAccess* component can be degraded. Once the error interval count exceeds the provisioned value, the *Unacknowledged*, *Utp*, or *FrAccess* component issues an alarm indicating that link quality has degraded, and it disables its parent component. The |

exception to this is a value of zero, the default, which indicates that the mechanism is completely disabled.

Values: Decimal (0; 1..15)

Units: minutes

Default: 0

### ATTRIBUTE DpnGate FrAccess receiveErrorSensitivity

Access: Read and write

Description: This attribute is the allowable error rate beyond which the *Unacknowledged*, *Utp*, or *FrAccess* component can be degraded if it persists for a duration longer than the *maximumErrorInterval*. The threshold is expressed as a percentage of number of errored frames in the last interval per number of frames received in the last interval. The exception to this is a value of zero, which indicates that the mechanism is completely disabled. The configurable values are:
0 = the mechanism is completely disabled
1 = 1/(2**1)
2 = 1/(2**2)
3 = 1/(2**3)
:
10 = 1/(2**10)

Values: Decimal (0; 1..10)

Default: 3

### GROUP DpnGate FrAccess OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE DpnGate FrAccess adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE DpnGate FrAccess operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE DpnGate FrAccess usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE DpnGate FrAccess availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The

*operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE DpnGate FrAccess proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been

initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE DpnGate FrAccess controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is

***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE DpnGate FrAccess alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE DpnGate FrAccess standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

| | |
|---|---|
| Values | hotStandby (hot)<br>coldStandby (cold)<br>providingService (serv)<br>notSet (nSet) |
| Default | notSet |

### ATTRIBUTE DpnGate FrAccess unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP DpnGate FrAccess Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes contains the set of LTP operational parameters measured and maintained by this component. |

### ATTRIBUTE DpnGate FrAccess roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This is the measured Round Trip Delay (ms) discovered with the remote through the LTP staging protocol. The value includes emission, propagation, and queuing delays. A 2 byte control frame is used to perform the measurement. A value of zero is displayed when the link is disabled or the measured Round Trip Delay is unknown. |
| Values | Decimal (0..1500) |

| | |
|---|---|
| Units | msec |
| Default | No default |

### GROUP DpnGate FrAccess Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for *FrAccess*. |

### ATTRIBUTE DpnGate FrAccess receivedBytesFromIf (rbfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received by *FrAccess* in information frames. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DpnGate FrAccess lostFramesFromIf (lfti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames lost in the direction from interface, the loss of which is detected based on the sequence number mechanism. The reason for a loss may be the congestion-related loss in the external frame relay network, or errors/ congestion developing in the *FrMux* service. When *FrMux* statistics do not show errors/congestion developing internally in *FrMux*, then the losses visible through this statistic should be attributed to the external frame relay network. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DpnGate FrAccess discardBadFromIf (dbfi)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames discarded in the direction ‘from interface’, because they are unknown to the *FrAccess* protocol. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE DpnGate FrAccess discardExcessToIf (deti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded in the direction ‘to interface’ because of congestion on the transmit queue. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT DpnGate FrAccess FrMuxSetup

| | |
|---|---|
| Groups | "GROUP DpnGate FrAccess FrMuxSetup TrafficDescriptors (TrafficDescr)"<br>"GROUP DpnGate FrAccess FrMuxSetup DlciCompNameOp" |
| Scope | Application |
| Description | *DpnGate/n FrAccess FrMuxSetup*<br>This component contains operational and provisionable attributes for setting up a *FrMux Dlci* to act as a transport for *DpnGate/n FrAccess*. |
| Subcomponents | "COMPONENT DpnGate FrAccess FrMuxSetup PvcSetup" |
| Common Verbs | Help<br>List<br>Display |

### GROUP DpnGate FrAccess FrMuxSetup TrafficDescriptors (TrafficDescr)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes for the application of which this *FrMuxSetup* is a subcomponent. The parameters are used for maximum frame size checking and traffic shaping and are to be passed over to *FrMux Dlci* associated with the application. The attributes in this group are defined in T1.606 Addendum 1. |

### ATTRIBUTE DpnGate FrAccess FrMuxSetup committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies, in bit/s, the committed information rate (CIR) to which the traffic transmitted towards the interface is shaped. The minimum value is 4800 bit/s. |
| Values | Decimal (4800..2048000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE DpnGate FrAccess FrMuxSetup maximumFrameSize (n203)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification. |
| Values | Decimal (1..4096) |
| Units | octets |
| Default | 4096 |

### GROUP DpnGate FrAccess FrMuxSetup DlciCompNameOp

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the component name of the *Dlci* which carries the traffic for this application. |

### ATTRIBUTE DpnGate FrAccess FrMuxSetup dlciCompName

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the component name of the *Dlci* with which the application using this *FrMuxSetup* component is associated. The name is a string *FrMux/n Dlci/m.* For a PVC this is the same component name as provisioned under the subcomponent *FrMuxPvcSetup*. |
| Values | The name of the component |
| Default | No default |

### COMPONENT DpnGate FrAccess FrMuxSetup PvcSetup

| | |
|---|---|
| Groups | "GROUP DpnGate FrAccess FrMuxSetup PvcSetup Provisioned (Prov)" |
| Scope | Application |
| Description | *DpnGate/n FrAccess FrMuxSetup PvcSetup*<br>This component contains provisionable attributes for setting up a *Dlci* associated with the application using this component. The *Dlci* is of a PVC type. |
| Common Verbs | Help<br>List<br>Display |

### GROUP DpnGate FrAccess FrMuxSetup PvcSetup Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for setting up a *Dlci* associated with the application using the *FrMuxSetup* component. The *Dlci* is of the PVC type. |

## ATTRIBUTE DpnGate FrAccess FrMuxSetup PvcSetup dlciName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the link to the *Dlci* which is associated with the application using the *FrMuxSetup* component. |
| Values | Link (Hardware, applicationName) |
| Default | No default |

# COMPONENT EM

| | |
|---|---|
| Scope | Device |
| Description | *Em/string*<br>This component represents the local node. An instance of the *EM* component class (with the local node name as its instance string) is automatically created as the root of the component hierarchy; that is, all of the top level components are its subcomponents.<br><br>The local node name is provisioned as the *nodeName* attribute of the *ModuleData* component.<br><br>An operator need not enter the *EM* component at the start of a component name; the local node is assumed by default. However, to specify some other node, it must be entered. Similarly, on output, the local node name is suppressed. |

Help
List

## VERB LOGOUT (LOGOFF)

Impact

Passive

Description

*Logout*
This verb terminates a Local or Telnet Operator session.

If the session was in provisioning mode, an *End Prov* command is effectively executed before the session terminates. The edit view is neither saved nor modified by logging out while in provisioning mode.

## VERB ME

| | |
|---|---|
| Impact | Passive |
| Description | *Me*<br>This verb displays an FMIP, Local or Telnet Operator's component name and userid as well as other information. |

## VERB CANCEL

| | |
|---|---|
| Impact | Passive |
| Description | *Cancel*<br>This verb aborts the latest command, if possible. |

## VERB QUIT (EXIT)

| | |
|---|---|
| Impact | Passive |
| Description | *Quit*<br>This verb terminates a Local or Telnet Operator session, just like the *Logout* command does.<br><br>If the session was in provisioning mode, an *End Prov* command is effectively executed before the session terminates. The edit view is neither saved nor modified by logging out while in provisioning mode. |

## VERB RESETLOCAL

| | |
|---|---|
| Impact | System_admin |
| Description | *Resetlocal*<br>This verb logs out a user currently using the local operator port on the CP. This command can be executed from a telnet session to force another user out of the local port. |

# COMPONENT FrameRelayAtmInterface (FrAtm)

| | |
|---|---|
| Instance | Decimal (1..4294967295) |
| Groups | "GROUP FrAtm CustomerIdentifierData (CidData)"<br>"GROUP FrAtm OsiState (State)"<br>"GROUP FrAtm Statistics (Stats)"<br>"GROUP FrAtm IfEntryProv (IfEntry)"<br>"GROUP FrAtm OperationalStatus (OperStatus)"<br>"GROUP FrAtm EmissionPriorityQs"<br>"GROUP FrAtm TrafficStatistics (TrafficStats)" |
| Scope | Application |
| Description | *FrameRelayAtmInterface/n*<br>This component defines an instance of the Frame Relay to ATM interworking interface. It manages the set of Frame Relay DLCI connections that are interworked with ATM connections. The component instance value is a unique positive integer within a module. Framer is created whenever the FrAtm is added. Users who need VirtualFramer should delete the Framer first, then add the VirtualFramer. |

| | |
|---|---|
| Subcomponents | "COMPONENT FrAtm LocalManagementInterface (Lmi)"<br>"COMPONENT FrAtm ConnectionAdministrator (Ca)" |

## GROUP FrAtm CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE FrAtm customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those |

components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

## GROUP FrAtm OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE FrAtm adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrAtm operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrAtm usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE FrAtm availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrAtm proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |

| | |
|---|---|
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

### ATTRIBUTE FrAtm controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrAtm alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component. |
| Set of | underRepair (repair)<br>critical (crit)<br>major<br>minor<br>alarmOutstanding (outst) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrAtm standbyStatus (osiStby)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Standby status of the component.<br><br>The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.<br><br>The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.<br><br>The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.<br><br>The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource. |
| Values | hotStandby (hot)<br>coldStandby (cold)<br>providingService (serv)<br>notSet (nSet) |
| Default | notSet |

### ATTRIBUTE FrAtm unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component. |

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values: false
true

Default: false

### GROUP FrAtm Statistics (Stats)

Properties: Operational

Description: FrUni/n Statistics
This group contains the statistics about the operational behavior of the service at the interface level.

### ATTRIBUTE FrAtm lastUnknownDlci (ludlc)

Access: Read only

Description: This attribute identifies the most recent DLCI which user frames were received on for which a DLCI has not been provisioned on the port.

Values: Decimal (0..1023)

Default: 0

### ATTRIBUTE FrAtm unknownDlciFramesFromIf (unknown)

Access: Read only

Description:

This attribute contains a count of the number of frames received from the interface with an unknown DLCI (DLCI which is not provisioned). When the maximum is reached the count wraps to zero.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrAtm invalidHeaderFramesFromIf (invalid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrAtm IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE FrAtm ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE FrAtm ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

## GROUP FrAtm OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

## ATTRIBUTE FrAtm snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## GROUP FrAtm EmissionPriorityQs

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute to specify the number of Frame Relay egress emission priority queues to be used on that Frame Relay Interface |

## ATTRIBUTE FrAtm numberOfEmissionQs

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of egress emission priority queues that will be used for that Frame Relay interface.<br><br>For V.35, V.11, HSSI, E1, DS1, E3, DS3 or 8pDS1 the possible values are: ***2*** (in which case they are hardware queues), or ***4*** (in which case they are software queues).<br><br>For DS1C, E1C or DS3C the possible values are ***2, 4*** (in all cases |

they are software queues).

For 32 port Msa cards the possible values are ***2, 4*** (in all cases they are hardware queues).

For 4pDS3Ch, 1pSTM1ChSmIr PQC6v2 (also known as PQC2) the possible values are ***2, 4*** (in all cases they are hardware queues).

For 4pDS3Ch PQC12, setting this attribute has no effect on the number of egress emission priority queues, four hardware queues are always used.

Values: Decimal (2; 4)

Default: 2

## GROUP FrAtm TrafficStatistics (TrafficStats)

Properties: Operational

Description: This operational group provides the traffic statistics of the service at the interface level. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE FrAtm frmToIfByQueue

Access: Read only

Description: This attribute counts the frames transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority.

The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4.

Values: Decimal (0..4294967295)

Replication: Decimal (0..3)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrAtm octetToIfByQueue

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority.<br><br>The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4. |
| Values | Decimal (0..4294967295) |
| Replication | Decimal (0..3) |
| Default | No default |

### COMPONENT FrAtm Framer

| | |
|---|---|
| Groups | "GROUP FrAtm Framer Provisioned (Prov)"<br>"GROUP FrAtm Framer LinkOptions (Link)"<br>"GROUP FrAtm Framer OsiState (State)"<br>"GROUP FrAtm Framer Statistics (Stats)"<br>"GROUP FrAtm Framer LinkUtilization (Util)" |

"COLLECTED STATS FrameRelayAtmInterface Framer"

| | |
|---|---|
| Scope | Application |
| Description | *FrUni/n Framer*<br>*FrNni/n Framer*<br>*FrAtm/n Framer*<br>This component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.<br><br>The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as |

modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

DELete

## GROUP FrAtm Framer Provisioned (Prov)

Properties: Provisioned

Description: This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE FrAtm Framer interfaceName

Access: Read and write

Criticality: Process

Description: This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values: Link (Hardware, applicationFramerName)

Default: No default

## GROUP FrAtm Framer LinkOptions (Link)

Properties: Provisioned

Description — This group contains attributes defining the framing of data on the link interface.

## ATTRIBUTE FrAtm Framer dataInversion

Access — Read and write

Description — This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed.

This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density.

Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.

This attribute may only take its default value for non-MSA cards.

Values — off
on

Default — off

## ATTRIBUTE FrAtm Framer frameCrcType

Access — Read and write

Description — This attribute defines the type of CRC used.

The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used.

This attribute may take only its default value for non-MSA cards.

Values — crc16
crc32
noCrc

Default crc16

### ATTRIBUTE FrAtm Framer flagsBetweenFrames

Access Read and write

Description This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP.

Values Decimal (1..16)

Default 1

### GROUP FrAtm Framer OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE FrAtm Framer adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrAtm Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrAtm Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrAtm Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a Framer component. |

### ATTRIBUTE FrAtm Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Framer frmModeErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm Framer ingressFrameDiscards

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the total number of frames discarded at ingress PQC. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrAtm Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE FrAtm Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE FrAtm Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |

Default 0

## COLLECTED STATS FrameRelayAtmInterface Framer

Description The statistics record generated by the FrameRelayAtmInterface Framer component.

### ATTRIBUTE FrAtm Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

### ATTRIBUTE FrAtm Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

### ATTRIBUTE FrAtm Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

### ATTRIBUTE FrAtm Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

### ATTRIBUTE FrAtm Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

## COMPONENT FrAtm LocalManagementInterface (Lmi)

| | |
|---|---|
| Groups | "GROUP FrAtm Lmi ProtocolParameters (Parms)"<br>"GROUP FrAtm Lmi OsiState (State)"<br>"GROUP FrAtm Lmi ProtocolStatusInfo (Psi)"<br>"GROUP FrAtm Lmi Statistics (Stats)"<br>"GROUP FrAtm Lmi UspProtocolParameters (UspParms)" |
| Scope | Application |
| Description | *FrUni/n LocalManagementInterface*<br>*FrNni/n LocalManagementInterface*<br>*FrAtm/n LocalManagementInterface*<br>This component defines the parameters for implementing the Local Management Interface protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrAtm Lmi ProtocolParameters (Parms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *LMI* component. |

## ATTRIBUTE FrAtm Lmi procedures (proc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute selects the procedures to be used for the Local Management Interface. The following procedures are supported:<br><br>***none:*** no Local Management Interface procedures are running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures. The remaining attributes of this group are ignored.<br><br>For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrUni* is set to ***none***, only ***none*** is |

permitted for the *procedures* attribute of this *Lmi* component.

***vendorForum***: Local Management Interface procedures from the Vendor Forum specification are supported on this interface. *DLCI 1023* is used for the LMI protocol. This value cannot be used if the side attribute is both.

***ansi***: Local Management Interface procedures from the ANSI specification are supported. *DLCI 0* is used for the LMI protocol.

***itu***: Local Management Interface procedures from the ITU-T specification are supported. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***.

***autoConfigure***: The interface determines automatically which Local Management Interface procedures to use. This value cannot be used if the side attribute is user.

The procedures currently in use can be seen in the operational attribute *opProcedures*.

Values
none
vendorForum
ansi
itu (ccitt)
autoConfigure

Default
autoConfigure

## ATTRIBUTE FrAtm Lmi asyncStatusReport (asr)

Access
Read and write

Description
This attribute selects the use of asynchronous PVC status report procedures as specified in ANSI, CCITT, and Vendor Forum.

This attribute can be set to ***on*** or ***off***. If *procedure*s is set to ***none***, this attribute is ignored.

Values
off
on

Default
off

### ATTRIBUTE FrAtm Lmi errorEventThreshold (n392)

| | |
|---|---|
| Access | Read and write |
| Description | An event is defined as follows: (1) receipt of a STATUS ENQUIRY message; or (2) expiration of timer T392. An error event is (1) nonreceipt of STATUS ENQUIRY in T392 seconds; (2) invalid contents of a LMI message; (3) invalid receive sequence number. This attribute specifies the number of error events which, if they occur within *eventCount* events, cause a protocol error condition. The condition is cleared after *eventCount* sequential correct events occur. This attribute corresponds to the nN2 parameter described in the Vendor Forum Specification.<br><br>It must be less than or equal to *eventCount*. |
| Values | Decimal (1..10) |
| Default | 3 |

### ATTRIBUTE FrAtm Lmi eventCount (n393)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed. This attribute corresponds to the nN3 parameter described in the Vendor Forum Specification.<br><br>It must be greater than or equal to *errorEventThreshold*. |
| Values | Decimal (1..10) |
| Default | 4 |

### ATTRIBUTE FrAtm Lmi checkPointTimer (t392)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute selects the time (in seconds) within which a STATUS ENQUIRY message is expected. This attribute corresponds to the nT2 parameter described in the Vendor Forum Specification. |

| | |
|---|---|
| | It must be less than *messageCountTimer.* |
| Values | Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30) |
| Units | seconds |
| Default | 15 |

### ATTRIBUTE FrAtm Lmi messageCountTimer (nt3)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute selects the time (in seconds) within which at most five (this is a fixed value and corresponds to maximum message count in VendorForum) STATUS ENQUIRY messages are expected. This attribute applies only when the *lmiProcedures* is set to ***vendorForum***.<br><br>*messageCountTimer* must always be greater than *checkPointTimer.* |
| Values | Decimal (5; 10; 15; 20; 25; 30) |
| Units | seconds |
| Default | 20 |

### ATTRIBUTE FrAtm Lmi ignoreActiveBit (inab)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether the Frame Relay LMI Active Bit (A-bit) has a bearing on the transfer of user data across this Frame Relay interface for both directions of traffic flow.<br><br>When this attribute is set to ***yes***, the A-bit status of a user DLCI connection does not affect data transfer.<br><br>When this attribute is set to ***no,*** data received from the local interface will be discarded if an A-bit =0 condition exists towards the local user. Data being sent to the local interface is discarded if an A-bit = 0 condition exists towards the subnet. |

| | |
|---|---|
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE FrAtm Lmi side

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute can be set to ***user, network,*** or ***both***.<br><br>When this attribute is set to ***user***, USP LMI procedures are running. When this attribute is set to ***network***, NSP LMI procedures are running. When this attribute is set to ***both***, USPNSP LMI procedures are running.<br>When the value is ***both***, the *procedures* attribute must not be set to ***vendorForum***.<br>Setting the value to ***user*** when the *procedures* attribute is set to ***autoConfigure*** is disallowed semantically. |
| Values | network<br>user<br>both |
| Default | network |

### ATTRIBUTE FrAtm Lmi pvcConfigParmsInFsr (pvcConfig)

| | |
|---|---|
| Access | Read and write |
| Description | When this attribute is set to ***yes***, additional Q.933 information elements are included in the LMI Full Status message to facilitate CPE PVC parameter configuring.<br><br>When set to ***yes***, the *Check Prov* command fails if the *Lmi side* is not set to ***network***.<br><br>When set to ***yes***, *Check Prov* fails if the number of DLCIs on the *FrUni* is greater than 300.<br><br>This attribute should be set to ***no*** if the *BnxProtocol* component is provisioned under this *FrUni* for BNX Frame Relay |

interworking.

If the service is not a *FrUni* this attribute is ignored.

Values
no
yes

Default
no

### ATTRIBUTE FrAtm Lmi pvcAlarmsReporting (pvcAlarms)

Access
Read and write

Description
This attribute specifies if alarms are generated when PVCs change state in the local network, an adjacent network or in remote networks.

When the value is ***internal***, PVCs operational status change in the local network are reported in alarms. When the value is ***external***, PVCs operational status change in an adjacent or remote networks are reported in alarms. When the value is ***both***, PVCs status change in local and adjacent or remote networks are reported in alarms. When the value is ***none***, no alarms are issued for PVCs status change.

There are four kinds of alarms controlled by the attribute.
Alarm 7007 200x reports PVCs that have lost connectivity in an adjacent or remote networks.
Alarm 7007 201x reports PVCs that have reached the data transfer state in an adjacent or remote networks.
Alarm 7007 202x reports PVCs that have lost connectivity in the local network.
Alarm 7007 203x reports PVCs that have reached the data transfer state in the local network.

Each alarm can report a maximum of 112 DLCIs. Up to nine alarms of the same kind may be required to report all PVCs that have changed state if all these PVCs have experienced the same condition at the *FrUni* interface.

Values
external
internal

| | |
|---|---|
| | both<br>none |
| Default | external |

### GROUP FrAtm Lmi OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrAtm Lmi adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE FrAtm Lmi operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE FrAtm Lmi usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP FrAtm Lmi ProtocolStatusInfo (Psi)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the protocol status of the Local Management Interface. |

## ATTRIBUTE FrAtm Lmi protocolStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the LMI is in an error condition or whether the LMI procedures are behaving normally. When operating with no LMI protocol, this attribute is always set to ***normalCondition***. When operating with LMI procedures, this attribute is set to ***errorCondition*** after n392 of the last n393 events are in error. The consequence of an ***errorCondition*** is that all DLCIs on this interface will become inactive in both directions. The ***errorCondition*** is cleared and a ***normalCondition*** is indicated when a sufficient number of events have occurred without error. In ANSI, this occurs when n393 consecutive good events take place.<br><br>If the *procedures* attribute is set to ***autoConfigure***, this attribute is set to ***configuring*** while adaptive LMI determines which LMI procedures are running on the link. A single LMI error event during auto configuration causes the attribute value to change to ***errorCondition***. If during ***configuring*** no LMI message is received, an LMI ***errorCondition*** is raised after n392 x t392 seconds. |
| Values | errorCondition<br>normalCondition<br>configuring |
| Default | No default |

## ATTRIBUTE FrAtm Lmi opProcedures (opproc)

| | |
|---|---|
| Access | Read only |
| Criticality | Process |

Description

The *opProcedures* attribute indicates the procedures being used for the Local Management Interface. This attribute should be ignored if *protocolStatus* is not ***normalCondition***. The following procedures are supported:

***none:*** Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures.

***vendorForum***: Local Management Interface procedures from the Vendor Forum specification are running on this interface. *DLCI 1023* is used for the LMI protocol.

***ansi***: Local Management Interface procedures from the ANSI specification are running. *DLCI 0* is used for the LMI protocol.

***itu***: Local Management Interface procedures from the ITU-T specification are running. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***.

***unknown***: Local Management Interface procedures have yet to be determined by Adaptive LMI.

Values

none
vendorForum
ansi
itu
unknown

Default

No default

## GROUP FrAtm Lmi Statistics (Stats)

Properties

Operational

Description

This group contains the operational statistics for the Frame Relay Local Management Interface.

## ATTRIBUTE FrAtm Lmi keepAliveStatusToIf (kasti)

Access

Read only

| | |
|---|---|
| Description | This attribute counts the number of Local Management Interface keep alive status messages sent to the external user device in response to a status enquiry for keep alive status. When the maximum count is exceeded it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi fullStatusToIf (fsti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi keepAliveStatusEnqFromIf (kafi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface valid keep alive status enquiry messages received from the external user device. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi fullStatusEnqFromIf (fsfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface valid full status enquiry messages received from the external user device. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi networkSideEventHistory (nsh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Local Management Interface network side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The leftmost event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status enquiry message. An error event is one of three possibilities, either a nT2/T392 timer expiry, receipt of a status enquiry message with bad sequence numbers, or when *lmiProcedures* is provisioned to vendorForum and we receive more than nN4 status enquiry messages within the provisioned *messageCountTimer* (nT3). |
| Values | String (1..10, ASCII) |
| Default | No default |

### ATTRIBUTE FrAtm Lmi protocolErrors (proto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface protocol errors. It is the sum of the sequence (*sequenceErrors*), timeout (*pollingVerifTimeouts*) and too many status enquiry messages received within the *messageCountTimer* (nT3) errors. The too many status enquiries error only applies when *lmiProcedures* is set to ***vendorForum***. When the maximum count is exceeded it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi unexpectedIes (uie)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface frames received with an Information Element identifier that is unknown or unexpected. An unexpected Information Element is |

| | |
|---|---|
| | not a protocol error. When the maximum count is reached, this counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi sequenceErrors (seq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface Status Enquiry message sequence errors. A sequence error is receipt of a Status Enquiry message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi unexpectedReports (ur)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface frames received with an unknown or unexpected report type. An unexpected report type is not a protocol error. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi pollingVerifTimeouts (tmo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of *checkPointTImer* (t392) timer expiries occurring on the Local Management Interface. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi keepAliveEnqToIf (kaeti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface keep alive enquiry status messages sent to the external user device for keep alive status. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi fullStatusEnqToIf (fseti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi userSideEventHistory (ush)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Local Management Interface user side procedure event history in order of occurrence. An event is represented by a single symbol. A ‘+’ symbol indicates a good event. An ‘X‘ symbol indicates a protocol error event. The left most event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status message. An error event is either a nT1/T391 timer expiry or receipt of a status message with bad sequence numbers. |
| Values | String (1..10, ASCII) |
| Default | No default |

### ATTRIBUTE FrAtm Lmi statusSequenceErrors (stseq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface Status message sequence errors. A sequence error is receipt of a Status message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Lmi noStatusReportCount (nsrc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented in two cases:<br>i) after a status enquiry is sent out and T391 timer expires without having a status report received.<br>ii) an invalid status report is received.<br><br>When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrAtm Lmi UspProtocolParameters (UspParms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the Local Management Interface user side procedure. |

### ATTRIBUTE FrAtm Lmi fullStatusPollingCycles (n391)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how frequently the Frame Relay UNI service should initiate a Status Enquiry for a full PVC status report. A polling cycle is a Status Enquiry and Status Report exchange. |

This attribute is used only if the *side* attribute is either ***user*** or ***both***.

Values: Decimal (1..255)

Default: 6

### ATTRIBUTE FrAtm Lmi linkVerificationTimer (t391)

Access: Read and write

Description: This attribute specifies how frequently the Frame Relay UNI service should initiate a Status Enquiry for link integrity verification. It must be less than *checkPointTimer (t392)*.

When the Lmi *side* is ***network***, this attribute is ignored.

Values: Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30)

Units: seconds

Default: 10

### COMPONENT FrAtm DataLinkConnectionIdentifier (Dlci)

Instance: Decimal (16..1007)

Groups:
"GROUP FrAtm Dlci OsiState (State)"
"GROUP FrAtm Dlci ABitStatus (ABit)"
"GROUP FrAtm Dlci ServiceParametersOp (SpOp)"
"GROUP FrAtm Dlci Statistics (Stats)"
"GROUP FrAtm Dlci CallData (Calld)"
"GROUP FrAtm Dlci IntervalData (Int)"

Scope: Application

Description: *FrAtm/n DataLinkConnectionIdentifier/n*
This component represents a data link connection. The instance value defines the DLCI value for this connection. For example, *Dlci*/30 defines a logical connection with a DLCI of 30.

For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrAtm* is set to ***none***, no *Dlci* component is allowed under this *FrAtm*.

The *Dlci* component is a subcomponent of *FrAtm*, and is responsible for the Frame Relay U-plane (User-plane) protocol for the specified data link connection.

Subcomponents "COMPONENT FrAtm Dlci ServiceParameters (Sp)"

Opt. Subcomp. "COMPONENT FrAtm Dlci ServiceInterworkingFunction (Siwf)"
"COMPONENT FrAtm Dlci NetworkInterworkingFunction (Niwf)"
"COMPONENT FrAtm Dlci EgressServiceParameters (EgSp)"

## GROUP FrAtm Dlci OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE FrAtm Dlci adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component.

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrAtm Dlci operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrAtm Dlci usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE FrAtm Dlci availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE FrAtm Dlci proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE FrAtm Dlci controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE FrAtm Dlci alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of
underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default
No default

## ATTRIBUTE FrAtm Dlci standbyStatus (osiStby)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE FrAtm Dlci unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP FrAtm Dlci ABitStatus (ABit)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the A-Bit status information for this Data Link Connection Identifier. |

### ATTRIBUTE FrAtm Dlci aBitStatusToIf (abti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the most recent A-bit status sent to the interface. The A-bit status is part of the LMI protocol, and indicates the remote end's willingness to accept data from the local interface. When an inactive setting is sent out, the Frame Relay service will discard any data offered from the local interface. When an active setting is sent out, the Frame Relay service tries to process all data offered from the local interface. |
| Values | inactive<br>active<br>notApplicable |
| Default | No default |

### ATTRIBUTE FrAtm Dlci aBitReasonToIf (abrti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the reason (if any) for an inactive status to be sent to the interface. This reason is ***notApplicable*** for an active status. |
| Values | notApplicable<br>remoteUserSignaled<br>localLmiError<br>remoteLmiError<br>localLinkDown<br>remoteLinkDown<br>pvcDown |
| Default | No default |

### ATTRIBUTE FrAtm Dlci aBitStatusFromIf (abfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the most recent A-Bit status received from the interface. |
| Values | inactive<br>active<br>notApplicable |
| Default | No default |

### ATTRIBUTE FrAtm Dlci aBitReasonFromIf (abrfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the reason (if any) for an inactive status to be sent to the subnet.<br>The value is ***notApplicable*** when the *aBitStatusFromIf* attribute is ***active***.<br>The value is ***remoteUserSignaled*** if the remote interface originating the A-Bit status detects that the virtual circuit is down at the remote network through the LMI protocol. The remote interface must be running network site LMI protocol for this A-Bit status reason to be sent.<br>The value is ***localLmiError*** if the LMI protocol is down at this |

interface.
The value is ***localLinkDown*** if the physical link is disabled at this interface.
The value is ***pvcDown*** if no A-Bit status has been sent to this interface from the local network.
The value is ***missingFromLmiReport*** if the remote interface did not provide a reason along with the inactive A-Bit status.

Values
notApplicable
remoteUserSignaled
localLmiError
localLinkDown
pvcDown
missingFromLmiReport

Default
No default

## GROUP FrAtm Dlci ServiceParametersOp (SpOp)

Properties
Operational

Description
This group contains service parameters for the *Dlci* component.

## ATTRIBUTE FrAtm Dlci maximumFrameSize (n203)

Access
Read only

Description
This attribute indicates the maximum number of octets which can be included in the information field. This definition does not include the FrameRelay header and CRC octets. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification.

Values
Decimal (1..8187)

Units
octets

Default
No default

## ATTRIBUTE FrAtm Dlci rateEnforcement (re)

Access
Read only

Description
This attribute indicates whether rate enforcement is in effect for this user Data Link Connection on this *FrAtm* interface.

When rate enforcement is on, Committed Information Rate (CIR) and DE=1 traffic will be measured and enforced.

When rate enforcement is off, all frames from the user will be accepted and no modifications to the frame with respect to the DE bit will be made.

Values
off
on

Default
No default

### ATTRIBUTE FrAtm Dlci committedInformationRate (cir)

Access
Read only

Description
This attribute indicates the committed information rate (CIR) in bits per second (bit/s) and represents the rate at which the network agrees to transfer information under normal conditions when *rateEnforcement* is ***on***. This rate is measured over a measurement interval (t).

This attribute is not applicable when *rateEnforcement* is ***off***.

Values
Decimal (0..50000000)

Units
bit/s

Default
No default

### ATTRIBUTE FrAtm Dlci committedBurstSize (bc)

Access
Read only

Description
This attribute indicates the committed burst size (Bc) in bits and represents the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*) when rateEnforcement is ***on***. Data marked with DE=1 is not accounted for in committed burst size.

This attribute is not applicable when *rateEnforcement* is ***off***.

Values
Decimal (0..50000000)

| | |
|---|---|
| Units | bits |
| Default | No default |

### ATTRIBUTE FrAtm Dlci excessBurstSize (be)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the excess burst size (Be) in bits and represents the amount of uncommitted data that the network attempts to deliver over measurement interval (t) when *rateEnforcement* is ***on***. Data marked DE=1 by the user or by the network is accounted for here.<br><br>This attribute is not applicable ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | No default |

### ATTRIBUTE FrAtm Dlci measurementInterval (t)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time interval over which rates and burst sizes are measured.<br><br>This attribute is not applicable when *rateEnforcement* is ***off***. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### ATTRIBUTE FrAtm Dlci emissionPriorityToIf (epToIf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the emission priority of frames sent to the interface.<br><br>If the value of *FrAtm/n numberOfEmissionQs* is ***2***, set the value |

of this attribute to either ***0*** or ***1***; if the value of *FrAtm/n numberOfEmissionQs* is ***4***, set the value of this attribute to one of ***0***, ***1***, ***2***, ***3***.

Values: Decimal (0; 1; 2; 3)

Default: No default

### ATTRIBUTE FrAtm Dlci dlciType (dlcty)

Access: Read only

Description: This attribute indicates the type of DLCI.
A value of ***serviceInterworking*** indicates that a *FrAtm/n Dlci/n Siwf* component is present.
A value of ***networkInterworking*** indicates that a *FrAtm/n Dlci/n Niwf* component is present.

Values: serviceInterworking
networkInterworking

Default: No default

### ATTRIBUTE FrAtm Dlci troubled (trb)

Access: Read only

Description: This attribute indicates whether or not the connection is in a troubled state. Connections may become troubled for the following reasons; if CAC failed to admit the call, or if one of the attributes *aBitStatusToIf*, *aBitStatusFromIf* goes inactive; otherwise it is set to no.

Values: no
yes

Default: no

### ATTRIBUTE FrAtm Dlci troubledReason (trbrc)

Access: Read only

Description: This attribute provides the reason (if any) for a troubled connection.

A value of ***notApplicable*** indicates no current failures; either

Connection Admission Control (CAC) is off, or call was admitted.

A value of ***notAdmitted*** indicates the CAC algorithm fails to admit this connection. Check if there is a sufficient bandwidth allocation.

A value of ***aBitInactive*** indicates that either the aBitStatusToIf or aBitStatusFromIf is inactive.

| | |
|---|---|
| Values | notApplicable<br>notAdmitted<br>aBitInactive |
| Default | notApplicable |

## GROUP FrAtm Dlci Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the Frame Relay Data Link Connection Identifier. |

## ATTRIBUTE FrAtm Dlci frmToIf (fti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames sent to the interface. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE FrAtm Dlci fecnFrmToIf (fecnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames sent to the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci becnFrmToIf (becnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames sent to the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci deFrmToIf (deti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames sent to the interface with the Discard Eligibility (DE) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discCongestedToIf (discardcti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the interface. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discDeCongestedToIf (discarddecti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion in the direction toward the interface. When the maximum count is reached, the count wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci frmFromIf (ffi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface. Frames that are discarded due to error or excess are not counted. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci fecnFrmFromIf (fecnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci becnFrmFromIf (becnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci efciFrmFromNetwork (efcifnwk)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames received from the interworking function with the Explicit Forward Congestion Indication (EFCI) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci deFrmFromIf (defi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface with the Discard Eligibility (DE) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci excessFrmFromIf (excess)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discExcessFromIf (discardefi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which were discarded due to rate enforcement. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discFrameAbit (discfab)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay Service, due to an inactive PVC status, in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discCongestedFromIf (discardcfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discDeCongestedFromIf (discarddecfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set due to local congestion in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci errorShortFrmFromIf (shortfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received with 0 octets in the information field. When the maximum count is reached, the count wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci errorLongFrmFromIf (longfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received with number of octets in the information field greater than the subscribed maximum. When the maximum count is reached, the count wraps to zero. The hardware ignores frame lengths greater than the hardware receive buffer, and therefore does not includes them in this count. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci becnFrmSetByService (becnset)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames with BECN set by the Frame Relay service. It is incremented when the Frame Relay service sets BECN on a frame upon detecting local congestion. This count is incremented regardless of whether the frame already bears a set BECN bit since its use is to determine the place of congestion. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci bytesToIf (bti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent out the interface. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci deBytesToIf (debti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent to the interface with the Discard Eligibility (DE) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discCongestedToIfBytes (discardctib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the link. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discDeCongestedToIfBytes (discarddectib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the link. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci bytesFromIf (bfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the interface. Bytes that are discarded due to error or excess are not counted. When the maximum count is reached, the count wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci deBytesFromIf (debi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the interface with the Discard Eligibility (DE) bit set. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci excessBytesFromIf (excessb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discExcessFromIfBytes (discardebi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes which were discarded due to rate enforcement. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discByteAbit (discbab)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the bytes number of which were discarded due to the A-bit being turned off. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discCongestedFromIfBytes (discardcbib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discDeCongestedFromIfBytes (discarddecbib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci errorShortBytesFromIf (shortbi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received with 0 octets in the information field. When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci errorLongBytesFromIf (longbi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received when the number of octets in the information field is greater than the subscribed maximum. The hardware ignores bytes lengths greater than the hardware receive buffer and therefore does not include them in this count.<br><br>When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrAtm Dlci CallData (CallD)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational values for the *FrAtm Dlci* call data. If the *accountingEnabled* attribute is ***no***, then this group except for *accountingEnabled* is not displayed. |

### ATTRIBUTE FrAtm Dlci accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether accounting is enabled. To enable accounting, the *FrAtm Ca accountCollection* attribute must be non-empty and *FrAtm Dlci Sp accounting* attribute must be ***on***. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE FrAtm Dlci accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether this DLCI represents the called or calling end of the connection. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |

| | |
|---|---|
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE FrAtm Dlci correlationTag

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the unique string which identifies this connection. The value of this operational attribute can be provisioned in the correlationTag attribute of either the Siwf Npvc, Siwf Spvc, or Niwf Spvc subcomponents. For the Siwf Spvc and Niwf Spvc cases, when the provisionable correlationTag is an empty string, then this attribute receives the value of a system- generated correlationTag. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network. If the accountingEnabled attribute is no, then this attribute is not displayed. |
| Values | String (0..32, ASCII) |
| Default | "" |

### GROUP FrAtm Dlci IntervalData (Int)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the *FrAtm Dlci* interval data. |

### ATTRIBUTE FrAtm Dlci startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the start time of this interval. A new interval is started each time an accounting record is generated and call at a setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci totalIngressBytes (tib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total payload bytes in received from the link since the start of the interval. To calculate total valid payload bytes received from link, subtract *discardedBytes* from this attribute. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm Dlci totalEgressBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total payload bytes sent to the link since the start of the interval. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm Dlci eirIngressBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total valid payload bytes in frames with the Discard Eligibility (DE) bit set to 1 received from the link since the start of the interval. Subtract this attribute and *discardedBytes* from *totalIngressBytes* to calculate total valid payload bytes in frames received from the link, with the DE bit set to 0. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm Dlci eirEgressBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total valid payload bytes in frames with the Discard Eligibility (DE) bit set sent to the link since the start of the interval. Subtract the value of this attribute from *totalEgressBytes* to calculate total valid payload bytes in frames, with DE set to 0, sent to the link. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm Dlci discardedBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total payload bytes in invalid frames received from the link and discarded at the DLCI since the start of the interval. This count is a sum of octets in frames discarded due to: frames too long or too short; A-Bit off; or to rate enforcement. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm Dlci totalIngressFrames

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of frames received from the link since the start of the interval. To calculate the total valid number of frames received from the link, subtract *discardedFrames* from this attribute. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Dlci totalEgressFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames sent to the link since the start of the interval. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Dlci eirIngressFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of valid frames with the Discard Eligibility (DE) bit set to 1 received from the link since the start of the interval. Subtract this attribute and *discardedFrames* from *totalIngressFrames* to calculate total valid frames received from the link, with the DE bit set to 0. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Dlci eirEgressFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the link since the start of the interval. Subtract the value of this attribute from *totalEgressFrames* to calculate total frames, with DE set to 0, sent to the link.The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Dlci discardedFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of invalid frames received from the link and discarded at the DLCI. The count is reset to zero when an accounting record is generated or at call setup. The count is a sum of frames discarded due to: frames too long or too short; A-Bit is off; or rate enforcement. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrAtm Dlci elapsedDifference

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the elapsed time representing the of this interval data. It is the elapsed time in 0.1 second increments since the start of the interval. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT FrAtm Dlci ServiceParameters (Sp)

| | |
|---|---|
| Groups | "GROUP FrAtm Dlci Sp Provisioned (Prov)" |
| Scope | Application |
| Description | *FrAtm/n Dlci/n ServiceParameters*<br>This component is a subcomponent of *Dlci*. It contains the provisionable attributes for the parent *Dlci* component. |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrAtm Dlci Sp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the Data Link Connection Identifier. These attributes reflect the service parameters specific to this instance of DLCI. The congestion control attributes in this group are defined in T1.606 Addendum 1. |

## ATTRIBUTE FrAtm Dlci Sp maximumFrameSize (n203)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of octets which may be included in the information field. The Frame Relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification. |
| Values | Decimal (1..8187) |
| Units | octets |
| Default | 2100 |

## ATTRIBUTE FrAtm Dlci Sp rateEnforcement (re)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies whether rate enforcement is in effect for this user data link connection.<br><br>When *rateEnforcement* is *on*, the *CIR* and *De=1* traffic will be measured and enforced.<br><br>When *rateEnforcement* is *off*, all frames from the user are accepted and no modifications to the frame with respect to the *De* bit will be made. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE FrAtm Dlci Sp committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed information rate (CIR). It represents the rate at which the network agrees to transfer information under normal conditions when rate enforcement is in effect.<br><br>When rate enforcement is not in effect, this attribute is ignored.<br><br>Determination of the actual CIR is based on *committedInformationRate*, *committedBurstSize* and a measurement interval. The measurement interval is determined internally when *committedInformationRate* has a non-zero value. Otherwise, it is based on *measurementInterval* which must be explicitly provisioned.<br><br>Note: The *committedBurstSize* must have a value of 0 when rate enforcement is in effect and *committedInformationRate* has a value of 0. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE FrAtm Dlci Sp committedBurstSize (bc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed burst size (Bc). It represents the amount of data that a network agrees to transfer under normal conditions over a measurement interval when rate enforcement is in effect. Data marked DE=1 is not accounted for in the committed burst size.<br><br>When rate enforcement is not in effect, this attribute is ignored.<br><br>Note: The *committedInformationRate* must have a value of 0 when rate enforcement is in effect and *committedBurstSize* has a value of 0. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 64000 |

### ATTRIBUTE FrAtm Dlci Sp excessBurstSize (be)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the excess burst size (Be). It represents the amount of uncommitted data that the network will attempt to deliver over a measurement interval when rate enforcement is in effect. Data marked DE=1 by the user or by the network is accounted for here.<br><br>*committedInformationRate*, *committedBurstSize*, and *excessBurstSize* cannot all be zero when rate enforcement is in effect. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE FrAtm Dlci Sp measurementInterval (t)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time interval over which rates and burst sizes are measured when rate enforcement is in effect.<br><br>When rate enforcement is in effect and both *committedInformationRate* and *committedBurstSize* have values of zero, this attribute must have a non-zero value.<br><br>When rate enforcement is not in effect or when *committedInformationRate* and *committedBurstSize* have non-zero values, this attribute is ignored.<br><br>When *committedInformationRate* and *committedBurstSize* have non-zero values, the time interval is internally calculated. In this situation, *measurementInterval* is ignored, and it does not represent the time interval. |
| Values | Decimal (0..25500) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE FrAtm Dlci Sp accounting (ac)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows the operator to control accounting for this DLCI. To enable accounting data collection and record generation, the value of this attribute must be ***on*** and at least one of the *accountCollection* reasons in the *FrAtm Ca* component must be set. |
| Values | off<br>on |
| Default | off |

### COMPONENT FrAtm Dlci ServiceInterworkingFunction (Siwf)

| | |
|---|---|
| Groups | "GROUP FrAtm Dlci Siwf ConnectionOp (ConnOp)"<br>"GROUP FrAtm Dlci Siwf ServiceDescriptorsOp (SdOp)"<br>"GROUP FrAtm Dlci Siwf FrAtmDlcSiwfSoftPvcOp (SiwfSpvcOp)"<br>"GROUP FrAtm Dlci Siwf Statistics (Stats)" |

| | |
|---|---|
| Scope | Application |
| Description | *FrAtm/n Dlci/n ServiceInterworkingFunction*<br>The *Siwf* component provides the service interworking function capability between a Frame Relay data link connection and an ATM connection. |
| Opt. Subcomp. | "COMPONENT FrAtm Dlci Siwf ServiceDescriptor (Sd)"<br>"COMPONENT FrAtm Dlci Siwf NailedUpPvc (NPvc)"<br>"COMPONENT FrAtm Dlci Siwf SoftPvc (SPvc)"<br>"COMPONENT FrAtm Dlci Siwf QualityOfService (QoS)" |
| Dyn. Subcomp. | "COMPONENT FrAtm Dlci Siwf AtmConnection (AtmCon)"<br>"COMPONENT FrAtm Dlci Siwf RerouteInfo (RerInfo)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrAtm Dlci Siwf ConnectionOp (ConnOp)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for the ATM connection. |

## ATTRIBUTE FrAtm Dlci Siwf discardPriority (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the discard priority of frames sent to and received from the ATM connection.<br><br>When *discardPriority* is ***dp3*** the frames belonging to this connection will be discarded first when the *FrAtm/n Dlci/n Siwf* and the ATM End-Point experience congestion.<br><br>When *discardPriority* is ***dp2*** the frames belonging to this connection will be discarded after all the ***dp3*** priority frames are discarded when the *FrAtm/n Dlci/n Siwf* and the ATM End-Point experience congestion. |

When *discardPriority* is ***dp1*** the frames belonging to this connection will be discarded after all the ***dp2*** and ***dp3*** priority frames are discarded when the *FrAtm/n Dlci/n Siwf* and the ATM End-Point experience congestion.

Values
dp1
dp2
dp3

Default
No default

### ATTRIBUTE FrAtm Dlci Siwf atmServiceCategory (sc)

Access
Read only

Description
This attribute indicates the ATM service category that is used for this connection. This attribute is only displayed for SPVCs.

Values
ubr
cbr
rtVbr
nrtVbr
notApplicable

Default
No default

### ATTRIBUTE FrAtm Dlci Siwf trafficParmConvPolicy (tpcp)

Access
Read only

Description
This attribute indicates the traffic parameter conversion policy that is being used for this connection.

For Npvcs, this attribute is not displayed.

Policy ***3*** characterizes the traffic in the following way:
- ATM traffic descriptor type 6 is selected
- ATM service category rtVbr and nrtVbr supported only
- PCR0+1 is based on AR
- SCR0+1 is based on CIR and EIR
- MBS0+1 is based on Bc, Be, CIR, EIR and AR
- Takes into account that the instantaneous rate of the frame relay stream can be above CIR and up to the AR.

Policy ***4*** characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer.
- PCR0+1 is based on AR
- SCR0 is based on CIR
- MBS0 is based on Bc, CIR, and AR
- There is no direct characterization of EIR. The allowed EIR can be derived using the difference between the AR and CIR.

Policy ***5*** characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer
- ATM service category rtVbr and nrtVbr supported only
- PCR0+1 is based on CIR and EIR
- SCR0 is based on the CIR
- MBS0 is based on the CIR
- The maximum PCR is no longer based on the AR but rather on the CIR and EIR or CIR.

Policy ***6*** characterizes the traffic in the following way:
- ATM traffic descriptor type 3 is selected
- ATM service category ubr, cbr, rtVbr and nrtVbr supported only
- PCR0+1 is based only on CIR.

Values
3
4
5
6
notApplicable

Default
No default

## ATTRIBUTE FrAtm Dlci Siwf avgFrameSize (afs)

Access
Read only

Description
This attribute indicates the average frame size that is used for this connection as part of the traffic parameter conversion policy.

| | |
|---|---|
| | Average frame size is not applicable for Npvcs, and therefore it is not displayed. |
| Values | Decimal (0..8187) |
| Units | bytes |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf remoteAddress (raddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remote address (native E.164, native X.121 or NSAP) for this connection. This attribute is only displayed for SPVCs. |
| Values | String (1..44, NativeAESANsapAddress) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf remoteConnectionIdentifier (rci)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remote connection identifier. This identifier is either a remote *Atm Vpi.Vci* logical channel number or a remote *Frame Relay Dlci* logical channel number. The remote *Atm Vpi.Vci* logical channel number is displayed as "***Vpi.Vci***". and the remote *Frame Relay Dlci* logical channel number is displayed as "***0.remoteDlci***".<br>For NPVCs, this attribute is not displayed. |
| Values | Integer Sequence (0..255; 0..16128) |
| Default | No default |

### GROUP FrAtm Dlci Siwf ServiceDescriptorsOp (SdOp)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational information for a *Siwf* component. |

### ATTRIBUTE FrAtm Dlci Siwf mode

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the mode of interoperability between the Frame Relay and ATM connections regarding upper layer protocol encapsulations.

A value of ***translationMode*** indicates that the interworking function performs translation between RFC 1490 and RFC 1483 encapsulated headers, including routed protocol translation, bridged protocol translation, and connection oriented protocol translation (except for RFC 1490 connection oriented protocol without RFC 1490 header, which is done in *speTranslationMode*).

A value of ***transparentMode*** indicates that the interworking function forwards data without altering the upper layer user protocol encapsulation. Transparent mode is selected when the upper layer user protocol encapsulation methods are compatible between terminal equipments.

A value of ***speTranslationMode*** indicates that the interworking function performs single protocol translation between RFC 1490 with no header and RFC 1483 encapsulated packets.

Values

translationMode
transparentMode
speTranslationMode

Default

No default

## ATTRIBUTE FrAtm Dlci Siwf deToClpMapping (detclp)

Access

Read only

Description

This attribute indicates the type of DE to CLP mapping that is performed in the Frame Relay to ATM direction.

A value of ***preserve*** indicates that the DE field in a Q.922 core frame is copied to the ATM CLP field of every cell containing the information of that frame.

A value of ***always0*** indicates that the CLP field of every generated ATM cell is always 0.

A value of ***always1*** indicates that the CLP field of every generated ATM cell is always1.

Values
always0
always1
preserve

Default
No default

### ATTRIBUTE FrAtm Dlci Siwf clpToDeMapping (clptde)

Access
Read only

Description
This attribute indicates the type of CLP to DE mapping that is performed in the ATM to Frame Relay direction.

A value of ***preserve*** indicates that the DE field of the Q.922 Core frame is set when one or more ATM cells belonging to an AAL5 frame have their CLP field set.

A value of ***always0*** indicates that the DE field of the Q.922 Core frame is always set to 0.

A value of ***always1*** indicates that the DE field of the Q.922 Core frame is always set to 1.

Values
always0
always1
preserve

Default
No default

### ATTRIBUTE FrAtm Dlci Siwf fecnToEfciMapping (fecntefci)

Access
Read only

Description
This attribute indicates the type of FECN to EFCI mapping that is performed in the Frame Relay to ATM direction.

A value of ***preserve*** indicates that the FECN field in a Q.922 Core frame is copied directly to the ATM EFCI field of every cell.

A value of ***always0*** indicates that the EFCI field in every ATM cell generated is set to 0.

Values
always0
preserve

Default
No default

## ATTRIBUTE FrAtm Dlci Siwf crToUuMapping (crtuu)

Access
Read only

Description
This attribute indicates the type of CR to UU mapping that is performed in the Frame Relay to ATM direction.

A value of ***preserve*** indicates that the proprietary and CR bits are mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. The proprietary bits are used for rate enforcement and rate adaption but are unused according to the FRF8 standard.

A value of ***standardFRF8*** indicates that only the CR bit is mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. This is in accordance with the FRF8 standard. This option is provided to avoid equipment inter-working issues with the proprietary use of the unused bits of the CPCS-UU field for rate enforcement and rate adaption.

Values
standardFRF8
preserve

Default
preserve

## ATTRIBUTE FrAtm Dlci Siwf transferPriority (tp)

Access
Read only

Description
This attribute indicates the transfer priority used to establish the connection.
For Npvcs, the value is ***notApplicable***.

| | |

### GROUP FrAtm Dlci Siwf FrAtmDlcSiwfSoftPvcOp (SiwfSpvcOp)

Properties Operational

Description This group contains operational attributes for the *FrAtm Dlci Siwf Spvc* connection.

### ATTRIBUTE FrAtm Dlci Siwf peakCellRate0 (pcr0)

Access Read only

Description This attribute indicates the Peak Cell Rate (PCR) of the ATM VCC to which this interworking function is linked for all cells (with CLP=0).

The *pcr0* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*.

For NPVCs, this attribute is not displayed.

Values Decimal (0..4294967295)

Units cell/s

Default No default

### ATTRIBUTE FrAtm Dlci Siwf peakCellRate01 (pcr01)

Access Read only

Description This attribute indicates the Peak Cell Rate (PCR) of the ATM VCC to which this interworking function is linked for all cells (with CLP=0 and CLP=1).

The *pcr01* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*.

For NPVCs, this attribute is not displayed.

Values Decimal (0..4294967295)

Units cell/s

Default No default

### ATTRIBUTE FrAtm Dlci Siwf sustainedCellRate0 (scr0)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Sustained Cell Rate (SCR) of the ATM VCC to which this interworking function is linked for high priority cells (with CLP=0).<br><br>The *scr0* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*.<br><br>For NPVCs, this attribute is not displayed. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf sustainedCellRate01 (scr01)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Sustained Cell Rate (SCR) of the ATM VCC that to which this interworking function is linked for all cells (with CLP=0 and CLP=1).<br><br>The *scr01* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*.<br><br>For NPVCs, this attribute is not displayed. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf maximumBurstSize0 (mbs0)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Maximum Burst Size (MBS) of the ATM VCC to which this interworking function is linked for high priority cells (with CLP=0). |

The *mbs0* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*.

For NPVCs, this attribute is not displayed.

Values: Decimal (0..4294967295)

Units: cell/s

Default: No default

### ATTRIBUTE FrAtm Dlci Siwf maximumBurstSize01 (mbs01)

Access: Read only

Description: This attribute indicates the Maximum Burst Size (MBS) of the ATM VCC to which this interworking function is linked for all cells (with CLP=0 and CLP=1).

The *mbs01* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping.*

For NPVCs, this attribute is not displayed.

Values: Decimal (0..4294967295)

Units: cell/s

Default: No default

### ATTRIBUTE FrAtm Dlci Siwf equivalentBitRate (ebr)

Access: Read only

Description: This attribute indicates the access reserved bandwidth for this FR-ATM connection when CAC is on. If a connection is subscribed to CIR only or CIR plus EIR service, the EBR reserved is CIR. If a connection is subscribed to EIR only service, the EBR reserved is 0.

Values: Decimal (0..4294967295)

Units: bit/s

Default: No default

### ATTRIBUTE FrAtm Dlci Siwf type (typ)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the component provisioned is a calling or called end. If the value is ***master***, the *Dlci Siwf Spvc* component is provisioned as a calling end and is responsible for originating the call to set up the ATM VCC. If the value is ***slave***, this *Dlci Siwf* component is provisioned as a called end and is responsible for terminating call setup requests from the remote end. This attribute is not displayed for NPVCs. |
| Values | master<br>slave<br>notApplicable |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf vccClearCause (vclc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last received clear cause message from the network. This attribute is not displayed for NPVCs.<br><br>Please refer to ATM User-Network Interface Specification for possible clear causes. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf vccCauseDiag (vcdg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the diagnostic value of the last release message received from the network. This attribute is not displayed for NPVCs.<br><br>Please refer to ATM User-Network Interface Specification for possible diagnostic values. |
| Values | String (1..8, Hex) |

| | |
|---|---|
| Default | No default |

### GROUP FrAtm Dlci Siwf Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics for the *Siwf* component. |

### ATTRIBUTE FrAtm Dlci Siwf unknown1490Frames (unknown1490)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface that have a frame header that is not recognized by the RFC 1490.<br><br>When the maximum count is reached, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf invalid1490Frames (invalid1490)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface that have an invalid frame header. An invalid frame header occurs when the frame has less than the expected number of bytes.<br><br>When the maximum count is reached, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf lastUnknown1490ProtocolHeader (lastUnk1490)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the most recent unrecognized protocol header that was received from the interface.<br><br>All the RFC 1490 protocols described in sections 5.3.1.1 through 5.3.1.3 of FRF.8 are supported, except ARP is not supported. |

| | |
|---|---|
| Values | String (1..8, Hex) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf unknown1483Frames (unknown1483)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the ATM connection that have a frame header that is not recognized by the RFC 1483.<br><br>When the maximum count is reached, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf invalid1483Frames (invalid1483)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the ATM connection that have an invalid frame header. An invalid frame header occurs when the frame has less than the expected number of bytes.<br><br>When the maximum count is reached, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf lastUnknown1483ProtocolHeader (lastUnk1483)

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the most recent unrecognized protocol header that was received from the ATM connection.<br><br>All the RFC 1483 protocols described in sections 5.3.1.1 through 5.3.1.3 of FRF.8 are supported except ARP. |
| Values | String (1..8, Hex) |
| Default | No default |

## COMPONENT FrAtm Dlci Siwf ServiceDescriptor (Sd)

| | |
|---|---|
| Groups | "GROUP FrAtm Dlci Siwf Sd Provisioned (Prov)" |
| Scope | Application |
| Description | *FrAtm/n Dlci/n Siwf ServiceDescriptor*<br>The *Sd* component contains provisioning information for its parent *Siwf* component. It is a required component when *Npvc* is provisioned. In the case of *Spvc*, if this component is not provisioned, the connection will use the provisioning information from the *FrAtm Ca* component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrAtm Dlci Siwf Sd Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the parent *Siwf* component. |

## ATTRIBUTE FrAtm Dlci Siwf Sd mode

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the mode of interoperability between the Frame Relay and ATM connections regarding upper layer protocol encapsulations.<br><br>When ***translationMode*** is selected, the interworking function performs translations between RFC 1490 and RFC 1483 encapsulated headers, including routed protocol translation, bridged protocol translation, and connection oriented protocol translation (except for RFC 1490 connection oriented protocol without RFC 1490 header, which is done in *speTranslationMode*).<br><br>A value of ***transparentMode*** indicates that the interworking |

function forwards data without altering the upper layer user protocol encapsulation. Transparent mode is selected when the upper layer user protocol encapsulation methods are compatible between terminal equipments.

A value of ***speTranslationMode*** indicates that the interworking function performs single protocol translation between RFC 1490 with no header and RFC 1483 encapsulated packets.

The default value is ***sameAsInterface,*** which means as defined in ***FrAtm/n Ca sdMode.***

speTranslationMode
sameAsInterface

Default
sameAsInterface

## ATTRIBUTE FrAtm Dlci Siwf Sd deToClpMapping (detclp)

Access
Read and write

Description
This attribute specifies the DE to CLP mapping that is performed in the Frame Relay to ATM direction.

When ***preserve*** is selected, the DE field in the Q.922 core frame is mapped to the ATM CLP field of every cell generated by the segmentation process of the AAL5 PDU containing the information of that frame.

When ***always0*** is selected, the CLP field of every ATM cell generated by the segmentation process of the AAL5 PDU containing the information of that frame is always set to 0.

When ***always1*** is selected, the CLP field of every ATM cell generated by the segmentation process of the AAL5 PDU containing the information of that frame is always set to 1.

Values
always0
always1
preserve
sameAsInterface

Default sameAsInterface

### ATTRIBUTE FrAtm Dlci Siwf Sd clpToDeMapping (clpToDe)

Access Read and write

Description This attribute specifies the type of CLP to DE mapping that is performed in the ATM to Frame Relay to direction.

When ***preserve*** is selected, the DE field of the Q.922 Core frame is set when one or more ATM cells belonging to an AAL5 frame have their CLP field set.

When ***always0*** is selected, the DE field of the Q.922 Core frame is always set to 0.

When ***always1*** is selected, the DE field of the Q.922 Core frame is always set to 1.

Values
always0
always1
preserve
sameAsInterface

Default sameAsInterface

### ATTRIBUTE FrAtm Dlci Siwf Sd fecnToEfciMapping (fecntefci)

Access Read and write

Description This attribute specifies the type of FECN to EFCI mapping that is performed in the Frame Relay to ATM direction.

When ***preserve*** is selected, the FECN field in the Q.922 Core frame is mapped directly to the ATM EFCI field of every cell generated by the AAL5 segmentation process.

When ***always0*** is selected, the EFCI field in every ATM cell generated is set to 0.

Values
always0
preserve
sameAsInterface

Default sameAsInterface

### ATTRIBUTE FrAtm Dlci Siwf Sd crToUuMapping (crtuu)

Access Read and write

Description This attribute indicates the type of CR to UU mapping that is performed in the Frame Relay to ATM direction.

A value of ***preserve*** indicates that the proprietary and CR bits are mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. The proprietary bits are used for rate enforcement and rate adaption but are unused according to the FRF8 standard.

A value of ***standardFRF8*** indicates that only the CR bit is mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. This is in accordance with the FRF8 standard. This option is provided to avoid equipment inter-working issues with the proprietary use of the unused bits of the CPCS-UU field for rate enforcement and rate adaption.

## GROUP FrAtm Dlci Siwf NPvc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the NPvc component. |

## ATTRIBUTE FrAtm Dlci Siwf NPvc atmConnection (atmConn)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ATM connection to which the interworking function is linked.<br><br>The ATM connection must be linked to an ATM end-point. For example *AtmIf/m Vcc/m Nep*. |
| Values | Link (Service, applicationName) |
| Default | No default |

## ATTRIBUTE FrAtm Dlci Siwf NPvc correlationTag

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a unique string, set by the operator, which identifies the call for accounting purposes. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network. Normally, this value is provisioned with the same value at each end of the connection. If the value of accountingEnabled is no, this attribute has no effect. |

| | |
|---|---|
| | This attribute is also visible in the FrAtm Dlci component when accounting is enabled. |
| Values | String (0..32, ASCII) |
| Default | "" |

### GROUP FrAtm Dlci Siwf NPvc FrAtmDlcSiwfNailedUpPvcOp (SiwfNpvcOp)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *FrAtm Dlci Siwf Npvc* connection. |

### ATTRIBUTE FrAtm Dlci Siwf NPvc connectionToAtm (connToAtm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM connection to which the interworking function is linked. |
| Values | The name of the component |
| Default | No default |

### COMPONENT FrAtm Dlci Siwf SoftPvc (SPvc)

| | |
|---|---|
| Groups | "GROUP FrAtm Dlci Siwf SPvc Provisioned (Prov)" |
| Scope | Application |
| Description | *FrAtm/n Dlci/n Siwf SoftPvc*<br>The *Spvc* component specifies the remote end for a soft PVC. |
| Opt. Subcomp. | "COMPONENT FrAtm Dlci Siwf SPvc RerouteOverride (RerOv)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrAtm Dlci Siwf SPvc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

Description This group contains provisionable attributes for the soft PVC component.

### ATTRIBUTE FrAtm Dlci Siwf SPvc remoteAddress (raddr)

Access Read and write

Description This attribute specifies the remote address of the SPVC.

It is represented as a prefix NPI string and a sequence of up to 15 digits to specify either a native (E.164 or X.121) address format or Atm End System Address(AESA) in ISO NSAP format.

For example:
native E.164 = “e.upto15digits”
native X.121 = “x.upto14digits”
NSAP E.164 ATM address = “n.upto15digits.ESI.SEL”
NSAP address = “40 hexadecimal digits”

Values String (1..44, ASCII)

Default No default

### ATTRIBUTE FrAtm Dlci Siwf SPvc remoteConnectionIdentifier (rci)

Access Read and write

Description This attribute specifies the remote connection identifier. The identifier is either a remote *Atm Vpi.Vci* logical channel number assignment or a remote *Frame Relay Dlci* logical channel number assignment. The remote *Atm Vpi.Vci* logical channel number is input as “***Vpi.Vci***” and the remote *Frame Relay Dlci* logical channel number is input as “***0.remoteDlci***”.

Values Integer Sequence (0..255; 0..16128)

Default No default

### ATTRIBUTE FrAtm Dlci Siwf SPvc correlationTag

Access Read and write

Description This attribute specifies the unique string, set by the operator, which identifies the call for accounting purposes. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network. If the value of

accountingEnabled is no, this attribute has no effect. This attribute is also visible in the FrAtm Dlci component when accounting is enabled. When this attribute is an empty string, the operational correlationTag attribute in the FrAtm Dlci component receives the value of a system-generated correlationTag.

Values: String (0..32, ASCII)

Default: ""

## COMPONENT FrAtm Dlci Siwf SPvc RerouteOverride (RerOv)

Groups: "GROUP FrAtm Dlci Siwf SPvc RerOv Provisioned (Prov)"

Scope: Device

Description: *FrAtm/n Dlci/x Siwf RerouteOverride*

This component represents the ability to override rerouting capability subscription options on a per connection basis for provisioned SPVC and SPVP connections.

The addition of this component and changes to the attributes contained in this component are critical to the parent SPVC or SPVP. However, the deletion of this component is not a critical change for the connection. If this component is deleted, the connection remains active with the last provisioned subscription options. Subscription is lost when the connection goes down and re-establishes.

Common Verbs:
- Help
- List
- Display
- Add
- DELete

### VERB OPTIMIZE FrAtm Dlci Siwf SPvc RerOv

Impact: Service

Description: *OPTimize FrAtm/n Dlci/x Siwf RerOv*

This command triggers path optimization for the connection segment. If the interface is already processing a path optimization request, then the *Optimize* command is cancelled.

Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

### GROUP FrAtm Dlci Siwf SPvc RerOv Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes related to rerouting subscription options for provisioned connections.

### ATTRIBUTE FrAtm Dlci Siwf SPvc RerOv protocol

Access: Read and write

Description: This attribute specifies the rerouting protocols which are requested by the connection segment. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

One of the following values can be specified:
***sameAsInterface***: The requested rerouting protocols are specified by the *protocol* attribute under the *Reroute Ov* component for the interface.
***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
***globalOnly***: Global rerouting is requested. Global rerouting is

granted if the DTL terminator is provisioned with the Rerouting feature.
***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values

localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsInterface (sameAs)

Default

sameAsInterface

## ATTRIBUTE FrAtm Dlci Siwf SPvc RerOv localConnectionRecoverySubscr (lRecSub)

Access

Read and write

Description

This attribute specifies whether the connection segment requests subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

If the connection segment requests ***localGlobal*** or ***localOnly*** protocols, this attribute controls local connection recovery subscription.

If the connection segment requests ***localEbr***, this attribute controls the local connection recovery subscription. Only one will be granted.

One of the following values can be specified:
***sameAsInterface***: The subscription rule is determined by the *localConnectionRecoverySubscr* attribute under the *Reroute Ov* component for the interface. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segment requests subscription to local connection recovery, otherwise the connection segment does not request subscription.

***yes:*** The connection segment requests subscription to local connection recovery.
***no***: The connection segment does not request subscription to local connection recovery.

Values
no
yes
sameAsInterface (sameAs)

Default
sameAsInterface

## ATTRIBUTE FrAtm Dlci Siwf SPvc RerOv localPathOptimizationSubscr (lOptSub)

Access
Read and write

Description
This attribute specifies whether the connection segment requests subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

If the connection segment requests ***localGlobal*** or ***localOnly*** protocols, this attribute controls local path optimization subscription.

If the connection segment requests ***localEbr***, this attribute controls the local path optimization subscription. Only one will be granted.

One of the following values can be specified:
***sameAsInterface***: The subscription rule is determined by the *localPathOptimizationSubscr* attribute under the *Reroute Ov* component for the interface. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segment requests subscription to local path optimization, otherwise the connection segment does not request subscription.
***yes:*** The connection segment requests subscription to local path optimization.
***no***: The connection segment does not request subscription to local path optimization.

Values
no
yes
sameAsInterface (sameAs)

Default
sameAsInterface

### ATTRIBUTE FrAtm Dlci Siwf SPvc RerOv globalConnectionRecoverySubscr (gRecSub)

Access
Read and write

Description
This attribute specifies whether the connection segment requests subscription to global or EBR connection recovery. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute affects connection segments for a node that is a DTL originator.

If the connection segment requests ***ebrOnly***, this attribute controls EBR connection recovery subscription.

If the connection segment requests ***localEbr***, this attribute controls the EBR connection recovery subscription. Only one will be granted.

One of the following values can be specified:
***sameAsInterface***: The subscription rule is determined by the *globalConnectionRecoverySubscr* attribute under the *Reroute Ov* component for the interface. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segment requests subscription to global or EBR connection recovery, otherwise the connection segment does not request subscription.
***yes:*** The connection segment requests subscription to global or EBR connection recovery.
***no***: The connection segment does not request subscription to global or EBR connection recovery.

Values
no
yes

## ATTRIBUTE FrAtm Dlci Siwf QoS emissionPriorityToIf (epToIf)

Access — Read and write

Description — This attribute specifies the emission priority of frames sent to the *FrAtm* interface. Frames in a higher priority queue, represented by a numerically higher number, will be sent before frames in a lower priority queue.
The value of this attribute is interpreted according to the value of the provisionable attribute *numberOfEmissionQs* under the parent *FrAtm* component. If the *numberOfEmissionQs* attribute is set to ***2***, *emissionPriorityToIf* value of ***0*** maps to emission priority queue 0 representing a lower priority queue, and *emissionPriorityToIf* values of ***1, 2,*** and ***3*** are mapped to emission priority queue 1 representing the highest priority queue. If the *numberOfEmissionQs* is set to ***4***, the *emissionPriorityToIf* values are directly assigned to the emission priority queues.
A value of ***deriveFromTp*** specifies that the emission priority is to be extracted from the *Mod Frs AtmNet Tpm/n* component using the *transferPriority* attribute.
A value of ***sameAsInterface*** specifies that the emission priority is to be extracted from the *FrAtm Ca* component using the *niwfEmissionPriorityToIf* attribute.

### ATTRIBUTE FrAtm Dlci Siwf QoS transferPriority (tp)

Access Read and write

Description This attribute specifies the transfer priority of frames sent to the ATM connection using this particular Dlci.
In the Frame Relay to ATM direction, the *tp* selects the ATM service category of the connection.
In the ATM to Frame Relay direction, the *tp* selects the *FrAtm* emission priority queue.
A value of ***sameAsInterface*** specifies that the emission priority extracts from the *FrAtm Ca* component using the *siwfTransferPriority* attribute.

### COMPONENT FrAtm Dlci Siwf AtmConnection (AtmCon)

Groups "GROUP FrAtm Dlci Siwf AtmCon Operational (Oper)"

| | |
|---|---|
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP FrAtm Dlci Siwf AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE FrAtm Dlci Siwf AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

### COMPONENT FrAtm Dlci Siwf RerouteInfo (RerInfo)

| | |

## GROUP FrAtm Dlci Siwf RerInfo Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes that indicate rerouting activities at the connection level.

## ATTRIBUTE FrAtm Dlci Siwf RerInfo lastOptimizationMetric (lOptMet)

Access: Read only

Description: This attribute indicates which optimization metric was last used to select a path for the connection segment.

Values:
cdv
maxCtd
aw

Default: No default

## GROUP FrAtm Dlci Siwf RerInfo EbrOperational (EOper)

Properties: Operational

Description: This group contains attributes that indicate the EBR rerouting characteristics of a connection segment.

This group is only present if the connection segment has been granted the EBR rerouting protocol.

## ATTRIBUTE FrAtm Dlci Siwf RerInfo ebrRecoverySubscribed (eRecSub)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates whether the connection segment is subscribed to EBR connection recovery.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo ebrOptimizationSubscribed (eOptSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to EBR path optimization.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo ebrOptimizationMetricValue (eOptVal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the EBR optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo ebrOptimalMetricValue (eOptMetVal)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the EBR optimization metric value of the connection's best path. It is initialized to the value collected during initial call establishment. It is set to the ***localOptimizationValue*** whenever a connection is optimized onto a path which has a better optimization value or when the number of optimization attempts is exhausted. It represents the segment of the connection between the rerouting and rendezvous nodes.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo ebrOptimizationState (eOptSt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current EBR optimization state of the connection segment.<br><br>One of the following values is indicated:<br>***optimal:*** This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value.<br>***recovered:*** This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment which is greater than the value specified by the optimal metric value.<br>***optimized:*** This value represents the state when the connection segment has moved to a path which is better than the recovered path but not as good as the optimal path.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | optimal<br>recovered<br>optimized |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo ebrTimeOfLastRecovery (eTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the date and time of the last EBR connection recovery.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Time (DHMS) |
| Default | No default |

### GROUP FrAtm Dlci Siwf RerInfo LocalOperational (LOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes that indicate the local rerouting characteristics of a connection segment.<br><br>This group is only present if the connection segment has been granted the local rerouting protocol. |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo localRecoverySubscribed (lRecSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to local connection recovery.<br><br>This attribute is only present if the connection segment has been granted the local rerouting protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo localOptimizationSubscribed (lOptSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to local path optimization. |

This attribute is only present if the connection segment has been granted the local rerouting protocol.

Values
no
yes

Default
No default

### ATTRIBUTE FrAtm Dlci Siwf RerInfo localOptimizationMetricValue (lOptVal)

Access
Read only

Description
This attribute indicates the local optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes. A value of ***undefined*** indicates that the local optimization metric value is undetermined.

This attribute is only present if the connection segment has been granted the local rerouting protocol.

Values
Decimal (0..4294967294)
undefined

Default
No default

### ATTRIBUTE FrAtm Dlci Siwf RerInfo localOptimalMetricValue (lOptMetVal)

Access

| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo localOptimizationState (lOptSt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current local optimization state of the connection segment.<br><br>One of the following values is indicated:<br>***optimal:*** This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value.<br>***recovered:*** This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment which is greater than the value specified by the optimal metric value.<br>***optimized:*** This value represents the state when the connection segment has moved to a path which is better than the recovered path but not as good as the optimal path.<br><br>This attribute is only present if the connection segment has been granted the local rerouting protocol. |
| Values | optimal<br>recovered<br>optimized |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo localTimeOfLastRecovery (lTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the date and time of the last local connection recovery.<br><br>This attribute is only present if the connection segment has been granted the local rerouting protocol. |

| | |
|---|---|
| Values | Time (DHMS) |
| Default | No default |

### GROUP FrAtm Dlci Siwf RerInfo GlobalOperational (GOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes that indicate the global rerouting characteristics of a connection.<br><br>This group is only present if the connection segment has been granted the global rerouting protocol. |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo globalRecoverySubscribed (gRecSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to global connection recovery.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo globalOptimizationSubscribed (gOptSub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the connection segment is subscribed to global path optimization.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo globalOptimizationMetricValue (gOptVal)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the global optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes. A value of ***undefined*** indicates that the global optimization metric value is undetermined.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | Decimal (0..4294967294)<br>undefined |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo globalOptimalMetricValue (gOptMetVal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the global optimization metric value of the connection's best path. It is initialized to the value collected during initial call establishment. It is set to the ***globalOptimizationValue*** whenever a connection is optimized onto a path which has a better optimization value or when the number of optimization attempts is exhausted. It represents the segment of the connection between the rerouting and rendezvous nodes.A value of ***undefined*** indicates that the global optimal optimization metric value is undetermined.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | Decimal (0..4294967294)<br>undefined |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo globalOptimizationState (gOptSt)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the current global optimization state of the connection segment.<br><br>One of the following values is indicated:<br>***optimal:*** This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value.<br>***recovered:*** This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment which is greater than the value specified by the optimal metric value.<br>***optimized:*** This value represents the state when the connection segment has moved to a path which is better than the recovered path but not as good as the optimal path.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | optimal<br>recovered<br>optimized |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo globalTimeOfLastRecovery (gTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the date and time of the last global connection recovery.<br><br>This attribute is only present if the connection segment has been granted the global rerouting protocol. |
| Values | Time (DHMS) |
| Default | No default |

### GROUP FrAtm Dlci Siwf RerInfo EbrStatistics (EStats)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains statistics related to Ebr rerouting for the connection segment. |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo totalEbrConnectionRecoveries (eConnRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful EBR connection recovery attempts. The counter wraps to zero when the maximum value is exceeded.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo totalEbrPathOptimizations (ePathOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts successful EBR path optimization attempts. The counter wraps to zero when the maximum value is exceeded.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Siwf RerInfo totalEbrOptimizationAttempts (eOptAtt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of EBR path optimization attempts. The counter wraps to zero when the maximum value is exceeded.<br><br>This attribute is only present if the connection segment has been granted the EBR protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## GROUP FrAtm Dlci Siwf RerInfo LocalStatistics (LStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics related to local rerouting for the connection segment. |

## ATTRIBUTE FrAtm Dlci Siwf RerInfo totalLocalConnectionRecoveries (lConnRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful local connection recovery attempts. The counter wraps to zero when the maximum value is exceeded.<br><br>This attribute is only present if the connection segment has been granted the local rerouting protocol. |

## COMPONENT FrAtm Dlci NetworkInterworkingFunction (Niwf)

| | |
|---|---|
| Groups | "GROUP FrAtm Dlci Niwf Operational (Oper)" |
| Scope | Application |
| Description | *FrAtm/n Dlci/n NetworkInterworkingFunction*<br>The *Niwf* component provides the network interworking function capability between a Frame Relay data link connection and a FRF.5 ATM end point. |
| Subcomponents | "COMPONENT FrAtm Dlci Niwf SoftPermanentVirtualCircuit (Spvc)" |
| Opt. Subcomp. | "COMPONENT FrAtm Dlci Niwf NetworkingDescriptor (Nd)"<br>"COMPONENT FrAtm Dlci Niwf QualityOfService (QoS)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrAtm Dlci Niwf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational networking description information for a *Niwf* component. |

## ATTRIBUTE FrAtm Dlci Niwf deToClpMapping (detclp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of DE to CLP mapping that is performed in the Frame Relay to ATM direction. |

A value of ***preserve*** indicates that the DE field in the Q.922 core frame copies to the CLP field of every ATM cell containing the frame.
A value of ***always0*** indicates that the CLP field of every ATM cell is always set to 0.
A value of ***always1*** indicates that the CLP field of every ATM cell is always set to 1.

Values
always0
always1
preserve

Default
No default

### ATTRIBUTE FrAtm Dlci Niwf clpToDeMapping (clptde)

Access
Read only

Description
This attribute indicates the type of CLP to DE mapping that is performed in the ATM to Frame Relay direction.
A value of ***preserve*** indicates that the DE field of the Q.922 core frame is set when one or more ATM cells belonging to the frame has its CLP field set, or when the DE field of the FR-SSCS PDU is set.
A value of ***transparent*** indicates that the DE field of the Q.922 core frame copies directly from the DE field of the FR-SSCS PDU.

Values
preserve
transparent

Default
No default

### ATTRIBUTE FrAtm Dlci Niwf transferPriority (tp)

Access
Read only

Description
This attribute indicates the transfer priority in use for a specific connection. This is the transfer priority that the local Frame Relay network uses for this connection to an ATM network.
In the Frame Relay to ATM direction, the *tp* selects the FRF.5 End Point which multiplexes the frames.
In the ATM to Frame Relay direction, the *tp* selects the default *FrAtm* emission priority queue to be used by this *Dlci*.

| | |
|---|---|
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Niwf atmServiceCategory (asc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM service category that was mapped for this connection.<br>A value of ***scNotAvailable*** indicates that *atmServiceCategory* is not yet available for this connection. |
| Values | ubr<br>cbr<br>rtVbr<br>nrtVbr<br>scNotAvailable |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Niwf trafficParmConvPolicy (tpcp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the traffic parameter conversion policy that is used for this connection.<br><br>Policy ***3*** characterizes the traffic in the following way:<br>- ATM traffic descriptor type 6 is selected.<br>- PCR(0+1) is based on the ATM link rate.<br>- SCR(0+1) is based on the CIR and EIR.<br>- MB(0+1) is based on Bc, Be, CIR, EIR and AR.<br>- Takes into account that the instantaneous rate of the frame relay stream can be above CIR and up to the AR.<br><br>Policy ***4*** characterizes the traffic in the following way:<br>- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer.<br>- PCR(0+1) is based on AR.<br>- SCR(0) is based on the CIR.<br>- MBS(0) is based on Bc, CIR, and AR.<br>- There is no direct characterization of EIR. The allowed EIR can |

be derived using the difference between the AR and CIR.

Policy ***5*** characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer.
- PCR(0+1) is based on the CIR and EIR.
- SCR(0) is based on the CIR.
- MBS(0) is based on the CIR.
- The maximum PCR is no longer based on the AR but rather on the CIR and EIR.

Policy ***6*** characterizes the traffic in the following way:
- ATM traffic descriptor type 3 is selected.
- PCR(0+1) is based only on the CIR

***policyNotAvailable*** indicates that the *trafficParmConvPolicy* is not yet available for this connection.

Values
policyNotAvailable
3
4
5
6

Default
No default

## ATTRIBUTE FrAtm Dlci Niwf avgFrameSize (afs)

Access
Read only

Description
This attribute indicates the average frame size that was used for this connection as part of the traffic parameter conversion policy. A value of zero indicates that the *avgFrameSize* is not yet available for this connection.

Values
Decimal (0..8187)

Units
bytes

Default
No default

## ATTRIBUTE FrAtm Dlci Niwf equivalentBitRate (ebr)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the access reserved bandwidth for this FR-ATM connection when CAC is on. If a connection is subcribed to CIR only or CIR plus EIR service, the EBR reserved is CIR. If a connection is subcribed to EIR only service, the EBR reserved is 0. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Niwf atmDlci

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the DLCI logical channel used inside the ATM VCC.<br>A null value indicates that the *atmDlci* is not yet available for this connection. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE FrAtm Dlci Niwf assignedBandwidthPool (asgBwPool)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the bandwidth pool which is used by this *Dlci*. |
| Values | 0<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12 |

13
14
15

Default No default

## COMPONENT FrAtm Dlci Niwf SoftPermanentVirtualCircuit (Spvc)

Groups "GROUP FrAtm Dlci Niwf Spvc Provisioned (Prov)"

Scope Application

Description *FrAtm/n Dlci/n Niwf SoftPermanentVirtualCircuit*
The *Spvc* component represents the remote end of a soft PVC.

Common Verbs
Help
List
Display

## GROUP FrAtm Dlci Niwf Spvc Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes for the soft PVC component.

## ATTRIBUTE FrAtm Dlci Niwf Spvc remoteAddress (raddr)

Access Read and write

Description This attribute specifies the remote address of the SPVC.
It is represented as a prefix NPI string and a sequence of up to 15 digits to specify either a native E.164 or native X.121 address format. For example, native E.164 = “e.upto15digits”.

Values String (3..17, ASCII)

Default No default

## ATTRIBUTE FrAtm Dlci Niwf Spvc remoteDlci

Access Read and write

Description This attribute specifies the remote connection identifier. This identifier is the DLCI logical channel number assignment used inside the ATM pipe.

| | |
|---|---|
| Values | Decimal (16..1007; 1022) |
| Default | 1022 |

### ATTRIBUTE FrAtm Dlci Niwf Spvc correlationTag

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies aunique string, set by the operator, which identifies the call for accounting purposes. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network. Normally, the attribute is provisioned with the same value at both ends of the connection. If the value of accountingEnabled is no, this attribute has no effect. This attribute is also visible in the FrAtm Dlci component when accounting is enabled. When this attribute is an empty string, the operational correlationTag attribute in the FrAtm Dlci component receives the value of a system-generated correlationTag. |
| Values | String (0..32, ASCII) |
| Default | "" |

### COMPONENT FrAtm Dlci Niwf NetworkingDescriptor (Nd)

| | |
|---|---|
| Groups | "GROUP FrAtm Dlci Niwf Nd Provisioned (Prov)" |
| Scope | Application |
| Description | *FrAtm/n Dlci/n Niwf NetworkingDescriptor*<br>The *Nd* component provides networking descriptor overrides for its parent *Niwf* component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrAtm Dlci Niwf Nd Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the parent *Niwf* component. |

### ATTRIBUTE FrAtm Dlci Niwf Nd deToClpMapping (detclp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of DE to CLP mapping performs in the Frame Relay to ATM direction.<br>When ***preserve*** is selected, the DE field in the Q.922 core frame copies to the CLP field of every ATM cell containing the frame.<br>When ***always0*** is selected, the CLP field of every ATM cell is always set to 0.<br>When ***always1*** is selected, the CLP field of every ATM cell is always set to 1. |
| Values | always0<br>always1<br>preserve<br>sameAsInterface |
| Default | sameAsInterface |

### ATTRIBUTE FrAtm Dlci Niwf Nd clpToDeMapping (clptde)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of CLP to DE mapping performs in the ATM to Frame Relay direction.<br>When ***preserve*** is selected, the DE field of the Q.922 core frame is set when one or more ATM cells belonging the frame has its CLP field set, or when the DE field of the FR-SSCS PDU is set.<br>When ***transparent*** is selected, the DE field of the Q.922 core frame copies directly from the DE field of the FR-SSCS PDU. |

## GROUP FrAtm Dlci Niwf QoS Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable quality of service attributes for the *Qos* component.

## ATTRIBUTE FrAtm Dlci Niwf QoS emissionPriorityToIf (epToIf)

Access Read and write

Description This attribute specifies the emission priority of frames sent to the *FrAtm* interface. Frames in a higher priority queue, depicted by a numerically higher number, are sent before frames in a lower priority queue.
The value of this attribute is interpreted according to the value of the provisionable attribute *numberOfEmissionQs* under the parent *FrAtm* component. If the *numberOfEmissionQs* attribute is set to ***2***, *emissionPriorityToIf* value of ***0*** maps to emission priority queue 0 representing a lower priority queue, and *emissionPriorityToIf* values of ***1, 2,*** and ***3*** map to emission priority queue 1 representing the highest priority queue. If the *numberOfEmissionQs* is set to ***4***, the *emissionPriorityToIf* values are directly assigned to the emission priority queues.
A value of ***deriveFromTp*** specifies that the emission priority is to be extracted from the *Mod Frs AtmNet Tpm/n* component using the *transferPriority* attribute.
A value of ***sameAsInterface*** specifies that the emission priority is extracts from the *FrAtm Ca* component using the *niwfEmissionPriorityToIf* attribute.

Values

deriveFromTp
sameAsInterface

Default sameAsInterface

### ATTRIBUTE FrAtm Dlci Niwf QoS transferPriority (tp)

Access Read and write

Description This attribute specifies the transfer priority of frames sent to the ATM connection.
In the Frame Relay to ATM direction, the *tp* selects the FRF.5 End Point which multiplexes the frames.
In the ATM to Frame Relay direction, the *tp* selects the default *FrAtm* emission priority queue to be used by this DLCI.
A value of ***sameAsInterface*** specifies that the emission priority is to be extracted from the *FrAtm Ca* component using the *niwfTransferPriority* attribute.

### COMPONENT FrAtm Dlci EgressServiceParameters (EgSp)

Groups "GROUP FrAtm Dlci EgSp Provisioned (Prov)"

| | |
|---|---|
| Scope | Application |
| Description | *FrAtm/n Dlci/n EgressServiceParameters*<br>This component contains the provisionable attributes of the egress direction for the parent *Dlci* component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrAtm Dlci EgSp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the egress direction for the Data Link Connection Identifier. These attributes reflect the service parameters for the egress direction specific to this instance of *Dlci*. |

## ATTRIBUTE FrAtm Dlci EgSp committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed information rate (CIR) for the egress direction. It is used for bandwidth reservation for the purpose of performing a Call Admission Control (CAC) function towards the egress link.<br><br>This attribute is not used to perform rate enforcement towards the egress link. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | 64000 |

## ATTRIBUTE FrAtm Dlci EgSp committedBurstSize (bc)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the committed burst size (Bc) for the egress direction. It is used for bandwidth reservation for the purpose of performing a Call Admission Control (CAC) function towards the egress link.<br><br>This attribute is not used to perform rate enforcement towards the egress link. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 64000 |

### ATTRIBUTE FrAtm Dlci EgSp excessBurstSize (be)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the excess burst size (Be) for the egress direction. It is used for bandwidth reservation for the purpose of performing a Call Admission Control (CAC) function towards the egress link.<br><br>This attribute is not used to perform rate enforcement towards the egress link. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE FrAtm Dlci EgSp measurementInterval (t)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval for the egress direction. It is used for bandwidth reservation for the purpose of performing a Call Admission Control (CAC) function towards the egress link.<br><br>This attribute is not used to perform rate enforcement towards the egress link. |
| Values | Decimal (0..25500) |

| | |
|---|---|
| Units | msec |
| Default | 0 |

### COMPONENT FrAtm VirtualFramer (VFramer)

| | |
|---|---|
| Groups | "GROUP FrAtm VFramer Provisioned (Prov)"<br>"GROUP FrAtm VFramer OsiState (State)"<br>"GROUP FrAtm VFramer Statistics (Stats)" |
| Scope | Application |
| Description | *FrUni/n VirtualFramer*<br>*FrDte/n VirtualFramer*<br>The *VirtualFramer* component binds two services together to provide data transfer between them. It is mutually exclusive from *Framer* component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrAtm VFramer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *VirtualFramer* component. |

### ATTRIBUTE FrAtm VFramer otherVirtualFramer (ovf)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the other *VirtualFramer* to which the service is linked, for example, *FrUni/n VirtualFramer*, *FrDte/n VirtualFramer*. |
| Values | Link (Service, otherVirtualFramer) |
| Default | No default |

### ATTRIBUTE FrAtm VFramer logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the logical processor on which the service component will reside. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### GROUP FrAtm VFramer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrAtm VFramer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE FrAtm VFramer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE FrAtm VFramer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrAtm VFramer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *VirtualFramer* component. |

### ATTRIBUTE FrAtm VFramer frmToOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames transmitted to the *otherVirtualFramer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm VFramer frmFromOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the *otherVirtualFramer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm VFramer octetFromOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets received from the *otherVirtualFramer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrAtm VFramer discFrmFromOtherVFramer (discFrmFromOvf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded frames from the *otherVirtualFramer*. Incrementing of this counter indicates that some incoming traffic cannot be handled by the FP. |
| Values | Long Integer |
| Default | No default |

### COMPONENT FrAtm Address (Addr)

| | |
|---|---|
| Groups | "GROUP FrAtm Addr Provisioned (Prov)"<br>"GROUP FrAtm Addr FrAtmAddrOp (addrOp)" |
| Scope | Application |
| Description | *FrAtm/n Address*<br>The *Addr* component contains the address for a *FrAtm* interface that supports native E.164 or X.121. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrAtm Addr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group specifies the address of the *FrAtm* Interface. |

### ATTRIBUTE FrAtm Addr address (addr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains digits which form the unique identifier of the customer. It is the equivalent of the telephone number in the telephone network (either native E.164 or X.121 address formats, or Atm End System Address(AESA) in ISO NSAP format ). |

For example, E.164 prefix “e.613722”, X.121 prefix “x.302”, NSAP “45000441812460730F000000000020480D200100”.

Values: String (1..44, ASCII)

Default: No default

### GROUP FrAtm Addr FrAtmAddrOp (addrOp)

Properties: Operational

Description: This group display the address of the *FrAtm* Interface.

### ATTRIBUTE FrAtm Addr myAddress (myAddr)

Access: Read only

Description: This attribute displays the parent FRATM component’s address in the ISO NSAP format.

Values: String (40, ASCII)

Default: No default

### COMPONENT FrAtm ConnectionAdministrator (Ca)

Groups:
"GROUP FrAtm Ca Provisioned (Prov)"
"GROUP FrAtm Ca ServiceDescriptor (Sd)"
"GROUP FrAtm Ca NetworkingDescriptor (Nd)"
"GROUP FrAtm Ca InterfaceQualityOfService (IfQoS)"
"GROUP FrAtm Ca Operational (Op)"
"GROUP FrAtm Ca AccountingOptions"

Scope: Application

Description: *FrAtm/n ConnectionAdministrator*
The *Ca* component allows common subscription options applicable to interworking with ATM networking to be specified by the network operator on a *FrAtm* interface. The values defined under the *Ca* component interface defaults are used for the majority of the connections. For exception cases, the interface defaults specified in the *Ca* component can be overridden on a

per connection basis by provisioning *FrAtm Dlci Siwf Qos* or *FrAtm Dlci Niwf Qos* components.

Opt. Subcomp. "COMPONENT FrAtm Ca TransferPriorityMapping (Tpm)"

Common Verbs
Help
List
Display

## GROUP FrAtm Ca Provisioned (Prov)

Properties Provisioned

Description This attribute group contains the common provisionable attributes of the *Ca* component.

## ATTRIBUTE FrAtm Ca callAdmissionControl (cac)

Access Read and write

Criticality Process

Description This attribute specifies the control to turn on Call Admission Control (CAC). The default value for CAC is off.

Values
off
on

Default off

## ATTRIBUTE FrAtm Ca overrideLinkRate (ovLinkRate)

Access Read and write

Criticality Process

Description This attribute allows the link rate to be overridden for this interface. This allows the user to specify a value other than the actual physical link rate computed when a *Framer* component is provisioned. In the absence of a *Framer* component, or when a *VirtualFramer* component is provisioned, this value needs to be explictly set to provide an equivalent link rate.

This attribute provides control on the amount of bandwidth available for performing CAC. This attribute also provides the

| | |
|---|---|
| | requested amount of bandwidth that is negotiated across an ATM network for traffic conversion polices 3 and 4, since these policies are a function of the access rate. |
| Values | Decimal (0..520000000) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE FrAtm Ca bandwidthPool (bwPool)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | Port capacity is partitioned into 16 pools (pool 0 through pool 15). This attribute specifies the percentage of port capacity that is allowed for each pool. The percentage for each pool ranges from 0% to 1000%. It allows for under or over subscription of the port. Under subscription occurs when the sum of the percentage assigned to the 16 pools is less than 100%. Over subscription occurs when the sum of the percentage for the 16 pools exceeds 100%. The sum of the percentage assigned to the 16 pools cannot exceed 1000%.<br><br>The default is full sharing of port capacity without pre-set partitions between transfer priorities. |
| Vector of | Decimal (0..1000) |
| Units | % |
| Index | Decimal (0..15) |
| Default | (100, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0) |

### GROUP FrAtm Ca ServiceDescriptor (Sd)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable service interworking attributes for the *FrAtm* component. The attributes defined in this group provide the defaults for all the connections on the *FrAtm* interface. |

## ATTRIBUTE FrAtm Ca sdMode

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the mode of interoperability between the Frame Relay and ATM connections regarding upper layer protocol encapsulations. This is used as the default for all the connections on the interface.<br><br>When ***translationMode*** is selected, the interworking function performs translations between RFC1490 and RFC1483 encapsulated headers. This includes routed protocol translation, bridged protocol translation, and connection oriented protocol translation (except for RFC 1490 connection oriented protocol without RFC 1490 header, which is done in *speTranslationMode*).<br><br>A value of ***transparentMode*** indicates that the interworking function is forwarding data without altering the upper layer user protocol encapsulation. Use transparent mode when the upper layer user protocol encapsulation methods are compatible between terminal equipments.<br><br>A value of ***speTranslationMode*** indicates that the interworking function performs single protocol translation between RFC1490 with no header and RFC1483 encapsulated packets. |
| Values | translationMode<br>transparentMode<br>speTranslationMode |
| Default | translationMode |

## ATTRIBUTE FrAtm Ca sdDeToClpMapping (sdetclp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the DE to CLP mapping that is performed in the Frame Relay to ATM direction. This is used as the default |

for all the connections on the interface.

When ***preserve*** is selected, the DE field in a Q.922 core frame copies to the ATM CLP field of every cell containing the information of that frame.

When ***always0*** is selected, the CLP field of every generated ATM cell is always 0.

When ***always1*** is selected, the CLP field of every generated ATM cell is always 1.

Values
always0
always1
preserve

Default
preserve

### ATTRIBUTE FrAtm Ca sdClpToDeMapping (sclpToDe)

Access
Read and write

Criticality
Process

Description
This attribute specifies the type of CLP to DE mapping that is performed in the ATM to Frame Relay direction.

When ***preserve*** is selected, the DE field of the Q.922 core frame is set when one or more ATM cells belonging to an AAL5 frame has its CLP field set.

When ***always0*** is selected, the DE field of the Q.922 core frame is always set to 0.

When ***always1*** is selected, the DE field of the Q.922 core frame is always set to 1.

Values
always0
always1
preserve

Default
preserve

## ATTRIBUTE FrAtm Ca sdFecnToEfciMapping (sfecntefci)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the type of FECN to EFCI mapping that is performed in the Frame Relay to ATM direction.<br><br>When ***preserve*** is selected, the FECN field in the Q.922 Core frame maps directly to the ATM EFCI field of every cell generated by the AAL5 segmentation process.<br><br>When ***always0*** is selected, the EFCI field in every ATM cell generated is set to 0. |
| Values | always0<br>preserve |
| Default | preserve |

## ATTRIBUTE FrAtm Ca sdCrToUuMapping (scrtuu)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the type of CR to UU mapping that is performed in the Frame Relay to ATM direction.<br><br>A value of ***preserve*** indicates that the proprietary and CR bits are mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. The proprietary bits are used for rate enforcement and rate adaption but are unused according to the FRF8 standard.<br><br>A value of ***standardFRF8*** indicates that only the CR bit is mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. This is in accordance with the FRF8 standard. This option is provided to avoid equipment inter-working issues with the proprietary use of the unused bits of the CPCS-UU field for rate enforcement and rate adaption. |

| | |
|---|---|
| Values | standardFRF8<br>preserve |
| Default | preserve |

### GROUP FrAtm Ca NetworkingDescriptor (Nd)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the default provisionable networking attributes for the *FrAtm* component. |

### ATTRIBUTE FrAtm Ca ndDeToClpMapping (ndetclp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the type of DE to CLP mapping to be performed in the Frame Relay to ATM direction.<br>When ***preserve*** is selected, the DE field in the Q.922 core frame copies to the CLP field of every ATM cell containing the frame.<br>When ***always0*** is selected, the CLP field of every ATM cell is always set to 0.<br>When ***always1*** is selected, the CLP field of every ATM cell is always set to 1. |
| Values | always0<br>always1<br>preserve |
| Default | preserve |

### ATTRIBUTE FrAtm Ca ndClpToDeMapping (nclptde)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the type of CLP to DE mapping to be performed in the ATM to Frame Relay direction.<br>When ***preserve*** is selected, the DE field of the Q.922 core frame is set when one or more ATM cells belonging to the frame has its CLP field set, or when the DE field of the FR-SSCS PDU is set. |

When ***transparent*** is selected, the DE field of the Q.922 core frame copies directly from the DE field of the FR-SSCS PDU.

Values
preserve
transparent

Default
preserve

## GROUP FrAtm Ca InterfaceQualityOfService (IfQoS)

Properties
Provisioned

Description
This attribute group contains the provisionable quality of service attributes for the parent *FrAtm* interface.

## ATTRIBUTE FrAtm Ca siwfEmissionPriorityToIf (sEpToIf)

Access
Read and write

Criticality
Process

Description
This attribute specifies the emission priority of frames sent to this *FrAtm* interface from its service interworking functions. Frames in a higher priority queue, designated by a numerically higher number, are sent before frames in a lower priority queue.
The value of this attribute is interpreted according to the value of the provisionable attribute *numberOfEmissionQs* under the parent *FrAtm* component. If the *numberOfEmissionQs* attribute is set to ***2***, *siwfEmissionPriorityToIf* value of ***0*** maps to emission priority queue 0 representing a lower priority queue, and *siwfEmissionPriorityToIf* values of ***1***, ***2*** or ***3*** map to emission priority queue 1 representing the highest priority queue. If the *numberOfEmissionQs* is set to ***4***, the *siwfEmissionPriorityToIf* values directly map to the emission priority queues.
A value of ***deriveFromTp*** specifies that the emission priority is extracted from the *Mod Frs AtmNet Tpm/n* component using the *siwfTransferPriority* attribute.
The *siwfEmissionPriorityToIf* can also be overridden on a per connection basis by setting the *emissionPriorityToIf* attribute in the *FrAtm Dlci Siwf Qos* component.

Values
0
1
2

| | |
|---|---|
| | 3<br>deriveFromTp |
| Default | 0 |

### ATTRIBUTE FrAtm Ca siwfTransferPriority (stp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the transfer priority of frames sent to and received from the ATM connection, through the service interworking functions of this interface.<br>In the Frame Relay to ATM direction, the *stp* selects the ATM service category of the connection.<br>In the ATM to Frame Relay direction, the s*tp* selects the *FrAtm* emission priority queue.<br>The *siwfTransferPriority* can also be overridden on a per connection basis by setting the *transferPriority* atribute in the *FrAtm Dlci Siwf Qos* component. |
| Values | Decimal (0..15) |
| Default | 0 |

### ATTRIBUTE FrAtm Ca niwfEmissionPriorityToIf (nEpToIf)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the emission priority of frames sent to this *FrAtm* interface from its network interworking functions. Frames in a higher priority queue are sent before frames in a lower priority queue.<br>The value of this attribute is interpreted according to the value of the provisionable attribute *numberOfEmissionQs* under the parent *FrAtm* component. If the *numberOfEmissionQs* attribute is set to ***2***, *niwfEmissionPriorityToIf* value of ***0*** maps to emission priority queue 0 representing a lower priority queue, and *niwfEmissionPriorityToIf* values of ***1, 2*** or ***3*** map to emission priority queue 1 representing the highest priority queue. If the *numberOfEmissionQs* is set to ***4***, the *emissionPrioToIf* values |

directly assign to the emission priority queues.
A value of ***deriveFromTp*** specifies that the emission priority is extracted from the *Mod Frs AtmNet Tpm/n* component using the *niwfTransferPriority* attribute.
The *niwfEmissionPriorityToIf* can also be overridden on a per connection basis by setting the *emissionPriorityToIf* atribute in the *FrAtm Dlci Niwf Qos* component.

Values

deriveFromTp

Default deriveFromTp

### ATTRIBUTE FrAtm Ca niwfTransferPriority (ntp)

Access Read and write

Criticality Process

Description This attribute specifies the transfer priority of frames sent to and received from the ATM connection, through the network interworking functions of this interface.
In the Frame Relay to ATM direction, the *ntp* selects the *Frf5EndPoint* which multiplexes the frames.
In the ATM to Frame Relay direction, the *ntp* selects the default *FrAtm* emission priority queue.
The *niwfTransferPriority* can also be overridden on a per connection basis by setting the *transferPriority* atribute in the *FrAtm Dlci Niwf Qos* component.

Values Decimal (0..15)

Default 0

### GROUP FrAtm Ca Operational (Op)

Properties Operational

Description This attribute group contains the operational status of the *Ca* component.

### ATTRIBUTE FrAtm Ca linkRate (linkRate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the link rate.<br><br>If the provisionable attribute, *overrideLinkRate*, under the *Ca* component is 0, then the link rate reported is the actual link rate of the port or channel. Otherwise, the link rate reported is the *overrideLinkRate* provisioned under the *Ca* component. |
| Values | Decimal (0..520000000) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrAtm Ca nailedUpPvcs (nPvcs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of nailed-Up PVCs currently provisioned on this interface. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrAtm Ca troubledDlcis (trbDlcis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of DLCIs that are disabled and are experiencing problems. This counter increments as a result of the following problem scenarios: Abit down, PVC down, local CAC failure, or call setup failure due to network problem. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrAtm Ca softPvcs (sPvcs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the number of soft PVCs currently provisioned on this interface. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrAtm Ca poolProvisionedBandwidth (poolProvBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the total bandwidth that is allowed for each pool. Total bandwidth for a given pool can be oversubscribed or undersubscribed. The value of this attribute for a given pool is a percentage of the value of the *linkRate* attribute. This percentage is provisioned by setting the *FrAtm Ca bandwidthPool* attribute. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrAtm Ca poolAvailableBandwidth (poolAvailBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total available bandwidth from the bandwidth pool. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrAtm Ca poolAdmittedBandwidth (poolAdmitBw)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total admitted bandwidth from each bandwidth pool. Each value is the sum of the equivalent bit rates of the admitted connections. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### GROUP FrAtm Ca AccountingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the common provisioned attributes for accounting on a *FrAtm*. |

### ATTRIBUTE FrAtm Ca accountClass (acl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the accounting class, which is reserved for network operations usage. Its value is an arbitrary number. The accounting records the value of this attribute. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE FrAtm Ca accountCollection (aco)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute controls accounting data collection at the interface level. It contains the following values: ***bill, test, study, audit, force*** which are used to specify the reason(s) for which accounting records are collected. If the ***bill, test, study and audit*** options are selected in the accountCollection field, accounting records are collected for bill, test, study, or audit purposes. If the ***force*** option is selected in the accountCollection field, accounting records are collected regardless of whether other reasons are |

provisioned. If no reason is provisioned for this attribute, then accounting data collection does not occur.

Default (bill)

### ATTRIBUTE FrAtm Ca serviceExchange (sre)

Access Read and write

Description This attribute is an arbitrary number, which is reserved for network operations usage. It is recorded in the accounting record.

Values Decimal (0..255)

Default 0

### COMPONENT FrAtm Ca TransferPriorityMapping (Tpm)

Instance Decimal (0..15)

Groups "GROUP FrAtm Ca Tpm Provisioned (Prov)"

Scope Application

Description *FrAtm/n Ca TransferPriorityMapping/n*
The *Tpm* component defines the corresponding traffic management subscription options on a *FrAtm* interface corresponding to a particular transfer priority. This component is needed only if there is a requirement to override the *Mod Frs AtmNet Tpm* component defaults.

## GROUP FrAtm Ca Tpm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the provisionable attributes of the *Tpm* component at this interface. |

## ATTRIBUTE FrAtm Ca Tpm assignedBandwidthPool (asgBwPool)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the bandwidth pool that supports this transfer priority at this interface. |
| Values | 0<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15<br>samePoolAsModule |
| Default | samePoolAsModule |

## ATTRIBUTE FrAtm Ca Tpm trafficParmConvPolicy (tpcp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the traffic parameter conversion policy to use for a specific transfer priority for specifying equivalent bandwidth rate at the *FrAtm* interface. |

Policy 3 characterizes the traffic in the following way:
- ATM traffic descriptor type 6 is selected
- ATM service category rtVbr and nrtVbr supported only
- PCR0+1 is based on AR
- SCR0+1 is based on CIR and EIR
- MBS0+1 is based on Bc, Be, CIR, EIR and AR
- Takes into account that the instantaneous rate of the Frame Relay stream can be above CIR and up to the AR.

Policy 4 characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by the UPC traffic policer.
- PCR0+1 is based on AR
- ATM service category rtVbr and nrtVbr supported only
- SCR0 is based on CIR
- MBS0 is based on Bc, CIR, and AR
- There is no direct characterization of EIR. The allowed EIR can be derived using the difference between the AR and CIR.

Policy 5 characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by the UPC traffic policer.
- ATM service category rtVbr and nrtVbr supported only
- PCR0+1 is based on CIR for descriptor type 7
- PCR0+1 is based on CIR and EIR for descriptor type 8
- SCR0 is based on CIR
- MBS0 is based on Bc, CIR, and AR
- The maximum PCR is no longer based on the AR but rather on the CIR and EIR or CIR

Policy 6 characterizes the traffic in the following way:
- ATM traffic descriptor type 3 is selected
- ATM service category ubr, cbr, rtVbr and nrtVbr supported only
- PCR0+1 is based only on CIR.

The default value ***sameAsModule*** implies the *trafficParmConversionPolicy* of *Mod Frs AtmNet Tpm/n* is as defined as *Mod Frs AtmNet Tpm/n*.

| | |
|---|---|
| Values | sameAsModule<br>policy3<br>policy4<br>policy5<br>policy6 |
| Default | sameAsModule |

### ATTRIBUTE FrAtm Ca Tpm averageFrameSize (aFs)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the average frame size at the FrAtm interface for connections using this transfer priority. If a value of ***0*** is specified, the average frame size defined in *Mod Frs AtmNet Tpm/n avgFrameSize* attribute is used. |
| Values | Decimal (0..8187) |
| Units | bytes |
| Default | 0 |

### COMPONENT FrAtm Reroute

| | |
|---|---|
| Groups | "GROUP FrAtm Reroute LocalOperational (LOper)"<br>"GROUP FrAtm Reroute GlobalOperational (GOper)"<br>"GROUP FrAtm Reroute Statistics (Stats)" |
| Scope | Device |
| Description | *FrAtm/n Reroute*<br><br>This component represents the rerouting capabilities of the FrAtm interface. If this component is provisioned, the *Artg Pnni* component must already exist. The addition or deletion of this component, or changes to its provisionable attributes, does not affect existing connections. |

### VERB OPTIMIZE FrAtm Reroute

| | |
|---|---|
| Impact | Service |
| Description | *Optimize [-all]FrAtm/n Reroute*<br><br>This command triggers path optimization for the connection segments managed by the *Reroute* component.<br><br>By default, only connection segsforation. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection.<br>The *-all* option causes all connection segments subscribed to path optimization to be considered.<br><br>Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows. |

### GROUP FrAtm Reroute LocalOperational (LOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the local rerouting activities at the interface level. |

### ATTRIBUTE FrAtm Reroute localSubscribedConnections (lsub)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the connection segments that are subscribed to one or more local rerouting capabilities. Note that a given connection segment is subscribed to either local rerouting capabilities capabilities, not both. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute localEligibleRecoveredCon (lerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered using local rerouting and are eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute localIneligibleRecoveredCon (lirc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that have been recovered by local rerouting but are not eligible for local path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute localLastRrCauseCode (lrrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last local rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute localPathsOptimized (lPathsOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the paths that were successfully optimized by local rerouting or EBR during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrAtm Reroute GlobalOperational (GOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that indicate the global and EBR rerouting activities at the interface level. |

### ATTRIBUTE FrAtm Reroute globalSubscribedConnections (gsub)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connection segments that are subscribed to one or more global and EBR rerouting capabilities. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute globalEligibleRecoveredCon (gerc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the connections that have been recovered by global and EBR rerouting and are eligible for global or EBR path optimization. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute globalIneligibleRecoveredCon (girc)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the connections that have been recovered by global and EBR rerouting but are not eligible for global or EBR path optimization. The value decreases as counted connections are released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute globalLastRrCauseCode (grrcc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of the last global or EBR rerouting cause code received at this interface. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute globalPathsOptimized (gPathsOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the paths that were successfully optimized by global and EBR rerouting during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrAtm Reroute Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the rerouting statistics for the interface. |

### ATTRIBUTE FrAtm Reroute totalLocalConnectionRecoveries (tLConRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful local connection recovery attempts. The counter wraps to zero when the maximum value is exceeded. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute totalLocalFailedRecoveries (lFailedRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts failed local connection recovery attempts. A connection recovery attempt fails if a rerouting connection segment can not be established. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute totalLocalPathOptimizations (tLPathOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful local path optimization attempts. A successful path optimization attempt results in a switch to a better route. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute totalGlobalConnectionRecoveries (tGConRec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful global and EBR connection recovery attempts. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute totalGlobalFailedRecoveries (gFailedRec)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts failed global and EBR connection recovery attempts. A connection recovery attempt fails if a rerouting connection segment cannot be established. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute totalGlobalPathOptimizations (tGPathOpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts successful global and EBR path optimization attempts. A successful path optimization attempt results in a switch to a better route. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrAtm Reroute totalOptimizationPasses (optPass)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts optimization passes at the interface. Both module and interface optimization passes are counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT FrAtm Reroute Ov

| | |
|---|---|
| Groups | "GROUP FrAtm Reroute Ov Provisioned (Prov)"<br>"GROUP FrAtm Reroute Ov LocalProvisioned (LProv)"<br>"GROUP FrAtm Reroute Ov GlobalProvisioned (GProv)" |
| Scope | Device |
| Description | *FrAtm/n Reroute Ov* |

This component represents the provisioning capabilities of the rerouting functionality for the FrAtm interface.

Common Verbs

Help
List
Display

## GROUP FrAtm Reroute Ov Provisioned (Prov)

Properties: Provisioned

Description: This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.

## ATTRIBUTE FrAtm Reroute Ov protocol

Access: Read and write

Description: This attribute specifies the rerouting protocols which are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute.
***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned

with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values
localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsARtgPnniReroute (sameAs)

Default
sameAsARtgPnniReroute

### ATTRIBUTE FrAtm Reroute Ov numOptAttempts

Access
Read and write

Description
This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Values
Decimal (0..15)
sameAsARtgPnniReroute (sameAs)

Default sameAs

### ATTRIBUTE FrAtm Reroute Ov moduleOptimizationConnections

Access Read and write

Description This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni Reroute* component.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute.
***none***: No connection segments are considered for path optimization.
***recoveredOnly***: Only connection segments which are foration. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
***allSubscribed***: All connection segments subscribed to path optimization are considered.

Values none
recoveredOnly
allSubscribed
sameAsARtgPnniReroute (sameAs)

Default sameAsARtgPnniReroute

### ATTRIBUTE FrAtm Reroute Ov switchoverMechanism

Access Read and write

Description This attribute specifies the mechanism used for switchover of a rerouted connection segment.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The switchover mechanism is specified by the *ARtg Pnni Reroute switchoverMechanism* attribute.
***standard***: The mechanism described in the ATM Forum “Domain based Rerouting” specification is used for switchover. This value

ensures interoperability with other vendors' equipment running ATM Forum "Domain based Rerouting".
***rcl***: The Reduced Cell Loss mechanism is used for switchover. RCL is a value-added Passport extension to the standard mechanism that allows faster switchover time.

Values: standard
rcl
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

## GROUP FrAtm Reroute Ov LocalProvisioned (LProv)

Properties: Provisioned

Description: This group contains the provisionable attributes for EBR and local rerouting protocols for the *FrAtm* interface.

## ATTRIBUTE FrAtm Reroute Ov localConnectionRecoverySubscr (lConRec)

Access: Read and write

Description: This attribute specifies whether the connection segments on this interface request subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either a local domain rerouting node or a DTL originator.

If a connection segment requests ***localGlobal*** or ***localOnly*** protocols, this attribute controls local connection recovery subscription.

If a connection segment requests ***localEbr***, this attribute controls the local connection recovery subscription. Only one will be granted.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The subscription rule is determined by the *Artg Pnni Reroute localConnectionRecoverySubscr* attribute. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segments request subscription to local connection

recovery, otherwise, the connection segments do not request subscription.
***yes:*** The connection segments request subscription to local connection recovery.
***no***: The connection segments do not request subscription to local connection recovery.

Values
no
yes
sameAsARtgPnniReroute (follow)

Default
sameAsARtgPnniReroute

## ATTRIBUTE FrAtm Reroute Ov localPathOptimizationSubscr (lPathOpt)

Access
Read and write

Description
This attribute specifies whether the connection segments on this interface request subscription to local path optimization. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either a local domain rerouting node or a DTL originator.

If a connection segment requests ***localGlobal*** or ***localOnly*** protocols, this attribute controls local path optimization subscription.

If a connection segment requests ***localEbr***, this attribute controls the local path optimization subscription. Only one will be granted.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The subscription rule is determined by the *Artg Pnni Reroute localPathOptimizationSubscr* attribute. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segments request subscription to local path optimization, otherwise, the connection segments do not request subscription.
***yes:*** The connection segments request subscription to local path optimization.
***no***: The connection segments do not request subscription to local

path optimization.

Values
no
yes
sameAsARtgPnniReroute (follow)

Default
sameAsARtgPnniReroute

## GROUP FrAtm Reroute Ov GlobalProvisioned (GProv)

Properties
Provisioned

Description
This group contains the provisionable attributes for the global rerouting protocol for the *FrAtm* interface.

## ATTRIBUTE FrAtm Reroute Ov globalConnectionRecoverySubscr (gConRec)

Access
Read and write

Description
This attribute specifies whether the connection segments on this interface request subscription to global or EBR connection recovery. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute only affects connection segments for a node that is a DTL originator.

If a connection segment requests ***ebrOnly***, this attribute controls EBR connection recovery subscription.

If a connection segment requests ***localEbr***, this attribute controls the EBR connection recovery subscription. Only one will be granted.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The subscription rule is determined by the *Artg Pnni Reroute globalConnectionRecoverySubscr* attribute. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segments request subscription to global or EBR connection recovery, otherwise, the connection segments do not request subscription.
***yes:*** The connection segments request subscription to global or EBR connection recovery.
***no***: The connection segments do not request subscription to

global or EBR connection recovery.

Values
no
yes
sameAsARtgPnniReroute (follow)

Default
sameAsARtgPnniReroute

## ATTRIBUTE FrAtm Reroute Ov globalPathOptimizationSubscr (gPathOpt)

Access
Read and write

Description
This attribute specifies whether the connection segments on this interface request subscription to global or EBR path optimization. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute only affects connection segments for a node that is a DTL originator.

If a connection segment requests ***ebrOnly***, this attribute controls EBR path optimization subscription.

If a connection segment requests ***localEbr***, this attribute controls the EBR path optimization subscription. Only one will be granted.

One of the following values can be specified:
***sameAsARtgPnniReroute***: The subscription rule is determined by the *Artg Pnni Reroute globalPathOptimizationSubscr* attribute. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segments request subscription to global or EBR path optimization, otherwise, the connection segments do not request subscription.
***yes:*** The connection segments request subscription to global or EBR path optimization.
***no***: The connection segments do not request subscription to global or EBR path optimization.

## GROUP FrDte CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE FrDte customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID |

provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP FrDte IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE FrDte ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE FrDte ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |

| | |
|---|---|
| Default | No default |

### GROUP FrDte Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *FrDte* component. |

### ATTRIBUTE FrDte acceptUndefinedDlci (aud)

| | |
|---|---|
| Access | Read and write |
| Description | This parameter allows previously undefined Data Link Connection Identifiers (DLCIs) to be dynamically accepted in the default remote group. If set to ***enabled***, undefined DLCIs will be accepted, if ***disabled***, they will not. |
| Values | enabled<br>disabled |
| Default | enabled |

### GROUP FrDte OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrDte adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrDte operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrDte usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in

use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP FrDte OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE FrDte snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP FrDte Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes for the *FrDte* component.

### ATTRIBUTE FrDte linkOperState (lstate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the operational state of the Link Control protocol. If the interface to the physical link hardware is inactive, the *linkOperState* is in the ***down*** state.<br><br>The ***polling*** state only occurs when the Local Management Interface (LMI) is enabled and the physical link is active. The ***polling*** state indicates LMI is polling for its peer. Once communication is established the *linkOperState* will transition to the ***active*** state.<br><br>If the *procedure* attribute of the *Lmi* component is set to ***none***, *linkOperState* will transition to the ***active*** state once the physical link becomes active. |
| Values | active<br>down<br>polling |
| Default | down |

### GROUP FrDte FrErrEntry (Err)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the SNMP frErrEntry attributes for the *FrDte* component. |

### ATTRIBUTE FrDte errType (etype)

| | |
|---|---|
| Access | Read only |
| Description | The type of error that was last seen on this interface. The error types are as follows:<br><br>***receiveShort***: This error indicates a received frame was discarded because it was less than four octets long or it was missing the Organizationally Unique Identifier (OUI) for a SNAP header.<br><br>***receiveLong***: This error indicates a received frame was discarded because it was longer than expected. This error is currently not |

used on this interface.

***illegalDlci***: This error indicates that a received frame was discarded because it's Q.922 address was not two octets in length. This error could also indicate that a frame was discarded because it was received on a DLCI reserved for LMI which had not been provisioned active.

***dlcmiProtoErr***: This error indicates an LMI frame was received with contents formatted incorrectly.

***dlcmiUnknownIe***: This error indicates that an LMI frame was received which contained an unsupported Information Element (IE) type

***dlcmiSequenceErr***: This error indicates that an LMI frame was received whose Keep Alive Sequence was incorrect.

***dlcmiUnknownRpt***: This error indicates that an LMI frame was received which contained a Report-type Information Element with an invalid type of report.

***noErrorSinceReset***: This error type indicates that there has not been an error since the interface has been reset.

***unknownError***: This error type contains the cumulation of receive frame errors that did not fit one of the MIB error descriptions above. These errors include those counted by the following attributes:

*ulpUnknownProtocol* - A received frame was discarded because the Upper Level Protocol (ULP) encapsulation used was unsupported.

*badFc* - A received frame was discarded because the frame control character was incorrect.

*defragSequenceErrors* - A fragment was received which was discarded due to an out of sequence error detection.

| | |
|---|---|
| Values | unknownError<br>receiveShort<br>receiveLong<br>illegalDlci<br>dlcmiProtoErr<br>dlcmiUnknownIe<br>dlcmiSequenceErr<br>dlcmiUnknownRpt<br>noErrorSinceReset |
| Default | noErrorSinceReset |

### ATTRIBUTE FrDte errData (edata)

| | |
|---|---|
| Access | Read only |
| Description | An octet string containing the first part of the frame in which an error was last detected. |
| Values | String (64, Hex) |
| Default | No default |

### ATTRIBUTE FrDte errTime (etime)

| | |
|---|---|
| Access | Read only |
| Description | The time at which the last error was detected and recorded in *errType*. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrDte errDiscards (ed)

| | |
|---|---|
| Access | Read only |
| Description | Number of inbound frames dropped because of format errors or because the virtual circuit was not known. Format errors, in this case, are any errors which would prevent the system from recognizing the DLCI and placing the error in the discard category. |

| | |
|---|---|
| | This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte errFaults (ef)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times LMI has taken down the interface. When the *procedure* attribute of the *Lmi* component is set to ***none***, this counter will not be incremented.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte errFaultTime (eftime)

| | |
|---|---|
| Access | Read only |
| Description | The last time the *errFaults* counter was incremented. |
| Values | Time (DHMS) |
| Default | No default |

### GROUP FrDte ErrorStatistics (ErrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains error counters for the *FrDte*. |

### ATTRIBUTE FrDte xmitDiscardPvcDown

| | |
|---|---|
| Access | Read only |
| Description | Count of transmitted frames discarded because the *Dlci* or a component positioned in a hierarchically fashion above it (e.g. it's remote group or the *FrDte* component) was administratively disabled. |

| | |
|---|---|
| | This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte xmitDiscardLmiInactive

| | |
|---|---|
| Access | Read only |
| Description | Count of transmitted frames discarded because the Local Management Interface (LMI) was not yet active (i.e. LMI was still in the polling state).<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte xmitDiscardFramerDown

| | |
|---|---|
| Access | Read only |
| Description | Count of transmitted frames discarded because the *framer* component was down.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte xmitDiscardPvcInactive

| | |
|---|---|
| Access | Read only |
| Description | Count of transmitted frames discarded because the Local Management Interface (LMI) had inactivated or invalidated the *Dlci*.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte xmitDiscardCirExceeded

| | |
|---|---|
| Access | Read only |
| Description | Count of transmitted frames discarded because CIR was enabled on a *Dlci* without a *HibernationQueue* subcomponent and the traffic exceeded the combined Committed and Excess Burst thresholds.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte recvDiscardPvcDown

| | |
|---|---|
| Access | Read only |
| Description | Count of received frames discarded because the *Dlci* or a component<br>positioned in a hierarchically fashion above it (e.g. it's remote group or<br>the *FrDte* component) was administratively disabled.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte recvDiscardLmiInactive

| | |
|---|---|
| Access | Read only |
| Description | Count of received frames discarded because the Local Management<br>Interface (LMI) was not yet active (i.e. LMI was still in the polling |

state).

This counter will wrap around to 0 when it exceeds its maximum count.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrDte recvDiscardPvcInactive

Access: Read only

Description: Count of received frames discarded because the Local Management
Interface (LMI) had inactivated or invalidated the *Dlci*.

This counter will wrap around to 0 when it exceeds its maximum count.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrDte badFc

Access: Read only

Description: Count of received frames discarded because the frame control character was incorrect. This may indicate that the other side of the link is configured for a different link level protocol.

This counter will wrap around to 0 when it exceeds its maximum count.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrDte ulpUnknownProtocol

Access: Read only

Description: Count of received frames discarded because the Upper Level Protocol (ULP) encapsulation used was unsupported.

| | |
|---|---|
| | This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte defragSequenceErrors

| | |
|---|---|
| Access | Read only |
| Description | Count of fragments received which were discarded due to out of sequence error detection.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte receiveShort

| | |
|---|---|
| Access | Read only |
| Description | Count of received frames (including LMI frames) discarded because they were less than four octets long or they were missing the Organizationally Unique Identifier (OUI) for a SNAP header.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte illegalDlci

| | |
|---|---|
| Access | Read only |
| Description | Count of received frames discarded because their Q.922 address was not two octets in length. This count also includes frames discarded because they were received on a *Dlci* reserved for LMI which had not been provisioned active. |

| | |
|---|---|
| | This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte dlcmiProtoErr

| | |
|---|---|
| Access | Read only |
| Description | Count of received LMI frames whose contents were formatted incorrectly.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte dlcmiUnknownIe

| | |
|---|---|
| Access | Read only |
| Description | Count of received LMI frames which contained an unsupported Information Element (IE) type.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte dlcmiSequenceErr

| | |
|---|---|
| Access | Read only |
| Description | Count of received LMI frames whose Keep Alive Sequence was incorrect.<br><br>This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE FrDte dlcmiUnknownRpt

Access Read only

Description Count of received LMI frames which contained a Report-type Information Element with an invalid type of report.

This counter will wrap around to 0 when it exceeds its maximum count.

Values Decimal (0..4294967295)

Default 0

### COMPONENT FrDte Framer

Groups "GROUP FrDte Framer Provisioned (Prov)"
"GROUP FrDte Framer OsiState (State)"
"GROUP FrDte Framer Statistics (Stats)"
"GROUP FrDte Framer LinkUtilization (Util)"

Scope Application

Description

*FrDte/n Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisional attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisional attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link

interface datapath statistics (such as frame counts and aborts).

Common Verbs

Add
DELete

## GROUP FrDte Framer Provisioned (Prov)

Properties: Provisioned

Description: This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisional *Framer* groups.

## ATTRIBUTE FrDte Framer interfaceName

Access: Read and write

Criticality: Process

Description: This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values: Link (Hardware, applicationFramerName)

Default: No default

## GROUP FrDte Framer OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE FrDte Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE FrDte Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE FrDte Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrDte Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a Framer component. |

### ATTRIBUTE FrDte Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrDte Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the link interface by Framer. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with CRC errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received which were too large. The frame exceeded the maximumFrameLengthLimit provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrDte Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE FrDte Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal priority data sent to the link as a percentage of the available bandwidth on the link. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE FrDte Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal priority data received from the link as a percentage of the available bandwidth on the link. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### COMPONENT FrDte LinkManagementInterface (Lmi)

| | |
|---|---|
| Groups | "GROUP FrDte Lmi Provisioned (Prov)"<br>"GROUP FrDte Lmi Operational (Oper)" |
| Scope | Application |
| Description | *FrDte/n Lmi*<br>This component defines parameters for implementing the Local Management Interface (LMI) protocol for the *FrDte* interface. |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrDte Lmi Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *Lmi* component. |

## ATTRIBUTE FrDte Lmi procedures (proc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute selects the Local Management Interface (LMI) protocol to be used on the interface. This attribute is equivalent to the SNMP variable frDlcmiState. The ***vendorForum*** LMI protocol automatically implies that the DLCI used by the protocol is 1023. The ***ansi*** (T1.617 Annex D) and ***ccitt*** (Q.933 Annex A) LMI protocols use DLCI 0. If ***none*** is selected, no LMI procedures will run on the interface. |
| Values | none<br>vendorForum<br>ansi<br>ccitt |
| Default | ccitt |

## ATTRIBUTE FrDte Lmi pollingInterval (polli)

| | |
|---|---|
| Access | Read and write |
| Description | This is the number of seconds between successive status enquiry messages. This field corresponds to the parameter T391 described in the ANSI T1.617-1991 Annex D. |
| Values | Decimal (5..30) |
| Units | seconds |
| Default | 10 |

## ATTRIBUTE FrDte Lmi fullEnquiryInterval (n391)

| | |
|---|---|
| Access | Read and write |
| Description | The count of status polls before a full status enquiry message is issued. Every nth poll will request a full status. This field |

| | |
|---|---|
| | corresponds to the parameter N391 described in the ANSI T1.617-1991 Annex D. |
| Values | Decimal (1..255) |
| Default | 6 |

### ATTRIBUTE FrDte Lmi errorThreshold (n392)

| | |
|---|---|
| Access | Read and write |
| Description | The number of errors detected within the monitored events window before declaring the link non-functional. This field corresponds to the parameter N392 described in the ANSI T1.617-1991 Annex D. |
| Values | Decimal (1..10) |
| Default | 3 |

### ATTRIBUTE FrDte Lmi monitoredEvents (n393)

| | |
|---|---|
| Access | Read and write |
| Description | The number of status polling intervals over which the *errorthreshold* is counted This is used to determine if the *errorThreshold* is exceeded. This field corresponds to the parameter N393 described in the ANSI T1.617-1991 Annex D. |
| Values | Decimal (1..10) |
| Default | 4 |

### GROUP FrDte Lmi Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Lmi* component. |

### ATTRIBUTE FrDte Lmi lmiStatus

| | |
|---|---|
| Access | Read only |
| Description | This indicates the status of the Frame Relay interface as determined by the performance of the link management interface |

(LMI). If no LMI is running, *lmiStatus* will stay in the ***running*** state indefinitely.

Values
running
fault
initializing

Default
No default

## COMPONENT FrDte RemoteGroup (Rg)

Instance

## GROUP FrDte Rg IfEntryProv (IfEntry)

Properties
Provisioned

Description
This group contains the provisionable attributes for the ifEntry.

### ATTRIBUTE FrDte Rg ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE FrDte Rg ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP FrDte Rg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the Remote Group component. |

### ATTRIBUTE FrDte Rg maxTransmissionUnit (mtuSize)

| | |
|---|---|
| Access | Read and write |
| Description | The Maximum Transmission Unit size of the largest datagram (including Frame Relay header) which can be sent on the interface. |
| Values | Decimal (80..9190) |
| Units | octets |

| | |
|---|---|
| Default | 1604 |

### ATTRIBUTE FrDte Rg linkToFrDteDlci (ltDlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute associates a *Rg* component with zero or more *StDlci* components. The *Rg* and *StDlci* components must be under the same *FrDte* component. |
| List of | Link (Service, linkToRemoteGroup) |
| List Size | 256 |
| Default | No default |

### GROUP FrDte Rg MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the Media Application component. |

### ATTRIBUTE FrDte Rg linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains a protocol port component name. The attribute associates the application with a protocol port. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP FrDte Rg OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrDte Rg adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE FrDte Rg operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE FrDte Rg usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrDte Rg OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE FrDte Rg snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

## COMPONENT FrDte Rg BridgedFrameRouting (Bfr)

| | |
|---|---|
| Groups | "GROUP FrDte Rg Bfr Provisioned (Prov)"<br>"GROUP FrDte Rg Bfr Operational (Opr)" |
| Scope | Application |
| Description | *FrDte/n Rg/n Bridged Frame Routing*<br><br>The *BridgedFrameRouting* component defines the parameters for implementing the Bridged Frame Routing port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrDte Rg Bfr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *Bfr* component. |

## ATTRIBUTE FrDte Rg Bfr macType (macType)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the MAC address type of the *Bfr* component.<br>The value must be chosen based on the media of the traffic source. For traffic originated from FDDI, use ***fddi***; for ethernet, use ***enet***; for token ring, use ***tokenRing*** |

| | |
|---|---|
| Values | fddi<br>enet<br>tokenRing |
| Default | enet |

### ATTRIBUTE FrDte Rg Bfr bfrIndex (index)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the value which is used to derive a unique MAC address for the *Bfr*. The *bfrIndex* must be unique across all *Bfr*s on the same *Lp*. |
| Values | Decimal (0..511) |
| Default | No default |

### GROUP FrDte Rg Bfr Operational (Opr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Bfr* component.. |

### ATTRIBUTE FrDte Rg Bfr macAddr (macAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the unique MAC address of the *Bfr* component. This value is derived by the value of the attribute *bfrIndex*.<br>The value is displayed as cannonical format. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### COMPONENT FrDte DynamicDlciDefaults (DynDlciDefs)

| | |
|---|---|
| Groups | "GROUP FrDte DynDlciDefs Provisioned (Prov)" |
| Scope | Application |

Description *FrDte/n DynDlciDefs*
This component defines the default values that will be used when a *Dlci* of *creationType* ***dynamic*** is created.

## GROUP FrDte DynDlciDefs Provisioned (Prov)

Properties Provisioned

Description This group contains the provisioned attributes for a virtual circuit. These attributes represent the default settings for the resulting *Dlci* components and can be operationally changed using the corresponding attributes under the *Dlci* component.

## ATTRIBUTE FrDte DynDlciDefs rowStatus

Access Read and write

Description This attribute is used to manage the status of a *StDlci* component.

Set to ***active*** to enable the *StDlci* component.
Set to ***notInService*** to disable the *StDlci* component.
Set to ***createAndGo*** (SNMP only) to create a new *StDlci* component.
Set to ***destroy*** (SNMP only) to delete an existing *StDlci* component.

Values
active
notInService

Default active

## ATTRIBUTE FrDte DynDlciDefs rateEnforcement (re)

Access Read and write

Description This attribute specifies whether the CIR attributes *committedInformationRate*, *committedBurst*, and *excessBurst* are used to define rate enforcement on this user DLCI.

If *rateEnforcement* is ***enabled***, and the combined Committed and Excess burst thresholds are exceeded, the frame in violation will be discarded immediately if a *HibernationQueue* subcomponent is not provisioned under the *StDlci* component. If a *HibernationQueue* is provisioned, the frame will be placed on the *HibernationQueue* at time of violation and transmission will be attempted later after the point at which the burst thresholds will no longer be exceeded.

Setting all the CIR attributes to zero has the same affect as setting this attribute to ***disabled***.

| | |
|---|---|
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE FrDte DynDlciDefs committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | The average number of bits to be transferred per second over the DLCI to the DCE. When this attribute is set to zero, the link speed will be used instead. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE FrDte DynDlciDefs committedBurst (bc)

| | |
|---|---|
| Access | Read and write |
| Description | The committed burst size (in bits) to which the DLCI wants to subscribe. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 64000 |

### ATTRIBUTE FrDte DynDlciDefs excessBurst (be)

| | |
|---|---|
| Access | Read and write |
| Description | The excess burst size (in bits) to which the DLCI wants to subscribe. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE FrDte DynDlciDefs excessBurstAction (beAction)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the action taken when the *committedBurst* size has been exceeded on the DLCI but the *excessBurst* size has not. If the attribute is set to ***setDeBit***, the Discard Eligibility bit in the Frame Relay header will be turned on. If the attribute is set to ***none***, no action will be taken. |
| Values | none<br>setDeBit |
| Default | none |

### ATTRIBUTE FrDte DynDlciDefs ipCos

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP connection class of the Frame Relay connection. This value is used to distinguish the connection from others for the purpose of IP forwarding and IP accounting. IP connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between IP routers.<br><br>If an IP packet is forwarded to a *ProtocolPort* or *Interface* configured to use more than one Frame Relay connection, then one of the connections is selected for transmitting the packet. The selection is made according to the connection class assigned to |

the packet.

An explanation of how an IP packet is assigned a connection class is found in the description of the *connectionClass* operational attribute of the *DifferentiatedServicesDomain PerHopBehavior* component, and in the description of *Vr Ip CosPolicyGroup* component.

Modifying this attribute will reset the Frame Relay connection.

The remainder of this description applies only to a Frame Relay connection used by a *VirtualRouter ProtocolPort* and not to a Frame Relay connection used by a *Router Interface* or *VpnRouteForwarder Interface* component.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial CoS value assigned to an IP packet received on the Frame Relay connection. See the description of *Vr Ip CosPolicyGroup* for more information.

Values: Decimal (0..3)

Default: 0

## ATTRIBUTE FrDte DynDlciDefs ipDscp

Access: Read and write

Criticality: Component

Description: This attribute specifies the value marked into the Differentiated Services Code Point (DSCP) field of an IP packet received at an *IpPort* over the Frame Relay connection. This DSCP marking is applied only if one of the following conditions is true:

1) the *IpPort* is linked by its *diffServAssignment* attribute to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, or

2) the *Ip* is linked by its *diffServAssignment* attribute to a *Vr Ip*

*DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, and the *IpPort* does not have the *diffServAssignment* attribute set.

If one of theseconditions is true, then the *ipDscp* value must match a *Virtual Router DifferentiatedServicesDomain PerHopBehavior* subcomponent instance value. See the description of *Vr Ip DifferentiatedServices* interface configuration for more information.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipDscp* must be set to ***na***.

This attribute is not applicable to a Frame Relay connection associated with a *Router Interface* or *VpnRouteForwarder Interface* component.

Modifying this attribute will reset the Frame Relay connection.

none

## ATTRIBUTE FrDte StDlci ipCos

Access
Read and write

Criticality
Component

Description
This attribute specifies the IP connection class of the Frame Relay connection. This value is used to distinguish the connection from others for the purpose of IP forwarding and IP accounting. IP connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between IP routers.

If an IP packet is forwarded to a *ProtocolPort* or *Interface* configured to use more than one Frame Relay connection, then one of the connections is selected for transmitting the packet. The selection is made according to the connection class assigned to the packet.

An explanation of how an IP packet is assigned a connection class is found in the description of the *connectionClass* operational attribute of the *DifferentiatedServicesDomain PerHopBehavior* component, and in the description of *Vr Ip CosPolicyGroup* component.

Modifying this attribute will reset the Frame Relay connection.

The remainder of this description applies only to a Frame Relay connection used by a *VirtualRouter ProtocolPort* and not to a Frame Relay connection used by a *Router Interface* or *VpnRouteForwarder Interface* component.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial CoS value assigned to an IP packet received

on the Frame Relay connection. See the description of *Vr Ip CosPolicyGroup* for more information.

Values Decimal (0..3)

Default 0

### ATTRIBUTE FrDte StDlci ipDscp

Access Read and write

Criticality Component

Description This attribute specifies the value marked into the Differentiated Services Code Point (DSCP) field of an IP packet received at an *IpPort* over the Frame Relay connection. This DSCP marking is applied only if one of the following conditions is true:

1) the *IpPort* is linked by its *diffServAssignment* attribute to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, or

2) the *Ip* is linked by its *diffServAssignment* attribute to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, and the *IpPort* does not have the *diffServAssignment* attribute set.

If one of theseconditions is true, then the *ipDscp* value must match a *Virtual Router DifferentiatedServicesDomain PerHopBehavior* subcomponent instance value. See the description of *Vr Ip DifferentiatedServices* interface configuration for more information.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipDscp* must be set to ***na***.

This attribute is not applicable to a Frame Relay connection associated with a *Router Interface* or *VpnRouteForwarder Interface* component.

Modifying this attribute will reset the Frame Relay connection.

## GROUP FrDte StDlci Hq Provisioned (Prov)

Properties: Provisioned

Description: This group contains the Link Emission Queue provisioned attributes.

## ATTRIBUTE FrDte StDlci Hq maxPackets (maxP)

Access: Read and write

Description: This attribute specifies the maximum number of packets allowed in the *Leq* before being discarded. If this attribute is set to zero then the maximum number of packets is calculated from the transmit data rate. This calculated value is placed in *queuePktThreshold*.

Values: Decimal (0..2048)

Default: 0

## ATTRIBUTE FrDte StDlci Hq maxMsecData (maxData)

Access: Read and write

Description: This attribute specifies the maximum number of “Milliseconds worth of data” allowed in the *Leq* before packets are discarded. The *queueByteThreshold* will be calculated from this attribute, based on the transmit data rate.

Values: Decimal (100..60000)

Default: 10000

### ATTRIBUTE FrDte StDlci Hq maxPercentMulticast (mpm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum percentage of multicast packets allowed in the *Leq*, based on *queuePktThreshold*, before being discarded. The calculated value will be placed in *queueMulticastThreshold*. |
| Values | Decimal (1..100) |
| Default | 50 |

### ATTRIBUTE FrDte StDlci Hq timeToLive (ttl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the “Milliseconds Time To Live” of packets in the *Leq*. If the *timeToLive* of a packet expires, it will be discarded. |
| Values | Decimal (100..60000) |
| Units | msec |
| Default | 10000 |

### GROUP FrDte StDlci Hq Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains *HibernationQueue* general statistics. |

### ATTRIBUTE FrDte StDlci Hq timedOutPkt (topkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets that have been discarded due to exceeding the *timeToLive*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq queuePurgeDiscards (qpd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets discarded by a queue purge which occurs when the *Dlci* goes down. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrDte StDlci Hq TotalStatistics (TStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue total statistics. |

### ATTRIBUTE FrDte StDlci Hq totalPktHandled (tpkthand)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets handled by the *Leq*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq totalPktForwarded (tpktfor)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets forwarded by the *Leq*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq totalPktQueued (tpktq)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of packets that required queuing by the *Leq* due to transmit congestion. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq totalMulticastPkt (tmulp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of multicast packets handled by this instance of *FrDte*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq totalPktDiscards (tpktdis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets that were discarded for this instance of *FrDte*. This is the sum of *timedOutPkt*, *forcedPktDiscards*, *queuePurgeDiscards*, *pktThresholdExceeded*, *byteThresholdExceeded*, *mulThresholdExceeded* and *memThresholdExceeded*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrDte StDlci Hq CurrentStatistics (CStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue current statistics. |

### ATTRIBUTE FrDte StDlci Hq currentPktQueued (cpktq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the current number of packets queued. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq currentBytesQueued (cbytesq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the current number of bytes queued. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq currentMulticastQueued (cmulq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the current number of multicast packets in the queue. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrDte StDlci Hq ThresholdStatistics (ThrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue threshold statistics. |

### ATTRIBUTE FrDte StDlci Hq queuePktThreshold (qpthr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the maximum number of packets that can be contained in the queue before being discarded. If *maxPackets* was set to 0 then this attribute will contain the value that has been calculated based on the transmit data rate. If *maxPackets* was set to one or more than this attribute will contain that number. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq pktThresholdExceeded (pthrx)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of packets discarded due to the *queuePktThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq queueByteThreshold (qbytethr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the maximum number of bytes allowed in the queue based on *maxMsecData* and the transmit data rate. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq byteThresholdExceeded (bthrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets discarded due to the *queueByteThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq queueMulticastThreshold (qmolthr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of multicast packets allowed in the queue based on *maxPercentMulticast* and *maxPackets*. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq mulThresholdExceeded (multhrx)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of packets discarded due to the *queueMulticastThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte StDlci Hq memThresholdExceeded (memthrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets discarded due to exceeding the memory usage threshold for *Leq*. The memory usage threshold is determined by the *Leq* software, guaranteeing that the *Leq* does not consume all of the memory. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT FrDte LinkEmissionQueue (Leq)

| | |

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum percentage of multicast packets allowed in the *Leq*, based on *queuePktThreshold*, before being discarded. The calculated value will be placed in *queueMulticastThreshold*. |
| Values | Decimal (1..100) |
| Default | 50 |

### ATTRIBUTE FrDte Leq timeToLive (ttl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the “Milliseconds Time To Live” of packets in the *Leq*. If the *timeToLive* of a packet expires, it will be discarded. |
| Values | Decimal (100..60000) |
| Units | msec |
| Default | 10000 |

### GROUP FrDte Leq Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue general statistics. |

### ATTRIBUTE FrDte Leq timedOutPkt (topkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets that have been discarded due to exceeding the *timeToLive*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq hardwareForcedPkt (hfpkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of hardware forced packets on this instance of *FrDte*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq forcedPktDiscards (fpktd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of hardware forced packets that had to be discarded due to link failure. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq queuePurgeDiscards (qpd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets discarded by a queue purge (i.e. a discarding of all packets on the queue). This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrDte Leq TotalStatistics (TStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue total statistics. |

### ATTRIBUTE FrDte Leq totalPktHandled (tpkthand)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets handled by the *Leq*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq totalPktForwarded (tpktfor)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets forwarded by the *Leq*. This counter will wrap around to 0 when it exceeds its maximum count. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq totalPktQueued (tpktq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets that required queuing by the *Leq* due to transmit congestion. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq totalMulticastPkt (tmulp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of multicast packets handled by this instance of *FrDte*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq totalPktDiscards (tpktdis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets that were discarded for this instance of *FrDte*. This is the sum of *timedOutPkt*, *forcedPktDiscards*, *queuePurgeDiscards*, *pktThresholdExceeded*, *byteThresholdExceeded*, *mulThresholdExceeded* and *memThresholdExceeded*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrDte Leq CurrentStatistics (CStats)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains Link Emission Queue current statistics. |

### ATTRIBUTE FrDte Leq currentPktQueued (cpktq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the current number of packets queued. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq currentBytesQueued (cbytesq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the current number of bytes queued. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq currentMulticastQueued (cmulq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the current number of multicast packets in the queue. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrDte Leq ThresholdStatistics (ThrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue threshold statistics. |

### ATTRIBUTE FrDte Leq queuePktThreshold (qpthr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the maximum number of packets that can be contained in the queue before being discarded. If *maxPackets* was set to 0 then this attribute will contain the value that has been calculated based on the transmit data rate. If *maxPackets* was set to one or more than this attribute will contain that number. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq pktThresholdExceeded (pthrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets discarded due to the *queuePktThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq queueByteThreshold (qbytethr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the maximum number of bytes allowed in the queue based on *maxMsecData* and the transmit data rate. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq byteThresholdExceeded (bthrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets discarded due to the *queueByteThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq queueMulticastThreshold (qmolthr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of multicast packets allowed in the queue based on *maxPercentMulticast* and *maxPackets*. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrDte Leq mulThresholdExceeded (multhrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets discarded due to the *queueMulticastThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Leq memThresholdExceeded (memthrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets discarded due to exceeding the memory usage threshold for *Leq*. The memory usage threshold is determined by the *Leq* software, guaranteeing that the *Leq* does not consume all of the memory. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT FrDte DataLinkConnectionIdentifier (Dlci)

| | |
|---|---|
| Instance | Decimal (0..1023) |
| Groups | "GROUP FrDte Dlci OsiState (State)"<br>"GROUP FrDte Dlci Operational (Oper)" |
| Scope | Application |
| Description | *FrDte/n Dlci/n*<br>This component provides access to both static and dynamic virtual circuit instances. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

### VERB Clear FrDte Dlci

| | |
|---|---|
| Impact | Service |
| Description | *Clear FrDte/n Dlci/n*<br><br>The *Clear* verb allows the user the ability to delete a *Dlci* component of *creationType* ***dynamic***. |

### GROUP FrDte Dlci OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrDte Dlci adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users |

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrDte Dlci operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrDte Dlci usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP FrDte Dlci Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes for the *Dlci* component.

### ATTRIBUTE FrDte Dlci dlciState

Access
Read only

Description
This attribute reflects the current operational circuit state of the *Dlci*. The state ***active*** indicates that the circuit is up and ***inactive*** that the circuit is down. The state ***invalid*** means the circuit has been deleted by the DCE (via *Lmi*).

Values
invalid
active
inactive

Default
inactive

### ATTRIBUTE FrDte Dlci lastTimeChange

Access
Read only

Description
The last time *dlciState* changed state.

Values
Time (DHMS)

Default
No default

### ATTRIBUTE FrDte Dlci sentFrames

Access
Read only

| | |
|---|---|
| Description | Number of frames transmitted across the interface. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Dlci sentOctets

| | |
|---|---|
| Access | Read only |
| Description | The number of octets sent from this virtual circuit since it was created. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Dlci receivedFrames (recvFrames)

| | |
|---|---|
| Access | Read only |
| Description | Number of frames received across the interface. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Dlci receivedOctets (recvOctets)

| | |
|---|---|
| Access | Read only |
| Description | The number of octets sent from this virtual circuit since it was created. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Dlci receivedFECNs (recvFecn)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | Number of frames with the FECN bit set received from the network. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Dlci receivedBECNs (recvBecn)

| | |
|---|---|
| Access | Read only |
| Description | Number of frames with the BECN bit set received from the network. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Dlci discardedFrames (discards)

| | |
|---|---|
| Access | Read only |
| Description | The number of inbound frames dropped because of format errors, or because the VC was inactive. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrDte Dlci creationType (type)

| | |
|---|---|
| Access | Read only |
| Description | This indicates whether the virtual circuit was manually created (static), or dynamically created (dynamic) via the data link control management interface. |
| Values | static<br>dynamic |
| Default | No default |

### ATTRIBUTE FrDte Dlci creationTime

| | |
|---|---|
| Access | Read only |
| Description | The time when the circuit was created, whether by the Data Link Connection Management Interface or by an SNMP set request. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrDte Dlci rateEnforcement (re)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the CIR attributes *committedInformationRate*, *committedBurst*, and *excessBurst* are used to define rate enforcement on this user DLCI.<br><br>If *rateEnforcement* is ***enabled***, and the combined Committed and Excess burst thresholds are exceeded, the frame in violation will be discarded immediately if a *HibernationQueue* subcomponent is not provisioned under the *StDlci* component (static entries only). If a *HibernationQueue* is provisioned, the frame will be placed on the *HibernationQueue* at time of violation and transmission will be attempted later after the point at which the burst thresholds will no longer be exceeded.<br><br>Setting all the CIR attributes to zero has the same affect as setting this attribute to ***disabled***.<br><br>Setting this attribute will operationally override the corresponding provisional value on static entries. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE FrDte Dlci committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | The average number of bits to be transferred per second over the DLCI to the DCE. When this attribute is set to zero, the link |

| | |
|---|---|
| | speed will be used instead.<br><br>Setting this attribute will operationally override the corresponding provisional value on static entries. |
| Values | Decimal (0..48000000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE FrDte Dlci committedBurst (bc)

| | |
|---|---|
| Access | Read and write |
| Description | The committed burst size (in bits) to which the DLCI wants to subscribe.<br><br>Setting this attribute will operationally override the corresponding provisional value on static entries. |
| Values | Decimal (0..2048000) |
| Units | bits |
| Default | 64000 |

### ATTRIBUTE FrDte Dlci excessBurst (be)

| | |
|---|---|
| Access | Read and write |
| Description | The excess burst size (in bits) to which the DLCI wants to subscribe.<br><br>Setting this attribute will operationally override the corresponding provisional value on static entries. |
| Values | Decimal (0..2048000) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE FrDte Dlci excessBurstAction (beAction)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the action taken when the *committedBurst* size has been exceeded on the *Dlci* but the *excessBurst* size has not. If the attribute is set to ***setDeBit***, the Discard Eligibility bit in the Frame Relay header will be turned on. If the attribute is set to ***none***, no action will be taken.<br><br>Setting this attribute will operationally override the corresponding provisional value on static entries. |
| Values | none<br>setDeBit |
| Default | none |

## COMPONENT FrDte VirtualFramer (VFramer)

| | |
|---|---|
| Groups | "GROUP FrDte VFramer Provisioned (Prov)"<br>"GROUP FrDte VFramer OsiState (State)"<br>"GROUP FrDte VFramer Statistics (Stats)" |
| Scope | Application |
| Description | *FrUni/n VirtualFramer*<br>*FrDte/n VirtualFramer*<br>The *VirtualFramer* component binds two services together to provide data transfer between them. It is mutually exclusive from *Framer* component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrDte VFramer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *VirtualFramer* component. |

### ATTRIBUTE FrDte VFramer otherVirtualFramer (ovf)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the other *VirtualFramer* to which the service is linked, for example, *FrUni/n VirtualFramer*, *FrDte/n VirtualFramer*. |
| Values | Link (Service, otherVirtualFramer) |
| Default | No default |

### ATTRIBUTE FrDte VFramer logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the logical processor on which the service component will reside. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### GROUP FrDte VFramer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrDte VFramer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively |

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrDte VFramer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrDte VFramer usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrDte VFramer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *VirtualFramer* component. |

### ATTRIBUTE FrDte VFramer frmToOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames transmitted to the *otherVirtualFramer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrDte VFramer frmFromOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the *otherVirtualFramer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrDte VFramer octetFromOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets received from the *otherVirtualFramer*. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrDte VFramer discFrmFromOtherVFramer (discFrmFromOvf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded frames from the *otherVirtualFramer*. Incrementing of this counter indicates that some incoming traffic cannot be handled by the FP. |
| Values | Long Integer |
| Default | No default |

### COMPONENT FrDte DirectConnection (Dconn)

| | |
|---|---|
| Groups | "GROUP FrDte Dconn DirectFrUniConnData (DirData)" |
| Scope | Application |
| Description | *FrDte/n DirectConnection*<br>This component defines the parameter for implementing the IP over Frame Relay Direct Connection for the *FrameRelayDte* interface.<br><br>The Direct Connection is only supported on the Passport 7000 32-Port Multi-Service Access (MSA32), and Passport 15000 4-Port DS3 Channelised and 1-Port STM1 Channelised cards. Before a Direct Connection can be establish, the provisioning check for this component will ensure that the following conditions are present:<br><br>- *FrameRelayDte* (*FrDte*) is provisioned with a Virtual Framer.<br>- *FrameRelayUni* (*FrUni*) to which the Direct Connection will be establish is provisioned with a Framer.<br>- *FrDte* and *FrUni* link by the Direct Connection are on the same. |

Logical Processor, and they are provisioned on a Passport 7000 Multi-Services Access card.
- accounting on the *FrUni* connected to the *FrDte* via the Virtual Framer is set to **off**.
- *Lmi* on the *FrUni* and *FrDte* connected via the Virtual Framer is off.
- all *Dlci*'s instances on the *FrUni*'s in the IP over Frame Relay setup match, and the provisioned PVC's do not connect to any other *FrUni* than the *FrUni*'s in IP over Frame Relay setup.

# COMPONENT FrameRelayIpServer (FrIpServer)

| | |
|---|---|
| Instance | Decimal (1..1024) |
| Groups | "GROUP FrIpServer CustomerIdentifierData (CidData)"<br>"GROUP FrIpServer IfEntryProv (IfEntry)"<br>"GROUP FrIpServer Provisioned (Prov)"<br>"GROUP FrIpServer Operational (Oper)"<br>"GROUP FrIpServer OperationalStatus (OperStatus)"<br>"GROUP FrIpServer OsiState (State)" |
| Scope | Application |
| Description | *FrameRelayIpServer/n*<br>This component represents a server that distributes traffic between an IP protocol port and multiple Frame Relay interfaces. The *FrIpServer* receives all datagrams destined for the subnet specified at the *ProtocolPort* and forwards each to the appropriate Frame Relay interface. An instance of this component should be provisioned for each *LogicalProcessor* having BNX DLCIs and for each subnet on which BNX DLCIs are located. |
| Dyn. Subcomp. | "COMPONENT FrIpServer IpAddress (IpAddr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrIpServer CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE FrIpServer customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

## GROUP FrIpServer IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

## ATTRIBUTE FrIpServer ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE FrIpServer ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP FrIpServer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all attributes that can be provisioned to define a *FrIpServer* instance. |

### ATTRIBUTE FrIpServer logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the *LogicalProcessor* where the *FrIpServer* is located. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE FrIpServer linkToProtocolPort (lToPp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *ProtocolPort* to which the *FrIpServer* instance is linked. The *ProtocolPort* must have only an *IpPort* subcomponent which has exactly one logical interface. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP FrIpServer Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes specific to the *FrIpServer* component. |

### ATTRIBUTE FrIpServer datagramsFromPp (dataFrPP)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams received from the *ProtocolPort*, including those counted in *unknownIpAddrErr*. Counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrIpServer lastUnknownIpAddress (lastUnkwnAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the destination IP address of the last datagram that was dropped because none of the interfaces specified in *linkToFrameRelayApps* have a matching IP address. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE FrIpServer unknownIpAddressErr (unkwnAddrErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams dropped by the *FrIpServer* because none of the interfaces specified in *linkToFrameRelayApps* have a matching IP address. The destination address from most recent dropped datagram is counted and saved in *lastUnknownIpAddress*. Counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrIpServer invalidIpHeaderVersion (iiphv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams dropped because the version in IP header was invalid. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### GROUP FrIpServer OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE FrIpServer snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

## GROUP FrIpServer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE FrIpServer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE FrIpServer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE FrIpServer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### COMPONENT FrIpServer IpAddress (IpAddr)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP FrIpServer IpAddr Operational (Oper)" |

| | |
|---|---|
| Scope | Application |
| Description | *FrIpServer/n IpAddress/<IP Address>*<br>This component represents the IP address of the Frame Relay interfaces that are connected to the parent *FrIpServer*. It is a dynamic component used for informational purposes only. |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrIpServer IpAddr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all *IpAddress* attributes. |

## ATTRIBUTE FrIpServer IpAddr hostApplication (host)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the component name of the Frame Relay interface with the IP Address specified by the index of the *IpAddress* component. |
| Values | The name of the component |
| Default | No default |

# COMPONENT FrMux

| | |
|---|---|
| Instance | Decimal (1..65535) |
| Groups | "GROUP FrMux OperationalStatus (OperStatus)"<br>"GROUP FrMux IfEntryProv (IfEntry)"<br>"GROUP FrMux CustomerIdentifierData (CidData)"<br>"GROUP FrMux OsiState (State)"<br>"GROUP FrMux Statistics (Stats)" |
| Scope | Application |
| Description | *FrMux/n*<br>This component defines an instance of the Frame Relay Multiplexer/Demultiplexer used by the *DpnGateway* as a frame relay transport mechanism. The component instance value n is a unique positive integer within a module. |
| Subcomponents | "COMPONENT FrMux Framer"<br>"COMPONENT FrMux LocalManagementInterface (Lmi)" |
| Opt. Subcomp. | "COMPONENT FrMux DataLinkConnectionIdentifier (Dlci)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>Unlock |

## VERB LOCK FrMux

| | |
|---|---|
| Impact | Service |
| Description | *Lock [-force] [-forever] frMux*.<br>This verb locks the frMux. If option [-forever] is present, then the locked state lasts forever and can only be terminated by a respective Unlock command. Without option [-forever] the service returns automatically to the unlocked state after five minutes. The option [-force] is accepted, but not acted upon; the effect of the Lock command with this option is the same as without this option. |

## GROUP FrMux OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

## ATTRIBUTE FrMux snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## GROUP FrMux IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

## ATTRIBUTE FrMux ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE FrMux ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP FrMux CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE FrMux customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID |

provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP FrMux OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE FrMux adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrMux operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrMux usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in

use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE FrMux availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot

operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE FrMux proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE FrMux controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE FrMux alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE FrMux standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE FrMux unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP FrMux Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics about the operational behavior of the *FrMux* at the interface level. |

### ATTRIBUTE FrMux lastUnknownDlci (ludlc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the most recent DLCI which user frames were received on, for which a *Dlci* has not been provisioned on the interface. |
| Values | Decimal (0..1023) |
| Default | 0 |

### ATTRIBUTE FrMux unknownDlciFramesFromIf (unknown)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts frames received from the interface with an unknown DLCI (*Dlci* which is not provisioned). When the maximum is reached the count wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux invalidHeaderFramesFromIf (invalid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux timeFramerCongested (timeCong)

| | |
|---|---|
| Access | Read only |
| Description | This attribute accumulates the time (in msec) during which *Framer* congestion has been observed in the direction towards the interface. The overload causing this statistic to increase may be caused by oversubscription. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | 0 |

### COMPONENT FrMux Framer

| | |
|---|---|
| Groups | "GROUP FrMux Framer Provisioned (Prov)"<br>"GROUP FrMux Framer LinkOptions (Link)"<br>"GROUP FrMux Framer OsiState (State)"<br>"GROUP FrMux Framer Statistics (Stats)"<br>"GROUP FrMux Framer LinkUtilization (Util)" |

"COLLECTED STATS FrMux Framer"

| | |
|---|---|
| Scope | Application |
| Description | *FrUni/n Framer*<br>*FrNni/n Framer* |

*FrAtm/n Framer*
This component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Common Verbs
Help
List
Display

## GROUP FrMux Framer Provisioned (Prov)

Properties: Provisioned

Description: This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE FrMux Framer interfaceName

Access: Read and write

Criticality: Process

Description: This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

| | |
|---|---|
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP FrMux Framer LinkOptions (Link)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes defining the framing of data on the link interface. |

### ATTRIBUTE FrMux Framer dataInversion

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed.<br><br>This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density.<br><br>Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.<br><br>This attribute may only take its default value for non-MSA cards. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE FrMux Framer frameCrcType

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of CRC used.<br><br>The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used. |

This attribute may take only its default value for non-MSA cards.

Values
crc16
crc32
noCrc

Default
crc16

### ATTRIBUTE FrMux Framer flagsBetweenFrames

Access
Read and write

Description
This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP.

Values
Decimal (1..16)

Default
1

### GROUP FrMux Framer OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE FrMux Framer adminState (osiAdmin)

Access
Read only

Description
This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrMux Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrMux Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrMux Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a Framer component. |

### ATTRIBUTE FrMux Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrMux Framer frmModeErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrMux Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrMux Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrMux Framer ingressFrameDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames discarded at ingress PQC. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrMux Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE FrMux Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE FrMux Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read onlyThis attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |

| | |
|---|---|
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

## COLLECTED STATS FrMux Framer

| | |
|---|---|
| Description | The statistics record generated by the FrMux Framer component. |

### ATTRIBUTE FrMux Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE FrMux Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE FrMux Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE FrMux Framer txFrames

| | |
|---|---|
| Description | This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE FrMux Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |

| | |
|---|---|
| Values | Decimal (0..100) |

## COMPONENT FrMux LocalManagementInterface (Lmi)

| | |
|---|---|
| Groups | "GROUP FrMux Lmi Provisioned (Prov)"<br>"GROUP FrMux Lmi OsiState (State)"<br>"GROUP FrMux Lmi ProtocolStatusInfo (Psi)"<br>"GROUP FrMux Lmi Statistics (Stats)" |
| Scope | Application |
| Description | *FrMux/n Lmi*<br>This component defines the parameters for implementing the Local Management Interface protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrMux Lmi Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the Local Management Interface component of the *FrMux*. The Local Management Interface of the *FrMux* is always User Side Procedure of the User Network Interface (USP-UNI). |

## ATTRIBUTE FrMux Lmi procedures (proc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute selects the procedures to be used for the Local Management Interface. The following are the supported procedures:<br>***none***: No Local Management Interface procedure is active.<br>***vendorForum***:Local Management Interface procedure according to the Vendor Forum specification is active. DLCI 1023 is used for the LMI protocol.<br>***ansi***: Local Management Interface procedure according to the ANSI specification is active. DLCI 0 is used for the LMI protocol. |

***ccitt***: Local Management Interface procedure according to the CCITT specification is active. DLCI 0 is used for the LMI protocol.

Values
none
vendorForum
ansi
ccitt

Default
ccitt

### ATTRIBUTE FrMux Lmi linkVerificationTimer (t391)

Access
Read and write

Description
This attribute specifies the time interval (in seconds) at which the *FrMux* sends Status Enquiry messages to the interface. Exchange of Status Enquiry and Status Report messages constitutes a polling cycle, so this attribute may also be interpreted as time interval at which the *FrMux* initiates polling cycles. It must be less than *checkPointTimer (t392)* configured at the other end of the Frame Relay interface.

This attribute corresponds to t391 of the ANSI and CCITT specifications, and nT1 of the Vendor Forum specification.

Values
Decimal (5; 10; 15; 20; 25; 30)

Units
seconds

Default
10

### ATTRIBUTE FrMux Lmi fullStatusPollingCycles (n391)

Access
Read and write

Description
This attribute specifies every which polling cycle the *FrMux* sends a full STATUS ENQUIRY to the interface. Every *fullStatusPollingCycles* polling cycles the *FrMux* sends a full STATUS ENQUIRY. In all other cycles of a sequence of *fullStatusPollingCycles* polling cycles the *FrMux* sends a keep alive STATUS ENQUIRY.

This attribute corresponds to n391 of the ANSI and CCITT specifications and nN1 of the Vendor Forum specification.

Values: Decimal (1..255)

Default: 6

### ATTRIBUTE FrMux Lmi errorEventThreshold (n392)

Access: Read and write

Description: This attribute specifies the number of error events which, if they occur within *eventCount* events, will cause a protocol error condition (*protocolStatus* = ***errorCondition***). The error condition is cleared after *eventCount* sequential correct events occur (*protocolStatus* = ***normalCondition***).

An event is one of the following: (1) expiry of the linkVerificationTimer (t391), (2) reception of a STATUS message. An error event is one of the following: (1)non-receipt of the STATUS message in t391 seconds, (2)invalid STATUS message, (3) invalid sequence number.

This attribute corresponds to n392 of the ANSI and CCITT specifications and nN2 of the Vendor Forum Specification.

This attribute must be less than or equal to *eventCount*.

Values: Decimal (1..10)

Default: 3

### ATTRIBUTE FrMux Lmi eventCount (n393)

Access: Read and write

Description: This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed.

This attribute corresponds to n392 of the ANSI and CCITT specifications and nN3 of the Vendor Forum Specification.

| | |
|---|---|
| | This attribute must be greater than or equal to *errorEventThreshold*. |
| Values | Decimal (1..10) |
| Default | 4 |

### GROUP FrMux Lmi OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrMux Lmi adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE FrMux Lmi operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE FrMux Lmi usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP FrMux Lmi ProtocolStatusInfo (Psi)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the protocol status of the Local Management Interface of this *FrMux*. |

## ATTRIBUTE FrMux Lmi protocolStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the *Lmi* is in an error condition or whether the protocol is behaving normally. When operating with no LMI protocol (*procedures* = ***none***), this attribute will always be set to ***normalCondition***. When operating with an LMI protocol (procedures set to one of ***venforForum***, ***ansi***, ***ccitt***), this attribute is set to ***errorCondition*** when *errorEventThreshold* of the last *eventCount* events are in error.<br>The error condition is cleared when *eventCount* consecutive good events take place.<br>The consequence of an error condition is that all *Dlci*'s on this interface become disabled and there is no data flow in either direction. |
| Values | errorCondition<br>normalCondition |
| Default | normalCondition |

## GROUP FrMux Lmi Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the *FrMux* Local Management Interface. |

## ATTRIBUTE FrMux Lmi keepAliveStatusEnqToIf (kati)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of keep alive STATUS ENQUIRY messages sent to the interface. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967275) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrMux Lmi fullStatusEnqToIf (fsti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of full STATUS ENQUIRY messages sent to the interface. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967275) |
| Default | 0 |

### ATTRIBUTE FrMux Lmi protocolErrors (proto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface protocol errors. Protocol errors include (1) protocol message format errors, (2) protocol timer expiry errors, and (3) sequence errors. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967275) |
| Default | 0 |

### ATTRIBUTE FrMux Lmi unexpectedIes (uie)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received with an Information Element identifier that is unknown or unexpected. When the maximum count is reached, this counter wraps to zero. |
| Values | Decimal (0..4294967275) |
| Default | 0 |

### ATTRIBUTE FrMux Lmi sequenceErrors (seq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface sequence errors. A sequence error is receipt of an LMI message with a receive sequence number not equal to the last send |

| | |
|---|---|
| | sequence number. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967275) |
| Default | 0 |

### ATTRIBUTE FrMux Lmi unexpectedReports (ur)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on the Local Management Interface with an unknown or unexpected report type. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967275) |
| Default | 0 |

### ATTRIBUTE FrMux Lmi noStatusReportCount (nsrc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented in two cases:<br>i) after a status enquiry is sent out and t391 timer expires without having a status report received.<br>ii) an invalid status report is received.<br>When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967275) |
| Default | 0 |

### COMPONENT FrMux DataLinkConnectionIdentifier (Dlci)

| | |
|---|---|
| Instance | Decimal (16..1007) |
| Groups | "GROUP FrMux Dlci Operational (Oper)"<br>"GROUP FrMux Dlci OsiState (State)"<br>"GROUP FrMux Dlci ABitStatus (Abit)"<br>"GROUP FrMux Dlci Statistics (Stats)" |
| Scope | Application |

| | |
|---|---|
| Description | *FrMux/n Dlci/n*<br>This component is responsible for the Frame Relay U-plane (User-plane) protocol for the specified instance. The instance value is used to identify the logical connection, multiplexed within the physical channel, with which a frame is associated. All frames carried within a particular physical channel and having the same DLCI value are associated with the same logical connection. |
| Subcomponents | "COMPONENT FrMux Dlci ApplicationInfo (ApplInfo)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrMux Dlci Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the name of the application associated with this *Dlci*. |

### ATTRIBUTE FrMux Dlci applicationName (applName)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the name of the application associated with this *Dlci*. |
| Values | The name of the component |
| Default | No default |

### GROUP FrMux Dlci OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE FrMux Dlci adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE FrMux Dlci operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrMux Dlci usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP FrMux Dlci ABitStatus (Abit)

Properties
Operational

Description
This group contains the A-Bit status information for this *Dlci*.

### ATTRIBUTE FrMux Dlci aBitStatusFromIf (abfi)

Access
Read only

Description
This attribute is the most recent A-Bit status received from the interface.

Values
inactive
active

Default
inactive

## GROUP FrMux Dlci Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the *FrMux Dlci*. |

## ATTRIBUTE FrMux Dlci frmToIf (fti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE FrMux Dlci bytesToIf (bti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent to the interface. When the maximum count is reached the count wraps to zero. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE FrMux Dlci frmFromIf (ffi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface. Frames that are discarded are not included in this count. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE FrMux Dlci deFrmFromIf (defi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci bytesFromIf (bfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received from the interface. Frames that are discarded are not included in this count. When the maximum count is reached the count wraps to zero. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrMux Dlci deBytesFromIf (debi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrMux Dlci fecnFrmToIf (fecnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci fecnFrmFromIf (fecnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci becnFrmToIf (becnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci becnFrmFromIf (becnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci discCongestedFromIf (disccfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded in the receive direction due to local congestion. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci discCongestedFromIfBytes (disccfib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes discarded in the receive direction due to local congestion. When this count reaches maximum, it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci discDeCongestedFromIf (discdecfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discard eligible (DE=1) frames discarded in the receive direction due to local congestion. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci discDeCongestedFromIfBytes (discdecfib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes of discard eligible (DE=1) traffic discarded in the receive direction due to local congestion. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci errorShortFrmFromIf (shortfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received with 0 octets in the information field. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrMux Dlci errorLongFrmFromIf (longfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received with number of octets in the information field greater than the maximum frame size |

provisioned in the component pointed to by the *applicationName*. When the count reaches maximum it wraps to zero. Frames whose lengths are greater than the hardware receive buffer are discarded by the *Framer* and are therefore not included in this count.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT FrMux Dlci ApplicationInfo (ApplInfo)

| | |
|---|---|
| Groups | "GROUP FrMux Dlci ApplInfo Provisioned (Prov)" |
| Scope | Application |
| Description | *FrMux/n Dlci/n ApplicationInfo*<br>This component contains provisionable attributes of this *Dlci*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP FrMux Dlci ApplInfo Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes of this *Dlci*. |

### ATTRIBUTE FrMux Dlci ApplInfo applicationName (applName)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the link to the application associated with this *Dlci*. |
| Values | Link (Service, dlciName) |
| Default | No default |

# COMPONENT FrameRelayNni (FrNni)

| | |
|---|---|
| Instance | Decimal (1..4294967295) |
| Groups | "GROUP FrNni CustomerIdentifierData (CidData)"<br>"GROUP FrNni OsiState (State)"<br>"GROUP FrNni Statistics (Stats)"<br>"GROUP FrNni IfEntryProv (IfEntry)"<br>"GROUP FrNni OperationalStatus (OperStatus)"<br>"GROUP FrNni EmissionPriorityQs"<br>"GROUP FrNni TrafficStatistics (TrafficStats)" |
| Scope | Application |
| Description | *FrameRelayNni/n*<br>This component defines an instance of the Frame Relay Network-to-Network Interface (NNI) service. This service allows two networks to be interconnected using the Frame Relay protocol. The component instance value n is a unique positive integer within a module. The *FrNni* interface must have either a *Framer* or a *VirtualFramer* subcomponent. As a default, a *Framer* is created whenever the *FrNni* is added. Users who need a *VirtualFramer* should delete the *Framer* and then add the *VirtualFramer*. |

| | |
|---|---|
| Subcomponents | "COMPONENT FrNni DataNetworkAddress (Dna)"<br>"COMPONENT FrNni LocalManagementInterface (Lmi)"<br>"COMPONENT FrNni ConnectionAdministrator (Ca)" |
| Opt. Subcomp. | "COMPONENT FrNni Framer"<br>"COMPONENT FrNni VirtualFramer (VFramer)"<br>"COMPONENT FrNni Signaling (Sig)"<br>"COMPONENT FrNni LoadTestSystem (Lts)"<br>"COMPONENT FrNni ServiceTrace (SrvTrace)"<br>"COMPONENT FrNni BnxProtocol (Bp)" |

## GROUP FrNni CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE FrNni customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. |

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

## GROUP FrNni OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE FrNni adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrNni operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrNni usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE FrNni availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE FrNni proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE FrNni controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE FrNni alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE FrNni standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE FrNni unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP FrNni Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics about the operational behavior of the service at the interface level. |

### ATTRIBUTE FrNni lastUnknownDlci (ludlc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the most recent DLCI which user frames were received on for which a DLCI has not been provisioned on the port. |
| Values | Decimal (0..1023) |
| Default | 0 |

### ATTRIBUTE FrNni unknownDlciFramesFromIf (unknown)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains a count of the number of frames received from the interface with an unknown DLCI (DLCI which is not |

| | |
|---|---|
| | provisioned). When the maximum is exceeded the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni invalidHeaderFramesFromIf (invalid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is exceeded the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrNni IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE FrNni ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE FrNni ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |

| | |
|---|---|
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP FrNni OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE FrNni snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP FrNni EmissionPriorityQs

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute to specify the number of Frame Relay egress emission priority queues to be used on that Frame Relay Interface |

### ATTRIBUTE FrNni numberOfEmissionQs

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of egress emission priority queues that will be used for that Frame Relay interface. |

For V.35, V.11, HSSI, E1, DS1, E3, DS3 or 8pDS1 the possible values are: ***2*** (in which case they are hardware queues), or ***4*** (in which case they are software queues).

For DS1C, E1C or DS3C the possible values are ***2, 4*** (in all cases they are software queues).

For 32 port Msa cards the possible values are ***2, 4*** (in all cases they are hardware queues).

For 4pDS3Ch, 1pSTM1ChSmIr PQC6v2 (also known as PQC2) the possible values are ***2, 4*** (in all cases they are hardware queues).

For 4pDS3Ch PQC12, setting this attribute has no effect on the number of egress emission priority queues, four hardware queues are always used.

| | |
|---|---|
| Values | Decimal (2; 4) |
| Default | 2 |

### GROUP FrNni TrafficStatistics (TrafficStats)

| | |
|---|---|
| Properties | Operational |
| Description | This operational group provides the traffic statistics of the service at the interface level. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

### ATTRIBUTE FrNni frmToIfByQueue

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority. |

| | |
|---|---|
| | The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4. |
| Values | Decimal (0..4294967295) |
| Replication | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE FrNni octetToIfByQueue

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority.<br><br>The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4. |
| Values | Decimal (0..4294967295) |
| Replication | Decimal (0..3) |
| Default | No default |

### COMPONENT FrNni DataNetworkAddress (Dna)

| | |
|---|---|
| Groups | "GROUP FrNni Dna Address"<br>"GROUP FrNni Dna OutgoingOptions"<br>"GROUP FrNni Dna CallOptions" |
| Scope | Application |
| Description | This group contains a superset of all attributes which may apply to a VC. Particular applications will typically offer only a subset of these attributes by providing a definition of their own DNA subcomponent. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT FrNni Dna HuntGroupMember (HgM)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrNni Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes. |

## ATTRIBUTE FrNni Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the DNA that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE FrNni Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the customer’s unique identifier. It is the equivalent of the telephone number in the telephone network. |
| Values | BCD (1..15) |
| Default | No default |

## GROUP FrNni Dna OutgoingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines DNA call options for calls made from the interface. These options are not used for calls arriving to the interface represented by this *DNA*. |

## ATTRIBUTE FrNni Dna outDefaultPriority (odf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the default priority of outgoing calls from the DTE to the network.<br><br>It can be overridden by the *discardPriority* under *DLCI Direct Call* subcomponent.<br><br>This option can be also included in X.25 signaling, in such case it will be overruled. |
| Values | normal<br>high |
| Default | normal |

## ATTRIBUTE FrNni Dna outDefaultPathReliability (opr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default class of routing for reliability routing for all outgoing calls (from the DTE to the network) using this particular DNA. The chosen default class of routing applies to all outgoing calls established using this DNA, and applies to the packets travelling in both directions on all outgoing calls (local to remote, and remote to local). For incoming calls, the default class of routing is chosen by the calling party (as opposed to DPN, where either end of the call can choose the default routing class).<br>This attribute, if set to a value of *normal*, indicates that the default class of routing is normal reliability routing. If set to a value of *high*, then the default class of routing is high reliability routing.<br>High reliability is the standard choice for most DPN and Passport |

services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the VC handles the duplication and disordering to ensure that packets are delivered to the DTE properly.
For the Frame Relay service, duplication of packets is not desired, in which case, normal reliability may be chosen as the preferred class of routing.

Values
normal
high

Default
normal

### ATTRIBUTE FrNni Dna defaultTransferPriority (dtp)

Access
Read and write

Description
This attribute specifies the default transfer priority for all outgoing calls using this particular *DNA*. It can be overridden by the *transferPriority* provisioned in the *Dlci DirectCall* sub-component.

The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Each transfer priority n, where n indicates the transfer priority index, contains a default setting for routing class of service (multimedia, delay or throughput) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.

The default *defaultTransferPriority* is ***0***.

Values
0
1

2
3
4
5
6
7
8
9
10
11
12
13
14
15

Default 0

### ATTRIBUTE FrNni Dna transferPriorityOverRide (tpor)

Access Read and write

Description When this attribute is set to ***yes*** in the call request, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority.

This attribute is not applicable for Frame Relay SVCs.

For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority.*

The default of *transferPriorityOverRide* is ***yes***.

Values yes
no

Default yes

### GROUP FrNni Dna CallOptions

Properties Provisioned

Description This group defines additional all options for not related to direction of the call.

## ATTRIBUTE FrNni Dna accountClass (acl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator.<br>This attribute is returned by the local VC in the accounting record for all calls that are set up using this particular DNA. |
| Values | Decimal (0..255) |
| Default | 0 |

## ATTRIBUTE FrNni Dna accountCollection (aco)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates that accounting records are to be collected by the network for the various reasons: billing, test, study, auditing. The last of the parameters, force, indicates that accounting records are to be collected irrespective of other collection reasons. The force option is available for X.75 Gateways only. If none of these reasons are set, then accounting will be suppressed.<br>To set a specific accounting collection reason, the reason is entered and the corresponding bit in the structure is set to a value of 1. To turn off a specific accounting collection reason, the reason is entered preceded with the '~' character, and the corresponding bit in the structure is set to a value of 0.<br>The bit placement for the accounting collection reasons is as follows:<br>Bit 0 - Bill<br>Bit 1 - Test<br>Bit 2 - Study<br>Bit 3 - Audit<br>Bit 4 - Force |

| | |
|---|---|
| Set of | bill<br>test<br>study<br>audit<br>force |
| Default | (bill) |

### ATTRIBUTE FrNni Dna serviceExchange (sre)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is an arbitrary number, Data Service Exchange, as entered by the network operator and reported in accounting record. It is converted into an internal 8-bit integer value for use in the accounting record as well as in various X.25 and X.75 Tariff utilities. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE FrNni Dna egressAccounting (ega)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if egress accounting is enabled by the frame relay service. If egress accounting is disabled, only segment counts are collected by the VC. No frame relay counts appear in the accounting records for the frame relay service. If egress accounting is enabled, the accounting records for the frame relay service will contain frame relay specific counts. |
| Values | yes<br>no |
| Default | no |

### ATTRIBUTE FrNni Dna dataPath (dpa)

| | |
|---|---|
| Access | Read and write |

Description

This attribute specifies the data path to be used by Virtual Circuits on this interface. If the connection has a *DirectCall* component then the value can be overridden by the *dataPath* attribute of the *DirectCall* component.

This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.

The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.

A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value.

***dprsOnly*** - dynamic packet routing system is used

***dprsMcsOnly*** - dprs Multi-Service Cut-Through Switching path is used.

***dprsMcsFirst*** - dprs Multi-Service Cut-Through Switching path is used if it is available. If it is not available ***dprsOnly*** is used.

Values

dprsOnly
dprsMcsOnly
dprsMcsFirst

Default

dprsOnly

## COMPONENT FrNni Dna HuntGroupMember (HgM)

Groups

"GROUP FrNni Dna HgM Interface (If)"
"GROUP FrNni Dna HgM Operational (Op)"

Scope

Application

Description

*FrNni/n Dna HuntGroupMember*
This component specifies the interaction of this *DNA* with one or more hunt groups to which it is expected to belong.
Note that is not possible to automatically verify the consistency of the hunt group membership specified under this component

| | |
|---|---|
| | with the hunt group provisioning on the DPN Hunt Group Server(s). |
| Subcomponents | "COMPONENT FrNni Dna HgM HuntGroupAddress (HgAddr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrNni Dna HgM Interface (If)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the interface parameters between the *HuntGroupMember* and the hunt group server. |

### ATTRIBUTE FrNni Dna HgM availabilityUpdateThreshold (aut)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how much *availableAggregateCIR* can change before an Availability Message Packet (AMP) is sent to the hunt group server informing it of the change.<br>If the value specified is not a multiple of 2048, the value actually used as the threshold will be the next higher multiple of 2048. |
| Values | Decimal (2048..16777216) |
| Units | bit/s |
| Default | 8192 |

### GROUP FrNni Dna HgM Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *HuntGroupMember* component. |

### ATTRIBUTE FrNni Dna HgM availabilityDelta (ad)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the net change in the available aggregate CIR since the last Availability Message Packet (AMP) was sent to the Hunt Group. Once the absolute value of this attribute reaches the *availabilityUpdateThreshold* an AMP is sent to the hunt group server(s) and the *availabilityDelta* is re-computed. |
| Values | Signed (-16777216..16777215) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrNni Dna HgM availableDlcis (adl)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of DLCIs available for SVCs on the interface associated with this DNA. If this value reaches 0, an AMP with zero availability is sent to the hunt group server(s). Both this attribute and the *availableAggregateCir* attribute must be non zero for this DNA to receive calls on the hunt group. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE FrNni Dna HgM maximumAvailableAggregateCir (mcir)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum available bandwidth for this hunt group member. This value represents the total sum of the sixteen egress bandwidth pools. It is the sum of the sixteen indices of the *FrNni Ca egressBandwidthPool* attribute multiplied by the link speed. |
| Values | Long Integer |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrNni Dna HgM availableAggregateCir (acir)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the current total available bandwidth reported to the hunt group server in the Availability Message Packet (AMP). This value represents the sum of the sixteen currently available egress bandwidth pools. It is the sum of the sixteen indices of the *FrNni Ca egressPoolAvailableBandwidth* attribute.<br>It increments when a connection is released.<br>It decrements when a connection is accepted.<br>Both this attribute and the *availableDlcis* attribute must be non zero for this interface to receive calls on a hunt group. |
| Values | Long Integer |
| Units | bit/s |
| Default | No default |

## COMPONENT FrNni Dna HgM HuntGroupAddress (HgAddr)

| | |
|---|---|
| Instance | Decimal (0..63) |
| Groups | "GROUP FrNni Dna HgM HgAddr Address (Addr)" |
| Scope | Application |
| Description | *FrNni/n Dna HgM HuntGroupAddress/n*<br>This component specifies a hunt group address to which this member belongs. A hunt group member belongs to at least one hunt group. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrNni Dna HgM HgAddr Address (Addr)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes. |

### ATTRIBUTE FrNni Dna HgM HgAddr numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the *DNA*. The address may belong to X.121 or E.164 plans. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE FrNni Dna HgM HgAddr dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains digits which form the unique identifier of the customer interface. It can be compared (approximation only) to a telephone number where the phone number identifies a unique telephone set. *DNA* digits are selected and assigned by network operators. |
| Values | BCD (1..15) |
| Default | No default |

### COMPONENT FrNni Framer

| | |
|---|---|
| Groups | "GROUP FrNni Framer Provisioned (Prov)"<br>"GROUP FrNni Framer LinkOptions (Link)"<br>"GROUP FrNni Framer OsiState (State)"<br>"GROUP FrNni Framer Statistics (Stats)"<br>"GROUP FrNni Framer LinkUtilization (Util)" |

"COLLECTED STATS FrameRelayNni Framer"

| | |
|---|---|
| Scope | Application |
| Description | *FrUni/n Framer*<br>*FrNni/n Framer*<br>*FrAtm/n Framer*<br>This component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface. |

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Common Verbs

DELete

## GROUP FrNni Framer Provisioned (Prov)

Properties: Provisioned

Description: This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE FrNni Framer interfaceName

Access: Read and write

Criticality: Process

Description: This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values: Link (Hardware, applicationFramerName)

Default: No default

## GROUP FrNni Framer LinkOptions (Link)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes defining the framing of data on the link interface. |

## ATTRIBUTE FrNni Framer dataInversion

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed.<br><br>This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density.<br><br>Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.<br><br>This attribute may only take its default value for non-MSA cards. |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE FrNni Framer frameCrcType

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of CRC used.<br><br>The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used.<br><br>This attribute may take only its default value for non-MSA cards. |

| | |
|---|---|
| Values | crc16<br>crc32<br>noCrc |
| Default | crc16 |

### ATTRIBUTE FrNni Framer flagsBetweenFrames

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP. |
| Values | Decimal (1..16) |
| Default | 1 |

### GROUP FrNni Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrNni Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it |

is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrNni Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrNni Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

| | |
|---|---|
| | The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrNni Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a Framer component. |

### ATTRIBUTE FrNni Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrNni Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Framer frmModeErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrNni Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrNni Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrNni Framer ingressFrameDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames discarded at ingress PQC. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrNni Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE FrNni Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE FrNni Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |

| | |
|---|---|
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

## COLLECTED STATS FrameRelayNni Framer

| | |
|---|---|
| Description | The statistics record generated by the FrameRelayNni Framer component. |

### ATTRIBUTE FrNni Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE FrNni Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE FrNni Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE FrNni Framer txFrames

| | |
|---|---|
| Description | This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE FrNni Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |
| Values | Decimal (0..100) |

### COMPONENT FrNni LocalManagementInterface (Lmi)

| | |
|---|---|
| Groups | "GROUP FrNni Lmi ProtocolParameters (Parms)"<br>"GROUP FrNni Lmi NniProtocolParameters (NniParms)"<br>"GROUP FrNni Lmi OsiState (State)"<br>"GROUP FrNni Lmi ProtocolStatusInfo (Psi)"<br>"GROUP FrNni Lmi Statistics (Stats)" |
| Scope | Application |
| Description | *FrNni/n LocalManagementInterface*<br>This component defines the parameters for implementing the Frame Relay NNI Local Management Interface protocol. This differs from its UNI counterpart in that bi-directional LMI procedures are supported and protocols other than ANSI and CCITT are not supported. |
| Common Verbs | Help<br>List<br>Display |

### GROUP FrNni Lmi ProtocolParameters (Parms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the Local Management Interface component. |

### ATTRIBUTE FrNni Lmi procedures (proc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute selects the procedures to be used for the Local Management Interface. The following are the supported |

procedures:

***none***: Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment which didn't implement any LMI procedures. In this case, the remaining attributes of this group are ignored.

For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrNni* is set to ***none***, only ***none*** is permitted for the *procedures* attribute of this *Lmi* component.

***ansi***: Local Management Interface procedures from the ANSI specification are supported. *DLCI 0* is used for the LMI protocol.

***itu***: Local Management Interface procedures from the ITU-T specification are supported. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***.

***autoConfigure***:The interface determines automatically which Local Management Interface procedures to use.

The procedures currently being used can be seen in the operational attribute *opProcedures*.

Values
none
ansi
itu (ccitt)
autoConfigure

Default
autoConfigure

## ATTRIBUTE FrNni Lmi asyncStatusReport (asr)

Access
Read and write

Description
This attribute selects the use of asynchronous PVC status report procedures as specified in ANSI and CCITT specification.

Values
off
on

Default
off

### ATTRIBUTE FrNni Lmi errorEventThreshold (n392)

| | |
|---|---|
| Access | Read and write |
| Description | For the network-side-procedure, an event is defined as follows: (1) receipt of a STATUS ENQUIRY message, or (2) expiration of timer T392. An error event is (1) nonreceipt of STATUS ENQUIRY in T392 seconds; (2) invalid format of a LMI message; (3) invalid receive sequence number.<br>For the user-side-procedure, an event is defined as a polling cycle or a status enquiry and status report exchange. An error event is (1) non-receipt of a STATUS within the polling cycle, or (2) invalid format of a LMI message, or (3) invalid sequence number<br>This attribute specifies the number of error events which, if they occur within *eventCount* events, will cause a protocol error condition. The condition is cleared after *eventCount* sequential correct events occur.<br><br>It must be less than or equal to *eventCount* (n393) |
| Values | Decimal (1..10) |
| Default | 3 |

### ATTRIBUTE FrNni Lmi eventCount (n393)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed.<br><br>It must be greater than or equal to *errorEventThreshold* (n392). |
| Values | Decimal (1..10) |
| Default | 4 |

### ATTRIBUTE FrNni Lmi checkPointTimer (t392)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute selects the time (in seconds) within which a STATUS ENQUIRY message is expected. It must be greater than *linkVerificationTimer (t391).* |

| | |
|---|---|
| Values | Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30) |
| Units | seconds |
| Default | 15 |

### ATTRIBUTE FrNni Lmi ignoreActiveBit (inab)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether the Frame Relay LMI Active Bit (A-bit) has a bearing on the transfer of user data across this Frame Relay interface for both directions of traffic flow.<br><br>When this attribute is set to ***yes***, the A-bit status of a user DLCI connection does not affect data transfer.<br><br>When this attribute is set to ***no,*** data received from the local interface is discarded if an A-bit =0 condition exists towards the local user. Data being sent to the local interface is discarded if an A-bit = 0 condition exists towards the local user. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE FrNni Lmi pvcAlarmsReporting (pvcAlarms)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if alarms are generated when PVCs change state in the local network, an adjacent network or in remote networks.<br><br>When the value is ***internal***, PVCs operational status change in the local network are reported in alarms. When the value is ***external***, PVCs operational status change in an adjacent or remote networks are reported in alarms. When the value is ***both***, PVCs status change in local and adjacent or remote networks are reported in alarms. When the value is ***none***, no alarms are issued |

for PVCs status change.

There are four kinds of alarms controlled by the attribute.
Alarm 7007 200x reports PVCs that have lost connectivity in an adjacent or remote networks.
Alarm 7007 201x reports PVCs that have reached the data transfer state in an adjacent or remote networks.
Alarm 7007 202x reports PVCs that have lost connectivity in the local network.
Alarm 7007 203x reports PVCs that have reached the data transfer state in the local network.

Each alarm can report a maximum of 112 DLCIs. Up to nine alarms of the same kind may be required to report all PVCs that have changed state if all these PVCs have experienced the same condition at the *FrNni* interface.

Values
external
internal
both
none

Default
external

## GROUP FrNni Lmi NniProtocolParameters (NniParms)

Properties
Provisioned

Description
This group contains the provisionable attributes of the Local Management Interface component which are unique to NNI.

## ATTRIBUTE FrNni Lmi fullStatusPollingCycles (n391)

Access
Read and write

Description
This attribute specifies how frequently the Frame Relay NNI service should initiate a Status Enquiry for a full PVC status report. A polling cycle is a Status Enquiry and Status Report exchange.

Values
Decimal (1..255)

Default
6

### ATTRIBUTE FrNni Lmi linkVerificationTimer (t391)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how frequently the Frame Relay NNI service should initiate a Status Enquiry for link integrity verification. It must be less than *checkPointTimer (t392)*. |
| Values | Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30) |
| Units | seconds |
| Default | 10 |

### GROUP FrNni Lmi OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrNni Lmi adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

| | |
|---|---|
| | administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE FrNni Lmi operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE FrNni Lmi usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP FrNni Lmi ProtocolStatusInfo (Psi)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the protocol status of the Local Management Interface. |

## ATTRIBUTE FrNni Lmi protocolStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the LMI is in an error condition or whether the LMI procedures are behaving normally. When operating with no LMI protocol, this attribute is always set to ***normalCondition***. When operating with LMI procedures, this attribute is set to ***errorCondition*** after n392 of the last n393 events are in error. The consequence of an ***errorCondition*** is that all DLCIs on this interface will become inactive in both directions. The ***errorCondition*** is lifted and a ***normalCondition*** is indicated when a sufficient number of events have occurred without error. In ANSI, this occurs when n393 consecutive good events take place.<br><br>If the *procedures* attribute is set to ***autoConfigure***, this attribute is se to ***configuring*** while adaptive LMI determines which LMI procedures are running on the link. A single LMI error event during auto configuration causes the attribute value to change to ***errorCondition***. If during ***configuring*** no LMI message is received, an LMI ***errorCondition*** is raised after n392 x t392 seconds. |
| Values | errorCondition<br>normalCondition<br>configuring |
| Default | No default |

### ATTRIBUTE FrNni Lmi opProcedures (opproc)

| | |
|---|---|
| Access | Read only |
| Criticality | Process |
| Description | This attribute indicates the procedures being used for the Local Management Interface. This attribute should be ignored if *protocolStatus* is not ***normalCondition***. The following procedures are supported:<br><br>***none***: Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures.<br><br>***ansi***: Local Management Interface procedures from the ANSI specification are running. *DLCI 0* is used for the LMI protocol.<br><br>***itu***: Local Management Interface procedures from the ITU-T specification are running. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***.<br><br>***unknown***: Local Management Interface procedures have yet to be determined by Adaptive LMI. |
| Values | none<br>ansi<br>itu<br>unknown |
| Default | No default |

### GROUP FrNni Lmi Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the Frame Relay NNI Local Management Interface. |

### ATTRIBUTE FrNni Lmi keepAliveStatusToIf (kasti)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of Local Management Interface keep alive status messages sent to the external network in response to a status enquiry for keep alive status. When the maximum count is exceeded it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi fullStatusToIf (fsti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface full status messages sent to the external network in response to a status enquiry for keep alive or full status. When the maximum count is exceeded it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi keepAliveStatusEnqFromIf (kafi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface valid keep alive status enquiry messages received from the external network. When the maximum count is exceeded it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi fullStatusEnqFromIf (fsfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface valid full status enquiry messages received from the external network. When the maximum count is exceeded it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi networkSideEventHistory (nsh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Local Management Interface network side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The leftmost event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status enquiry message. An error event is either a nT2/T392 timer expiry or receipt of a status enquiry with bad sequence numbers. |
| Values | String (1..10, ASCII) |
| Default | No default |

### ATTRIBUTE FrNni Lmi userSideEventHistory (ush)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Local Management Interface user side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The leftmost event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status message. An error event is either a nT1/T391 timer expiry or receipt of a status message with bad sequence numbers. |
| Values | String (1..10, ASCII) |
| Default | No default |

### ATTRIBUTE FrNni Lmi protocolErrors (proto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface protocol errors. It is the sum of the sequence (*sequenceErrors* and *statusSequenceErrors*) and timeout (*pollingVerifTimeouts* and *noStatusReportCount*) errors. When the maximum count is exceeded it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi unexpectedIes (uie)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface frames received with an Information Element identifier that is unknown or unexpected. An unexpected Information Element is not a protocol error. When the maximum count is exceeded, this counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi sequenceErrors (seq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface Status Enquiry message sequence errors. A sequence error is receipt of a Status Enquiry message with a receive sequence number not equal to the last send sequence number. When the maximum count is exceeded the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi statusSequenceErrors (stseq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface Status message sequence errors. A sequence error is receipt of a Status message with a receive sequence number not equal to the last send sequence number. When the maximum count is exceeded the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi unexpectedReports (ur)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface frames received with an unknown or unexpected report type. An unexpected report type is not a protocol error. When the maximum count is exceeded the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi pollingVerifTimeouts (tmo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of checkPointTImer (t392) timer expiries occurring on the Local Management Interface. When the maximum count is exceeded the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lmi noStatusReportCount (nsrc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented in two cases:<br>i) after a status enquiry is sent out and T391 timer expires without having a status report received.<br>ii) an invalid status report is received.<br><br>When the maximum count is exceeded it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT FrNni DataLinkConnectionIdentifier (Dlci)

| | |
|---|---|
| Instance | Decimal (16..1007) |

| | |
|---|---|
| Groups | "GROUP FrNni Dlci OsiState (State)"<br>"GROUP FrNni Dlci ABitStatus (Abit)"<br>"GROUP FrNni Dlci ServiceParametersOp (SpOp)"<br>"GROUP FrNni Dlci Statistics (Stats)"<br>"GROUP FrNni Dlci IntervalData (Int)"<br>"GROUP FrNni Dlci CallData (Calld)" |
| Scope | Application |
| Description | *FrNni/n DataLinkConnectionIdentifier/n*<br>This component represents a Data Link Connection Identifier. It is responsible for the Frame Relay U-plane (User-plane) protocol for the specified instance. There can be many instances of *Dlci* for each *FrNni*. The instance value is used to identify the logical connection, multiplexed within the physical channel, with which a frame is associated. All frames carried within a particular physical channel and having the same DLCI value are associated with the same logical connection.<br><br>A DLCI instance can be a permanent virtual circuit (PVC) or switched permanent virtual circuit (P-SPVC) added through provisioning, or a switched virtual circuit (SVC) or S-SPVC which is created dynamically through signaling.<br><br>The *lock* and *unlock* commands apply to permanent DLCIs. The *clear* command applies to switched DLCIs.<br><br>For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrNni* is set to ***none***, no *Dlci* component is allowed under this *FrNni*. |

| | |
|---|---|
| Subcomponents | "COMPONENT FrNni Dlci ServiceParametersProv (Sp)"<br>"COMPONENT FrNni Dlci EgressServiceParameters (EgressSp)" |

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## VERB CLEAR FrNni Dlci

| | |
|---|---|
| Impact | Service |
| Description | This command is used to clear a Frame Relay switched (SVC or S-SPVC) connection. |

## GROUP FrNni Dlci OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE FrNni Dlci adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE FrNni Dlci operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrNni Dlci usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE FrNni Dlci availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE FrNni Dlci proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been

initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE FrNni Dlci controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is

administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE FrNni Dlci alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or

***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE FrNni Dlci standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)

providingService (serv)
notSet (nSet)

Default notSet

### ATTRIBUTE FrNni Dlci unknownStatus (osiUnknw)

Access Read only

Description This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values false
true

Default false

### GROUP FrNni Dlci ABitStatus (Abit)

Properties Operational

Description This group contains the A-Bit status information for this Data Link Connection Identifier.

### ATTRIBUTE FrNni Dlci aBitStatusToIf (abti)

Access Read only

Description This attribute is the most recent A-bit status sent to the interface. The A-bit status is part of the LMI protocol, and indicates willingness to accept data from the local interface.

***inactive*** - the Frame Relay service discards all data offered from the local interface.

***active*** - the Frame Relay service tries to process all data offered from the local interface.

***notApplicable*** - the DLCI is switched, so this attribute is ignored.

| | |
|---|---|
| Values | inactive<br>active<br>notApplicable |
| Default | inactive |

### ATTRIBUTE FrNni Dlci aBitReasonToIf (abrti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the reason (if any) for an ***inactive*** status to be sent to the interface. This reason is ***notApplicable*** for an ***active*** status. |
| Values | notApplicable<br>remoteUserSignaled<br>localLmiError<br>remoteLmiError<br>localLinkDown<br>remoteLinkDown<br>pvcSpvcDown<br>userNotAuthorized<br>resourceNotAvailable<br>dlciCollisionAtNni |
| Default | notApplicable |

### ATTRIBUTE FrNni Dlci aBitStatusFromIf (abfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the most recent A-Bit status received from the interface.<br><br>***inactive*** - the Frame Relay service informs the remote DLCI not to send user data to this interface.<br><br>***active*** - the Frame Relay service informs the remote DLCI that it is okay to send user data to this interface.<br><br>***notApplicable*** - the DLCI is switched, so this attribute is ignored. |

| | |
|---|---|
| Values | inactive<br>active<br>notApplicable |
| Default | inactive |

### ATTRIBUTE FrNni Dlci aBitReasonFromIf (abrfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the reason (if any) for an ***inactive*** status to be sent to the subnet. This reason is ***notApplicable*** for an ***active*** status. |
| Values | notApplicable<br>remoteUserSignaled<br>localLmiError<br>localLinkDown<br>missingFromLmiReport |
| Default | notApplicable |

### ATTRIBUTE FrNni Dlci loopbackState

| | |
|---|---|
| Access | Read only |
| Description | This attribute has the value ***on*** when the DLCI is in loopback mode and ***off*** otherwise. The loopback command verbs *start* and *stop* are used to initiate and terminate the loopback mode for a DLCI. While *loopbackState* is ***on***, the local LMI will report to the interface the A-bit status as active. Also an active A-bit signal will be reliably propagated across the subnet to the remote DLCI. |
| Values | off<br>on |
| Default | off |

### GROUP FrNni Dlci ServiceParametersOp (SpOp)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines the service and traffic parameters specific to this instance of DLCI. In the case of permanent (PVC and P-SPVC) DLCIs, the values of attributes with the exception of the |

*measurementInterval* reflect the provisioning under the *FrNni Dlci Sp* component. In the case of switched (SVC and S-SPVC) DLCIs, the values of attributes reflect the service parameter negotiations between what is provisioned under the *FrNni Sig* component and the signaled parameters.

### ATTRIBUTE FrNni Dlci maximumFrameSize (n203)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification. |
| Values | Decimal (1..8187) |
| Units | octets |
| Default | No default |

### ATTRIBUTE FrNni Dlci committedInformationRate (cir)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the committed information rate (CIR) in bits per second (bit/s). When *rateEnforcement* is set to ***on***, *cir* is the rate at which the network agrees to transfer information under normal conditions. This rate is measured over a measurement interval (*t*) that is determined internally based on CIR and the committed burst size (Bc). An exception to this occurs when CIR is provisioned to be zero, in which case the measurement interval (*t*) must be provisioned explicitly.<br><br>This attribute should be ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..2048000) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrNni Dlci committedBurstSize (bc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc.<br><br>This attribute should be ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..2048000) |
| Units | bits |
| Default | No default |

### ATTRIBUTE FrNni Dlci excessBurstSize (be)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here.<br><br>This attribute should be ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..2048000) |
| Units | bits |
| Default | No default |

### ATTRIBUTE FrNni Dlci measurementInterval (t)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured.<br><br>This attribute should be ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..4294967295) |
| Units | msec |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrNni Dlci accounting (ac)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***accountingOn*** bit and at least one of the ***accountCollection*** bits in the ***DataNetworkAddress*** component must be set to on. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE FrNni Dlci emissionPriorityToIf (epToIf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the emission priority of frames sent to the interface. A larger value denotes a higher priority. |
| Values | Decimal (0; 1; 2; 3) |
| Default | No default |

### ATTRIBUTE FrNni Dlci transferPriorityToNetwork (tpToNwk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the priority at which data is transferred to the network.<br><br>The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 indices from 0 to 15.<br><br>Each transfer priority n, where n specifies the transfer priority index, contains a default setting for routing class of service (***multimedia***, ***delay***, or ***throughput***) and frame relay egress queue |

(depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.

Values Decimal (0..15)

Default No default

### ATTRIBUTE FrNni Dlci transferPriorityFromNetwork (tpFromNwk)

Access Read only

Description This attribute indicates the priority at which data is transferred from
the network.

The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 indices from 0 to 15.

Each transfer priority n, where n specifies the transfer priority index, contains a default setting for routing class of service (***multimedia***, ***delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.

Values Decimal (0..15)

Default No default

### ATTRIBUTE FrNni Dlci correlationTag (ctag)

Access Read only

| | |
|---|---|
| Description | This attribute indicates the unique string which identifies this connection. The value of this attribute is provisioned under the *correlationTag* attribute under *Service Parameters* subcomponent. If required for correlation purposes, the attribute is provisioned with the same value at both endpoints of the connection.<br><br>An empty string value for this attribute indicates that the user either does not want to use the correlation tag functionality, or wants the correlation tag string to be an empty string.<br><br>This attribute can be used for off-switch data correlation purposes. Downstream processing uses this attribute to correlate data records (accounting etc.) issued at different nodes in the network. In accounting, the value of this attribute appears as the *circuitId* (circuit identifier) for the endpoint.<br><br>There is no system-generated value for the correlationTag. Therefore, this attribute does not appear for SVC DLCIs. |
| Values | String (0..32, ASCII) |
| Default | "" |

### GROUP FrNni Dlci Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the Frame Relay Data Link Connection Identifier.<br><br>When the DLCI is in local loopback mode, the DLCI statistics do not increment. |

### ATTRIBUTE FrNni Dlci frmToIf (fti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent out the interface. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci fecnFrmToIf (fecnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci becnFrmToIf (becnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci bciToSubnet (bcits)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent into the local network with the Backward Congestion Indication (BCI) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci deFrmToIf (deti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discCongestedToIf (discardcti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the interface. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discDeCongestedToIf (discarddecti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion in the direction toward the interface. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci frmFromIf (ffi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface. It includes the frames that are discarded due to error or excess. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci fecnFrmFromIf (fecnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrNni Dlci becnFrmFromIf (becnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci fciFromSubnet (fcifs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the network with the Forward Congestion Indication (FCI) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci bciFromSubnet (bcifsb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the network with the Backward Congestion Indication (BCI) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci deFrmFromIf (defi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrNni Dlci excessFrmFromIf (excess)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discExcessFromIf (discardefi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames which were discarded due to rate enforcement. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discFrameAbit (discfab)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay Service, due to an inactive PVC status, in the direction toward the local network. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discCongestedFromIf (discardcfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the network. When this count reaches maximum, it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discDeCongestedFromIf (discarddecfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion, in the direction toward the local network. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci errorShortFrmFromIf (shortfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received with 0 octets in the information field. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci errorLongFrmFromIf (longfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received with number of octets in the information field greater than the subscribed maximum. When the count reaches maximum it wraps to zero. Frames whose lengths are greater than the hardware receive buffer are ignored by the hardware and are therefore not included in this count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci becnFrmSetByService (becnset)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames with BECN set by the Frame Relay service. It is incremented whenever the Frame Relay service sets BECN on a frame upon detecting local congestion. This count is incremented regardless of whether the frame already bears a set BECN bit since its use is to determine the place of congestion. When the count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci bytesToIf (bti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent out the interface. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci deBytesToIf (debti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent to the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discCongestedToIfBytes (discardctib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the link. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discDeCongestedToIfBytes (discarddectib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the link. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci bytesFromIf (bfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received from the interface. Bytes that are discarded due to error or excess are not counted. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci deBytesFromIf (debi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci excessBytesFromIf (excessb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrNni Dlci discExcessFromIfBytes (discardebi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes which were discarded due to rate enforcement. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discByteAbit (discbab)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes which were discarded due to aBit turned off. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discCongestedFromIfBytes (discardcbib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the network. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discDeCongestedFromIfBytes (discarddecbib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the network. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrNni Dlci errorShortBytesFromIf (shortbi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received with 0 octets in the information field. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci errorLongBytesFromIf (longbi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received with number of octets in the information field greater than the subscribed maximum. When the count reaches maximum it wraps to zero. Bytes whose lengths are greater than the hardware receive buffer are ignored by the hardware and are therefore not included in this count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci rateAdaptReduct (rar)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of rate reductions due to rate adaptation. Rate adaptation causes the allowed rate to be reduced in steps. After each reduction, a period of time is awaited before further action is taken. At the end of this period, the allowed rate is further reduced if congestion is still prevalent. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci rateAdaptReductPeriod (rarp)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute provides a cumulative count of the amount of time that rate adaptation procedures have been in effect. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE FrNni Dlci cirPresent

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the actual Committed Information Rate (CIR) enforced for this DLCI. This number is in units of 800 bits/sec, since that is the internal resolution of Passport rate enforcement. If *rateEnforcement* is **off**, then this number does not have meaning. Normally, this attribute matches the provisioned CIR for the DLCI. But when Rate Adaptation is active, then this number will vary to represent the actual Allowed CIR at the moment that this attribute is collected. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE FrNni Dlci eirPresent

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the actual Excess Information Rate (EIR) enforced for this DLCI. This number is in units of 800 bits/sec, since that is the internal resolution of Passport rate enforcement. If *rateEnforcement* is **off**, then this number does not have meaning. Normally, this attribute matches the provisioned EIR for the DLCI. But when Rate Adaptation is active, then this number will vary to represent the actual Allowed EIR at the moment that this attribute is collected. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Units | bit/s |
| Default | 0 |

### GROUP FrNni Dlci IntervalData (Int)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the Frame Relay Data Link Connection Identifier interval data (accounting data). |

### ATTRIBUTE FrNni Dlci startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. A new interval period is started each time an accounting record is generated. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrNni Dlci totalIngressBytes (tib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total bytes received from the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrNni Dlci totalEgressBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total bytes sent to the interface since the start of the interval period. The start of the interval period is |

captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values Long Integer

Default No default

### ATTRIBUTE FrNni Dlci eirIngressBytes

Access Read only

Description This attribute counts the total bytes with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values Long Integer

Default No default

### ATTRIBUTE FrNni Dlci eirEgressBytes

Access Read only

Description This attribute counts the total bytes with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values Long Integer

Default No default

### ATTRIBUTE FrNni Dlci discardedBytes

Access Read only

Description This attribute counts the total bytes in invalid frames received from the interface and discarded at the DLCI since the start of the interval period. This count is a sum of octets in frames discarded due to the number of octets in the information field greater than the subscribed maximum or equal to 0, due to aBit turned off, or due to rate enforcement. The start of the interval period is

captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values: Long Integer

Default: No default

### ATTRIBUTE FrNni Dlci totalIngressSegFrm

Access: Read only

Description: If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the total number of segments in frames received from the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the total number of frames received from the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrNni Dlci totalEgressSegFrm

Access: Read only

Description: If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the total number of segments in frames sent to the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the total number of frames sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrNni Dlci eirIngressSegFrm

| | |
|---|---|
| Access | Read only |
| Description | If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in frames with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci eirEgressSegFrm

| | |
|---|---|
| Access | Read only |
| Description | If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in frames with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci discardedSegFrm

| | |
|---|---|
| Access | Read only |
| Description | If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in invalid frames received from the interface and |

discarded at the DLCI. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of invalid frames received from the interface and discarded at the DLCI. Segments of frames are counted since the start of the interval period. The count is reset to zero when an accounting record is generated. The count is a sum of segments in frames or frames discarded due to the number of octets in the information field greater than the subscribed maximum or equal to 0, due to aBit turned off, or due to rate enforcement.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrNni Dlci localRateAdaptOccurred

Access: Read only

Description: This attribute indicates whether rate adaptation has occurred on this user Data Link Connection on this Frame Relay interface. The value is set to ***no*** when an accounting record is generated.

Values: yes
no

Default: no

### ATTRIBUTE FrNni Dlci elapsedDifference

Access: Read only

Description: This attribute indicates the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since the call started.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrNni Dlci callRefNumber

Access: Read only

Description: This attribute indicates the call reference number which is a unique number generated by the switch. The same Call Reference Number is stored in the interval data (accounting record) at both

ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the connection.

Values: Decimal (0..4294967295)

Default: 0

### GROUP FrNni Dlci CallData (CallId)

Properties: Operational

Description: This group of attributes describes the characteristics of the call such as call type and call state.

### ATTRIBUTE FrNni Dlci callType (ct)

Access: Read only

Description: This attribute indicates whether this DLCI is a permanent virtual circuit (PVC), a switched virtual circuit (SVC), or a switched permanent virtual circuit (SPVC).

Values:
pvc
svc
spvc

Default: No default

### ATTRIBUTE FrNni Dlci callState

Access: Read only

Description: This attribute indicates the FRF.10 state of a switched call. The value of this attribute for a permanent (PVC and P-SPVC) DLCI is always ***notApplicable***. In the description that follows, “calling STE” refers to the network who has initiated the SETUP request, and “called STE” refers to the network that receives the request.

State description:
In the ***null*** state, the network has neither received nor sent call setup requests for this DLCI.

In the ***callInitiated*** state, the called STE has received a SETUP message from the calling STE.

In the ***callProceedingSent*** state, the called STE has sent a CALL PROCEEDING message to the calling STE in response to the SETUP message.

In the ***callPresent*** state, the calling STE has sent a SETUP message to the called STE but has not received a response.

In the ***callProceedingReceived*** state, the calling STE has received a CALL PROCEEDING message from the called STE in response to a SETUP message.

In the ***active*** state, either the called STE has sent a CONNECT message to the calling STE, or the calling STE has received a CONNECT from the called STE.

In the ***releaseRequest*** state, the STE has sent a RELEASE message to release the call and is waiting for a RELEASE COMPLETE message.

In the ***releaseIndication*** state, the STE has received a RELEASE and sends a RELEASE COMPLETE message after releasing the relevant call resources.

In the ***restartRequest*** state, the STE has sent a RESTART request to the other STE and is waiting for an acknowledgement.

In the ***restart*** state, the STE has received a request for a restart from the other STE and this STE has not returned an acknowledgement.

Values

null
callInitiated
callProceedingSent
callPresent
callProceedingReceived
active
releaseRequest
releaseIndication
restartRequest
restart
notApplicable

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrNni Dlci callReference (callref)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the FRF.10 call reference number associated with this DLCI. The value of this attribute for a provisioned (PVC or P-SPVC) DLCI is always ***0***. |
| Values | Decimal (0..32767) |
| Default | No default |

### COMPONENT FrNni Dlci DirectCall (Dc)

| | |
|---|---|
| Groups | "GROUP FrNni Dlci Dc Options" |
| Scope | Application |
| Description | *FrUni/n Dlci/n DirectCall*<br>*FrNni/n Dlci/n DirectCall*<br>This component defines direct call options for calls issued without operator intervention. Connection is complete and can be initiated automatically. Frequency of connection tries is controlled by retry timer.<br><br>If no BnxProtocol component is provisioned under a FrUni or FrNni, a DirectCall component is automatically added to all the Dlci components added to the FrUni or FrNni.<br><br>If a BnxProtocol component is provisioned under a FrUni or FrNni, no DirectCall is automatically added under the Dlci component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrNni Dlci Dc Options

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group defines attributes associated with a direct call. It defines connection in terms of path and call option parameters. This connection can be permanent (PVC), switched (SVC), or switched permanent (SPVC). It can have four facilities:<br>- CCITT Facilities<br>- DTE Facilities<br>- National Facilities<br>- International Facilities<br>The total number of bytes of facilities including the facility codes and all of the facility data from all of the four classes of facilities must not exceed 512 bytes. |

### ATTRIBUTE FrNni Dlci Dc remoteNpi (rnpi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Numbering Plan Indicator (NPI) of the *remoteDna.* |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE FrNni Dlci Dc remoteDna (rdna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Data Network Address (DNA) of the service at the remote end of the DLCI. This is the called (destination) DCE address (DNA) of this PVC. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Dc remoteDlci (rdlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the remote DLCI of the PVC connection. |
| Values | Decimal (16..1007) |
| Default | No default |

## ATTRIBUTE FrNni Dlci Dc type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of VC call. |

If the value is set to ***permanentMaster,*** then a permanent connection will be established between two ends. The remote end must be defined as a ***permanentSlave, permanentBackupSlave,*** or ***permanentSlaveWithBackup***. The connection cannot be established if the remote end is defined as anything else. The end defined as ***permanentMaster*** always initiates the calls. It attempts to call once per minute.

If the value is set to ***permanentSlave*** then a permanent connection will be established between two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote end is defined as anything else. The ***permanentSlave*** end attempts to call once per minute.

If the value is set to ***permanentSlaveWithBackup*** then a permanent connection will be established between the two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote interface is defined as anything else. The ***permanentSlaveWithBackup*** attempts to call once per minute. When *type* is set to ***permanentSlaveWithBackup,*** the connection is cleared if the interface becomes unavailable. This enables a retry of the connection which can be redirected to the ***permanentBackupSlave***.

If the value is set to ***permanentBackupSlave*** then a permanent connection is established between the two ends only if the ***permanentMaster*** end is disconnected from the ***permanentSlaveWithBackup*** end and a backup call is established by the call redirection system. If the ***permanentSlaveWithBackup*** interface becomes available again, the ***permanentBackupSlave*** end is disconnected and the ***permanentSlaveWithBackup*** end is reconnected to the ***permanentMaster*** end. The ***permanentBackupSlave*** end does

not try to establish a call.

Values
permanentMaster (master)
permanentSlave (slave)
permanentBackupSlave (backSl)
permanentSlaveWithBackup (slavWB)
spvcMaster (spvcM)
spvcSlave (spvcS)
spvcBackupSlave (spvcBackS)
spvcSlaveWithBackup (spvcSWBack)

Default
permanentMaster

### ATTRIBUTE FrNni Dlci Dc transferPriority (tp)

Access
Read and write

Description
This attribute specifies the transfer priority to the local network for the outgoing calls using this particular DLCI. It overrides the *defaultTransferPriority* provisioned in its associated *Dna* component.

The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Each transfer priority n, where n is the transfer priority index, has a default setting for routing class of service (multimedia, delay, or throughput) and Frame Relay egress queue (depending on the number of supported egress queues on the remote end interface). These settings are specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned under the *Mod Frs DprsNet Tpm/n* component.

Specifying ***useDnaDefTP*** means using the value given by *defaultTransferPriority* in the associated *Dna* for this DLCI.

Values
0
1
2

3
4
5
6
7
8
9
10
11
12
13
14
15
useDnaDefTP

Default useDnaDefTP

### ATTRIBUTE FrNni Dlci Dc discardPriority (dp)

Access Read and write

Description This attribute specifies the discard priority for outgoing call using this DLCI.

The discard priority has three provisioning values: ***normal***, ***high***, and ***useDnaDefPriority***. Under congestion conditions, traffic with ***normal*** priority is discarded before traffic with ***high*** priority. The *Dna* default value (provisioned by *outDefaultPriority*) is taken if this attribute is set to the value ***useDnaDefPriority***.

Values normal
high
useDnaDefPriority

Default useDnaDefPriority

### ATTRIBUTE FrNni Dlci Dc deDiscardPriority (ddp)

Access Read and write

Description This attribute specifies whether the *discardPriority* applies to DE frames for this DLCI.

When set to ***determinedByDiscardPriority***, traffic with DE bit set

will be discarded according to the setting of the *discardPriority.*

When set to ***lowest***, all traffic with DE bit set is treated the same and is sent to the subnet at the lowest discard priority.

Values: lowest
determinedByDiscardPriority

Default: determinedByDiscardPriority

## ATTRIBUTE FrNni Dlci Dc dataPath (dpa)

Access: Read and write

Description: This attribute specifies the data path to be used by Virtual Circuits on this interface. The value of the *dataPath* attribute in the *Dna* component is overridden by this attribute if the value is not ***useDnaValue***.

This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.

The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.

A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value.

***dprsOnly*** - The dynamic packet routing system is used.

***dprsMcsOnly*** - The DPRS Multi-Service Cut-Through Switching path is used.

***dprsMcsFirst*** - The DPRS Multi-Service Cut-Through Switching path is used if it is available. If it is not available, ***dprsOnly*** is used.

***useDnaValue*** - The routing system used is based on the value provisioned in the *Dna* component.

| | |
|---|---|
| Values | dprsOnly (dpOnly)<br>dprsMcsOnly (mcOnly)<br>dprsMcsFirst (mcFrst)<br>useDnaValue (dnaVal) |
| Default | useDnaValue |

### ATTRIBUTE FrNni Dlci Dc cugIndex (ci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the CUG index which is to be signaled in PVC and SPVC call requests to the remote end.<br><br>The type of CUG signaling is defined in attribute *cugType* in this component. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci Dc cugType (ct)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of CUG signaling to be used in PVC and SPVC call requests. Index of CUG to be used is defined in attribute *cugIndex* in this component.<br><br>Possible values are:<br>***cug*** **-** signal CUG<br>***cugOa*** **-** signal CUG with outgoing access<br>***doNotSignal*** **-** no CUG in call request |
| Values | cug<br>cugOa<br>doNotSignal |
| Default | doNotSignal |

### ATTRIBUTE FrNni Dlci Dc mapIpCosToFrQos (mapctof)

| | |
|---|---|
| Access | Read and write |

Description

This attribute specifies whether an IP TOS value is mapped to an FR QOS. The mapping used is provisioned in the *Mod Frs IpCosToFrQos* component.

When this attribute is set to ***yes***, at Frame Relay egress, the IP TOS byte in each frame is checked. The TOS value determines the egress emission queue and the discard priority for that frame.

When this attribute is set to ***no***, FR QOS is determined by the provisioned discard priority and transfer priority.

When this attribute is set to ***protocolDependent*** at Frame Relay egress, the IP version field in each frame is checked. If the IP version is IP version Four, the TOS value determines the egress emission queue and the discard priority for that frame. If not, the FR QOS is determined by the provisioned discard priority and transfer priority.

A semantic check error is generated when this attribute is set to either ***yes*** or ***protocolDependent***, and a *FrUni DirectConnection* component is provisioned under the same *FrUni* component.

Values

no
yes
protocolDependent

Default

no

## VERB Ping FrNni Dlci Vc

Impact: Passive

Description: *Ping [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] FrUni/<n> Dlci/<n> Vc*

*Ping* causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the *ping* query packet will be the same as that of the Frame Relay data except at the source and destination module. The *ping* packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the *roundTripDelay* option is specified, the command reports the time taken to reach the destination and back. For the *roundTripDelay* option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the *ping* packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The *ping* command supports the following options:

*-roundTripDelay (-rtd):* If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

*-sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is

less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

### GROUP FrNni Dlci Vc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application. |

### ATTRIBUTE FrNni Dlci Vc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***. |
| Values | pvc<br>svc<br>spvc<br>frf10spvc |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***. |

| | |
|---|---|
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc callingNpi

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc fastSelectCall

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc segmentSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum packet size allowed on the *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc rcosToNetwork (rcosto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the routing metric routing class of service to<br>the network. |
| Values | throughput<br>delay<br>multimedia |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc rcosFromNetwork (rcosfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the routing metric Routing Class of Service from the Network. |
| Values | throughput<br>delay<br>multimedia |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc emissionPriorityToNetwork (epto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority to the<br>network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc emissionPriorityFromNetwork (epfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority from the network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc dataPath (dapa)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value.<br><br>If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system)<br><br>If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed. |

If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed.

Values: String (0..32, ASCII)

Default: No default

### ATTRIBUTE FrNni Dlci Vc dprsMcsEndPoint (dmep)

Access: Read only

Description: This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components.

If the connection is using ***dprsOnly*** data path, this attribute is empty.

If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint.

List of: The name of the component

Default: No default

### GROUP FrNni Dlci Vc IntervalData (Intd)

Properties: Operational

Description: This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.

### ATTRIBUTE FrNni Dlci Vc elapsedTimeTillNow

Access: Read only

Description: This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.

Values: Decimal (0..16777215)

Default: No default

### ATTRIBUTE FrNni Dlci Vc segmentsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc segmentsSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. |

| | |
|---|---|
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc callReferenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrNni Dlci Vc FrameRelayData (Frd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines Frame Relay attributes collected by Frame Relay *Vc*.<br>The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.<br>Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.<br>Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers |

### ATTRIBUTE FrNni Dlci Vc frmCongestedToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc cannotForwardToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc notDataXferToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc outOfRangeFrmFromSubnet

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc combErrorsFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc* |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc duplicatesFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc notDataXferFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery. |

| | |
|---|---|
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc frmLossTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc ooSeqByteCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc peakOoSeqPktCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc sendSequenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame. |
| Values | Decimal (0..1048575) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc pktRetryTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc subnetRecoveries

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of successful *Vc* recovery attempts. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc ooSeqPktCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Vc peakOoSeqByteCount

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the frame relay peak byte count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..50000) |
| Default | No default |

## COMPONENT FrNni Dlci ServiceParametersProv (Sp)

| | |
|---|---|
| Groups | "GROUP FrNni Dlci Sp ServiceParametersProv (Parms)" |
| Scope | Application |
| Description | *FrNni/n Dlci/n ServiceParametersProv*<br>This component contains the provisionable traffic control attributes for its parent *Dlci* component. |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrNni Dlci Sp ServiceParametersProv (Parms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the Data Link Connection Identifier. These attributes reflect the service parameters specific to this instance of DLCI . The congestion control attributes in this group are defined in T1.606 Addendum 1. |

## ATTRIBUTE FrNni Dlci Sp maximumFrameSize (n203)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification. |
| Values | Decimal (1..8187) |

| | |
|---|---|
| Units | octets |
| Default | 2100 |

### ATTRIBUTE FrNni Dlci Sp rateEnforcement (re)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether rate enforcement is in effect for this user Data Link Connection on this Frame Relay interface. Turning on rate enforcement means that CIR and DE=1 traffic will be measured and enforced. Turning off rate enforcement means that all frames from the user will be accepted and no modifications to the frame with respect to the DE bit will be made. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE FrNni Dlci Sp committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed information rate (CIR) in bits per second (bit/s). When *rateEnforcement* is set to ***on***, *cir* is the rate at which the network agrees to transfer information under normal conditions. This rate is measured over a measurement interval (*t*) that is determined internally based on CIR and the committed burst size (Bc). An exception to this occurs when CIR is provisioned to be zero, in which case the measurement interval (*t*) must be provisioned explicitly.<br><br>This attribute is ignored when *rateEnforcement* is ***off***. If *rateEnforcement* is ***on*** and this attribute is ***0***, *Bc* must also be ***0***. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE FrNni Dlci Sp committedBurstSize (bc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc.<br><br>This attribute is ignored when *rateEnforcement* is ***off***. If *rateEnforcement* is ***on*** and this attribute is ***0***, *cir* must also be ***0***. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 64000 |

### ATTRIBUTE FrNni Dlci Sp excessBurstSize (be)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here.<br><br>CIR, Bc, and Be cannot all be zero when rateEnforcement is on. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE FrNni Dlci Sp measurementInterval (t)

| | |
|---|---|
| Access | Read and write |
| Description | When *cir* and *bc* are zero and *rateEnforcement* is on, this attribute must be provisioned to specify the time interval (in milliseconds) over which rates and burst sizes are measured.<br><br>When *cir* and *bc* are non-zero, the time interval is internally calculated and is *not shown*. In that situation, this field is ignored, |

and is not representative of the time interval.

This attribute is ignored when *rateEnforcement* is ***off***, or when *cir* and *bc* are ***non-zero***. If *rateEnforcement* is ***on*** and both *cir* and *bc* are ***zero***, this field must be ***non-zero***.

Values: Decimal (0..25500)

Units: msec

Default: 0

### ATTRIBUTE FrNni Dlci Sp rateAdaptation (ra)

Access: Read and write

Description: This attribute specifies whether rate adaptation is in effect for this user Data Link Connection on this Frame Relay interface. Rate adaptation is a feature that, in periods of congestion, adapts the rate at which the user is allowed to send data into the network to that which the network is able to handle at that time. This pro-active measure of handling congestion optimizes network resources by causing the ingress to discard frames that would otherwise be discarded in the network.

If this attribute is set to ***on***, then, at the onset of congestion, the excess information rate (EIR) is reduced to a very low rate. If congestion persists, then the allowed CIR is reduced geometrically by 25% of the current value at that time. The minimum to which CIR can be reduced is 1/16th (6.25%) of the provisioned value. As congestion alleviates, CIR is increased linearly by 6.25% of the provisioned value specified in *committedInformationRate*.

If set to ***eirOnly***, then rate adaptation will only apply to the excess information rate (EIR). At the onset of congestion, the allowed EIR is reduced by 25% of its provisioned value. If congestion persists, EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR.

If set to ***cirProportionate***, then rate adaptation will also only apply to the excess information rate (EIR). At the onset of

congestion the initial allowed EIR is set to a multiple of the provisioned CIR. If congestion persists, the allowed EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. Note that the allowed EIR may be set higher than the provisioned EIR, since it is calculated initially using another parameter, the provisioned CIR. If the allowed EIR at the moment is higher than the provisioned EIR, then the provisioned EIR is used instead.

This attribute can only be set to ***on eirOnly*** or ***cirProportionate*** if *rateEnforcement* is turned ***on***.

This attribute must be set to ***off*** if the *BnxIwf* component is provisioned under this *Dlci*.

Values
off
on
eirOnly
cirProportionate

Default
off

## ATTRIBUTE FrNni Dlci Sp accounting (ac)

Access
Read and write

Description
This attribute specifies whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***accountingOn*** bit and at least one of the ***accountCollection*** bits in the ***DataNetworkAddress*** component must be set to on.

Values
off
on

Default
on

## ATTRIBUTE FrNni Dlci Sp raSensitivity (rasens)

Access
Read and write

Description
This attribute specifies the sensitivity of the rate adaptation system. A higher number indicates a higher sensitivity and

therefore a quicker reaction time to network conditions. A quicker reaction time allows the network to discard frames at the access and protect network resources, but can lead to false alarms and a greater fluctuation of the allowed rate. A higher setting therefore tends to favour the protection of the network over the allowed throughput of the user.

A lower number indicates a lower sensitivity and therefore a slower reaction to network conditions. A slower reaction time results in a greater amount of user traffic allowed into the network, but can lead to a waste of network bandwidth since the traffic may be discarded at the congested resource. A lower setting therefore tends to favour the allowed throughput of the user over the protection of the network.

This attribute is applicable for adapting EIR when *rateAdaptation* is ***eirOnly*** or ***cirProportionate***, or CIR when *rateAdaptation* is ***on***.

This attribute is ignored if *rateAdaptation* is turned ***off***.

Values — Decimal (1..20)

Default — 7

### ATTRIBUTE FrNni Dlci Sp updateBCI (updBCI)

Access — Read and write

Description — This attribute specifies whether internal Backward Congestion Indication (BCI) bits will report congestion external to the Passport network, as communicated through incoming BECN bits.

If *updateBCI* is set to ***on***, then BCI bits for incoming frames will be set if the BECN on the frame is set. If *updatBCI* is set to ***off***, then incoming BECN bits will have no effect.

Setting *updateBCI* ***on*** for a DLCI means that the remote end of the DLCI, which is specified by the *remotedna* and *remotedlci* attributes of the *dc* component of the *dlci*, may perform Rate Adaptation using the flow of incoming BECN bits, in addition to

internal Passport congestion management systems.

If the *rateAdaptation* attribute of the remote dlci is provisioned as ***eirOnly***, ***cirProportionate***, or ***on***, then congestion from another network connected to a Passport network may trigger dynamic congestion management. If the *rateAdaptation* attribute of the remote dlci is provisioned to ***off***, then the setting of *updateBCI* attribute here will have no effect.

Values
off
on

Default
off

## ATTRIBUTE FrNni Dlci Sp correlationTag (ctag)

Access
Read and write

Description
This attribute specifies the unique string which identifies each end of a connection.

If required for correlation purposes, the attribute must be provisioned with the same value at both ends of the connection. This attribute can be left as an empty string when the functionality is not required, or when the user requires an empty circuit identifier string against the DLCI.

This attribute can be used for off-switch data correlation purposes. Downstream processing uses this attribute to correlate data records (accounting etc.) issued at different nodes in the network. In the accounting record, the value for the *correlationTag* attribute appears as the attribute *circuitId* (circuit identifier) for the endpoint.

Values
String (0..32, ASCII)

Default
""

## COMPONENT FrNni Dlci LoopBack (Lb)

Groups
"GROUP FrNni Dlci Lb Statistics (Stats)"

Scope
Application

| | |
|---|---|
| Description | *FrUni/n Dlci/n LoopBackFrNni/n Dlci/n LoopBack*This component is the data loopback tool for the parent *DLCI*. |

## GROUP FrNni Dlci EgressSp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for this component. |

## ATTRIBUTE FrNni Dlci EgressSp committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed information rate (CIR) for the egress direction. It is used for Call Admission Control (CAC) at the egress link.<br>If the value is set to ***sameAsSp***, the value of this attribute is the same as the *committedInformationRate* attribute under the *ServiceParameters* component. |
| Values | Decimal (0..50000000)<br>sameAsServiceParameters (sameAsSp) |
| Units | bit/s |
| Default | sameAsServiceParameters |

## ATTRIBUTE FrNni Dlci EgressSp committedBurstSize (bc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed burst size (Bc) for the egress direction. It is used for performing Call Admission Control (CAC) at the egress link.<br>If the value is set to ***sameAsSp***, the value of this attribute is the same as the *committedBurstSize* attribute under the *ServiceParameters* component. |

| | |
|---|---|
| Values | Decimal (0..50000000)<br>sameAsServiceParameters (sameAsSp) |
| Units | bits |
| Default | sameAsServiceParameters |

### ATTRIBUTE FrNni Dlci EgressSp excessBurstSize (be)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the excess burst size (Be) for the egress direction. It is used for Call Admission Control (CAC) function towards the egress link.<br>If the value is set to ***sameAsSp***, the value of this attribute is the same as the *excessBurstSize* attribute under the *ServiceParameters* component. |
| Values | Decimal (0..50000000)<br>sameAsServiceParameters (sameAsSp) |
| Units | bits |
| Default | sameAsServiceParameters |

### ATTRIBUTE FrNni Dlci EgressSp measurementInterval (t)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval over which rates and burst sizes are measured in the egress direction. It is used for bandwidth reservation for Call Admission Control (CAC) towards the egress link.<br>If the value is set to ***sameAsSp***, the value of this attribute is the same as the *measurementInterval* attribute under the *ServiceParameters* component. |
| Values | Decimal (0..25500)<br>sameAsServiceParameters (sameAsSp) |
| Units | msec |
| Default | sameAsServiceParameters |

## COMPONENT FrNni Dlci BnxInterworkingFunction (BnxIwf)

Groups
"GROUP FrNni Dlci BnxIwf Provisioned (Prov)"
"GROUP FrNni Dlci BnxIwf Operational (Op)"

Scope
Application

Description
*FrUni/n Dlci/n BnxInterworkingFunction*
*FrNni/n Dlci/n BnxInterworkingFunction*
This component specifies that the parent DLCI uses BNX frame relay over an IP network as its networking mechanism. It contains the networking parameters specific to BNX networking.

## VERB Redirect FrNni Dlci BnxIwf

Impact
Service

Description
*Redirect [-**force**] -**destination**(<**destination**>) FrUni/n Dlci/n BnxInterworkingFunction*
or
*Redirect [-**force**] -**destination**(<**destination**>) FrNni/n Dlci/n BnxInterworkingFunction*

This verb is used to manually select the PVC destination between the primary and backup destinations, or to enable the automatic redirection. The primary destination and the backup destination are specified by the *BnxInterworkingFunction* component.

The ***-destination*** option indicates the destination of PVC redirection. The value of this option can be ***primary***, ***backup,*** or ***onDemand***.

The value ***primary*** means that the destination for this PVC has been manually selected to be the primary destination, automatic redirection is disabled. This redirect action corresponds to the “Redirect to Primary” redirect action in the BNX

implementation.

The value ***backup*** means that the destination for this PVC has been manually selected to be the backup destination, and automatic redirection is disabled. The backup destination must be provisioned. This redirect action corresponds to the “Redirect to Backup” redirect action in the BNX implementation.

The value ***onDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The *crossNetListenEnabled* attribute of the *BnxProtocol* component must be ***yes*** and the backup destination must be provisioned. This redirect action corresponds to the “Switch on Demand” redirect action in the BNX implementation.

The ***-force*** option specifies that the PVC is redirected to either the primary destination or the backup destination indicated by the ***-destination*** option even if the destination is not active. When the value of ***-destination*** is ***onDemand***, this option is ignored.

## GROUP FrNni Dlci Bnxlwf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the provisioning attributes associated with a PVC using BNX frame relay interworking. |

## ATTRIBUTE FrNni Dlci Bnxlwf calledIpAddress (cia)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address of the primary destination which receives the datagrams. |
| Values | IP address |
| Default | 0.0.0.0 |

## ATTRIBUTE FrNni Dlci Bnxlwf calledDlci (cdlci)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the DLCI of the primary destination which receives the datagrams. |
| Values | Decimal (16..1007) |
| Default | No default |

### ATTRIBUTE FrNni Dlci BnxIwf trafficPriority (tp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the user control on traffic priority. The value is transmitted in the traffic priority field of the BNX header. Possible values are:<br>***1*** - High Priority<br>***2*** - Normal Priority<br>***3*** - Low Priority<br>***useBpDefault*** - use the *defaultTrafficPriority* attribute value from the *BnxProtocol* component. |
| Values | 1<br>2<br>3<br>useBpDefault |
| Default | useBpDefault |

### ATTRIBUTE FrNni Dlci BnxIwf backupCalledIpAddress (bcia)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address of the backup destination which receives the datagrams. A value of ***0.0.0.0*** for this attribute and a value of ***undefined*** for the *backupCalledDlci* attribute specify that there is no backup destination. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE FrNni Dlci BnxIwf backupCalledDlci (bcdlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the DLCI of the backup destination which receives the datagrams. A value of ***undefined*** for this attribute |

and a value of ***0.0.0.0*** for the *backupCalledIpAddress* attribute specify that there is no backup destination.

Values
Decimal (16..1007)
undefined

Default
undefined

## ATTRIBUTE FrNni Dlci Bnxlwf redirectType (rtype)

Access
Read and write

Description
This attribute indicates the type of DTE notification when a PVC redirection between primary and backup destinations occurs.

***transparent*** means no notification is sent to the DTE.

***aIntrusive*** means that an asynchronous update with the A-bit not set is sent to the DTE.

***nIntrusive*** means that an asynchronous update with the N-bit set is sent to the DTE.

Values
transparent
aIntrusive
nIntrusive

Default
aIntrusive

## ATTRIBUTE FrNni Dlci Bnxlwf minActiveIntervals (mai)

Access
Read and write

Description
This attribute specifies the minimum number of consecutive time intervals for which the primary destination must be active before the PVC is redirected back to the primary destination from the backup destination in ***switchOnDemand*** mode. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***.

If the value of this attribute is ***0***, the PVC is redirected back to the primary destination as soon as an active cross-net message is received from the primary destination.

| | |
|---|---|
| Values | Decimal (0..4) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci Bnxlwf redirectAction (ra)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the redirect action for a PVC. The Redirect command can be used to override this redirect action.<br><br>***switchOnDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The *crossNetListenEnabled* attribute of the *BnxProtocol* component must be ***yes*** and the backup destination must be provisioned. This redirect action corresponds to the “Switch on Demand” redirect action in the BNX implementation.<br><br>***manualPrimary*** means that the destination for this PVC has been manually selected to be the primary destination, automatic redirection is disabled. This redirect action corresponds to the “Redirect to Primary” redirect action in the BNX implementation.<br><br>***manualBackup*** means that the destination for this PVC has been manually selected to be the backup destination, and automatic redirection is disabled. The backup destination must be provisioned. This redirect action corresponds to the “Redirect to Backup” redirect action in the BNX implementation. |
| Values | switchOnDemand<br>manualPrimary<br>manualBackup |
| Default | manualPrimary |

### GROUP FrNni Dlci Bnxlwf Operational (Op)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This attribute group contains the operational status of the BNX frame relay interworking functionality. |

### ATTRIBUTE FrNni Dlci Bnxlwf timeOfLastStateChange (tlsc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time at which the state of the DLCI last changed. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Bnxlwf crossNetSent (cnsent)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if a cross-net status message was sent to the primary destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. |
| Values | unsent<br>sent |
| Default | No default |

### ATTRIBUTE FrNni Dlci Bnxlwf crossNetStatus (cns)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the PVC when the remote end is the primary destination. If the *crossNetListenEnabled* attribute of the *BnxProtocol* component is set to ***yes***, this attribute reflects the state as reported by the remote end. If the *crossNetListenEnabled* attribute is set to ***no***, the PVC is assumed to be up and this attribute has a value of ***active***. |
| Values | inactive<br>active |
| Default | inactive |

### ATTRIBUTE FrNni Dlci Bnxlwf crossNetReceived (cnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the DLCI has received a cross-net status message from the primary destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***. |
| Values | unrecv<br>recv |
| Default | unrecv |

### ATTRIBUTE FrNni Dlci Bnxlwf crossNetErrors (cne)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many polling intervals have elapsed without receiving an error free cross-net status message from the primary destination of the PVC. Errors are generally caused by time-outs. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci Bnxlwf ipAddressMismatches (iam)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the received datagrams which were dropped because the source IP address in the IP header did not match the value of *calledIpAddress* or *backupCalledIpAddress* attribute. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci Bnxlwf lastMismatchedIpAddress (lmia)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the source IP address in the IP header of the most recently received datagram which was dropped because this IP address did not match the value of *calledIpAddress* or *backupCalledIpAddress* attribute. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE FrNni Dlci Bnxlwf backupCrossNetSent (bcnsent)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if a cross-net status message was sent to the backup destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. |
| Values | unsent<br>sent |
| Default | No default |

### ATTRIBUTE FrNni Dlci Bnxlwf backupCrossNetStatus (bcns)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the PVC when the remote end is the backup destination. If the *crossNetListenEnabled* attribute of the *BnxProtocol* component is set to ***yes***, this attribute reflects the state as reported by the remote end. If the *crossNetListenEnabled* attribute is set to ***no***, the PVC is assumed to be up and this attribute has a value of ***active***. |
| Values | inactive<br>active |
| Default | inactive |

### ATTRIBUTE FrNni Dlci Bnxlwf backupCrossNetReceived (bcnr)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates if the DLCI has received a cross-net status message from the backup destination of the PVC during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol*. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***. |
| Values | unrecv<br>recv |
| Default | unrecv |

### ATTRIBUTE FrNni Dlci Bnxlwf backupCrossNetErrors (bcne)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many polling intervals have elapsed without receiving an error free cross-net status message from the backup destination of the PVC. Errors are generally caused by time-outs. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci Bnxlwf redirectMode (rmode)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of the PVC redirection.<br><br>The value ***switchOnDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination.<br><br>The value ***manual*** means that the destination for this PVC has been manually selected and automatic redirection is disabled.<br><br>When the value is ***noBackup***, the PVC does not have a backup destination provisioned. |

| | |
|---|---|
| Values | switchOnDemand<br>manual<br>noBackup |
| Default | No default |

### ATTRIBUTE FrNni Dlci Bnxlwf currentDestination (cdest)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the current destination is the primary destination or the backup destination. |
| Values | primary<br>backup |
| Default | No default |

### ATTRIBUTE FrNni Dlci Bnxlwf remoteIpAddress (ria)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the current destination. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE FrNni Dlci Bnxlwf remoteDlci (rdlci)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the DLCI of the current destination. |
| Values | Decimal (16..1007) |
| Default | No default |

### ATTRIBUTE FrNni Dlci Bnxlwf ipFragFromSubnet (fragfs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the IP fragments received from subnet by this Dlci. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrNni Dlci Bnxlwf discardedIpFragments (discFrag)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the IP fragments that are dropped by this Dlci. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci Bnxlwf discMisorderedFrm (dmfrm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames from subnet that are dropped due to misordered fragments. A misordered fragment occurs when the offset in the IP header is not equal to the expected offset, or the timer expires before the last fragment is received. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Dlci Bnxlwf lastDroppedIpFragmentId (lastid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Id of the last misordered frame that was dropped. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT FrNni VirtualFramer (VFramer)

| | |

| Groups | "GROUP FrNni VFramer Provisioned (Prov)"<br>"GROUP FrNni VFramer OsiState (State)"<br>"GROUP FrNni VFramer Statistics (Stats)" |
| Scope | Application |

| | |
|---|---|
| Description | *FrUni/n VirtualFramer*<br>*FrDte/n VirtualFramer*<br>The *VirtualFramer* component binds two services together to provide data transfer between them. It is mutually exclusive from *Framer* component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrNni VFramer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *VirtualFramer* component. |

## ATTRIBUTE FrNni VFramer otherVirtualFramer (ovf)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the other *VirtualFramer* to which the service is linked, for example, *FrUni/n VirtualFramer*, *FrDte/n VirtualFramer*. |
| Values | Link (Service, otherVirtualFramer) |
| Default | No default |

## ATTRIBUTE FrNni VFramer logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the logical processor on which the service component will reside. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

## GROUP FrNni VFramer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE FrNni VFramer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE FrNni VFramer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrNni VFramer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP FrNni VFramer Statistics (Stats)

Properties
Operational

Description
This group contains the operational statistics data for a *VirtualFramer* component.

### ATTRIBUTE FrNni VFramer frmToOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames transmitted to the *otherVirtualFramer*. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrNni VFramer frmFromOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the *otherVirtualFramer*. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrNni VFramer octetFromOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets received from the *otherVirtualFramer*. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrNni VFramer discFrmFromOtherVFramer (discFrmFromOvf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded frames from the *otherVirtualFramer*. Incrementing of this counter indicates that some incoming traffic cannot be handled by the FP. |
| Values | Long Integer |
| Default | No default |

## COMPONENT FrNni Signaling (Sig)

| | |
|---|---|
| Groups | "GROUP FrNni Sig Prov"<br>"GROUP FrNni Sig ServiceParameters (ServParms)"<br>"GROUP FrNni Sig SystemParameters (SysParms)"<br>"GROUP FrNni Sig LapfSystemParameters (LapfSys)"<br>"GROUP FrNni Sig LastSvcClearCodes (Codes)"<br>"GROUP FrNni Sig OsiState (State)"<br>"GROUP FrNni Sig Statistics (Stats)"<br>"GROUP FrNni Sig LapfStatus"<br>"GROUP FrNni Sig LapfStatistics (LapfStats)"<br>"GROUP FrNni Sig FrsSvcAcc (Svcacc)" |
| Scope | Application |
| Description | *FrNni/n Signaling*<br>This component defines the FRF.10 and Q.922 (LAPF) parameters for Frame Relay switched virtual circuits at the Network-Network interface. This component must be provisioned for the *FrNni* interface to support switched connections. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrNni Sig Prov

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains common provisionable attributes for signaling at the interface. |

## ATTRIBUTE FrNni Sig dlciAllocation

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the order in which DLCIs are dynamically allocated for SVCs. The purpose of this attribute is to prevent DLCI collisions between SVCs initiated by two FrNni interfaces |

talking to each other. This is achieved by provisioning a different value for this attribute at each end of the NNI link.

A value of ***fromLowEnd*** specifies that the DLCI number assignment for SVC connections is initiated from the lowest value of the range (that is, *highestPvcDlci*+1 up to 1007).

A value of ***fromHighEnd*** specifies that the DLCI number assignment for SVC connections is initiated from the highest value of the range (that is, 1007 down to *highestPvcDlci*+1).

Values: fromLowEnd
fromHighEnd

Default: fromLowEnd

### ATTRIBUTE FrNni Sig highestPvcDlci

Access: Read and write

Criticality: Process

Description: This attribute specifies the highest DLCI value that can be provisioned for a permanent connection. It partitions the DLCI space into permanent and switched connections. Permanent DLCI numbers higher than this value cannot be provisioned. The value ***0*** is used to indicate that no permanent connections are allowed on this interface. The value ***1007*** indicates that no switched connections are allowed on this interface.

Values: Decimal (0; 16..1007)

Default: 500

### GROUP FrNni Sig ServiceParameters (ServParms)

Properties: Provisioned

Description: This group contains the provisionable service parameters.

### ATTRIBUTE FrNni Sig maximumFrameSize (dn1)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the maximum number of octets that may be included in the information field of the user DLCI of any switched connections using this interface. Its value must not be smaller than the value of *defaultMaximumFrameSize*. |
