When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the

resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Pbg Sts Vt1dot5 DS1 Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for a component in a digital hierarchy interface.

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 rxAisAlarm (rxAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds<br>+/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** for the duration of an AIS alarm state.<br>The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 lofAlarm (lofAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (2 out of 5 framing bits in error) have been detected for 3 seconds +/- 0.5 seconds. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state<br>The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 rxRaiAlarm (rxRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds. The RAI alarm is usually an indication that the far end facility is unable to gain synchronization. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 txAisAlarm (txAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the tributary is in a locked state. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 txRaiAlarm (txRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the tributary detects a LOF alarm condition. |
| Values | on<br>off |

| | |
|---|---|
| Default | off |

### GROUP Pbg Sts Vt1dot5 DS1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common statistical data for a component in a digital hierarchy interface. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of seconds since the tributary was activated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of seconds that the tributary has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of errored seconds the tributary has counted since it was activated. An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of severely errored seconds the tributary has counted since it was activated. A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of severely errored framing seconds the tributary has counted since it was activated A severely errored framing second occurs when a second with one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of seconds that the tributary has been in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of CRC-6 errors. These will only be counted when the *lineType* is ***esf***. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frame errors. A frame error is an error in the framing bits. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Pbg Sts Vt1dot5 DS1 Channel (Chan)

| | |
|---|---|
| Instance | Decimal (0..23) |
| Groups | "GROUP Pbg Sts Vt1dot5 DS1 Chan Provisioned (Prov)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan CustomerIdentifierData (CidData)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan IfEntryProv (IfEntry)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan OperationalStatus (OperStatus)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan OsiState (State)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan Operational (Oper)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan AdminInfo (AdminInfo)" |
| Scope | Application |
| Description | *Channel*<br>The *Channel* component is configured to control a group of timeslots that form a fractional group on a DS1 or E1 port. Cell-based cards allow only one channel per port, and this is |

automatically provisioned with all available timeslots. Similarly, the ***1pDS3C*** card type only allows one channel per port, and this is automatically provisioned with all available timeslots.

Opt. Subcomp. "COMPONENT Pbg Sts Vt1dot5 DS1 Chan AtmCell (Cell)"

## GROUP Pbg Sts Vt1dot5 DS1 Chan Provisioned (Prov)

Properties Provisioned

Description This group contains all of the provisional data for a *Channel* component.

## ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan timeslots (ts)

Access Read and write

Criticality Component

Description This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component.

For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.

| | |
|---|---|
| Set of | none<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15<br>16<br>17<br>18<br>19<br>20<br>21<br>22<br>23<br>24<br>25<br>26<br>27<br>28<br>29<br>30<br>31 |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan timeslotDataRate (dataRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.<br><br>When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.<br><br>When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.<br><br>On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.<br><br>One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes. |
| Values | 56k<br>doNotOverride |
| Default | doNotOverride |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan applicationFramerName

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the link to the software stack. It defines which application is running on top of this hardware component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Pbg Sts Vt1dot5 DS1 Chan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Pbg Sts Vt1dot5 DS1 Chan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is |

| | |
|---|---|
| | not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Pbg Sts Vt1dot5 DS1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Pbg Sts Vt1dot5 DS1 Chan OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan operationalState (osiOper)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the

component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which

doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of
underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default
No default

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan standbyStatus (osiStby)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization

activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Pbg Sts Vt1dot5 DS1 Chan Operational (Oper)

Properties
Operational

Description
This group contains all of the operational data for a *Channel* component.

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan actualChannelSpeed

Access
Read only

Description
This attribute displays the measured link speed of the *Channel* component.

Values
Decimal (0..4294967295)

Units
bit/s

| | |
|---|---|
| Default | 0 |

### GROUP Pbg Sts Vt1dot5 DS1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### COMPONENT Pbg Sts Vt1dot5 DS1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Pbg Sts Vt1dot5 DS1 Chan Test OsiState (State)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan Test Setup (Setup)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Pbg Sts Vt1dot5 DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Pbg Sts Vt1dot5 DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Pbg Sts Vt1dot5 DS1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Pbg Sts Vt1dot5 DS1 Chan Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. |

***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

## ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Pbg Sts Vt1dot5 DS1 Chan Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination: |

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

| | |
|---|---|
| Default | 0.00 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Pbg Sts Vt1dot5 DS1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Pbg Sts Vt1dot5 DS1 Chan Cell Provisioned (Prov)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan Cell Operational (Oper)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Pbg Sts Vt1dot5 DS1 Chan Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are |

corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values: off
on

Default: off

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell clearDelay (clear)

Access: Read and write

Description: This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell hecSampleInterval (hSample)

Access: Read and write

Description: This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the

| | |
|---|---|
| | *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell hecErrorLimit (hLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..250000) |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell lcdStateDelay (delay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* |

| | |
|---|---|
| | or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..50) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

### GROUP Pbg Sts Vt1dot5 DS1 Chan Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.<br>In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.<br>For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.<br>If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle<br>The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.<br>The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked. |
| Values | on<br>off |
| Default | off |

## GROUP Pbg Sts Vt1dot5 DS1 Chan Cell Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell uncorrectableHeaderErrors (ucErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.<br><br>Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |

Default 0

## COMPONENT Pbg Sts Vt1dot5 DS1 Chan TrunkConditioning (Tc)

Groups "GROUP Pbg Sts Vt1dot5 DS1 Chan Tc Provisioned (Prov)"
"GROUP Pbg Sts Vt1dot5 DS1 Chan Tc Operational (Op)"

Scope Device

Description *Lp/n Ds1/n Chan/n Tc*
*Lp/n E1/n Chan/n Tc*
*Lp/n Ds3/n Ds1/n Chan/n Tc*
*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*
*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*
*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*
*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the

following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

## GROUP Pbg Sts Vt1dot5 DS1 Chan Tc Provisioned (Prov)

Properties: Provisioned

Description: This group contains all specific provisioning data for a *Tc* component.

## ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc replacementData (data)

Access: Read and write

Description: This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.

The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:
DS1 MUX Out Of Service Code = 0x1A
E1 MUX Out Of Service Code = 0xFF

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.

On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***.

Values: Hex (H.0..H.ff)

| | |
|---|---|
| Units | Hex |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc signalOneDuration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.<br><br>If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.<br><br>The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc noServiceResponse (resp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:<br><br>***autoConfigure*** - automatically configure the channels response.<br>***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.<br>***ais*** - transmit AIS in the egress direction.<br>***noResponse*** - no response is sent in the egress direction.<br><br>A value of ***autoConfigure*** will result in TC being transmitted for all card types. |

| | |
|---|---|
| Values | autoConfigure<br>tc<br>ais<br>noResponse |
| Default | autoConfigure |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc signalOne (sigOne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc signalTwo (sigTwo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |

| | |
|---|---|
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### GROUP Pbg Sts Vt1dot5 DS1 Chan Tc Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all specific operational data for a *Tc* component. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc ingressConditioning (inCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the ATM network.<br><br>When trunk conditioning is being locally generated towards the ATM network, *ingressConditioning* is set to ***on.***<br><br>When trunk conditioning is not being locally generated towards the ATM network, *ingressConditioning* is set to ***off***.<br><br>Trunk conditioning is transmitted towards the ATM network under the following conditions:<br>lossOfSignal (LOS)<br>lossOfFrame (LOF)<br>remoteAlarmIndication (RAI)<br>alarmIndicationSignal (AIS)<br>bufferUnderflow (BU)<br>and in addition for E1:<br>lossOfMultiframe (LOMF)<br>receiveMultiframeRemoteAlarmIndication (RMRAI) |

| | |
|---|---|
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc egressConditioning (egCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the PDH line.<br><br>When trunk conditioning is being locally generated towards the PDH line, *egressConditioning* is set to ***on.***<br><br>When trunk conditioning is not being locally generated towards the PDH line, *egressConditioning* is set to ***off***.<br><br>Trunk conditioning is transmitted towards the PDH line under the following conditions:<br>bufferUnderflow (BU)<br>AAL1 protocol errors. |
| Values | off<br>on |
| Default | off |

### COMPONENT Pbg Sts Vt1dot5 DS1 Test (Test)

| | |
|---|---|
| Groups | "GROUP Pbg Sts Vt1dot5 DS1 Test OsiState (State)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Test Setup (Setup)"<br>"GROUP Pbg Sts Vt1dot5 DS1 Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Pbg Sts Vt1dot5 DS1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Pbg Sts Vt1dot5 DS1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Pbg Sts Vt1dot5 DS1 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Pbg Sts Vt1dot5 DS1 Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection |

(B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test frmPatternType (fpt)

Access
Read and write

| | |
|---|---|
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Pbg Sts Vt1dot5 DS1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started. |

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values

testTimeExpired
stoppedByOperator
unknown

| | |
|---|---|
| | neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

# COMPONENT PseudoBridge (PB)

| | |
|---|---|
| Groups | "GROUP PB IfEntryProv (IfEntry)"<br>"GROUP PB MediaProv (Mp)"<br>"GROUP PB Operational (Oper)"<br>"GROUP PB OsiState (State)"<br>"GROUP PB OperationalStatus (OperStatus)" |
| Scope | Application |
| Description | *PseudoBridge*<br>The PseudoBridge component represents one PseudoBridge application. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP PB IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

## ATTRIBUTE PB ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is |

| | |
|---|---|
| | not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE PB ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP PB MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the media base component. |

### ATTRIBUTE PB linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

## GROUP PB Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the operational attibutes which are specific to the PseudoBridge component. |

## ATTRIBUTE PB macAddress (addr)

| | |
|---|---|
| Access | Read only |
| Description | The medium access controller (MAC) address is an address that is only recognized by one station on the attached bus. This address is automatically assigned by the system. |
| Values | String (6, Hex) |
| Default | No default |

## GROUP PB OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE PB adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it |

is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE PB operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE PB usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

| | |
|---|---|
| | The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP PB OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE PB snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## GROUP PcGtl Nse Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute to link the Network Service Entity (NSE) in the *PcGprsTransportLayer (PcGtl)* with the corresponding NSE provisioned in the |

*PacketControlUnitSupportNode (Pcusn).*

### ATTRIBUTE PcGtl Nse linkToMasterNse (lTonse)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the corresponding *Pcusn Nse* component which provides common parameters to all instances of this Network<br>Service Entity (NSE). |
| Values | Link (Service, linkToSlaveNse) |
| Default | No default |

### GROUP PcGtl Nse Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational information of the Network Service Entity (NSE). |

### ATTRIBUTE PcGtl Nse octetsToSgsn (octsTxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets sent to the Serving GPRS Support Node (SGSN) by all the Network Service Virtual Connections (NS-VCs) served by that Network Service Entity (NSE). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse octetsFromSgsn (octsRxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets received from the Serving GPRS Support Node's (SGSN) Network Service Virtual Connections |

(NS-VCs) served by the peer Network Service Entity (NSE). The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS PcGprsTransportLayer NetworkServiceEntity

Description The statistics record generated by the PcGprsTransportLayer NetworkServiceEntity component.

### ATTRIBUTE PcGtl Nse octetsToSgsn (octsTxSgsn)

Description This attribute counts the octets sent to the Serving GPRS Support Node (SGSN) by all the Network Service Virtual Connections (NS-VCs) served by this Network Service Entity (NSE). This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE PcGtl Nse octetsFromSgsn (octsRxSgsn)

Description This attribute counts the octets received from the Serving GPRS Support Node's (SGSN) Network Service Virtual Connections (NS-VCs) served by the peer Network Service Entity (NSE). This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

"GROUP PcGtl Nse Nsvc Statistics (Stats)"

## "COLLECTED STATS PcGprsTransportLayer NetworkServiceEntity NetworkServiceVirtualConnection"

Scope Application

Description *PcGtl/n Nse/<nsei> Nsvc/<nsvci>*

This component represents the Network Service Virtual Connection (NS-VC) functionality of the Network Service (NS) protocol layer. Each instance provides a virtual connection between the NS peer entities. An NS-VC is unique across all instances of this Network Service Entity Identifier (NSEI).

An NS-VC is associated with a single Frame Relay Data Link Connection Identifier (DLCI). The Frame Relay port and the NS-VC must be located on the same Logical Processor.

## GROUP PcGtl Nse Nsvc Provisioned (Prov)

Properties Provisioned

Description This group contains provisionable attributes to associate a Network Service Virtual Connection (NS-VC) with a Frame Relay Data Link Connection Identifier (DLCI). The FR interface is provided by the *FrAtm* component which must be provisioned on the same Logical Processor as this NS-VC.

## ATTRIBUTE PcGtl Nse Nsvc localFrAddress (frAddr)

Access Read: All
Write: All

Criticality Component

Description This attribute specifies the local Frame Relay address (native E.164, native x.121) to be used for this connection. This is the address defined at the peer *FrAtm/n Address* component. The peer *FrAtm* component must be provisioned on the same Logical Processor as this Network Service Virtual Connection (NS-VC).

| | |
|---|---|
| Values | String (1..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc localFrDlci (frDlci)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the local Frame Relay connection identifier. This identifier is a Frame Relay Data Link Connection Identifier (DLCI) logical channel number. There must be a matching DLCI value at the peer *FrAtm* component. The combination of FrAtm and DLCI value must be unique across all instances of NS-VC for this NSEI. |
| Values | Decimal (16..1007) |
| Default | No default |

### GROUP PcGtl Nse Nsvc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Network Service Virtual Connection (NS-VC) operational information. |

### ATTRIBUTE PcGtl Nse Nsvc state (st)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the Network Service Virtual Connection (NS-VC).<br>***idle -*** This is the initial state of the NS-VC upon activation.<br>***unBlocked -*** Indicates that this NS-VC is unblocked and is now available for traffic.<br>***localInitiatedBlocked -*** This state indicates that the NS-VC is blocked by a locally initiated Block Request. NS-UNITDATA Protocol Data Units (PDUs) received in this state are discarded.<br>***netInitiatedBlocked -*** This state indicates that this NS-VC has been blocked by the remote node. NS-UNITDATA PDUs received in this state are discarded. |

***dead*** **-** This state indicates that the NS-VC is unavailable. This can be because the Frame Relay (FR) link is dead or if an operator locks the Data Link Connection Identifier (DLCI).

Values
idle
unBlocked
localInitiatedBlocked
netInitiatedBlocked
dead

Default
No default

## GROUP PcGtl Nse Nsvc Statistics (Stats)

Properties
Operational

Description
This group contains the Network Service Virtual Connection (NS-VC) statistical information.

## ATTRIBUTE PcGtl Nse Nsvc blocksFromSgsn (blksRxSgsn)

Access
Read: All
Write: Illegal

Description
This attribute counts the NS-BLOCK requests received from the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value.

Values

| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc aliveAcksToSgsn (aliveAcksTxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-ALIVE ACK Protocol Data Units (PDUs) encoded to be sent to the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc resetsFromSgsn (rstsRxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-RESET requests received from the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc resetsToSgsn (rstsTxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-RESET Protocol Data Units (PDUs) encoded to be sent to the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc resetAcksFromSgsn (rstAcksRxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-RESET ACKs received from the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc resetAcksToSgsn (rstAcksTxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-RESET ACK Protocol Data Units (PDUs) encoded to be sent to the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc statusFromSgsn (statusRxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-STATUS PDUs received from the Serving GPRS Support Node (SGSN). The SGSN sends an NS-STATUS PDU when it receives an invalid packet or a packet that has undergone corruption over the Gb interface in the SGSN-PCU direction.<br>The counter to zero wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc statusToSgsn (statusTxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-STATUS PDUs sent to the Serving GPRS Support Node (SGSN). The Packet Control Unit (PCU) sends an NS-STATUS PDU when it receives an invalid packet or a packet that has undergone corruption over the Gb interface in the PCU-SGSN direction.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc statusIndications (statusInds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-STATUS Indications formatted by the Network Service (NS) for this Network Service Virtual Connection (NS-VC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc fecnBitSet (fecnBit)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the frames received from the network that contain the Forward Explicit Congestion Notification (FECN) bit set to 1. Setting of the FECN bit to 1 indicates that frames received from the network can experience congestion. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc becnBitSet (becnBit)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the frames received from the network that contain the Backward Explicit Congestion Notification (BECN) bit set to 1. Setting of the BECN bit to 1 indicates that frames transmitted to the network may experience congestion. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc octetsFromSgsn (octsRxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets the Network Service Virtual Connection (NS-VC) has processed that were received from the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE PcGtl Nse Nsvc octetsToSgsn (octsTxSgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets the Network Service Virtual Connection (NS-VC) has processed that were received from the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS PcGprsTransportLayer NetworkServiceEntity NetworkServiceVirtualConnection

Description — The statistics record generated by the PcGprsTransportLayer NetworkServiceEntity NetworkServiceVirtualConnection component.

### ATTRIBUTE PcGtl Nse Nsvc unitDatasFromSgsn (unitDataRxSgsn)

Description — This attribute counts the NS-UNITDATA Protocol Data Units (PDUs) received from the Serving GPRS Support Node (SGSN) in the collection interval.

Values — Decimal (0..4294967295)

### ATTRIBUTE PcGtl Nse Nsvc unitDatasToSgsn (unitDataTxSgsn)

Description — This attribute counts the NS-UNITDATA Protocol Data Units (PDUs) encoded to be sent to the Serving GPRS Support Node (SGSN) in the collection interval.

Values — Decimal (0..4294967295)

### ATTRIBUTE PcGtl Nse Nsvc octetsFromSgsn (octsRxSgsn)

Description — This attribute counts the octets the Network Service Virtual Connection (NS-VC) has processed that were received from the Serving GPRS Support Node (SGSN) in the collection interval.

Values — Decimal (0..4294967295)

### ATTRIBUTE PcGtl Nse Nsvc octetsToSgsn (octsTxSgsn)

Description — This attribute counts the octets the Network Service Virtual Connection (NS-VC) has processed that were sent to the Serving GPRS Support Node (SGSN) in the collection interval.

Values — Decimal (0..4294967295)

### COMPONENT PcGtl Nse Nsvc AtmConnection (AtmCon)

Groups — "GROUP PcGtl Nse Nsvc AtmCon Operational (Oper)"

Scope — Device

| | |
|---|---|
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

## GROUP PcGtl Nse Nsvc AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

## ATTRIBUTE PcGtl Nse Nsvc AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

# COMPONENT PCUSupportApplication (Pcusa)

| | |
|---|---|
| Instance | Decimal (0..15999) |
| Groups | "GROUP Pcusa Provisioned (Prov)"<br>"GROUP Pcusa OsiState (State)" |
| Scope | Device |
| Description | *PCUSupportApplication/n*<br>This component represents all Packet Control Unit (PCU) for a single Packet Control Unit Services Processor (PCUSP) LP. As such, there is one *Pcusa* per PCUSP FP. Each *Pcusa* can have up to 12 *Connection* subcomponents. |
| Opt. Subcomp. | "COMPONENT Pcusa Connection (Conn)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Pcusa Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioning data for the *Pcusa* component. |

### ATTRIBUTE Pcusa linkToServer (l2s)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies a hardware link to a *Pcusp* component on a Packet Control Unit Services Processor FP and defines the LP on which the service will run. |
| Values | Link (Hardware, linkToApplication) |
| Default | No default |

### GROUP Pcusa OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Pcusa adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Pcusa operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Pcusa usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## COMPONENT Pcusa Connection (Conn)

| | |
|---|---|
| Instance | Decimal (0..256) |
| Groups | "GROUP Pcusa Conn CustomerIdentifierData (CidData)"<br>"GROUP Pcusa Conn Provisioned (Prov)"<br>"GROUP Pcusa Conn OsiState (State)" |
| Scope | Device |
| Description | *Pcusa/n Connection/n*<br>This component represents a PCUSA connection which corresponds to a group of channels representing all the PCM links on one Base Station Controller (BSC). This component is linked to an *NSE* component, which provides transport to the Frame Relay network. The *Conn* instance value is the BSC identifier. Each *Conn* must have between 1 and 12 *PcmLink* subcomponents. |
| Opt. Subcomp. | "COMPONENT Pcusa Conn PcmLink (PcmLk)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## VERB RESET Pcusa Conn

| | |
|---|---|
| Impact | Service |
| Description | *Reset conn/n*<br>The *Reset* verb is used to reset CAS operational counters under a *Connection*. |

## GROUP Pcusa Conn CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Pcusa Conn customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Pcusa Conn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioning data for the *Connection*. |

### ATTRIBUTE Pcusa Conn linkToNse (l2nse)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies a link to an *NSE* component, which provides transport to the Frame Relay network. |

| | |
|---|---|
| Values | Link (Service, linkToPcuConn) |
| Default | No default |

### GROUP Pcusa Conn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Pcusa Conn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Pcusa Conn operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Pcusa Conn usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## COMPONENT Pcusa Conn PcmLink (PcmLk)

| | |
|---|---|
| Instance | Decimal (0..167) |
| Groups | "GROUP Pcusa Conn PcmLk Provisioned (Prov)"<br>"GROUP Pcusa Conn PcmLk OsiState (State)"<br>"GROUP Pcusa Conn PcmLk Operational (Oper)"<br>"GROUP Pcusa Conn PcmLk RelayStatistics (RelStats)"<br>"GROUP Pcusa Conn PcmLk PcmLkPcu (PcuOper)" |

"COLLECTED STATS PCUSupportApplication Connection PcmLink"

| | |
|---|---|
| Scope | Device |
| Description | *Pcusa/n Conn/n PcmLink/n*<br>This component represents one PCM link and must be linked to a DS1 or E1 channel. |
| Subcomponents | "COMPONENT Pcusa Conn PcmLk LapdSignaling (LapdSig)" |
| Dyn. Subcomp. | "COMPONENT Pcusa Conn PcmLk Cell (Cell)"<br>"COMPONENT Pcusa Conn PcmLk BssgpVirtualConnection (Bvc)"<br>"COMPONENT Pcusa Conn PcmLk CgiCell (CgiCell)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Pcusa Conn PcmLk Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioning data for the PCM link. |

## ATTRIBUTE Pcusa Conn PcmLk interfaceName (ifName)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies a service link to a *Chan* component located on the TDM card. |

| | |
|---|---|
| Values | Link (Service, applicationFramerName) |
| Default | No default |

### GROUP Pcusa Conn PcmLk OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Pcusa Conn PcmLk adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Pcusa Conn PcmLk operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Pcusa Conn PcmLk usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Pcusa Conn PcmLk Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains status information about the PCM link coming from PCUSA. |

## ATTRIBUTE Pcusa Conn PcmLk processingBlockNumber (pBNum)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processing block which has been assigned to support this PCM link. |
| Values | The name of the component |
| Default | No default |

## ATTRIBUTE Pcusa Conn PcmLk failureCause (failCause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cause for the PCM link's failure.<br>The failure cause messages are:<br>***serviceChanNotReady*** - the TDM LP is down, or waiting for the *Chan* to establish communication.<br>***operatorLock*** - this failure message occurs when a dependent component is locked by the operator.<br>***internalError*** - an internal error, which cannot be determined has occurred.<br>***outOfResource*** - an SPM could not be allocated to handle the requested capacity.<br>***processingResourceNotReady*** - the allocated SPM is under reset or provisioning.<br>***none*** - no failure. |
| Values | none<br>serviceChanNotReady<br>operatorLock<br>internalError<br>outOfResource<br>processingResourceNotReady |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk pcuRole (role)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the role of the PCM link on the Gb interface.<br>***master*** - the PCM link manages the BVCI 0.<br>***slave*** - the PCM link does not manage the BVCI 0. |
| Values | master<br>slave |
| Default | No default |

### GROUP Pcusa Conn PcmLk RelayStatistics (RelStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data that pertains to information on the Frame Relay side. |

### ATTRIBUTE Pcusa Conn PcmLk pduDn (pduDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the BSSGP PDUs received from the SGSN by all the BVCs associated to this PCM link.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk pduUp (pduUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the BSSGP PDUs transmitted to the SGSN by all the BVCs associated to this PCM link.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk octetsDn (octDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets received by all the BVCs associated to this PCM link.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk octetsUp (octUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets sent by all the BVCs associated to this PCM link.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk bvcsBlocked (bvcB)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the BVCs that are currently in blocked state. |
| Values | Decimal (0..120) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk bvcsUnBlocked (bvcUB)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the BVCs that are currently in unblocked state. |
| Values | Decimal (0..120) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk totalBvcs (totbvc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the BVCs that currently exist within an NSE. |
| Values | Decimal (0..120) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk psPaging (psPag)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the BSSGP PAGING PS PDUs received from the SGSN by this PCM link.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk csPaging (csPag)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the BSSGP PAGING CS PDUs received from the SGSN by this PCM link.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk dyAgprsLackOfTimeslots (dyAgprsLTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that the PCU has not been able to satisfy the request sent by the most loaded cell that appears to have a lack of resource.<br><br>The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk PcmLkPcu (PcuOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains status information about the PCM link coming from the PCU element. |

### ATTRIBUTE Pcusa Conn PcmLk agprsVersion (agprsVer)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the AGPRS interface version requested by the BSC. When the version number is incorrect, an alarm is to be raised. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk pcuProvisioningState (pcuProvState)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the PCU element has received the provisioning information.<br>***notReceived*** - one of the provisioning messages has not been received.<br>***received*** - all the provisioning messages have been received. |
| Values | notReceived<br>received |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk pcuConfiguration (pcuConfig)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the PCU element has received the configuration message from the BSC.<br>***pcuConfigMsgReceived*** - the pcuConfig message has been received. |

***pcuConfigMsgNotReceived*** - the pcuConfig message has not been received.

Values
notReceived
received

Default
No default

### ATTRIBUTE Pcusa Conn PcmLk pcuGbState (pcuGbState)

Access
Read only

Description
This attribute indicates the transmission capability on the Gb interface for the related NSE.
***down*** - the transmission capability is null (that is, none of the related NSVCs are unblocked).
***up*** - the transmission capability is not null (that is, at least one of the related NSVCs is unblocked).
***notReceived*** - the transmission capability on the Gb interface has not been received by the PcuElement application.

Values
down
up
notReceived

Default
No default

### ATTRIBUTE Pcusa Conn PcmLk pcuSigBvcState (pcuSigBvcState)

Access
Read only

Description
This attribute indicates the state of the signalization BVC on the Gb interface.
***down*** - the BSSGP BVCI 0 procedure has not been successfully performed.
***up*** - the BSSGP BVCI 0 procedure has been successfully performed.
***notReceived*** - the BSSGP BVCI 0 procedure status has not yet been received.

Values
down
up
notReceived

Default
No default

## COLLECTED STATS PCUSupportApplication Connection PcmLink

Description The statistics record generated by the PCUSupportApplication Connection PcmLink component.

### ATTRIBUTE Pcusa Conn PcmLk pduDn (pduDn)

Description This attribute counts the BSSGP PDUs received from the SGSN by all the BVCs associated to this PCM link during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk pduUp (pduUp)

Description This attribute counts the BSSGP PDUs transmitted to the SGSN by all the BVCs associated to this PCM link during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk octetsDn (octDn)

Description This attribute counts the octets received by all the BVCs associated to this PCM link during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk octetsUp (octUp)

Description This attribute counts the octets sent by all the BVCs associated to this PCM link during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk psPaging (psPag)

Description This attribute counts the BSSGP PAGING PS PDUs received from the SGSN by this PCM link during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk csPaging (csPag)

Description: This attribute counts the BSSGP PAGING CS PDUs received from the SGSN by this PCM link during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk dyAgprsLackOfTimeslots (dyAgprsLTs)

Description: This attribute counts the number of time that the PCU has not been able to satisfy the request sent by the most loaded cell on which appears a lack of resource during the statistics collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Pcusa Conn PcmLk LapdSignaling (LapdSig)

Instance: Decimal (0..31)

Groups: "GROUP Pcusa Conn PcmLk LapdSig Operational (Oper)"
"GROUP Pcusa Conn PcmLk LapdSig Lev1ErrStatistics (L1ErrStats)"
"GROUP Pcusa Conn PcmLk LapdSig Lev2UpStatistics (L2ULStats)"
"GROUP Pcusa Conn PcmLk LapdSig Lev2DownStatistics (L2DLStats)"

#### "COLLECTED STATS PCUSupportApplication Connection PcmLink LapdSignaling"

Scope: Device

Description: *Pcusa/n Conn/n PcmLink/n LapdSignaling*
This component represents the LAPD signaling protocol on a PCM link.

### GROUP Pcusa Conn PcmLk LapdSig Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains status information about the communication link. |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig sigStatus (sigStus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the 3 LAPD SAPIs (GSL, RSL, OML) on the AGPRS interface.<br>***down*** - One of the three LAPD SAPIs is down.<br>***up*** - The three LAPD SAPIs are up. |
| Values | down<br>up |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig omlStatus (omlStus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the OML LAPD SAPI on the AGPRS interface.<br>***down*** - OML LAPD SAPI is down.<br>***up*** - OML LAPD SAPI is up. |
| Values | down<br>up |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig gslStatus (gslStus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the GSL LAPD SAPI on the AGPRS interface.<br>***down*** - GSL LAPD SAPI is down.<br>***up*** - GSL LAPD SAPI is up. |
| Values | down<br>up |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig rslStatus (rslStus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the RSL LAPD SAPI on the AGPRS interface.<br>***down*** - RSL LAPD SAPI is down.<br>***up*** - RSL LAPD SAPI is up. |
| Values | down<br>up |
| Default | No default |

### GROUP Pcusa Conn PcmLk LapdSig Lev1ErrStatistics (L1ErrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains level 1 error counts collected on LAPD signaling layer frames. |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig framesLostOverflowUp (fLovfUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the uplink frames lost due to data overrun or receive buffer overflow.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig framesLostOverflowDn (fLovfDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink frames which were not sent because of buffer overflow.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig errorsCRC (errCRC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames with CRC errors which were received.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig framesLostAlignment (fLAlign)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames lost due to abort or lack of alignment.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk LapdSig Lev2UpStatistics (L2ULStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on uplink frame types. |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig iFramesUp (iFrmUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the I frames received.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig uiFramesUp (uiFrmUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the unnumbered I frames received.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk LapdSig Lev2DownStatistics (L2DLStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on downlink transmitted frame format. |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig iFramesDn (iFrmDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the I frames transmitted.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig uiFramesDn (uiFrmDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the unnumbered I frames transmitted.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |
| Default | COLLECTED STATS PCUSupportApplication Connection PcmLink LapdSignaling |
| Description | The statistics record generated by the PCUSupportApplication Connection PcmLink LapdSignaling component. |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig framesLostOverflowUp (fLovfUp)

| | |
|---|---|
| Description | This attribute counts the uplink frames lost due to data overrun or receive buffer overflow during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig framesLostOverflowDn (fLovfDn)

| | |
|---|---|
| Description | This attribute counts the downlink frames which were not sent because of buffer overflow during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig errorsCRC (errCRC)

| | |
|---|---|
| Description | This attribute counts the frames with CRC errors which were received during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig framesLostAlignment (fLAlign)

| | |
|---|---|
| Description | This attribute counts the frames lost due to abort or lack of alignment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig iFramesUp (iFrmUp)

| | |
|---|---|
| Description | This attribute counts the I frames received during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig uiFramesUp (uiFrmUp)

| | |
|---|---|
| Description | This attribute counts the unnumbered I frames received during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig iFramesDn (iFrmDn)

| | |
|---|---|
| Description | This attribute counts the I frames transmitted during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk LapdSig uiFramesDn (uiFrmDn)

Description: This attribute counts the unnumbered I frames transmitted during the statistics collection interval.

Values: Decimal (0..4294967295)

## GROUP Pcusa Conn PcmLk Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains information about the cell. |

## ATTRIBUTE Pcusa Conn PcmLk Cell cellBVCI

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the corresponding BSSGP Virtual Channel Identifier corresponding to the cell. |
| Values | Decimal (0..65535) |
| Default | No default |

## ATTRIBUTE Pcusa Conn PcmLk Cell cellState (state)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of a GSM cell as specified by the BSC.<br>***unConfigured*** - The cell is not configured.<br>***configured*** - The message cell_config has been received from the BSC and acknowledged.<br>***availableOos*** - The message cell_available has been received from the BSC and acknowledged.<br>***inService*** - The message cell_gprs_open has been sent to the BTS, and the BTS has acknowledged the message.<br>***destroying*** - The cell object instance is being destroyed in the PCU element, and is waiting for completion of the BSSGP BVC blocking procedure. |
| Values | unConfigured<br>configured<br>availableOos<br>inService<br>destroying |
| Default | No default |

## GROUP Pcusa Conn PcmLk Cell CellIdentifierOperational (CellIdOper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains attributes used for cell‘s identification as defined in the GSM 08.18 Technical Specification. |

### ATTRIBUTE Pcusa Conn PcmLk Cell msCountryCode (mCC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mobile country code. |
| Values | Decimal (0..999) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell msNetworkCode (mNC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mobile network code. |
| Values | Decimal (0..999) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell PdchAllocStatistics (AllocStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data. |

### ATTRIBUTE Pcusa Conn PcmLk Cell upMultiSlotRequests (upMSlotReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the multislot allocation requests received by the PCU from the mobile station.<br><br>Index 1 counts the number of 1-timeslot allocation requests.<br>Index 2 counts the number of 2-timeslot allocation requests.<br>Index 3 counts the number of 3-timeslot allocation requests.<br>Index 4 counts the number of 4- or more timeslot allocation requests.<br><br>The counters wrap to zero when they exceed their maximum value. |

| Access | Read only |
| Description | This attribute counts the multislot granted allocations received by the mobile station from the PCU.<br><br>Index 1 counts the number of 1-timeslot granted allocations.<br>Index 2 counts the number of 2-timeslot granted allocations.<br>Index 3 counts the number of 3-timeslot granted allocations.<br>Index 4 counts the number of 4- or more timeslot granted allocations.<br><br>The counters wrap to zero when they exceed their maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..4) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell PdchFullDpxStatistics (FDpxStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on Packet Data Channel (PDCH) full duplex parameters. |

### ATTRIBUTE Pcusa Conn PcmLk Cell fullDuplexTbfEstablishment (fdTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many full duplex TBFs were established.<br><br>The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell currentFullDuplexTbfEstablishment (currFdTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of full duplex TBFs currently established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeDowngradedTbf (EDgrdTbf)

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the EGPRS TBFs downgraded in GPRS. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeTbfEstReq (ETbfEstReq)

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the EGPRS TBF establishment requests. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell PdchUplkStatistics (ULStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on PDCH uplink parameters. |

### ATTRIBUTE Pcusa Conn PcmLk Cell upTbfEstablishment (upTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many uplink TBFs were established.<br><br>The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell currentUpTbfEstablishment (currUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uplink TBFs currently established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell allocatedBlocksUpTbf (allBUpTbf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the blocks allocated for the uplink TBFs.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell currentAllocatedBlocksUpTbf (currAllBUpTbf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the blocks currently allocated for the uplink TBFs. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell nonAckUpTbfEstablishment (nAckUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the non-acknowledged uplink TBFs established.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell currentNonAckUpTbfEstablishment (currNAckUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current non-acknowledged uplink TBFs established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell ackUpTbfEstablishment (ackUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the acknowledged uplink TBFs established.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfReleases (dnTbfRel)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many downlink TBFs were released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeDnCumUsefulDataPerCell (EDnCumUseDt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cumulated size, in octets, of all the RLC EDGE data blocks sent for the first time on a pipe in verbose state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeDnUsefulDataDurationPerCell (EDnUseDtDur)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cumulated time, in multiple of 20ms, where the pipes for DL EGPRS TBF are in verbose state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell DynAgprsStatistics (DynAgprsStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on dynamic AGPRS parameters. |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsNbModif (dyAgprsNbMod)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of changes to allocated AGPRS timeslots in the cell. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsAvgNbTimeslots (dyAgprsAvgNbTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the average number of allocated AGPRS timeslots in the cell. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsMinNbTimeslots (dyAgprsMinNbTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum number of allocated AGPRS timeslots in the cell. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsMaxNbTimeslots (dyAgprsMaxNbTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of allocated AGPRS timeslots in the cell. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsAvgLoadCriterion (dyAgprsAvgLdCrit)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the average AGPRS load criterion value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsMaxLoadCriterion (dyAgprsMaxLdCrit)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum AGPRS load criterion value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeDynAgprsJokerCumNbTimeslot (EDyAJkCumTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cumulative number of Agprs Joker timeslots allocated to the cell by the BSC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeDynAgprsJokerMinNbTimeslot (EDyAJkMinTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum number of Agprs Joker timeslots allocated to the cell by the BSC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeDynAgprsJokerMaxNbTimeslot (EDyAJkMaxTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of Agprs Joker timeslots allocated to the cell by the BSC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeAgprsJokerNbofBlocks (EAJkNbBlks)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of TRAU EDGE data blocks sent on the Agprs Joker channels in the DL direction. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell pcuEdgeAgprsMainNbofBlocks (EAMnNbBlks)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of TRAU EDGE data blocks sent on the Agprs Main channels in the DL direction. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell QoSStatistics (QoSStats)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains statistical data collected on downlink TBFs on which a QoS parameter is attributed. |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfGoldSatisfactMore90pCent (dnTbfGSatM90)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink TBFs with golden QoS that have a satisfaction rate greater or equal to 90 per cent.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfGoldSatisfactBet5090pCent (dnTbfGSatB5090)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the multislot granted allocations received by the mobile station from the PCU during the statistics collection interval. |

| | |
|---|---|
| | Index 1 counts the number of 1- timeslot granted allocations.<br>Index 2 counts the number of 2- timeslot granted allocations.<br>Index 3 counts the number of 3- timeslot granted allocations.<br>Index 4 counts the number of 4- or more timeslot granted allocations. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..4) |

### ATTRIBUTE Pcusa Conn PcmLk Cell fullDuplexTbfEstablishment (fdTbfEst)

| | |
|---|---|
| Description | This attribute counts how many full duplex TBFs were established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell upTbfReleases (upTbfRel)

| | |
|---|---|
| Description | This attribute counts how many uplink TBFs were released during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell cumulativeTimeUpTbf (cumTimeUpTbf)

| | |
|---|---|
| Description | This attribute indicates the cumulative duration of all uplink TBFs released during the statistics collection interval. |
| Values | Decimal (0..4294967295) |
| Units | seconds |

### ATTRIBUTE Pcusa Conn PcmLk Cell allocatedBlocksUpTbf (allBUpTbf)

| | |
|---|---|
| Description | This attribute counts the blocks allocated for the uplink TBFs during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell nonAckUpTbfEstablishment (nAckUpTbfEst)

| | |
|---|---|
| Description | This attribute counts the non-acknowledged uplink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell ackUpTbfEstablishment (ackUpTbfEst)

| | |
|---|---|
| Description | This attribute counts the acknowledged uplink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell closeEndedUpTbfEstablishment (closeEndUpTbfEst)

| | |
|---|---|
| Description | This attribute counts the close-ended uplink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfReleases (dnTbfRel)

| | |
|---|---|
| Description | This attribute counts how many downlink TBFs were released during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell cumulativeTimeDnTbf (cumTimeDnTbf)

| | |
|---|---|
| Description | This attribute indicates the cumulative duration of all downlink TBFs released during the statistics collection interval. |
| Values | Decimal (0..4294967295) |
| Units | seconds |

### ATTRIBUTE Pcusa Conn PcmLk Cell nonAckDnTbfEstablishment (nAckDnTbfEst)

| | |
|---|---|
| Description | This attribute counts the non-acknowledged downlink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell ackDnTbfEstablishment (ackDnTbfEst)

| | |
|---|---|
| Description | This attribute counts the acknowledged downlink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsNbModif (dyAgprsNbMod)

| | |
|---|---|
| Description | This attribute counts the modifications of Agprs timeslots allocated in the cell during the statistics collection interval. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsAvgNbTimeslots (dyAgprsAvgNbTs)

| | |
|---|---|
| Description | This attribute indicates the average number of Agprs timeslots allocated in the cell during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsMinNbTimeslots (dyAgprsMinNbTs)

| | |
|---|---|
| Description | This attribute indicates the minimum number of Agprs timeslots allocated in the cell during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsMaxNbTimeslots (dyAgprsMaxNbTs)

| | |
|---|---|
| Description | This attribute indicates the maximum number of Agprs timeslots allocated in the cell during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsAvgLoadCriterion (dyAgprsAvgLdCrit)

| | |
|---|---|
| Description | This attribute indicates the average Agprs load criterion value during the statistics collection interval. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Pcusa Conn PcmLk Cell dyAgprsMaxLoadCriterion (dyAgprsMaxLdCrit)

| | |
|---|---|
| Description | This attribute indicates the maximum Agprs load criterion value during the statistics collection interval. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfGoldSatisfactMore90pCent (dnTbfGSatM90)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfGoldSatisfactBet5090pCent (dnTbfGSatB5090)

Description This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfGoldSatisfactLess50pCent (dnTbfGSatL50)

Description This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfGoldRejectedForMinTput (dnTbfGRejMinTput)

Description This attribute counts the downlink TBFs with gold QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfSilverSatisfactMore90pCent (dnTbfSSatM90)

Description This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfSilverSatisfactBet5090pCent (dnTbfSSatB5090)

Description This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfSilverSatisfactLess50pCent (dnTbfSSatL50)

Description This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfSilverRejectedForMinTput (dnTbfSRejMinTput)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with silver QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfBronzeSatisfactMore90pCent (dnTbfBSatM90)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfBronzeSatisfactBet5090pCent (dnTbfBSatB5090)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfBronzeSatisfactLess50pCent (dnTbfBSatL50)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell dnTbfBronzeRejectedForMinTput (dnTbfBRejMinTput)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with bronze QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

## GROUP Pcusa Conn PcmLk Cell Tdma Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes describing the time division multiple access. |

## ATTRIBUTE Pcusa Conn PcmLk Cell Tdma tdmaState (state)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of a TDMA relative to the BSC. |
| Values | unconfigured<br>configured<br>available |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuTdmaEdgeCapacity (edgeCap)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the EDGE capacity of a TDMA. |
| Values | noEdge<br>upToMCS4DlFullEdgeUl<br>fullEdge<br>upToMCS4DlUl |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell Tdma Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data. |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma localBusy (locBus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the blocks sent with the window stalled indicator set.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma remoteBusy (remBus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the blocks received with the window stalled indicator set.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell Tdma UplkStatistics (ULStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected by counters in uplink transmission mode. |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma llcPacketsUp (llcPktUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the LLC packets reassembled and transmitted to the LLC relay.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma dataBlocksUp (dataBUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the uplink RLC data blocks received.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma controlBlocksUp (ctrlBUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the uplink RLC control blocks received.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma invalidBlocksUp (invalidBUp)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the uplink invalid radio blocks received.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma invalidProtocolErrorBlocksUp (invalidProtErrBUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the uplink invalid radio blocks received with invalid RLC protocol.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma outOfSequenceBlocksUp (outOfSeqBUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the data blocks received uplink with Block Sequence Number outside the received window.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma packetAckNackUp (pktANUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the PACKET-UPLINK-ACK-NACK messages received.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma totalRetransmissionRequested (totRtxReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the RLC/MAC block retransmission requests.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuEdgeDataBlocksUp (EDtBlkUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the cumulative number of EGPRS RLC data blocks received by the PCU on this TDMA.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuEdgeUpCumMeanBep (EUpCumMnBep)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the cumulated value of the assumed BEP received by the PCU in each EGPRS RLC data block on this TDMA.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuEdgeUpNbsMeanBep (EUpNbMnBep)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the MEAN_BEP values received by the PCU in each EGPRS RLC data block on this TDMA.<br><br>The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell Tdma DownlkStatistics (DLStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected by counters in downlink transmission mode. |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma llcPacketsDn (llcPktDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the LLC packets segmented into RLC data blocks received.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma dataBlocksDn (dataBDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink RLC data blocks transmitted.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma controlBlocksDn (ctrlBDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink RLC control blocks transmitted.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma retransmittedDataBlocksDn (rtxDataBDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the data blocks retransmitted downlink.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma packetAckNackDn (pktANDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the PACKET-DOWNLINK-ACK-NACK messages transmitted.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuEdgeDataBlocksDn (EDtBlkDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the cumulative number of EGPRS RLC data blocks sent by the PCU on this TDMA.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuEdgeDnCum8PskMeanBep (EDnCum8PMnB)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the cumulative value of the 8PSK_BEP derived from the 8PSK_MEAN_BEP received from a MS in this TDMA in the EGPRS BEP Link Quality Measurements (8PSK_MEAN_BEP).<br><br>The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuEdgeDnNbs8PskMeanBep (EDnNb8PMnB)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the 8PSK_MEAN_BEP values received from a MS in this TDMA in the EGPRS BEP Link Quality Measurements (8PSK_MEAN_BEP).<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuEdgeDnCumGmskMeanBep (EDnCumGMnB)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the cumulative value of the GMSK_BEP derived from the GMSK_MEAN_BEP received from a MS in this TDMA in the EGPRS BEP Link Quality Measurements (GMSK_MEAN_BEP).<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma pcuEdgeDnNbsGmskMeanBep (EDnNbGMnB)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the GMSK_MEAN_BEP values received from a MS in this TDMA in the EGPRS BEP Link Quality Measurements (GMSK_MEAN_BEP).<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell Tdma PdchAllocationStatistics (PdchAllocStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data. |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma configuredTimeslots (cfgTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of configured timeslots. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma unavailableTimeslots (unavailTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the unavailable timeslots as signalled by the BSC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma upActiveTimeslots (upActTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of active uplink timeslots bearing at least one TBF. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma dnActiveTimeslots (dnActTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of active downlink timeslots bearing at least one TBF. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Cell Tdma ReleaseStatistics (RelStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected by release counters. |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma tbfNormalReleaseUp (tbfNormRelUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the uplink TBFs that terminated normally.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma tbfNormalReleaseDn (tbfNormRelDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink TBFs that terminated normally.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma noPacketResourceReq (noPktResReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the TBFs abnormally released due to non-receipt of Packet Resource Request.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComNN002Max (lOCNN002Max)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the TBFs abnormally released due to V(Q) non-progression.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComT3169 (lOCT3169)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the TBFs abnormally released due to T3169 timer expiry.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComNT0001 (lOCNT0001)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the TBFs abnormally released due to NT0001 timer expiry.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComT3195 (lOCT3195)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the TBFs abnormally released due to T3195 timer expiry.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComT3191 (lOCT3191)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the TBFs abnormally released due to T3191 timer expiry.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |
| Default | COLLECTED STATS PCUSupportApplication Connection PcmLink Cell Tdma |
| Description | The statistics record generated by the PCUSupportApplication Connection PcmLink Cell Tdma component. |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma localBusy (locBus)

| | |
|---|---|
| Description | This attribute counts the blocks sent with the window stalled indicator set during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma remoteBusy (remBus)

| | |
|---|---|
| Description | This attribute counts the blocks received with the window stalled indicator set during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma configuredTimeslots (cfgTs)

| | |
|---|---|
| Description | This attribute indicates the number of configured timeslots at the end of the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma cumulativeUnavailableTimeslots (cumUnavailTs)

| | |
|---|---|
| Description | This attribute indicates the cumulative number of unavailable timeslots at the sample time during the statistics collection interval.<br><br>The average can be calculated by dividing this attribute value by the *nbSamples* value. |

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma cumulativeUpActiveTimeslots (cumUpActTs)

Description This attribute indicates the cumulative number of active uplink timeslots bearing at least one TBF at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma cumulativeUpTbfPerTimeslots (cumUpTbfPerTs)

Description This attribute indicates the cumulative number of uplink TBFs per timeslots for all the timeslots in the TDMA at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma cumulativeDnActiveTimeslots (cumDnActTs)

Description This attribute indicates the cumulative number of active downlink timeslots bearing at least one TBF at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma cumulativeDnTbfPerTimeslots (cumDnTbfPerTs)

Description This attribute indicates the cumulative number of downlink TBFs per timeslots for all the timeslots in the TDMA at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma nbSamples (nbS)

Description: This attribute indicates how many samples were taken during the statistics collection interval.

This value can be used with the cumulative attribute for average calculs.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma llcPacketsUp (llcPktUp)

Description: This attribute counts the LLC packets reassembled and transmitted to the LLC relay during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma dataBlocksUp (dataBUp)

Description: This attribute counts the uplink RLC data blocks received during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma controlBlocksUp (ctrlBUp)

Description: This attribute counts the uplink RLC control blocks received during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma invalidBlocksUp (invalidBUp)

Description: This attribute counts the uplink invalid radio blocks received during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma invalidProtocolErrorBlocksUp (invalidProtErrBUp)

Description: This attribute counts the uplink invalid radio blocks received with invalid RLC protocol during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma outOfSequenceBlocksUp (outOfSeqBUp)

Description This attribute counts the data blocks received uplink with Block Sequence Number outside the received window during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma packetAckNackUp (pktANUp)

Description This attribute counts the PACKET-UPLINK-ACK-NACK messages received during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma totalRetransmissionRequested (totRtxReq)

Description This attribute counts the RLC/MAC block retransmission requests during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma cumulativeUpRxQual (cumUpRxQual)

Description This attribute indicates the cumulative uplink RxQual value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma cumulativeUpRxLev (cumUpRxLev)

Description This attribute indicates the cumulative uplink RxLev value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma nbSamplesUpQuality (nbSamplesUpQuality)

Description This attribute counts the samples for RxQual and RxLev cumulative values during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma llcPacketsDn (llcPktDn)

Description This attribute counts the LLC packets segmented into RLC data blocks received during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma dataBlocksDn (dataBDn)

Description This attribute counts the downlink RLC data blocks transmitted during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma controlBlocksDn (ctrlBDn)

Description This attribute counts the downlink RLC control blocks transmitted during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma retransmittedDataBlocksDn (rtxDataBDn)

Description This attribute counts the data blocks retransmitted downlink during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma packetAckNackDn (pktANDn)

Description This attribute counts the PACKET-DOWNLINK-ACK-NACK messages transmitted during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma cumulativeDnRxQual (cumDnRxQual)

Description This attribute indicates the cumulative downlink RxQual value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma nbSamplesDnQuality (nbSamplesDnQuality)

Description This attribute counts the samples for RxQual cumulative values during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma tbfNormalReleaseUp (tbfNormRelUp)

Description This attribute counts the uplink TBFs which terminated normally during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma tbfNormalReleaseDn (tbfNormRelDn)

Description This attribute counts the downlink TBFs which terminated normally during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma noPacketResourceReq (noPktResReq)

Description This attribute counts the TBFs abnormally released due to non receipt of Packet Resource Request during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComNN002Max (lOCNN002Max)

Description This attribute counts the TBFs abnormally released due to V(Q) non progression during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComT3169 (lOCT3169)

Description This attribute counts the TBFs abnormally released due to timer T3169 expiry during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComNT0001 (lOCNT0001)

Description This attribute counts the TBFs abnormally released due to NT0001 timer expiry during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComT3195 (lOCT3195)

Description This attribute counts the TBFs abnormally released due to T3195 timer expiry during the statistics collection interval.

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Tdma lossOfComT3191 (lOCT3191)

| | |
|---|---|
| Description | This attribute counts the TBFs abnormally released due to T3191 timer expiry during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Pcusa Conn PcmLk Cell Tdma Timeslot (Ts)

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch packetDnAssignment (pktDnAss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the PACKET-DOWNLINK-ASSIGNMENT messages generated by the PCU to the mobile station in the downlink TBF establishment.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch dnTbfPacketAccessRejectNoPdch (pktDnNoPdch)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No |

PDCH available for GPRS” in the second phase of the two-phase access downlink TBF establishment.

The counter wraps to zero when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch dnTbfPacketAccessRejectNoTs (pktDnNoTs)

Access Read only

Description This attribute counts the PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access downlink TBF establishment.

The counter wraps to zero when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch dnTbfPacketAccessRejectNoTbf (pktDnNoTbf)

Access Read only

Description This attribute counts the PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access downlink TBF establishment.

The counter wraps to zero when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default No default

Default COLLECTED STATS PCUSupportApplication Connection PcmLink Cell Ccch

Description The statistics record generated by the PCUSupportApplication Connection PcmLink Cell Ccch component.

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch upTbfImmediateAssignment (immAssUp)

Description: This attribute counts IMMEDIATE-ASSIGNMENT messages generated by the PCU to the mobile station in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch upTbfImmAssigRejectNoPdch (noPdch)

Description: This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch upTbfImmAssigRejectNoTs (noTs)

Description: This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch upTbfImmAssigRejectNoTbf (noTbf)

Description: This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch channelRequest (chanReq)

Description: This attribute counts CHANNEL-REQUEST messages received by the PCU from the mobile station in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch packetResourceRequest (pktResReq)

| | |
|---|---|
| Description | This attribute counts PACKET-RESOURCE-REQUEST messages received by the PCU from the mobile station in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch deleteIndicationUp (delIndUp)

| | |
|---|---|
| Description | This attribute counts DELETE-INDICATION messages sent by the BTSs when an IMMEDIATE-ASSIGNMENT message for uplink transfer is dropped during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch packetUpAssignment (pktUpAss)

| | |
|---|---|
| Description | This attribute counts PACKET-UPLINK-ASSIGNMENT messages generated by the PCU after a PACKET-RESOURCE-REQUEST in the second phase of the two_phase access uplink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch upTbfPacketAccessRejectNoPdch (pktNoPdch)

| | |
|---|---|
| Description | This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch upTbfPacketAccessRejectNoTs (pktNoTs)

| | |
|---|---|
| Description | This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch upTbfPacketAccessRejectNoTbf (pktUpNoTbf)

| | |
|---|---|
| Description | This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch dnTbfImmediateAssignment (immAssDn)

| | |
|---|---|
| Description | This attribute counts IMMEDIATE-ASSIGNMENT messages sent for a downlink TBF establishment from the PCU to the mobile station during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch pagingRequest (pagReq)

| | |
|---|---|
| Description | This attribute counts PAGING-REQUEST messages generated by the PCU to the mobile station during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch deleteIndicationDn (delIndDn)

| | |
|---|---|
| Description | This attribute counts DELETE-INDICATION messages sent by the BTSs when an IMMEDIATE-ASSIGNMENT message for downlink transfer is dropped during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch packetDnAssignment (pktDnAss)

| | |
|---|---|
| Description | This attribute counts PACKET-DOWNLINK-ASSIGNMENT messages generated by the PCU to the mobile station in the downlink TBF establishment phase during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch dnTbfPacketAccessRejectNoPdch (pktDnNoPdch)

| | |
|---|---|
| Description | This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch dnTbfPacketAccessRejectNoTs (pktDnNoTs)

| | |
|---|---|
| Description | This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Cell Ccch dnTbfPacketAccessRejectNoTbf (pktDnNoTbf)

| | |
|---|---|
| Description | This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Pcusa Conn PcmLk Cell MobileStation (Ms)

### "COLLECTED STATS PCUSupportApplication Connection PcmLink BssgpVirtualConnection"

| | |
|---|---|
| Scope | Device |
| Description | *Pcusa/n Conn/n PcmLink/n BssgpVirtualConnection/n*<br>This dynamic component represents a BSSGP Virtual Connection. There is one *Bvc* per *Cell*. It is identified by a *Bvc* identifier coming from the PCU when the *Cell* is created. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Pcusa Conn PcmLk Bvc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes describing *Bvc* upon receipt of a *Cell* configuration request. |

## ATTRIBUTE Pcusa Conn PcmLk Bvc bvcState (state)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the BVC state. The SGSN sends the BVC blocked and unblocked status to the PCU on the Gb interface. This attribute is set to ***blocked*** when the transmission or reception is stopped and ***unblocked*** when the transmission or reception is resumed. |
| Values | blocked<br>unblocked |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc maxBucketSize (maxBktSize)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum bucket size for the BVC. This parameter sent by the PCU is used by the BVC flow control algorithm in SGSN. |
| Values | Decimal (0..32000) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bucketLeakRate (bktLRate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum allowed BVC leak rate. The SGSN does not leak more traffic for a BVC to the PCU than is specified by this attribute. |
| Values | Decimal (0..6144) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bufferSize (buffSize)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of bytes currently buffered for a BVC. |
| Values | Decimal (0..32000) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc cell

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the cell identity number associated with this BVC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcCellLocationArea (bvcCLA)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the location area associated with the BVC and the cell. This attribute is used for paging. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcCellRoutingArea (bvcCRA)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the routing area associated with the BVC and the cell. |
| Values | Decimal (0..256) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcNumberMs (bvcNbMs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of mobiles in the cell that are currently transferring data. |
| Values | Decimal (0..960) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Bvc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected by counters. |

### ATTRIBUTE Pcusa Conn PcmLk Bvc pduDn

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the PDUs received by this BVC from the Gb interface.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc pduUp

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the PDUs sent by this BVC to the Gb interface.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc octetsDn (octDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets received by the BVC from the Gb interface.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc octetsUp (octUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets sent by the BVC to the Gb interface.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Bvc BvcUnitDataStatistics (BvcUnitDataStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected by counters. |

### ATTRIBUTE Pcusa Conn PcmLk Bvc pduDataDn

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the UNIT-DATA PDUs received by the BVC from the Gb interface.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc pduDataUp

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the UNIT-DATA PDUs sent by the BVC to the Gb interface.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc octetsDataDn

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets received by the BVC from the Gb interface in DL-UNIT-DATA PDUs.<br><br>The counter wraps to zero when it exceeds its maximum value. |

| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc octetsDataUp

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the octets sent by the BVC to the Gb interface in UL-UNIT-DATA PDUs.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc maxSizeDataDn

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the largest size of LLC frame received. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc maxSizeDataUp

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the largest size of LLC frame sent. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk Bvc BvcComSigStatistics (BvcComSigStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected by counters. |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcBlockRequests (bvcBReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the BVC-BLOCK PDU message was sent by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcUnBlockRequests (bvcUBReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the BVC-UNBLOCK PDU message was sent by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvct1TimeOuts (t1TO)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the BVC-BLOCK-ACK timer as well as BVC-UNBLOCK-ACK timer expired.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcResetRequestsUp (bvcResReqUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times a BVC-RESET PDU message was sent by a BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcResetRequestsDn (bvcResReqDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times a BVC-RESET PDU message was received by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvct2TimeOuts (t2TO)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the BVC-RESET-ACK timer expired.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcFlowControlRequests (bvcFCtrlReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the FLOW-CONTROL-BVC PDUs sent by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc msFlowControlRequests (msFCtrlReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the FLOW-CONTROL-MS PDUs sent by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc llcDiscardedPdu (llcDiscPdu)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the LLC-DISCARDED PDUs sent by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc llcDiscardedOctets (llcDiscOct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets discarded according to the LLC-DISCARDED-INDICATION message sent by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc nmStatusUp (nmStusUp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NM-STATUS PDUs sent by a BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc nmStatusDn (nmStusDn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NM-STATUS PDUs received by a BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc msFlushLLRequest (msFlushLLReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the FLUSH-LL PDUs sent from the SGSN to the PCU.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc msRadioStatusInd (msRadStusInd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the INDICATION messages when a radio exception condition occurred on the radio interface in the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc msSuspendReq (msSusReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the SUSPEND PDUs sent by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc msRaCapabilityInd (msRaCapInd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the RA-CAPABILITY PDUs received by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc msRaCapabilityUpdateReq (msRaCapUpdateReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the RA-CAPABILITY-UPDATE PDUs sent by the BVC.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvct3TimeOuts (t3TO)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the SUSPEND-ACK timer expired.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvct5TimeOuts (t5TO)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the RA-CAPABILITY-UPDATE-ACK timer expired.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk Bvc msCellTransitionDn (msCellTransDn)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the FLUSH-LL PDUs that are sent by SGSN to PCU when the Mobile Station located on a cell indicated by the BVCI has moved to another cell indicated to the new BVCI.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |
| Default | COLLECTED STATS PCUSupportApplication Connection PcmLink BssgpVirtualConnection |
| Description | The statistics record generated by the PCUSupportApplication Connection PcmLink BssgpVirtualConnection component. |

### ATTRIBUTE Pcusa Conn PcmLk Bvc cell

| | |
|---|---|
| Description | This attribute indicates the cell identity number associated to this BVC. |
| Values | Decimal (0..65535) |

### ATTRIBUTE Pcusa Conn PcmLk Bvc pduDn

| | |
|---|---|
| Description | This attribute counts the PDUs received by this BVC from the Gb interface during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Bvc pduUp

| | |
|---|---|
| Description | This attribute counts the PDUs sent by this BVC to the Gb interface during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Bvc octetsDn (octDn)

| | |
|---|---|
| Description | This attribute counts the octets received by the BVC from the Gb interface during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk Bvc octetsUp (octUp)

Description This attribute counts the octets sent by the BVC to the Gb interface during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc pduDataDn

Description This attribute counts the UNIT-DATA PDUs received by the BVC from the Gb interface during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc pduDataUp

Description This attribute counts the UNIT-DATA PDUs sent by the BVC to the Gb interface during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc octetsDataDn

Description This attribute counts the octets received by the BVC from the Gb interface in DL-UNIT-DATA PDUs during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc octetsDataUp

Description This attribute counts the octets sent by the BVC to the Gb interface in UL-UNIT-DATA PDUs during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc maxSizeDataDn

Description This attribute indicates the largest size of LLC frame received during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc maxSizeDataUp

Description This attribute indicates the biggest size of LLC frames sent during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcBlockRequests (bvcBReq)

Description This attribute counts BVC-BLOCK PDU messages sent by the BVC during the statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcUnBlockRequests (bvcUBReq)

Description This attribute counts BVC-UNBLOCK PDU messages sent by the BVC during the statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvct1TimeOuts (t1TO)

Description This attribute counts BVC-BLOCK-ACK and BVC-UNBLOCK-ACK timer expiries during the statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcResetRequestsUp (bvcResReqUp)

Description This attribute counts BVC-RESET PDU messages sent by a BVC during the statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcResetRequestsDn (bvcResReqDn)

Description This attribute counts BVC-RESET PDU messages received by the BVC during the statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvct2TimeOuts (t2TO)

Description This attribute counts BVC-RESET-ACK timer expiries during the statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvcFlowControlRequests (bvcFCtrlReq)

Description This attribute counts FLOW-CONTROL-BVC PDUs sent by the BVC during the statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Pcusa Conn PcmLk Bvc msFlowControlRequests (msFCtrlReq)

Description This attribute counts FLOW-CONTROL-MS PDUs sent by the BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc llcDiscardedPdu (llcDiscPdu)

Description This attribute counts LLC-DISCARDED PDUs sent by the BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc llcDiscardedOctets (llcDiscOct)

Description This attribute counts the octets discarded with a LLC-DISCARDED-INDICATION message sent by the BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc nmStatusUp (nmStusUp)

Description This attribute counts NM-STATUS PDUs sent by a BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc nmStatusDn (nmStusDn)

Description This attribute counts NM-STATUS PDUs received by a BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc msFlushLLRequest (msFlushLLReq)

Description This attribute counts FLUSH-LL PDUs sent from the SGSN to the PCU during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc msRadioStatusInd (msRadStusInd)

Description This attribute counts INDICATION messages reporting that a radio exception condition occurred on the radio interface in the BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc msSuspendReq (msSusReq)

Description This attribute counts SUSPEND PDUs sent by the BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc msRaCapabilityInd (msRaCapInd)

Description This attribute counts RA-CAPABILITY-INDICATION PDUs received by the BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc msRaCapabilityUpdateReq (msRaCapUpdateReq)

Description This attribute counts RA-CAPABILITY-UPDATE PDUs sent by the BVC during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvct3TimeOuts (t3TO)

Description This attribute counts SUSPEND-ACK timer expiries during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc bvct5TimeOuts (t5TO)

Description This attribute counts RA-CAPABILITY-UPDATE-ACK timer expiries during the statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk Bvc msCellTransitionDn (msCellTransDn)

Description This attribute counts FLUSH-LL PDUs sent by the SGSN to the PCU when the mobile station located on a cell indicated by the BVCI has moved to another cell indicated to the new BVCI.

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### GROUP Pcusa Conn PcmLk CgiCell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains information about the cell. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell cellBVCI

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the corresponding BSSGP Virtual Channel Identifier corresponding to the cell. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell cellState (state)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of a GSM cell as specified by the BSC.<br>***unConfigured*** - The cell is not configured.<br>***configured*** - The message cell_config has been received from the BSC and acknowledged.<br>***availableOos*** - The message cell_available has been received from the BSC and acknowledged.<br>***inService*** - The message cell_gprs_open has been sent to the BTS, and the BTS has acknowledged the message.<br>***destroying*** - The cell object instance is being destroyed in the PCU element, and is waiting for completion of the BSSGP BVC blocking procedure. |
| Values | unConfigured<br>configured<br>availableOos<br>inService<br>destroying |
| Default | No default |

### GROUP Pcusa Conn PcmLk CgiCell CellIdentifierOperational (CellIdOper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains attributes used for cell‘s identification as defined in the GSM 08.18 Technical Specification. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell msCountryCode (mCC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mobile country code. |
| Values | Decimal (0..999) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell msNetworkCode (mNC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mobile network code. |
| Values | Decimal (0..999) |
| Default | No default |

### GROUP Pcusa Conn PcmLk CgiCell PdchAllocStatistics (AllocStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell upMultiSlotRequests (upMSlotReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the multislot allocation requests received by the PCU from the mobile station.<br><br>Index 1 counts the number of 1-timeslot allocation requests.<br>Index 2 counts the number of 2-timeslot allocation requests.<br>Index 3 counts the number of 3-timeslot allocation requests.<br>Index 4 counts the number of 4- or more timeslot allocation requests. |

| | |
|---|---|
| | The counters wrap to zero when they exceed their maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..4) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell upMultiSlotAllocations (upMSlotAll)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the multislot granted allocations received by the PCU from the mobile station.<br><br>Index 1 counts the number of 1-timeslot granted allocations.<br>Index 2 counts the number of 2-timeslot granted allocations.<br>Index 3 counts the number of 3-timeslot granted allocations.<br>Index 4 counts the number of 4- or more timeslot granted allocations.<br><br>The counters wrap to zero when they exceed their maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..4) |

### GROUP Pcusa Conn PcmLk CgiCell PdchFullDpxStatistics (FDpxStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on Packet Data Channel (PDCH) full duplex parameters. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell fullDuplexTbfEstablishment (fdTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many full duplex TBFs were established.<br><br>The counter wraps to zero when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentFullDuplexTbfEstablishment (currFdTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of full duplex TBFs currently established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeDowngradedTbf (EDgrdTbf)

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the EGPRS TBFs downgraded in GPRS. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeTbfEstReq (ETbfEstReq)

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the EGPRS TBF establishment requests. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk CgiCell PdchUplkStatistics (ULStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on PDCH uplink parameters. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell upTbfEstablishment (upTbfEst)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts how many uplink TBFs were established.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentUpTbfEstablishment (currUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uplink TBFs currently established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell allocatedBlocksUpTbf (allBUpTbf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the blocks allocated for the uplink TBFs.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentAllocatedBlocksUpTbf (currAllBUpTbf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the blocks currently allocated for the uplink TBFs. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell nonAckUpTbfEstablishment (nAckUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the non-acknowledged uplink TBFs established. |

| | |
|---|---|
| | The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentNonAckUpTbfEstablishment (currNAckUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current non-acknowledged uplink TBFs established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell ackUpTbfEstablishment (ackUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the acknowledged uplink TBFs established.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentAckUpTbfEstablishment (currAckUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current acknowledged uplink TBFs established.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell upTbfReleases (upTbfRel)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts how many uplink TBFs were released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell closeEndedUpTbfEstablishment (closeEndUpTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the close-ended uplink TBFs established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeUpCumUsefulDataPerCell (EUpCumUseDt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cumulated size, in octets, of all the RLC EDGE data blocks received for the first time on a pipe in verbose state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeUpUsefulDataDurationPerCell (EUpUseDtDur)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cumulated time, in multiple of 20ms, where the pipes for UL EGPRS TBF are in verbose state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk CgiCell PdchDownlkStatistics (DLStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on PDCH downlink parameters. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfEstablishment (dnTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many downlink TBFs were established.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentDnTbfEstablishment (currDnTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current downlink TBFs established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentAllocatedBlocksDnTbf (currAllBDnTbf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the blocks currently allocated for the downlink TBFs. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell nonAckDnTbfEstablishment (nAckDnTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the non-acknowledged downlink TBFs established.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentNonAckDnTbfEstablishment (currNAckDnTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current non-acknowledged downlink TBFs established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell ackDnTbfEstablishment (ackDnTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the acknowledged downlink TBFs established.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell currentAckDnTbfEstablishment (currAckDnTbfEst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current acknowledged downlink TBFs established. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfReleases (dnTbfRel)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many downlink TBFs were released. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeDnCumUsefulDataPerCell (EDnCumUseDt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cumulated size, in octets, of all the RLC EDGE data blocks sent for the first time on a pipe in verbose state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeDnUsefulDataDurationPerCell (EDnUseDtDur)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cumulated time, in multiple of 20ms, where the pipes for DL EGPRS TBF are in verbose state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk CgiCell DynAgprsStatistics (DynAgprsStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on dynamic AGPRS parameters. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsNbModif (dyAgprsNbMod)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of changes to allocated AGPRS timeslots in the cell. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsAvgNbTimeslots (dyAgprsAvgNbTs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the average number of allocated AGPRS timeslots in the cell. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsMinNbTimeslots (dyAgprsMinNbTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum number of allocated AGPRS timeslots in the cell. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsMaxNbTimeslots (dyAgprsMaxNbTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of allocated AGPRS timeslots in the cell. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsAvgLoadCriterion (dyAgprsAvgLdCrit)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the average AGPRS load criterion value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsMaxLoadCriterion (dyAgprsMaxLdCrit)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum AGPRS load criterion value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeDynAgprsJokerCumNbTimeslot (EDyAJkCumTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cumulative number of Agprs Joker timeslots allocated to the cell by the BSC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeDynAgprsJokerMinNbTimeslot (EDyAJkMinTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum number of Agprs Joker timeslots allocated to the cell by the BSC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeDynAgprsJokerMaxNbTimeslot (EDyAJkMaxTs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of Agprs Joker timeslots allocated to the cell by the BSC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeAgprsJokerNbofBlocks (EAJkNbBlks)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of TRAU EDGE data blocks sent on the Agprs Joker channels in the DL direction. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell pcuEdgeAgprsMainNbofBlocks (EAMnNbBlks)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of TRAU EDGE data blocks sent on the Agprs Main channels in the DL direction. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Pcusa Conn PcmLk CgiCell QoSStatistics (QoSStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data collected on downlink TBFs on which a QoS parameter is attributed. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldSatisfactMore90pCent (dnTbfGSatM90)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink TBFs with golden QoS that have a satisfaction rate greater or equal to 90 per cent.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldSatisfactBet5090pCent (dnTbfGSatB5090)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink TBFs with golden QoS that have a satisfaction rate between 50 to 90 per cent.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldSatisfactLess50pCent (dnTbfGSatL50)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with golden QoS that have a satisfaction rate lower than 50 per cent.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldRejectedForMinTput (dnTbfGRejMinTput)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink TBFs with golden QoS rejected at the establishment due to non-allocation of corresponding minimum throughput.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfSilverSatisfactMore90pCent (dnTbfSSatM90)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink TBFs with silver QoS that have a satisfaction rate greater or equal to 90 per cent.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfSilverSatisfactBet5090pCent (dnTbfSSatB5090)

| | |
|---|---|
| Access | Read only |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfBronzeRejectedForMinTput (dnTbfBRejMinTput)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the downlink TBFs with bronze QoS rejected at the establishment due to non-allocation of corresponding minimum throughput.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

| | |
|---|---|
| Default | COLLECTED STATS PCUSupportApplication Connection PcmLink CgiCell |
| Description | The statistics record generated by the PCUSupportApplication Connection PcmLink CgiCell component. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell cellBVCI

| | |
|---|---|
| Description | This attribute indicates the corresponding BSSGP Virtual Channel Identifier during the statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell upMultiSlotRequests (upMSlotReq)

| | |
|---|---|
| Description | This attribute counts the multislot allocation requests received by the PCU from the mobile station during the statistics collection interval.<br><br>Index 1 counts the number of 1- timeslot allocation requests.<br>Index 2 counts the number of 2- timeslot allocation requests.<br>Index 3 counts the number of 3- timeslot allocation requests.<br>Index 4 counts the number of 4- or more timeslot allocation requests. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..4) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell upMultiSlotAllocations (upMSlotAll)

| | |
|---|---|
| Description | This attribute counts the multislot granted allocations received by the PCU from the mobile station during the statistics collection interval.<br><br>Index 1 counts the number of 1- timeslot granted allocations.<br>Index 2 counts the number of 2- timeslot granted allocations.<br>Index 3 counts the number of 3- timeslot granted allocations.<br>Index 4 counts the number of 4- or more timeslot granted allocations. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..4) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnMultiSlotRequests (dnMSlotReq)

| | |

| Description | This attribute counts the multislot allocation requests received by the mobile station from the PCU during the statistics collection interval.<br><br>Index 1 counts the number of 1- timeslot allocation requests.<br>Index 2 counts the number of 2- timeslot allocation requests.<br>Index 3 counts the number of 3- timeslot allocation requests.<br>Index 4 counts the number of 4- or more timeslot allocation requests. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..4) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnMultiSlotAllocations (dnMSlotAll)

| | |
|---|---|
| Description | This attribute counts the multislot granted allocations received by the mobile station from the PCU during the statistics collection interval.<br><br>Index 1 counts the number of 1- timeslot granted allocations.<br>Index 2 counts the number of 2- timeslot granted allocations.<br>Index 3 counts the number of 3- timeslot granted allocations.<br>Index 4 counts the number of 4- or more timeslot granted allocations. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..4) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell fullDuplexTbfEstablishment (fdTbfEst)

| | |
|---|---|
| Description | This attribute counts how many full duplex TBFs were established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell upTbfReleases (upTbfRel)

| | |
|---|---|
| Description | This attribute counts how many uplink TBFs were released during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell cumulativeTimeUpTbf (cumTimeUpTbf)

| | |
|---|---|
| Description | This attribute indicates the cumulative duration of all uplink TBFs released during the statistics collection interval. |
| Values | Decimal (0..4294967295) |
| Units | seconds |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell allocatedBlocksUpTbf (allBUpTbf)

| | |
|---|---|
| Description | This attribute counts the blocks allocated for the uplink TBFs during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell nonAckUpTbfEstablishment (nAckUpTbfEst)

| | |
|---|---|
| Description | This attribute counts the non-acknowledged uplink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell ackUpTbfEstablishment (ackUpTbfEst)

| | |
|---|---|
| Description | This attribute counts the acknowledged uplink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell closeEndedUpTbfEstablishment (closeEndUpTbfEst)

| | |
|---|---|
| Description | This attribute counts the close-ended uplink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfReleases (dnTbfRel)

| | |
|---|---|
| Description | This attribute counts how many downlink TBFs were released during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell cumulativeTimeDnTbf (cumTimeDnTbf)

| | |
|---|---|
| Description | This attribute indicates the cumulative duration of all downlink TBFs released during the statistics collection interval. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Units | seconds |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell nonAckDnTbfEstablishment (nAckDnTbfEst)

| | |
|---|---|
| Description | This attribute counts the non-acknowledged downlink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell ackDnTbfEstablishment (ackDnTbfEst)

| | |
|---|---|
| Description | This attribute counts the acknowledged downlink TBFs established during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsNbModif (dyAgprsNbMod)

| | |
|---|---|
| Description | This attribute counts the modifications of Agprs timeslots allocated in the cell during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsAvgNbTimeslots (dyAgprsAvgNbTs)

| | |
|---|---|
| Description | This attribute indicates the average number of Agprs timeslots allocated in the cell during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsMinNbTimeslots (dyAgprsMinNbTs)

| | |
|---|---|
| Description | This attribute indicates the minimum number of Agprs timeslots allocated in the cell during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsMaxNbTimeslots (dyAgprsMaxNbTs)

| | |
|---|---|
| Description | This attribute indicates the maximum number of Agprs timeslots allocated in the cell during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsAvgLoadCriterion (dyAgprsAvgLdCrit)

| | |
|---|---|
| Description | This attribute indicates the average Agprs load criterion value during the statistics collection interval. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dyAgprsMaxLoadCriterion (dyAgprsMaxLdCrit)

| | |
|---|---|
| Description | This attribute indicates the maximum Agprs load criterion value during the statistics collection interval. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldSatisfactMore90pCent (dnTbfGSatM90)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldSatisfactBet5090pCent (dnTbfGSatB5090)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldSatisfactLess50pCent (dnTbfGSatL50)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldRejectedForMinTput (dnTbfGRejMinTput)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with gold QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfSilverSatisfactMore90pCent (dnTbfSSatM90)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfSilverSatisfactBet5090pCent (dnTbfSSatB5090)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfSilverSatisfactLess50pCent (dnTbfSSatL50)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfSilverRejectedForMinTput (dnTbfSRejMinTput)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with silver QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfBronzeSatisfactMore90pCent (dnTbfBSatM90)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfBronzeSatisfactBet5090pCent (dnTbfBSatB5090)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfBronzeSatisfactLess50pCent (dnTbfBSatL50)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfBronzeRejectedForMinTput (dnTbfBRejMinTput)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs with bronze QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma lossOfComT3191 (lOCT3191)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the TBFs abnormally released due to T3191 timer expiry. |

| | |
|---|---|
| | The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |
| Default | COLLECTED STATS PCUSupportApplication Connection PcmLink CgiCell Tdma |
| Description | The statistics record generated by the PCUSupportApplication Connection PcmLink CgiCell Tdma component. |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma localBusy (locBus)

| | |
|---|---|
| Description | This attribute counts the blocks sent with the window stalled indicator set during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma remoteBusy (remBus)

| | |
|---|---|
| Description | This attribute counts the blocks received with the window stalled indicator set during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma configuredTimeslots (cfgTs)

| | |
|---|---|
| Description | This attribute indicates the number of configured timeslots at the end of the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeUnavailableTimeslots (cumUnavailTs)

| | |
|---|---|
| Description | This attribute indicates the cumulative number of unavailable timeslots at the sample time during the statistics collection interval.<br><br>The average can be calculated by dividing this attribute value by the *nbSamples* value. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeUpActiveTimeslots (cumUpActTs)

Description — This attribute indicates the cumulative number of active uplink timeslots bearing at least one TBF at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeUpTbfPerTimeslots (cumUpTbfPerTs)

Description — This attribute indicates the cumulative number of uplink TBFs per timeslots for all the timeslots in the TDMA at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeDnActiveTimeslots (cumDnActTs)

Description — This attribute indicates the cumulative number of active downlink timeslots bearing at least one TBF at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeDnTbfPerTimeslots (cumDnTbfPerTs)

Description — This attribute indicates the cumulative number of downlink TBFs per timeslots for all the timeslots in the TDMA at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma nbSamples (nbS)

Description: This attribute indicates how many samples were taken during the statistics collection interval.

This value can be used with the cumulative attribute for average calculs.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma llcPacketsUp (llcPktUp)

Description: This attribute counts the LLC packets reassembled and transmitted to the LLC relay during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma dataBlocksUp (dataBUp)

Description: This attribute counts the uplink RLC data blocks received during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma controlBlocksUp (ctrlBUp)

Description: This attribute counts the uplink RLC control blocks received during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma invalidBlocksUp (invalidBUp)

Description: This attribute counts the uplink invalid radio blocks received during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma invalidProtocolErrorBlocksUp (invalidProtErrBUp)

Description: This attribute counts the uplink invalid radio blocks received with invalid RLC protocol during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma outOfSequenceBlocksUp (outOfSeqBUp)

| | |
|---|---|
| Description | This attribute counts the data blocks received uplink with Block Sequence Number outside the received window during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma packetAckNackUp (pktANUp)

| | |
|---|---|
| Description | This attribute counts the PACKET-UPLINK-ACK-NACK messages received during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma totalRetransmissionRequested (totRtxReq)

| | |
|---|---|
| Description | This attribute counts the RLC/MAC block retransmission requests during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeUpRxQual (cumUpRxQual)

| | |
|---|---|
| Description | This attribute indicates the cumulative uplink RxQual value during the statistics collection interval.<br><br>The average can be calculated by dividing this attribute value by the *nbSamples* value. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeUpRxLev (cumUpRxLev)

| | |
|---|---|
| Description | This attribute indicates the cumulative uplink RxLev value during the statistics collection interval.<br><br>The average can be calculated by dividing this attribute value by the *nbSamples* value. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma nbSamplesUpQuality (nbSamplesUpQuality)

| | |
|---|---|
| Description | This attribute counts the samples for RxQual and RxLev cumulative values during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma llcPacketsDn (llcPktDn)

Description: This attribute counts the LLC packets segmented into RLC data blocks received during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma dataBlocksDn (dataBDn)

Description: This attribute counts the downlink RLC data blocks transmitted during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma controlBlocksDn (ctrlBDn)

Description: This attribute counts the downlink RLC control blocks transmitted during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma retransmittedDataBlocksDn (rtxDataBDn)

Description: This attribute counts the data blocks retransmitted downlink during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma packetAckNackDn (pktANDn)

Description: This attribute counts the PACKET-DOWNLINK-ACK-NACK messages transmitted during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeDnRxQual (cumDnRxQual)

Description: This attribute indicates the cumulative downlink RxQual value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma nbSamplesDnQuality (nbSamplesDnQuality)

Description: This attribute counts the samples for RxQual cumulative values during the statistics collection interval.

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma tbfNormalReleaseUp (tbfNormRelUp)

| | |
|---|---|
| Description | This attribute counts the uplink TBFs which terminated normally during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma tbfNormalReleaseDn (tbfNormRelDn)

| | |
|---|---|
| Description | This attribute counts the downlink TBFs which terminated normally during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma noPacketResourceReq (noPktResReq)

| | |
|---|---|
| Description | This attribute counts the TBFs abnormally released due to non receipt of Packet Resource Request during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma lossOfComNN002Max (lOCNN002Max)

| | |
|---|---|
| Description | This attribute counts the TBFs abnormally released due to V(Q) non progression during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma lossOfComT3169 (lOCT3169)

| | |
|---|---|
| Description | This attribute counts the TBFs abnormally released due to timer T3169 expiry during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma lossOfComNT0001 (lOCNT0001)

| | |
|---|---|
| Description | This attribute counts the TBFs abnormally released due to NT0001 timer expiry during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma lossOfComT3195 (lOCT3195)

| | |
|---|---|
| Description | This attribute counts the TBFs abnormally released due to T3195 timer expiry during the statistics collection interval. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma lossOfComT3191 (lOCT3191)

| | |
|---|---|
| Description | This attribute counts the TBFs abnormally released due to T3191 timer expiry during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Pcusa Conn PcmLk CgiCell Tdma Timeslot (Ts)

| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch packetDnAssignment (pktDnAss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the PACKET-DOWNLINK-ASSIGNMENT messages generated by the PCU to the mobile station in the downlink TBF establishment.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch dnTbfPacketAccessRejectNoPdch (pktDnNoPdch)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No |

PDCH available for GPRS” in the second phase of the two-phase access downlink TBF establishment.

The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch dnTbfPacketAccessRejectNoTs (pktDnNoTs)

Access: Read only

Description: This attribute counts the PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access downlink TBF establishment.

The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch dnTbfPacketAccessRejectNoTbf (pktDnNoTbf)

Access: Read only

Description: This attribute counts the PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access downlink TBF establishment.

The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

Default: COLLECTED STATS PCUSupportApplication Connection PcmLink CgiCell Ccch

Description: The statistics record generated by the PCUSupportApplication Connection PcmLink CgiCell Ccch component.

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch upTbfImmediateAssignment (immAssUp)

Description: This attribute counts IMMEDIATE-ASSIGNMENT messages generated by the PCU to the mobile station in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch upTbfImmAssigRejectNoPdch (noPdch)

Description: This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch upTbfImmAssigRejectNoTs (noTs)

Description: This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch upTbfImmAssigRejectNoTbf (noTbf)

Description: This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch channelRequest (chanReq)

Description: This attribute counts CHANNEL-REQUEST messages received by the PCU from the mobile station in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch packetResourceRequest (pktResReq)

Description: This attribute counts PACKET-RESOURCE-REQUEST messages received by the PCU from the mobile station in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch deleteIndicationUp (delIndUp)

Description: This attribute counts DELETE-INDICATION messages sent by the BTSs when an IMMEDIATE-ASSIGNMENT message for uplink transfer is dropped during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch packetUpAssignment (pktUpAss)

Description: This attribute counts PACKET-UPLINK-ASSIGNMENT messages generated by the PCU after a PACKET-RESOURCE-REQUEST in the second phase of the two_phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch upTbfPacketAccessRejectNoPdch (pktNoPdch)

Description: This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch upTbfPacketAccessRejectNoTs (pktNoTs)

Description: This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch upTbfPacketAccessRejectNoTbf (pktUpNoTbf)

| | |
|---|---|
| Description | This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch dnTbfImmediateAssignment (immAssDn)

| | |
|---|---|
| Description | This attribute counts IMMEDIATE-ASSIGNMENT messages sent for a downlink TBF establishment from the PCU to the mobile station during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch pagingRequest (pagReq)

| | |
|---|---|
| Description | This attribute counts PAGING-REQUEST messages generated by the PCU to the mobile station during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch deleteIndicationDn (delIndDn)

| | |
|---|---|
| Description | This attribute counts DELETE-INDICATION messages sent by the BTSs when an IMMEDIATE-ASSIGNMENT message for downlink transfer is dropped during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch packetDnAssignment (pktDnAss)

| | |
|---|---|
| Description | This attribute counts PACKET-DOWNLINK-ASSIGNMENT messages generated by the PCU to the mobile station in the downlink TBF establishment phase during the statistics collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch dnTbfPacketAccessRejectNoPdch (pktDnNoPdch)

Description: This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch dnTbfPacketAccessRejectNoTs (pktDnNoTs)

Description: This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch dnTbfPacketAccessRejectNoTbf (pktDnNoTbf)

Description: This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Pcusa Conn PcmLk CgiCell MobileStation (Ms)

Instance: Decimal (0..4294967295)

Scope: Device

Description: *Pcusa/n Conn/n PcmLink/n Cell/n MobileStation/n*
This dynamic component represents a mobile station in a *Cell*. It is used to display information on the mobile.

## GROUP Pcusn Gtl NsProv

Properties: Provisioned

Description: This group contains provisionable attributes for the Network Service (NS) protocol layer of GPRS.

## ATTRIBUTE Pcusn Gtl nsBlockTimer (tnsBlk)

Access: Read: All
Write: All

Description: This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) BLOCK and UNBLOCK procedures. This is the time interval between an NS-BLOCK and NS-BLOCK ACK, or between an NS-UNBLOCK and NS-UNBLOCK
ACK.

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification.

Values: Decimal (1..120)

Units: seconds

Default: 3

## ATTRIBUTE Pcusn Gtl nsBlockRetries (nBlk)

Access: Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies the number of times the NS-BLOCK message can be retried if NS-BLOCK ACK is not received before the *nsBlockTimer* expires. |
| Values | Decimal (0..10) |
| Default | 3 |

### ATTRIBUTE Pcusn Gtl nsUnBlockRetries (nUnBlk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times the NS-UNBLOCK message can be retried if NS-UNBLOCK ACK is not received before the *nsBlockTimer* expires. The default value is the value provided in the GPRS specification. |
| Values | Decimal (3..15) |
| Default | 3 |

### ATTRIBUTE Pcusn Gtl nsResetTimer (tnsReset)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) RESET procedure. This is the time interval between an NS-RESET and NS-RESET ACK.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification. |
| Values | Decimal (1..120) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Pcusn Gtl nsResetRetries (nReset)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the times the NS-RESET message can be retried if NS-RESET ACK is not received before the *nsResetTimer* expires. |
| Values | Decimal (3..10) |
| Default | 5 |

### ATTRIBUTE Pcusn Gtl nsTestTimer (tnsTest)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the periodicity of the Network Service Virtual Connection (NS-VC) TEST procedure which is the initiation of the NS-ALIVE Protocol Data Unit (PDU).<br>The range is the value provided in the GPRS specification. |
| Values | Decimal (1..60) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Pcusn Gtl nsAliveTimer (tnsAlive)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) ALIVE procedure. This is the time interval between an NS-ALIVE and NS-ALIVE ACK.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification. |
| Values | Decimal (1..10) |
| Units | seconds |
| Default | 3 |

## ATTRIBUTE Pcusn Gtl nsAliveRetries (nAlive)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times the NS-ALIVE message can be retried if NS-ALIVE ACK is not received before the *nsAliveTimer* expires. |
| Values | Decimal (3..10) |
| Default | 10 |

## COMPONENT Pcusn NetworkServiceEntity (Nse)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Pcusn Nse Provisioned (Prov)" |
| Scope | Application |
| Description | *Pcusn NetworkServiceEntity/<nsei>*<br><br>This component represents a Network Service Entity (NSE). Each NSE is associated with a single Packet Control Unit (PCU) and is identified by means of a Network Service Entity Identifier (NSEI). The same NSE can be provisioned in multiple PcGtl instances to<br>enable load sharing. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Pcusn Nse Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the BSS GPRS Protocol (BSSGP) layer of GPRS. |

### ATTRIBUTE Pcusn Nse linkToPcuConn (lToPcu)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a *Pcusa Connection* component that this NSE associates with. The purpose is to associate an NSE (Gb interface) with a *Connection* which groups the PCM links to a BSC (a GPRS interface). The operator will provision this link when setting up the conections through the PCUSN for the BSC to SGSN. |
| Values | Link (Service, linkToNse) |
| Default | No default |

### ATTRIBUTE Pcusn Nse bvcBlockUnblockTimer (tBlkUnblk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the blocking and unblocking procedures. The Packet Control Unit (PCU) sends a BVC-BLOCK (UNBLOCK) Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) and starts the *bvcBlockUnblockTimer*. The PCU stops the timer upon reception of a BVC-BLOCK (UNBLOCK)-ACK PDU from the SGSN. If the timer expires, the PCU retries the BVC-BLOCK(UNBLOCK) procedure.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 15 |

### ATTRIBUTE Pcusn Nse bvcBlockRetries (nBvcBlk)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the maximum number of times the Packet Control Unit (PCU) can send the BVC-BLOCK Protocol Data Unit (PDU) in case a BVC-BLOCK ACK is not received before the *bvcBlockUnblockTimer* expiry (defined in *Pcusn Nse* component). |
| Values | Decimal (0..6) |
| Default | 3 |

### ATTRIBUTE Pcusn Nse bvcUnblockRetries (nBvcUnblk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the BVC-UNBLOCK Protocol Data Unit (PDU) in case a BVC-UNBLOCK ACK is not received before the *bvcBlockUnblockTimer* expires. |
| Values | Decimal (0..6) |
| Default | 3 |

### ATTRIBUTE Pcusn Nse bvcResetReqTimer (tReset)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the BVC-RESET procedure. The Packet Control Unit (PCU) sends a BVC-RESET Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) and starts the *bvcResetReqTimer* for a BVC. The PCU stops the timer upon reception of a BVC-RESET-ACK PDU from the SGSN. If the timer expires, the PCU retries the BVC-RESET procedure.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..120) |
| Units | seconds |

| | |
|---|---|
| Default | 60 |

### ATTRIBUTE Pcusn Nse bvcResetReqRetries (nBvcRst)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the BVC-RESET Protocol Data Unit (PDU) in case a BVC-RESET ACK is not received before the *bvcResetReqTimer* expires. |
| Values | Decimal (0..6) |
| Default | 3 |

### ATTRIBUTE Pcusn Nse suspendTimer (tSuspend)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the SUSPEND procedure. The Packet Control Unit (PCU) sends a SUSPEND Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) and starts the *suspendTimer*. The PCU stops the timer upon reception of a SUSPEND-ACK (NACK) PDU from the SGSN. If the timer expires, the PCU retries the SUSPEND procedure.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..10) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Pcusn Nse suspendRetries (nSuspend)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the SUSPEND Protocol Data Unit (PDU) in case a SUSPEND ACK is not received before the *suspendTimer* expires. |
| Values | Decimal (0..6) |
| Default | 3 |

### ATTRIBUTE Pcusn Nse resumeTimer (tResume)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the RESUME procedure. The Packet Control Unit (PCU) sends a RESUME Protocol Data<br>Unit (PDU) to the Serving GPRS Support Node (SGSN) and starts the *resumeTimer.* The PCU stops the timer upon reception of a RESUME-ACK (NACK) PDU from the SGSN. If the timer expires, the PCU retries the RESUME procedure.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..10) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Pcusn Nse resumeRetries (nResume)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the RESUME PDU in case a RESUME ACK is not received before the *resumeTimer* expires. |
| Values | Decimal (0..6) |
| Default | 3 |

### ATTRIBUTE Pcusn Nse raCapabilityUpTimer (tRaUp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the RA-CAPABILITY-UPDATE procedure. When the Packet Control Unit (PCU) sends a RA-CAPABILITY-UPDATE Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) it starts the *raCapabilityUpTimer*. The PCU stops the timer upon reception of a RA-CAPABILITY-UPDATE-ACK PDU from the SGSN. If the timer expires, the PCU retries the RA-CAPABILITY-UPDATE procedure.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 15 |

### ATTRIBUTE Pcusn Nse raCapabiltyUpRetries (nRaUp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the RA-CAPABILITY-UPDATE PDU in case a RA-CAPABILITY-UPDATE ACK is not received before the *raCapabilityUpTimer* expires. |
| Values | Decimal (0..6) |
| Default | 3 |

### ATTRIBUTE Pcusn Nse flowControlMaxRate (flCntlMaxRt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the minimum interval between sending consequent Flow Control Protocol Data Unit (PDU) for a given |

| | |
|---|---|
| | BSS GPRS Virtual Connection (BVC) or for a Mobile Station (MS).<br>Changing the value can affect the flow control function at the Packet Control Unit (PCU) level, with the Logical Link Control (LLC) frames discarded due to overflow of the MS or the BVC buckets. |
| Values | Decimal (100..10000) |
| Units | msec |
| Default | 1000 |

### ATTRIBUTE Pcusn Nse tsFlowCntlBucketSize (tsBmax)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum bucket size (Bmax) for a BSS GPRS Virtual Connection (BVC) Flow Control procedure. The value is the BVC Max Bucket size for a BVC with 1 time slot. The Packet Control Unit (PCU) calculates the actual BVC Max Bucket size for the configuration, by multiplying this provisioned value by the number of time slots in the cell, dynamically given by the Base Station Control (BSC). The default value has been estimated based on the *msFlowCntlBucketSize* default value, with 8 Mobiles in downlink transfer. The unit is 100 bytes. |
| Values | Decimal (0..65535) |
| Default | 720 |

### ATTRIBUTE Pcusn Nse tsLeakRate (tsLeakRt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the leak rate parameter for a BSS GPRS Virtual Connection (BVC) with 1 time slot. The Packet Control Unit (PCU) calculates the actual BVC leak rate for the configuration, by multiplying this provisioned value by the number of time slots in the cell, dynamically given by the Base Station Control (BSC). The default value assumes a CS1 Mobile |

| | |
|---|---|
| | Station (MS), with a throughput of 10000 bit/s, with assumption that the flow is statistically regular in the cell. The unit is 100 bit/s. |
| Values | Decimal (0..65535) |
| Default | 100 |

### ATTRIBUTE Pcusn Nse msFlowCntlBucketSize (msBmax)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Mobile Station (MS) maximum bucket size. The default value assumes 6 Logical Link Control (LLC) frames in the bucket. The unit is 100 bytes. |
| Values | Decimal (0..65535) |
| Default | 90 |

### ATTRIBUTE Pcusn Nse linkToSlaveNse (lTonse)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the corresponding *PcGtl Nse* component instances provisioned on the FPs. The purpose is to provide common parameters to all instances of this NSE on the FPs and also to associate the *Pcusa Connection* component with this NSE. |
| List of | Link (Service, linkToMasterNse) |
| Default | No default |

## GROUP Piwf CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Piwf customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Piwf IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Piwf ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Piwf ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Piwf OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Piwf adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users |

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Piwf operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Piwf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Piwf OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Piwf snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### COMPONENT Piwf Link (Lnk)

Groups
"GROUP Piwf Lnk Provisioned (Prov)"
"GROUP Piwf Lnk Operational (Oper)"

Scope
Application

Description
*Ppp/n Link*
This component is used to contain all the attributes related to the

*Ppp* link. This is a mandatory subcomponent of *Ppp* and does not need to be added.

Common Verbs

Help
List
Display

## GROUP Piwf Lnk Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioned attributes for the *Ppp* Link component.

## ATTRIBUTE Piwf Lnk configInitialMru (cimru)

Access: Read and write

Description: This is the initial Maximum Receive Unit (Mru) that the local *Ppp* entity will advertise to the remote entity. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).

Values: Decimal (68..18000)

Units: octets

Default: 18000

## ATTRIBUTE Piwf Lnk configMagicNumber (cmn)

Access: Read and write

Description: If ***enabled*** the local node will attempt to perform Magic Number negotiation with the remote node. If ***disabled*** this negotiation is not performed. In any event, the local node will comply with any magic number negotiations attempted by the remote node, per the *Ppp* specification. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).

Values:
disabled
enabled

Default: enabled

### ATTRIBUTE Piwf Lnk restartTimer (rtimer)

| | |
|---|---|
| Access | Read and write |
| Description | This is the time, in milliseconds, that *Ppp* will wait for a response to a configure request or a terminate request before retrying. |
| Values | Decimal (1000..10000) |
| Units | msec |
| Default | 3000 |

### ATTRIBUTE Piwf Lnk continuityMonitor (cntmon)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute turns on/off (***enabled/disabled***) the Link Continuity Monitor. If set to ***enabled***, periodic keep alive echo packet will be sent over the *Ppp* link. If set to ***disabled***, no keep alive packets will be sent. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock). |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Piwf Lnk negativeAckTries (naks)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum negative acknowledgments sent to the remote *Ppp* entity during negotiation before defaulting its configuration parameters. |
| Values | Decimal (0..4294967295) |
| Default | 10 |

### ATTRIBUTE Piwf Lnk qualityThreshold (quality)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum allowed line quality before the line is considered too poor to continue operation. The value for this attribute is a percentage measure of the line quality given |

| | |
|---|---|
| | in integers (10 to 99). The higher the value, the more stringent the line requirements. |
| Values | Decimal (10..99) |
| Units | % |
| Default | 90 |

### ATTRIBUTE Piwf Lnk qualityWindow (qwindow)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of seconds used for sampling line quality. If line quality drops below the level set with the *qualityThreshold* attribute during this window, this instance of *Ppp* will be marked down until line quality recovers. |
| Values | Decimal (10..400) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Piwf Lnk terminateRequestTries (term)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum terminate requests to be sent, when closing the connection, and not answered before this instance of *Ppp* enters a closing state. |
| Values | Decimal (0..4294967295) |
| Default | 10 |

### ATTRIBUTE Piwf Lnk configureRequestTries (try)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of configuration requests that will be sent out and not answered before this instance of *Ppp* enters a listening state. If both sides enter the listening state then the link will not come up. To eliminate this possibility, this attribute should be set to 1000000000. This will ensure that this end of the *Ppp* link will continue to try until the link is good. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 1000000000 |

### GROUP Piwf Lnk Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the *Ppp* Link Operational attributes. |

### ATTRIBUTE Piwf Lnk operState (state)

| | |
|---|---|
| Access | Read only |
| Description | This is the operational state of the Link Control Protocol. For more information as to the definition of each state see RFC1331 section 5.3. |
| Values | initial<br>starting<br>closed<br>stopped<br>closing<br>stopping<br>reqsent<br>ackrcvd<br>acksent<br>opened |
| Default | initial |

### ATTRIBUTE Piwf Lnk lineCondition (lcond)

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the condition of the physical line that *Ppp* is running over.<br>***ok***: The condition of the line is good.<br>***looped***: The line is looped back on itself, probably at the remote end.<br>***noClock***: There is a hardware problem with the line. The cable may not be plugged in correctly.<br>***badLineCondition***: The quality of the line is below the *qualityThreshold*. |

| | |
|---|---|
| Values | ok<br>looped<br>noClock<br>badLineCondition |
| Default | ok |

### ATTRIBUTE Piwf Lnk badAddresses (ba)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received with an incorrect Address Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Lnk badControls (bc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received on this link with an incorrect Control Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Lnk packetTooLongs (ptl)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received that have been discarded because their length exceeded the Maximum Receive Unit (Mru). This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Piwf Lnk badFcss (bfcs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received that have been discarded due to having an incorrect Frame Check Sequence (Fcs). This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Lnk localMru (lmru)

| | |
|---|---|
| Access | Read only |
| Description | This is the current value of the Maximum Receive Unit (Mru) for the local *Ppp* Entity. This value is the Mru that the remote entity is using when sending packets to the local *Ppp* entity. |
| Values | Decimal (1..2147483648) |
| Units | octets |
| Default | 1 |

### ATTRIBUTE Piwf Lnk remoteMru (rmru)

| | |
|---|---|
| Access | Read only |
| Description | This is the current value of the Maximum Receive Unit (Mru) for the remote *Ppp* entity. This value is the Mru that the local entity is using when sending packets to the remote *Ppp* entity. |
| Values | Decimal (1..2147483648) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Piwf Lnk transmitFcsSize (tfcs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This is the size of the Frame Check Sequence (Fcs) in bits that the local node will generate when sending packets to the remote node. |
| Values | Decimal (0..128) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE Piwf Lnk receiveFcsSize (rfcs)

| | |
|---|---|
| Access | Read only |
| Description | This is the size of the Frame Check Sequence (Fcs) in bits that the remote node will generate when sending packets to the local node. |
| Values | Decimal (0..128) |
| Units | bits |
| Default | 0 |

### COMPONENT Piwf LinkQualityMonitor (Lqm)

| | |
|---|---|
| Groups | "GROUP Piwf Lqm Provisioned (Prov)"<br>"GROUP Piwf Lqm Operational (Oper)" |
| Scope | Application |
| Description | *Ppp/n LinkQualityMonitor*<br>This component is used to contain all the operational attributes for the *Ppp* Link Quality Monitor. This is a mandatory subcomponent of *Ppp* and does not need to be manually added. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Piwf Lqm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisioned attributes for the *Ppp* Link Quality Monitor component. |

### ATTRIBUTE Piwf Lqm configPeriod (cfgper)

| | |
|---|---|
| Access | Read and write |
| Description | This is the *Lqm* reporting period that the local *Ppp* entity will attempt to negotiate with the remote entity, in units of hundredths of a second. A value of “0” allows the remote *Ppp* entity to determine the reporting period. A value greater than 180,000 (1/2 hour) allows the period to be determined dynamically as a function of the transmit data rate. A value from 1-9 is rounded up to 10 during negotiation. A change to this attribute does not take effect until *Ppp* is restarted (lock/unlock). |
| Values | Decimal (0..2147483647) |
| Units | centiseconds |
| Default | 0 |

### ATTRIBUTE Piwf Lqm configStatus (cfgstat)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | If this attribute is ***enabled***, the local node will attempt to perform *Lqm* negotiation with the remote node. If it is ***disabled*** this negotiation is not performed. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock). |
| Values | disabled<br>enabled |
| Default | disabled |

### GROUP Piwf Lqm Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Ppp* Link Quality Monitor component. |

### ATTRIBUTE Piwf Lqm quality (qual)

| | |
|---|---|
| Access | Read only |
| Description | This is the current quality of the link as declared by the local *Ppp* entity's LinkQuality Management modules. A value of ***good*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and *Link quality* is above *LinkQuality Threshold*. A value of ***bad*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and *Link quality* is not above *Link qualityThreshold*. A value of ***notDetermined*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and the quality of the link has not been calculated yet or *LinkQualityMonitor configStatus* is ***disabled***. |
| Values | good<br>bad<br>notDetermined |
| Default | notDetermined |

### ATTRIBUTE Piwf Lqm inGoodOctets (ingo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of good octets received. This counter wraps around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Lqm localPeriod (localp)

| | |
|---|---|
| Access | Read only |
| Description | This is the *Lqm* reporting period, in hundredths of a second that is in effect for the local *Ppp* entity. |
| Values | Decimal (1..4294967295) |
| Units | centiseconds |
| Default | 1 |

### ATTRIBUTE Piwf Lqm remotePeriod (remotep)

| | |
|---|---|
| Access | Read only |
| Description | This is the *Lqm* reporting period, in hundredths of a second, that is in effect for the remote *Ppp* entity. |
| Values | Decimal (1..4294967295) |
| Units | centiseconds |
| Default | 1 |

### ATTRIBUTE Piwf Lqm outLqrs (outr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of link quality reports sent out. This counter wraps around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Lqm inLqrs (inr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of link quality reports received. This counter wraps around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Piwf NetworkControlProtocol (Ncp)

| | |
|---|---|
| Groups | "GROUP Piwf Ncp IpOperational (IpOper)"<br>"GROUP Piwf Ncp MplsOperational (MplsOper)" |
| Scope | Application |
| Description | *Ppp/n NetworkControlProtocol*<br>This component is used to contain all the operational attributes for the *Ppp* Network Control Protocols (*Ncp*). This is a |

mandatory subcomponent of *Ppp* and does not need to be manually added.

## GROUP Piwf Ncp IpOperational (IpOper)

Properties: Operational

Description: This group contains the Ip Network Control Protocol operational attributes.

## ATTRIBUTE Piwf Ncp ipOperState (ipostate)

Access: Read only

Description: This is the operational state of the Ip network protocol. For more information as to the definition of each state see RFC1331 section 5.3.

Values:
initial
starting
closed
stopped
closing
stopping
reqsent
ackrcvd
acksent
opened

Default: initial

## GROUP Piwf Ncp MplsOperational (MplsOper)

Properties: Operational

Description: This group contains the MPLS Network Control Protocol operational attribute.

## ATTRIBUTE Piwf Ncp mplsOperState (mplsostate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the operational states of the MPLS Network Control Protocol. In the initial state the lower layer (LCP in this case) is in a Down state The lower layer is also Down in the starting state where in contrast an administrative Open has been recieved. When the lower Layer is Up a req-sent is sent to the peer awaiting an ackrcvd. An ack-sent is reached when an ack is sent in reply to the peer ack-req request. An open state is reached when both peers have sent ack-req and recieved ack-rcvd. Closing is before closed state when waiting for a terminate-ack after sending a terminate-req. The same for stopping and stopped states with the difference that the The Stopping state provides a well defined opportunity to terminate the link before allowing new traffic. (for more information as to the definition of each state see RFC 1331 section 5.3). |
| Values | initial<br>starting<br>closed<br>stopped<br>closing<br>stopping<br>reqsent<br>ackrcvd<br>acksent<br>opened |
| Default | initial |

## COMPONENT Piwf Framer

| | |
|---|---|
| Groups | "GROUP Piwf Framer Provisioned (Prov)"<br>"GROUP Piwf Framer OsiState (State)"<br>"GROUP Piwf Framer Statistics (Stats)"<br>"GROUP Piwf Framer LinkUtilization (Util)" |

## "COLLECTED STATS PppIwf Framer"

| | |
|---|---|
| Scope | Application |

Description

*Ppp/n Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer* that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute that binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Common Verbs

Help
List
Display

## GROUP Piwf Framer Provisioned (Prov)

Properties Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE Piwf Framer interfaceName

Access Read and write

Criticality Process

Description

This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the logical processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values: Link (Hardware, applicationFramerName)

Default: No default

### GROUP Piwf Framer OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Piwf Framer adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE Piwf Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Piwf Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Piwf Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *Framer* component. |

## ATTRIBUTE Piwf Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Piwf Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with CRC errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Piwf Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Piwf Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received that were too large. The frame execeeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Piwf Framer octetToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets transmitted to the link interface by *Framer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Piwf Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attritube counts the number of octetes received from the link interface by *Framer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Piwf Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the link interface by *Framer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Piwf Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted to the link interface by *Framer.*<br><br>Note: For the 1pOC48SmIrPos card, the count includes frames transmitted directly to the hardware queue; for all other cards, these frames are not included.. |
| Values | Long Integer |
| Default | No default |

### GROUP Piwf Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE Piwf Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the utilization of the normal priority data sent to the link as a percentage of the available bandwidth on the link. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Piwf Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal priority data received from the link as a percentage of the available bandwidth on the link. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### COLLECTED STATS PppIwf Framer

| | |
|---|---|
| Description | The statistics record generated by the PppIwf Framer component. |

### ATTRIBUTE Piwf Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Piwf Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Piwf Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |

Values Long Integer

### ATTRIBUTE Piwf Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

### ATTRIBUTE Piwf Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

## COMPONENT Piwf AtmAdaptionPoint (AtmAp)

Groups "GROUP Piwf AtmAp Provisioned (AtmApProv)"
"GROUP Piwf AtmAp OsiState (State)"
"GROUP Piwf AtmAp Operational (AapOper)"

Scope Application

Description *Piwf/n AtmAdaptionPoint*
This component represents a SoftPVC between Point-to-Point Protocol and remote ATM Interface. Multiprotocol Encapsulation as specified in RFC1483 is used to transfer higher-layer protocol (IP) data across a virtual channel in an ATM network.

Subcomponents "COMPONENT Piwf AtmAp TrafficManagement (Tm)"

Dyn. Subcomp. "COMPONENT Piwf AtmAp AtmConnection (AtmCon)"

Common Verbs
Help
List
Display

DELete
LOCK
Unlock

### VERB Restart Piwf AtmAp

| | |
|---|---|
| Impact | Service |
| Description | This command is used to restart the automatic connections procedure. The operational attributes *retryTimerValue* and *retryFailures* will also be reset.<br><br>This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed, as specified by *retryLimit*, or before the limit has been reached.<br><br>This command may also be used when a connection has been established, in which case the connection will first be released.<br><br>This command will fail if the *channel* associated with the *Framer* component is disabled, or if *spvcStatus* has the value ***initialising***. If *spvcStatus* has the value ***failed***, this command may fail. |

### GROUP Piwf AtmAp Provisioned (AtmApProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the previsional attribute for *AtmAdaptionPoint* component. |

### ATTRIBUTE Piwf AtmAp maxTransmissionUnit (mtu)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the size of the largest datagram which can be sent on the SoftPVC. This includes the size of the Logical Link Control header (if applicable) as well as the protocol data unit. |
| Values | Decimal (256..9188) |
| Units | octets |
| Default | 9188 |

## ATTRIBUTE Piwf AtmAp encapType (etype)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the RFC1483 encapsulation type to be used for the *AtmConnections* under this *PppAtmIwf*. Specifying ***llcEncap*** allows multiplexing of multiple protocols over the VCCs. The protocol of the carried PDU will be identified by an IEEE 802.2 Logical Link Control header. If Bridging or Inverse ARP is to be carried over a VCC, ***llcEncap*** must be used. Specifying ***ipVcEncap*** indicates that the VCC (e.g. *AtmConnection*) under an *AtmAdaptionPoint* component will use VC based multiplexing and will carry IP PDUs only. |
| Values | llcEncap<br>ipVcEncap |
| Default | ipVcEncap |

## ATTRIBUTE Piwf AtmAp localAddress (localAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the local NSAP address.<br><br>If the switch prefix (the *nodePrefix* attribute of the *ModuleData* component) has been provisioned, a default value for *localAddress* based on *nodePrefix* will be provided.<br><br>If *ModuleData nodePrefix* is empty and one or more alternate switch prefixes (the *alternatePorsPrefixes* attribute of the *ModuleData* component) have been provisioned, a default value for *localAddress* based on the first provisioned *alternatePorsPrefix* value will be provided.<br><br>If switch prefixes are empty, *localAddress* will default to an empty string. To obtain a valid default *localAddress* in this case, either or both of the *ModuleData nodePrefix* and *ModuleData alternatePorsPrefixes* attributes must be provisioned, and this end point component must then be deleted and re-added. |

| | |
|---|---|
| Values | String (40, AESANsapAddress) |
| Default | No default |

### ATTRIBUTE Piwf AtmAp calledVpiVci (vc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | *calledVpiVci* specifies the identity of the PVC at the remote ATM node on which the SoftPVC connection terminates. |
| Values | Integer Sequence (0..4095; 1..65535) |
| Default | No default |

### ATTRIBUTE Piwf AtmAp addressToCall (addrToCall)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the remote NSAP address which this *AtmAdaptionPoint* will call. |
| Values | String (40, AESANsapAddress) |
| Default | No default |

### ATTRIBUTE Piwf AtmAp firstRetryInterval (int)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the time to wait, in seconds, before attempting to establish the connection after the first failed attempt.<br><br>The time to wait between subsequent call attempts will generally differ due to a backoff scheme. |
| Values | Decimal (1..3600) |
| Units | seconds |

| | |
|---|---|
| Default | 10 |

### ATTRIBUTE Piwf AtmAp retryLimit (limit)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | *retryLimit* specifies the maximum number of consecutive unsuccessful connection setup attempts that may be made before further attempts are abandoned.<br><br>If this limit is reached, the *Restart* verb may be used to restart connection attempts.<br><br>If *retryLimit* is ***0***, there is no limit; attempts will continue indefinitely until a successful connection is established. |
| Values | Decimal (0..65535) |
| Default | 0 |

### GROUP Piwf AtmAp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Piwf AtmAp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Piwf AtmAp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Piwf AtmAp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP Piwf AtmAp Operational (AapOper)

Properties
Operational

Description
This group contains operational attributes for *AtmAdaptionPoint* component.

## ATTRIBUTE Piwf AtmAp spvcStatus (status)

Access
Read only

Description
*spvcStatus* indicates the status of the incoming and outgoing connections.

When this attribute has the value ***initialising***, it indicates that the component is initialising when first created; a connection has not been established, and no incoming setup requests will be processed.

When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests will be sent.

When this attribute has the value ***connected***, it indicates that a connection has been established.

When this attribute has the value ***idle***, it indicates that a connection has not been established, and the component is waiting to restart.

When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* consecutive connection setup attempts have failed, and the connection procedure has been aborted.

When this attribute has the value ***failed***, it indicates that the ATM Networking resources are not available to setup the connection.

Values
initialising
connecting
connected
idle
retriesExhausted
failed

Default
No default

### ATTRIBUTE Piwf AtmAp retryTimeRemaining (timer)

Access
Read only

Description
*retryTimerValue* is the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt will be made. *retryTimerValue* is initialized when a connection attempt fails.

When *retryTimerValue* reaches ***0***, an attempt will be made to establish the connection.

When the timer is not running, for example when the connection has been established, *retryTimerValue* will be ***0***.

Values
Decimal (0..86400)

Units
seconds

Default
No default

### ATTRIBUTE Piwf AtmAp retryFailures (failures)

Access
Read only

Description
*retryFailures* counts the number of consecutive failed connection attempts.

| | |
|---|---|
| | *retryFailures* is reset to ***0*** whenever a connection is successfully established, or the connection is restarted using the *Restart* verb. The counter wraps when the maximum value is exceeded. |
| Values | Decimal (0..2147483647) |
| Default | No default |

### ATTRIBUTE Piwf AtmAp lastSetupFailureCause (failCause)

| | |
|---|---|
| Access | Read only |
| Description | *lastSetupFailureCause* indicates the cause of the last connection setup failure.<br><br>The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Piwf AtmAp lastSetupFailureDiagnostic (failDiag)

| | |
|---|---|
| Access | Read only |
| Description | *lastSetupFailureDiagnostic* provides a diagnostic to supplement the *lastSetupFailureCause* attribute.<br><br>The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. |
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE Piwf AtmAp lastTearDownCause (cause)

| | |
|---|---|
| Access | Read only |
| Description | *lastTearDownCause* indicates the cause of the last connection tear down.<br><br>The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. |

| | |
|---|---|
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Piwf AtmAp lastTearDownDiagnostic (diag)

| | |
|---|---|
| Access | Read only |
| Description | *lastTearDownDiagnostic* provides a diagnostic to supplement the *lastTearDownCause* attribute.<br><br>The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. |
| Values | String (0..8, ASCII) |
| Default | No default |

### COMPONENT Piwf AtmAp TrafficManagement (Tm)

| | |
|---|---|
| Groups | "GROUP Piwf AtmAp Tm Provisioned (TmProv)" |
| Scope | Application |
| Description | *Piwf/n AtmAp trafficManagement*<br>This component contains ATM QoS information used by the SPVC connection to request a particular QoS from ATM. |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

### GROUP Piwf AtmAp Tm Provisioned (TmProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisional attribute for *TrafficManagement* component. |

### ATTRIBUTE Piwf AtmAp Tm atmServiceCategory (service)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the desired ATM service category for this connection.<br><br>Refer to NTP 241-5701-705 for more information on ATM Traffic Management. |
| Values | unspecifiedBitRate (ubr)<br>rtVariableBitRate (rtvbr)<br>nrtVariableBitRate (nrtvbr)<br>constantBitRate (cbr) |
| Default | unspecifiedBitRate |

### ATTRIBUTE Piwf AtmAp Tm peakCellRate (pcr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the desired peak cell rate (PCR) for this connection.<br><br>Refer to NTP 241-5701-705 for more information on ATM Traffic Management. |
| Values | Decimal (0..2147483647) |
| Default | 0 |

### COMPONENT Piwf AtmAp AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Piwf AtmAp AtmCon Operational (Oper)" |
| Scope | Device |

| | |
|---|---|
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Piwf AtmAp AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

## ATTRIBUTE Piwf AtmAp AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

### GROUP Ppp CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Ppp customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Ppp IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Ppp ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Ppp ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Ppp MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the Media Application component. |

### ATTRIBUTE Ppp linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains a protocol port component name. The attribute associates the application with a protocol port. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

## GROUP Ppp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Ppp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Ppp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Ppp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Ppp OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

## ATTRIBUTE Ppp snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## COMPONENT Ppp ConnectionAdministrator (Ca)

| | |
|---|---|
| Groups | "GROUP Ppp Ca Provisioned (Prov)"<br>"GROUP Ppp Ca Operational (Oper)" |
| Scope | Application |
| Description | *Ppp/n ConnectionAdministrator*<br>This component manages the link bandwidth, and reports the information about the link usage.<br><br>This component can only be provisioned if the *MplsPort* component is provisioned. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Ppp Ca Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Ca* component. |

### ATTRIBUTE Ppp Ca percentBandwidthManaged (pBwManaged)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the percentage of link capacity used for transmitting the network clients' MPLS traffic and managed by the bandwidth manager. If this percent is selected to be less than 100% then an explicit amount of bandwidth is reserved for other traffic that is not managed by the bandwidth manager such as IP native traffic or IP control traffic. It should be noted that this attribute is used for bandwidth reservation for Connection Admission Control purpose and does not control the actual transmission of traffic which is controlled by the scheduler configuration.<br><br>The total bandwidth for transmitting the network clients' MPLS traffic (*managedBandwidthTotal*) can be obtained as the multiplication of this attribute and the link transmitting capacity. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 100 |

### GROUP Ppp Ca Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes of the *Ca* component. |

### ATTRIBUTE Ppp Ca managedBandwidthTotal (bwTotal)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total bandwidth for transmitting the network clients' traffic. Its value is equal to the multiplication of link capacity and the provisioned value of *percentBandwidthManaged*. |
| Values | Decimal (0..4294967295) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Ppp Ca maxBandwidthPool (maxBwPool)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum amount of bandwidth allowed for each pool.<br><br>The value of each pool is equal to the multiplication of *managedBandwidthTotal* and the provisioned value of *percentMaxBandwidthPool*. |
| Vector of | Decimal (0..4294967295) |
| Units | kbit/s |
| Index | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE Ppp Ca guaranteedBandwidthPool (gBwPool)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the amount of bandwidth guaranteed for each pool.<br><br>This value is equal to the multiplication of *managedBandwidthTotal* and the provisioned value of *percentGuaranteeBandwidthPool*. |
| Vector of | Decimal (0..4294967295) |
| Units | kbit/s |
| Index | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE Ppp Ca poolAdmittedBandwidth (poolAdmBw)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the bandwidth reserved by the admitted T-LSPs in each bandwidth pool by each holding priority. |
| Array of | Decimal (0..4294967295) |
| Units | kbit/s |
| Row | pool [Decimal (0..3)] |
| Column | holdingPriority [Decimal (0..7)] |
| Default | No default |

### ATTRIBUTE Ppp Ca poolAvailableBandwidth (poolAvlBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the available bandwidth in each bandwidth pool by each setup priority. |
| Array of | Decimal (0..4294967295) |
| Units | kbit/s |
| Row | pool [Decimal (0..3)] |
| Column | setupPriority [Decimal (0..7)] |
| Default | No default |

### ATTRIBUTE Ppp Ca igAvailBwDataPath (igBwDp)

| | |
|---|---|
| Access | Read only |
| Description | For cards with multiple ingress datapaths, this attribute indicates the available bandwidth on each ingress card datapath.<br><br>On the ***1pOC48SmSrPos*** and ***1pOC48SmIrPos*** FPs there are two ingress card datapath each limited to 1,198,080 kbit/s (OC-24). Connections with an even receive service label (*receiveLabel*) are assigned to card datapath 0, connections with an odd receive service label are assigned to card datapath 1. |

| | |
|---|---|
| | This attribute is not displayed for other cards. |
| Vector of | Decimal (0..100) |
| Units | % |
| Index | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Ppp Ca egAvailBwDataPath (egBwDp)

| | |
|---|---|
| Access | Read only |
| Description | For cards with multiple egress datapaths, this attribute indicates the available bandwidth on each egress card datapath.<br><br>On the ***1pOC48SmSrPos*** and ***1pOC48SmIrPos*** FPs, there are two egress card datapaths each limited to 1,198,080 kbit/s (OC-24). Connections with an even transmit service label (*transmitLabel*) are assigned to card datapath 0, connections with an odd transmit service label are assigned to card datapath 1.<br><br>This attribute is not displayed for other cards. |
| Vector of | Decimal (0..100) |
| Units | % |
| Index | Decimal (0..1) |
| Default | No default |

### COMPONENT Ppp Link (Lnk)

| | |
|---|---|
| Groups | "GROUP Ppp Lnk Provisioned (Prov)"<br>"GROUP Ppp Lnk Operational (Oper)" |
| Scope | Application |
| Description | *Ppp/n Link*<br>This component is used to contain all the attributes related to the |

*Ppp* link. This is a mandatory subcomponent of *Ppp* and does not need to be added.

Common Verbs

List
Display

## GROUP Ppp Lnk Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioned attributes for the *Ppp* Link component.

## ATTRIBUTE Ppp Lnk configInitialMru (cimru)

Access: Read and write

Description: This is the initial Maximum Receive Unit (Mru) that the local *Ppp* entity will advertise to the remote entity. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).

Values: Decimal (68..18000)

Units: octets

Default: 18000

## ATTRIBUTE Ppp Lnk configMagicNumber (cmn)

Access: Read and write

Description: If ***enabled*** the local node will attempt to perform Magic Number negotiation with the remote node. If ***disabled*** this negotiation is not performed. In any event, the local node will comply with any magic number negotiations attempted by the remote node, per the *Ppp* specification. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).

Values:
disabled
enabled

Default: enabled

### ATTRIBUTE Ppp Lnk restartTimer (rtimer)

| | |
|---|---|
| Access | Read and write |
| Description | This is the time, in milliseconds, that *Ppp* will wait for a response to a configure request or a terminate request before retrying. |
| Values | Decimal (1000..10000) |
| Units | msec |
| Default | 3000 |

### ATTRIBUTE Ppp Lnk continuityMonitor (cntmon)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute turns on/off (***enabled/disabled***) the Link Continuity Monitor. If set to ***enabled***, periodic keep alive echo packet will be sent over the *Ppp* link. If set to ***disabled***, no keep alive packets will be sent. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock). |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Ppp Lnk negativeAckTries (naks)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum negative acknowledgments sent to the remote *Ppp* entity during negotiation before defaulting its configuration parameters. |
| Values | Decimal (0..4294967295) |
| Default | 10 |

### ATTRIBUTE Ppp Lnk qualityThreshold (quality)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum allowed line quality before the line is considered too poor to continue operation. The value for this attribute is a percentage measure of the line quality given |

| | |
|---|---|
| | in integers (10 to 99). The higher the value, the more stringent the line requirements. |
| Values | Decimal (10..99) |
| Units | % |
| Default | 90 |

### ATTRIBUTE Ppp Lnk qualityWindow (qwindow)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of seconds used for sampling line quality. If line quality drops below the level set with the *qualityThreshold* attribute during this window, this instance of *Ppp* will be marked down until line quality recovers. |
| Values | Decimal (10..400) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Ppp Lnk terminateRequestTries (term)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum terminate requests to be sent, when closing the connection, and not answered before this instance of *Ppp* enters a closing state. |
| Values | Decimal (0..4294967295) |
| Default | 10 |

### ATTRIBUTE Ppp Lnk configureRequestTries (try)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of configuration requests that will be sent out and not answered before this instance of *Ppp* enters a listening state. If both sides enter the listening state then the link will not come up. To eliminate this possibility, this attribute should be set to 1000000000. This will ensure that this end of the *Ppp* link will continue to try until the link is good. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 1000000000 |

### GROUP Ppp Lnk Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the *Ppp* Link Operational attributes. |

### ATTRIBUTE Ppp Lnk operState (state)

| | |
|---|---|
| Access | Read only |
| Description | This is the operational state of the Link Control Protocol. For more information as to the definition of each state see RFC1331 section 5.3. |
| Values | initial<br>starting<br>closed<br>stopped<br>closing<br>stopping<br>reqsent<br>ackrcvd<br>acksent<br>opened |
| Default | initial |

### ATTRIBUTE Ppp Lnk lineCondition (lcond)

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the condition of the physical line that *Ppp* is running over.<br>***ok***: The condition of the line is good.<br>***looped***: The line is looped back on itself, probably at the remote end.<br>***noClock***: There is a hardware problem with the line. The cable may not be plugged in correctly.<br>***badLineCondition***: The quality of the line is below the *qualityThreshold*. |

| | |
|---|---|
| Values | ok<br>looped<br>noClock<br>badLineCondition |
| Default | ok |

### ATTRIBUTE Ppp Lnk badAddresses (ba)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received with an incorrect Address Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Lnk badControls (bc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received on this link with an incorrect Control Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Lnk packetTooLongs (ptl)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received that have been discarded because their length exceeded the Maximum Receive Unit (Mru). This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Ppp Lnk badFcss (bfcs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received that have been discarded due to having an incorrect Frame Check Sequence (Fcs). This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Lnk localMru (lmru)

| | |
|---|---|
| Access | Read only |
| Description | This is the current value of the Maximum Receive Unit (Mru) for the local *Ppp* Entity. This value is the Mru that the remote entity is using when sending packets to the local *Ppp* entity. |
| Values | Decimal (1..2147483648) |
| Units | octets |
| Default | 1 |

### ATTRIBUTE Ppp Lnk remoteMru (rmru)

| | |
|---|---|
| Access | Read only |
| Description | This is the current value of the Maximum Receive Unit (Mru) for the remote *Ppp* entity. This value is the Mru that the local entity is using when sending packets to the remote *Ppp* entity. |
| Values | Decimal (1..2147483648) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Ppp Lnk transmitFcsSize (tfcs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This is the size of the Frame Check Sequence (Fcs) in bits that the local node will generate when sending packets to the remote node. |
| Values | Decimal (0..128) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE Ppp Lnk receiveFcsSize (rfcs)

| | |
|---|---|
| Access | Read only |
| Description | This is the size of the Frame Check Sequence (Fcs) in bits that the remote node will generate when sending packets to the local node. |
| Values | Decimal (0..128) |
| Units | bits |
| Default | 0 |

### COMPONENT Ppp LinkQualityMonitor (Lqm)

| | |
|---|---|
| Groups | "GROUP Ppp Lqm Provisioned (Prov)"<br>"GROUP Ppp Lqm Operational (Oper)" |
| Scope | Application |
| Description | *Ppp/n LinkQualityMonitor*<br>This component is used to contain all the operational attributes for the *Ppp* Link Quality Monitor. This is a mandatory subcomponent of *Ppp* and does not need to be manually added. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Ppp Lqm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisioned attributes for the *Ppp* Link Quality Monitor component. |

### ATTRIBUTE Ppp Lqm configPeriod (cfgper)

| | |
|---|---|
| Access | Read and write |
| Description | This is the *Lqm* reporting period that the local *Ppp* entity will attempt to negotiate with the remote entity, in units of hundredths of a second. A value of “0” allows the remote *Ppp* entity to determine the reporting period. A value greater than 180,000 (1/2 hour) allows the period to be determined dynamically as a function of the transmit data rate. A value from 1-9 is rounded up to 10 during negotiation. A change to this attribute does not take effect until *Ppp* is restarted (lock/unlock). |
| Values | Decimal (0..2147483647) |
| Units | centiseconds |
| Default | 0 |

### ATTRIBUTE Ppp Lqm configStatus (cfgstat)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | If this attribute is ***enabled***, the local node will attempt to perform *Lqm* negotiation with the remote node. If it is ***disabled*** this negotiation is not performed. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock). |
| Values | disabled<br>enabled |
| Default | disabled |

### GROUP Ppp Lqm Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Ppp* Link Quality Monitor component. |

### ATTRIBUTE Ppp Lqm quality (qual)

| | |
|---|---|
| Access | Read only |
| Description | This is the current quality of the link as declared by the local *Ppp* entity's LinkQuality Management modules. A value of ***good*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and *Link quality* is above *LinkQuality Threshold*. A value of ***bad*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and *Link quality* is not above *Link qualityThreshold*. A value of ***notDetermined*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and the quality of the link has not been calculated yet or *LinkQualityMonitor configStatus* is ***disabled***. |
| Values | good<br>bad<br>notDetermined |
| Default | notDetermined |

### ATTRIBUTE Ppp Lqm inGoodOctets (ingo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of good octets received. This counter wraps around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Lqm localPeriod (localp)

| | |
|---|---|
| Access | Read only |
| Description | This is the *Lqm* reporting period, in hundredths of a second that is in effect for the local *Ppp* entity. |
| Values | Decimal (1..4294967295) |
| Units | centiseconds |
| Default | 1 |

### ATTRIBUTE Ppp Lqm remotePeriod (remotep)

| | |
|---|---|
| Access | Read only |
| Description | This is the *Lqm* reporting period, in hundredths of a second, that is in effect for the remote *Ppp* entity. |
| Values | Decimal (1..4294967295) |
| Units | centiseconds |
| Default | 1 |

### ATTRIBUTE Ppp Lqm outLqrs (outr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of link quality reports sent out. This counter wraps around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Lqm inLqrs (inr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of link quality reports received. This counter wraps around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Ppp NetworkControlProtocol (Ncp)

| | |
|---|---|
| Groups | "GROUP Ppp Ncp IpOperational (IpOper)"<br>"GROUP Ppp Ncp MplsOperational (MplsOper)" |
| Scope | Application |
| Description | *Ppp/n NetworkControlProtocol*<br>This component is used to contain all the operational attributes for the *Ppp* Network Control Protocols (*Ncp*). This is a |

mandatory subcomponent of *Ppp* and does not need to be manually added.

## GROUP Ppp Ncp IpOperational (IpOper)

Properties: Operational

Description: This group contains the Ip Network Control Protocol operational attributes.

## ATTRIBUTE Ppp Ncp ipOperState (ipostate)

Access: Read only

Description: This is the operational state of the Ip network protocol. For more information as to the definition of each state see RFC1331 section 5.3.

Values:
initial
starting
closed
stopped
closing
stopping
reqsent
ackrcvd
acksent
opened

Default: initial

## GROUP Ppp Ncp MplsOperational (MplsOper)

Properties: Operational

Description: This group contains the MPLS Network Control Protocol operational attribute.

### ATTRIBUTE Ppp Ncp mplsOperState (mplsostate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the operational states of the MPLS Network Control Protocol. In the initial state the lower layer (LCP in this case) is in a Down state The lower layer is also Down in the starting state where in contrast an administrative Open has been recieved. When the lower Layer is Up a req-sent is sent to the peer awaiting an ackrcvd. An ack-sent is reached when an ack is sent in reply to the peer ack-req request. An open state is reached when both peers have sent ack-req and recieved ack-rcvd. Closing is before closed state when waiting for a terminate-ack after sending a terminate-req. The same for stopping and stopped states with the difference that the The Stopping state provides a well defined opportunity to terminate the link before allowing new traffic. (for more information as to the definition of each state see RFC 1331 section 5.3). |
| Values | initial<br>starting<br>closed<br>stopped<br>closing<br>stopping<br>reqsent<br>ackrcvd<br>acksent<br>opened |
| Default | initial |

### COMPONENT Ppp Framer

| | |
|---|---|
| Groups | "GROUP Ppp Framer Provisioned (Prov)"<br>"GROUP Ppp Framer OsiState (State)"<br>"GROUP Ppp Framer Statistics (Stats)"<br>"GROUP Ppp Framer LinkUtilization (Util)" |

### "COLLECTED STATS PointToPointProtocol Framer"

| | |
|---|---|
| Scope | Application |

Description *Ppp/n Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer* that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute that binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Common Verbs
Help
List
Display

## GROUP Ppp Framer Provisioned (Prov)

Properties Provisioned

Description This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE Ppp Framer interfaceName

Access Read and write

Criticality Process

Description This attribute contains a hardware component name.

The attribute associates the application with a specific link. This

| | |
|---|---|
| | defines the logical processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP Ppp Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Ppp Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Ppp Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Ppp Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Ppp Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *Framer* component. |

## ATTRIBUTE Ppp Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Ppp Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with CRC errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Ppp Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Ppp Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received that were too large. The frame execeeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Framer octetToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets transmitted to the link interface by *Framer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Ppp Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attritube counts the number of octetes received from the link interface by *Framer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Ppp Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the link interface by *Framer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Ppp Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted to the link interface by *Framer.*<br><br>Note: For the 1pOC48SmIrPos card, the count includes frames transmitted directly to the hardware queue; for all other cards, these frames are not included.. |
| Values | Long Integer |
| Default | No default |

### GROUP Ppp Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE Ppp Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the utilization of the normal priority data sent to the link as a percentage of the available bandwidth on the link. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Ppp Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal priority data received from the link as a percentage of the available bandwidth on the link. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### COLLECTED STATS PointToPointProtocol Framer

| | |
|---|---|
| Description | The statistics record generated by the PointToPointProtocol Framer component. |

### ATTRIBUTE Ppp Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Ppp Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Ppp Framer txBytes

Description: This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values: Long Integer

### ATTRIBUTE Ppp Framer txFrames

Description: This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values: Long Integer

### ATTRIBUTE Ppp Framer rxTotalLinkUtil

Description: This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values: Decimal (0..100)

### COMPONENT Ppp LinkEmissionQueue (Leq)

Groups:
"GROUP Ppp Leq Provisioned (Prov)"
"GROUP Ppp Leq Statistics (Stats)"
"GROUP Ppp Leq TotalStatistics (TStats)"
"GROUP Ppp Leq CurrentStatistics (CStats)"
"GROUP Ppp Leq ThresholdStatistics (ThrStats)"

Scope: Application

Description: *Ppp/n LinkEmissionQueue*
This component provides a means of statistics gathering and packet discard.

DELete

## GROUP Ppp Leq Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *LinkEmissionQueue* component. |

## ATTRIBUTE Ppp Leq maxPackets (maxP)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of packets allowed in the *Leq* before being discarded. If this attribute is set to zero then the maximum number of packets is calculated from the transmit data rate. This calculated value is placed in *queuePktThreshold*. |
| Values | Decimal (0..2048) |
| Default | 0 |

## ATTRIBUTE Ppp Leq maxMsecData (maxData)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of “Milliseconds worth of data” allowed in the *Leq* before packets are discarded. The *queueByteThreshold* will be calculated from this attribute, based on the transmit data rate. |
| Values | Decimal (100..60000) |
| Default | 10000 |

## ATTRIBUTE Ppp Leq maxPercentMulticast (mpm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum percentage of multicast packets allowed in the *Leq*, based on *queuePktThreshold*, before being discarded. The calculated value will be placed in *queueMulticastThreshold*. |
| Values | Decimal (1..100) |
| Default | 50 |

### ATTRIBUTE Ppp Leq timeToLive (ttl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the “Milliseconds Time To Live” of packets in the *Leq*. If the *timeToLive* of a packet expires, it will be discarded. |
| Values | Decimal (100..60000) |
| Units | msec |
| Default | 10000 |

### GROUP Ppp Leq Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue general statistics. |

### ATTRIBUTE Ppp Leq timedOutPkt (topkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets that have been discarded due to exceeding the *timeToLive*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq hardwareForcedPkt (hfpkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of hardware forced packets on this instance of *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq forcedPktDiscards (fpktd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of hardware forced packets that had to be discarded due to link failure. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq queuePurgeDiscards (qpd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets discarded by a queue purge (i.e. a discarding of all packets on the queue). This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Ppp Leq TotalStatistics (TStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue total statistics. |

### ATTRIBUTE Ppp Leq totalPktHandled (tpkthand)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets handled by the *Leq*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq totalPktForwarded (tpktfor)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets forwarded by the *Leq*. This counter will wrap around to 0 when it exceeds its maximum count. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq totalPktQueued (tpktq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets that required queuing by the *Leq* due to transmit congestion. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq totalMulticastPkt (tmulp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of multicast packets handled by this instance of *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq totalPktDiscards (tpktdis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets that were discarded for this instance of *Ppp*. This is the sum of *timedOutPkt*, *forcedPktDiscards*, *queuePurgeDiscards*, *pktThresholdExceeded*, *byteThresholdExceeded*, *mulThresholdExceeded*, and *memThresholdExceeded*. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Ppp Leq CurrentStatistics (CStats)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains Link Emission Queue current statistics. |

### ATTRIBUTE Ppp Leq currentPktQueued (cpktq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the current number of packets queued. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq currentBytesQueued (cbytesq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the current number of bytes queued. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq currentMulticastQueued (cmulq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the current number of multicast packets in the queue. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Ppp Leq ThresholdStatistics (ThrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Link Emission Queue threshold statistics. |

### ATTRIBUTE Ppp Leq queuePktThreshold (qpthr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the maximum number of packets that can be contained in the queue before being discarded. If *maxPackets* was set to 0 then this attribute will contain the value that has been calculated based on the transmit data rate. If *maxPackets* was set to one or more than this attribute will contain that number. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq pktThresholdExceeded (pthrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets discarded due to the *queuePktThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq queueByteThreshold (qbytethr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the maximum number of bytes allowed in the queue based on *maxMsecData* and the transmit data rate. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq byteThresholdExceeded (bthrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets discarded due to the *queueByteThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Ppp Leq queueMulticastThreshold (qmolthr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of multicast packets allowed in the queue based on *maxPercentMulticast* and *maxPackets*. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Ppp Leq mulThresholdExceeded (multhrx)

Access Read only

Description This attribute counts the number of packets discarded due to the *queueMulticastThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Ppp Leq memThresholdExceeded (memthrx)

Access Read only

Description This attribute counts the number of packets discarded due to exceeding the memory usage threshold for *Leq*. The memory usage threshold is determined by the *Leq* software, guaranteeing that the *Leq* does not consume all of the memory. This counter will wrap around to 0 when it exceeds its maximum count.

Values Decimal (0..4294967295)

Default 0

### COMPONENT Ppp EgressWeightedFairQueuing (Ewfq)

Groups "GROUP Ppp Ewfq Provisioned (Prov)"

Scope Application

Description Ppp/n EgressWeightedFairQueuin*g*
The egressWeightedFairQueuing component provides a mechanism to redistribute the WFQ servicing values among the queues in a manner which satisfy the requirements for the end users. The servicing values for the queues must add up to 100.

Common Verbs

Display
Add
DELete

## GROUP Ppp Ewfq Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the EgressWeightedFairQueuing component. There are four attributes in this group and the sum of their values must add up to 100. |

## ATTRIBUTE Ppp Ewfq egressServicingForQueue0 (q0)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transmission frequency of queue 0 as a percentage of the total (100) port capacity. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 91 |

## ATTRIBUTE Ppp Ewfq egressServicingForQueue1 (q1)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transmission frequency of queue 1 as a percentage of the total (100) port capacity. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 3 |

## ATTRIBUTE Ppp Ewfq egressServicingForQueue2 (q2)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transmission frequency of queue 2 as a percentage of the total (100) port capacity. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 3 |

## ATTRIBUTE Ppp Ewfq egressServicingForQueue3 (q3)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transmission frequency of queue 3 as a percentage of the total (100) port capacity. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 3 |

# COMPONENT ProvisioningSystem (Prov)

| | |
|---|---|
| Groups | "GROUP Prov OsiState (State)"<br>"GROUP Prov Operational (Oper)"<br>"GROUP Prov Provisioned (Prov)" |
| Scope | Application |
| Description | *ProvisioningSystem*<br>This component implements the operator commands that are specific to the provisioning system. It also provides information about the state of the provisioning system. |
| Dyn. Subcomp. | "COMPONENT Prov View"<br>"COMPONENT Prov SoftwareMigration (Migration)" |
| Common Verbs | Help<br>List<br>Display |

## VERB ACTivate Prov

Impact: Service

Description: *Activate [-file(<file name>)] [-force] [-noPause] Prov*
This verb is used to activate (or bring into service) the provisioning data changes in the edit view or from a specified provisioning data file.

After activation completes, the operator must issue a *Confirm* command in order to prevent automatic re-activation of the committed view. Note that the committed view is not necessarily the same as the view which was in effect prior to the activation.

**Options:**
*-file (<file name>)*
specifies the name of a file containing provisioning data to be loaded, checked and activated. Note that only this form of the activate verb is allowed outside of provisioning mode.

The *file name* argument has the form
*name[.type[.number]]*
where *name* is the name of the file; *type* must be ***full***; and *number* is the unique sequence number of the file.

The *name* part of the argument must be between 1 and 31 characters in length, and may contain only alphanumeric characters and underscores. Note that file names are case-sensitive. If *number* is omitted, the most recent file beginning with *name.type* will be used; if both *type* and *number* are omitted, the most recent (complete) file beginning with *name.**full*** will be used.

*-force*
When a complete provisioning view is activated, the provisioning system checks to make sure that all the software necessary to activate the components contained in the view is currently running on the module. If any necessary software is missing, the *Activate* command fails and a list of missing software is displayed. The *-force* option overrides the checks for required software, and causes the file to be loaded and activated by

reloading the module with this provisioning data file.

When an unchecked provisioning view is being activated, the provisioning system runs a semantic *check* to issue errors and warnings. Some warnings are considered critical. For example, a service may have to be restarted in order to activate the specified provisioning data change, or a complete system restart may be required. If a semantic check error or critical warning occurs, the *activate* command is aborted. The *-force* option overrides the critical warnings, and activates the changes regardless. Note that semantic check errors can not be overridden.

In addition, if the journaled current view can be restored, then the *Activate Prov* command may cause the journaled current view to be purged, and a restore to be no longer possible. In this case, the *-force* option is required for the activation to proceed. Note that a restore is only possible if the attribute *restorePossible* is set to ***yes***.

*-noPause*
A staged software migration may enter a paused state if certain events occur. These events include software and hardware alarms on the migration shelf, provisioning data that is nacked, and the failure of an application to indicate that it is ready for the migration switchover. Once a software migration is paused, the user must issue the *Continue* command to unpause it.

The *-noPause* option indicates that the migration is never paused, even if a pausable event occurs.

*-pause*
A staged software migration is going to enter a paused state. Once a software migration is paused, the user must issue the *Continue* command to unpause it.

The *-noPause* and *-pause* Options are mutually exclusive.

## VERB Check Prov

| | |
|---|---|
| Impact | Configuration |
| Description | *Check [-stopOnError][-component (<name>) [-nonrecursive]] [-changed] Prov*<br><br>This verb checks the provisioning data in the edit view to ensure it is semantically correct. A view cannot be activated until this check has been successfully completed.<br><br>If the semantic check fails, all errors must be corrected before an activation attempt will succeed.<br><br>**Options:**<br>*-stopOnError*<br>This option specifies that the check should be aborted immediately upon finding the first error. If this option is not specified, the system will abort after five (or more) errors have been detected.<br><br>*-component(<name>)*<br>This option specifies that the named component and all its subcomponents (recursively) are to be checked for semantic correctness. That is, the entire subtree, rooted at the named component will be checked. If this option is not specified, the entire edit view is checked.<br><br>*-nonrecursive*<br>This option specifies that only the named component (that is, none of its subcomponents) is to be checked for semantic correctness.<br><br>*-changed*<br>This option specifies that checks will only be run on added or changed components. Note that this may mean that not all required checks will run. This option is not valid when the *-component* option is used. |

## VERB CLEAR Prov

Impact: System_admin

Description: *Clear [-removedFeature] Prov*
This verb, when used with no options, will remove all deletable components (and their subcomponents) from the edit view. Components which cannot be deleted (and their subcomponents) are not affected.

**Options**:
*-removedFeature*
This option is typically used in conjunction with previously having removed one or more features from one or more LPTs. This option specifies that all components, both deletable and non-deletable, which will have their associated software unloaded from the switch, are to be removed from the edit view by the provisioning system.

## VERB COMMIT Prov

Impact: Service

Description: *Commit [-file(<file name>)] [-force] Prov*
*Commit* makes the current view of the provisioning data the "committed" view. The committed view is the configuration that the module will activate following a Control Processor reset.

If the command specifies a filename, *Commit* will save the data for the current view in that file. If the current view has not been saved, the filename must be specified.

Note: in a system having two disks, the disks must be synchronized before the *commit* command will be accepted.

**Options:**
*-file(<file name>)*
specifies the name of the output file (actually the prefix for the output file name, as explained below) to be used for saving the current view data. If this option is not specified, the data for the current view must have already been saved, otherwise an error response will be generated.

The *file name* argument must be between 1 and 31 characters in length, and may contain only alphanumeric characters and underscores. File names are case-sensitive.

The actual file name used for the saved data has the form *name*.full.*number*
where *name* is the name specified in the *-file* option; and *number* is a unique sequence number for the file generated by the provisioning system.

*-force*
If the journaled current view can be restored, then the *Commit Prov* command will cause the journaled current view to be purged, and a restore will no longer be possible. In this case, the *-force* option is required for the *commit prov* command to proceed. Note that a restore is only possible if the attribute *restorePossible* is set to ***yes***.

## VERB Confirm Prov

| | |
|---|---|
| Impact | Service |
| Description | *Confirm Prov*<br>A *Confirm* command must be issued following each *Activate* command. This ensures that management connectivity has not been lost when a new provisioning view is brought into service.<br><br>If a *Confirm* is not entered within a reasonable time following an *Activate*, a system restart will occur and the committed view will be re-activated by the system. Service will be disrupted while the restart is in progress. |

## VERB Copy Prov

| | |
|---|---|
| Impact | Configuration |
| Description | *Copy [-source(<component name>) [-current] [-nonrecursive] [-destination(<component name>)] ]Prov*<br>This verb is used to copy all or part of a view into the edit view.<br><br>If no options are provided, the entire current view is copied into the edit view, replacing whatever was in the edit view previously, so that the two views are identical afterward.<br><br>**Options:**<br>*-source(<component name>)*<br>specifies that only the named component and its subcomponents are to be copied. If any of these components already exist in the edit view, the copy fails and the edit view is unchanged. When *-source* is the only option specified, the system automatically copies the component and its subcomponents, if any, from the current view into the edit view.<br><br>*-current*<br>specifies that components are to be copied from the current view to the edit view, rather than being copied from the edit view.<br><br>*-nonrecursive*<br>This option is valid only if the *-source* option is also present. It specifies that the named *source* component (but not its subcomponents) should be copied. If, however, the copied component has “required” subcomponents, the default instances of these “required” subcomponents are always created. (This is similar to the behavior of the *Add* command.)<br><br>*-destination(<component name>)*<br>specifies the name to be given to the copy of the *source* component when it is put into the edit view. Any copied subcomponents of the *source* component will be likewise renamed in the edit view. If any renamed component already exists in the edit view, the copy fails and the edit view is unchanged. |

## VERB End Prov

Impact: Configuration

Description:

*End Prov*
This verb is used to leave provisioning mode.

The edit view is unchanged by this command. The edit view is not automatically saved on disk; it will be presented to the next provisioning operator as it was when the *End* command was executed.

## VERB Load Prov

Impact: Configuration

Description:

*Load [-force] -file(<file name>) Prov*
This verb is used to load a specified file of provisioning data from the disk into the edit view.

**Options:**
*-file (<file name>)*
specifies the name of the file containing the provisioning data to be loaded.The *file name* argument has the form
*name[.type[.number]]*
where *name* is the name of the file; *type* is either ***full*** if the file contains a complete view, or ***part*** if the file contains only a particular component (and its subcomponents); and *number* is the unique sequence number of the file.

The *name* part of the argument must be between 1 and 31 characters in length, and may contain only alphanumeric characters and underscores. Note that file names are case-sensitive. If *number* is omitted, the most recent file beginning with *name.type* will be used; if both *type* and *number* are omitted, the most recent (complete) file beginning with *name.**full*** will be used.

*-force*
Normally, when a complete provisioning view is loaded, the provisioning system checks to make sure that all the software necessary to activate the components contained in the view is

currently running on the module. If any necessary software is missing, the *Load* command fails and a list of missing software is displayed.

The *-force* option overrides the checks for required software; that is, it causes the file to be loaded regardless of what software is currently running. When this option is used, error messages and software alarms may appear during loading of the file, and some components which are present in the file may be missing from the edit view when loading is complete.

The *-force* option also ensures the system processes the entire provisioning file rather than stopping after 5 errors.

## VERB Save Prov

Impact: Configuration

Description: *Save [-current] [-file(<file name>)] [-component(<component name>)] [-ascii] [-portable] Prov*
This verb is used to save all or part of a provisioning view on the disk.

If no options are provided, the entire edit view is saved, using a default file name (see the description of the *-file* option below).

**Options:**
*-current*
specifies that the provisioning data of the current view is to be saved. If this option is not specified, the data of the edit view is saved.

*-file(<file name>)*
This option specifies the name of the output file (actually the prefix for the output file name, as explained below). The name must be between 1 and 31 characters in length, and may contain only alphanumeric characters and underscores.

The actual file name used for the saved data has the form
*name.type.number*
where *name* is the name specified in the *-file* option; *type* is

automatically set to ***full*** if the file contains a complete view, or ***part*** otherwise; and *number* will be a unique sequence number for the file, generated by the provisioning system.

If the *-file* option is not specified, the *name* used in the most recent *Save*, *Load* or *Commit* command involving a complete view is used to construct the output file name as described above.

*-component(<component name>)*
This option specifies a particular component to be saved; the named component must be provisionable. Only this component and its subcomponents will appear in the saved provisioning data.

When this option is used, the *-file* option must also be specified; the name of the saved file will always have the form *name.**part**.number*

*-ascii*
This option is used to force the system to write a file in ASCII format. This format is not required by the Passport switch itself, but a file in this format may be used by external tools.

*-portable*
This option forces the system to write a complete file to disk. The ***portable*** format may at times be automatically generated when needed and the user would not normally be required to use this option. One reason to use this option is that the ***portable*** format is one complete unit (not dependent on any other view) and may be backed up, while the ***delta*** format has dependencies on the current view when saved.

If the *-ascii*, *-component* and *-portable* options are not specified, the system will save the differences between the edit and current views in the ***delta*** format.

## VERB Start (St) Prov

Impact: Configuration

Description:

*Start [-force] Prov*
This verb is used to enter the provisioning mode. Only one operator session can be in provisioning mode at a given time. Therefore a *Start* command is normally rejected if another session is in provisioning mode.

**Options:**
*-force*
This option allows an operator with at least ***systemAdministration*** impact to enter provisioning mode even when another operator's session is already in provisioning mode.

The other operator's session is forced out of provisioning mode, after completing any commands in progress. A message alarm is generated to indicate that the other session is no longer in provisioning mode. The contents of the edit view created by the other operator are unaffected by the change of ownership of the provisioning session; therefore on entering provisioning mode the new provisioning operator may see a partially provisioned edit view created by the previous provisioning operator. Note that this view might not have been saved on disk by the previous operator.

## VERB Tidy Prov

Impact: Configuration

Description:

*Tidy[-all]*
*[-keep(<file> ...)]*
*[-remove(<file> ...)]*
*[-fromDate(<date>) -toDate(<date>)]*

This verb causes the system to remove old provisioning views and/or software from the disk. Note that at least one option must be included in the command.

The following views and files are never removed by the *Tidy* command, regardless of the options specified in the command:
- the committed view

- the most recent complete view used by an *Activate*, *Load*, *Save* or *Commit* command
- the current view, if it exists as a saved view
- any view that is a base view for another kept view
- all protected views
- views that are currently opened for reading or writing
- non-provisioning files

The sequence of tidying events is as follows:
- prepare a list of candidate files for deletion (using the *-all*, *-remove* options)
- remove files from the list if they must be kept (using the *-keep*, *-fromDate*, *-toDate* option)
- remove the files on the list

This means that if the options specify a particular file (either explicitly or by wild-carding) both for removal and keeping, then the file will be kept.

**Options:**

*-all*
specifies that all views except the special views mentioned above are to be removed. This option can not be combined with the *-remove*, *-fromDate*, or *-toDate* options.

*-keep(<view> <view> ...)*
specifies that all views except the given list of views and the special views mentioned above are to be removed. Combining the *-all* option with this option is redundant.

*-remove(<view> <view>...)*
specifies that the given list of views are to be removed.

*-fromDate(<date>)*
specifies the start date (which has a format of yyyy-mm-dd) of the period for which views are to be removed. The period

specification is inclusive, that is, views created or modified on this date will be removed. If this option is specified, the *-toDat*e option must also be specified in the command. Also, the time specified by *toDate* must not be earlier than *fromDate*.

*-toDate(<date>)*
specifies the end date (which has a format of yyyy-mm-dd) of the period for which views are to be removed. The period specification is inclusive, that is, views created or modified on this date will be removed. If this option is specified, the *-fromDate* option must also be specified in the command. Also, the time specified by *toDate* must not be earlier than *fromDate*.

## VERB STOP Prov

Impact: Configuration

Description: *Stop Prov*
This verb causes certain potentially long-running *ProvisioningSystem* commands to be aborted. Only the *Apply*, *Check*, *Load*, *Save*, and *Activate* commands can be stopped in this manner and they can only be stopped by a user in provisioning mode.

If *provisioningActivity* has the value "***semantic checking***", "***saving***" or "***loading or applying***", the *ProvisioningSystem* attempts to abort the activity at the earliest possible time. This may not happen immediately as the command must finish the phase it is in before aborting. If *provisioningActivity* has the value "***activating***" and this is a software upgrade and only the sw component was changed, then *ProvisioningSystem* attempts to abort the command.

The *activityProgress* indicates the status of the abort until it has occurred. Note that the *Stop* command itself completes immediately (indicating success) even if the long-running command does not (the long-running command will indicate that it has been cancelled when it actually stops).

If *provisioningActivity* has any other value, or is not applicable to the activation, the user is notified that the *Stop* command is not supported for the current activity.

## VERB APPly Prov

| | |
|---|---|
| Impact | Configuration |
| Description | *Apply [-force] -file(<file name>) Prov*<br>This verb is used to apply a previously stored set of changes (saved in ***delta*** format) to the edit view.<br><br>**Options:**<br>*-file (<file name>)*<br>specifies the file, saved with a ***delta*** format, containing the changes to be applied.The *file name* argument has the form *name[*.full*[.number]]*<br>where *name* is the name of the file; and *number* is the unique sequence number of the file.<br><br>The *name* must refer to a file saved with a ***delta*** format, that is, created by the *Save Prov* command without the *-ascii* or *-portable* options. Note that file names are case-sensitive. If *number* is omitted, the most recent file beginning with *name.**full*** will be used; if only name is specified, the most recent (complete) file beginning with *name.**full*** will be used.<br><br>*-force*<br>Normally, when a complete provisioning view is applied, the provisioning system checks to make sure that all the software necessary to activate the components contained in the view is currently running on the module. If any necessary software is missing, the *Apply* command fails and a list of missing software is displayed.<br><br>The *-force* option overrides the checks for required software; that is, it causes the file to be loaded regardless of what software is currently running. When this option is used, error messages and software alarms may appear during processing of the file, and some components which are present in the file may be missing from the edit view when the apply completes.<br><br>The *-force* option also ensures the system processes the entire provisioning file rather than stopping after 5 errors. |

## VERB Continue Prov

| | |
|---|---|
| Impact | Service |
| Description | *Continue [-force] Prov*<br>This verb causes a software migration activation to be continued if it has been paused. Only an *Activate* command where the *provisioningActivity* has the value "***software migration paused, manual intervention required***" can be continued.<br><br>If *provisioningActivity* has any other value, the user is notified that this command is not supported for the current activity.<br><br>*-force*<br>The *-force* option is going to continue software migration regardless of the pause cause. Pause cause can be that operator used *Activate* command with *-pause* option, or some pausable event occurred. These events include software and hardware alarms on the migration shelf, provisioning data that is nacked, and the failure of an application to indicate that it is ready for the migration switchover. |

## VERB REStore Prov

| | |
|---|---|
| Impact | Service |
| Description | *Restore Prov*<br>This verb causes the provisioning system to re-activate the journaled current view if a switch resets to the committed view. The attribute *restorePossible* is set to ***yes*** in the case where the *Restore Prov* command can be issued to restore the journaled current view. |

## GROUP Prov OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Prov adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Prov operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Prov usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Prov Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes for the *ProvisioningSystem* component.

### ATTRIBUTE Prov provisioningActivity

Access
Read only

Description
This attribute describes the type of provisioning activity that the *ProvisioningSystem* component is performing.

Values
initial loading
none

activation
initial activation
rolling back
saving
loading or applying
semantic checking
waiting for confirm
clearing
copying
committing
deleting
confirming
adding
restoring

Default: No default

### ATTRIBUTE Prov activityProgress

Access: Read only

Description: This attribute indicates the status relating to a long-running command handled by the *ProvisioningSystem*. It is usually expressed as a percentage of the number of elements (for example, components) processed with respect to the total set of elements that need to be processed for that activity. Note that, one cannot assume that the percentage implies how much time the task may still take. The time to complete the activity is dependent on many things which are beyond the control of the *ProvisioningSystem* itself.

Values: String (1..255, ASCII)

Default: No default

### ATTRIBUTE Prov committedFileName

Access: Read only

Description: This attribute contains the name of the committed file. This is the file that will be used to obtain the provisioning data if the module restarts.

| | |
|---|---|
| | Immediately after system power-up, this attribute contains the name of the file used during initial loading. |
| Values | String (1..40, ASCII) |
| Default | No default |

### ATTRIBUTE Prov currentViewFileName

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the name of the provisioning file that contains the current view provisioning data.<br><br>After system power-up, this attribute contains the name of the file used during initial loading.<br><br>If the current view data has not been saved, this attribute is empty. |
| Values | String (1..40, ASCII) |
| Default | No default |

### ATTRIBUTE Prov lastUsedFileName

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the last saved, loaded or committed file name. If a *Load*, *Save* or *Commit* command returns an error, this attribute remains unchanged.<br><br>Immediately after system power-up, this attribute contains the name of the file used during initial loading. |
| Values | String (1..40, ASCII) |
| Default | No default |

### ATTRIBUTE Prov provisioningSession (session)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the component name of the operator session which is currently in provisioning mode. For example, |

| | |
|---|---|
| | ***NMIS Telnet Session/2***<br>If no session is in provisioning mode, this attribute will be empty. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Prov provisioningUser (user)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the *userid* of the operator who is currently provisioning the module. If no session is in provisioning mode, this attribute will be empty. |
| Values | String (1..8, ASCII) |
| Default | No default |

### ATTRIBUTE Prov checkRequired

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether semantic checking is required before activating the edit view. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Prov confirmRequired

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the operator must enter a *Confirm Prov* command in order to keep a newly activated or restored current view in effect.<br><br>If an activation or restore is not confirmed within 20 minutes of its completion, the module will restart using the committed provisioning data. |
| Values | yes<br>no |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Prov editViewName (evName)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the name of the provisioning view that represents the edit view provisioning data.<br><br>If the edit view data has not been saved, this attribute is empty. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Prov editViewAddedComponents (evAdded)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of provisioning components that have been added to the edit view with respect to the current view. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Prov editViewDeletedComponents (evDeleted)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of provisioned components that have been deleted from the edit view with respect to the current view. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Prov editViewChangedComponents (evChanged)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of provisioned components whose attributes differ between the edit and current views. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Prov standbyCpActivity

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current activity being performed by the provisioning system on the standby CP. This attribute may take the following values:<br>***none*** - When no provisioning activity is in progress.<br>***loading provisioning data*** - When a committed file is being loaded.<br>***saving commit-format provisioning data*** - When provisioning data is being saved with commit formats in preparation for a software migration.<br>***delivering provisioning data on migrating cards*** - When the standby CP is being activated as the migration active card for a software migration.<br>***synchronizing provisioning data***- When a journal log file is being loaded on the standby CP in order to synchronize the standby CP configuration database with the active CP configuration database. This occurs after a manual activation has been confirmed when CP equipment protection is provisioned.<br>***loading new software on CP*** - When the standby CP is coming up and is being loaded with software. |
| Values | none<br>loading provisioning data<br>saving commit-format provisioning data<br>delivering provisioning data on migrating cards<br>synchronizing provisioning data<br>loading new software on CP |
| Default | No default |

### ATTRIBUTE Prov standbyCpActivityProgress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the provisioning activity which the *ProvisioningSystem* is performing on the standby CP. |
| Values | String (1..255, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Prov journalDisabledReason

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason (if any) that journal log file saving is disabled. This attribute may take the following values:<br>***"not disabled"*** - If journal log file saving is operationally enabled.<br>***"not configured"*** - If journal log file saving is provisioned to be disabled.<br>***"file system error***" - If journal log file saving is operationally disabled due to a file system problem, such as disk full or file system locked.<br>***"threshold exceeded"*** - If journal log file saving is operationally disabled because the maximum number of journal log files has already been reached.<br>***"reload activation***" - If journal log file saving is operationally disabled because the last activation was a reload activation.<br>***"initial commit required"*** - If journaling has just been enabled by provisioning but a *Commit Prov* has not been issued.<br>"***restore failed***" - If journal log saving is operationally disabled because the *restore prov* command failed to restore all the journal logs.<br><br>After the error condition is corrected, a *Commit Prov* command causes journaling to become enabled once again. |
| Values | not disabled<br>not configured<br>file system error<br>threshold exceeded<br>reload activation<br>initial commit required<br>restore failed |
| Default | No default |

### ATTRIBUTE Prov restorePossible

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates whether or not it is possible to use the *Restore Prov* command to restore to the last known current view after a switch reset.
If a switch comes up and a *Restore Prov* command is possible, a warning alarm with index 7000 0038 will be raised against the *Prov* component. This alarm will be cleared when the *Restore Prov* command is issued by the operator. It will also be cleared if the operator does not perform a *Restore Prov* command, but performs an *Activate Prov* or a *Commit Prov.*
Note that an activation or commit before a *Restore Prov* command results in the removal of all the existing journal log files, so that a *Restore Prov* command will no longer be possible. This situation is indicated to the operator by a semantic check warning.

Values

yes
no

Default

No default

### ATTRIBUTE Prov currentJournal (currentJn)

Access

Read only

Description

This attribute indicates the number of journal logs files that have been saved since the last *Commit Prov* command.

When the value of the *currentJournal* attribute approaches the provisioned maximum allowed number of journal log files (a value represented by the *maxNumberJournalFiles* attribute), an alarm with index 7000 0036 is raised against the *Prov* component. The severity of the alarm depends on the percentage of the maximum allowed number of journal log files that have been saved since the last *Commit Prov* command:

75% - Warning
85% - Minor
95% - Major

If the user does not perform a *Commit Prov* command and allows the value of the *currentJournal* attribute to equal the *maxNumberJournalFiles* attribute, journal log file saving becomes operationally disabled. In this case, a critical alarm with

index 7000 0037 is raised against the *Prov* component. The resulting impact is that CP equipment protection is disabled, and a CP switchover attempt would result in a shelf reset instead.

When the user enters a *Commit Prov* command, all previous journal logs are removed and the *currentJournal* attribute is reset to zero. If an alarm was raised because journal log saving was disabled, it is cleared. If an alarm was raised due to the number of journal log files before the commit prov, it is cleared. If CP equipment protection and journal log saving were disabled before the *Commit Prov* command because of the number of journal log files, they become enabled after the *Commit Prov* command.

Values: Decimal (0..2000)

Default: No default

## GROUP Prov Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for the *ProvisioningSystem* component.

## ATTRIBUTE Prov maxNumberJournalFiles (maxJn)

Access: Read and write

Description: This attribute specifies the maximum number of journal files that can be saved. A value of ***none*** specifies that journaling is disabled, while any other value specifies that journaling is enabled. The *Shelf cpEquipmentProtection* attribute must be set to ***cold*** when the *maxNumberJournalFiles* attribute is set to ***none***.

The value of the *maxNumberJournalFiles* attribute must be greater than the value of the *Prov currentJournal* operational attribute. If it is not, the resulting impact is that journal log file saving becomes operationally disabled. A critical alarm with index 7000 0037 is also raised against the *Prov* component. A *Commit Prov* command would need to be entered to re-enable journaling.

The operator may want to set the *maxNumberJournalFiles*

attribute to be less than the default value of ***2000*** in order to force a *Commit Prov* command to be entered more frequently. If a switch reset to the committed view occurs, the *Restore Prov* command may take less time to complete in this case, since there are fewer journal log files to load and activate.

Values: Decimal (100..2000)
none

Default: 2000

## COMPONENT Prov View

Instance: String (1..40, ASCII)

Groups: "GROUP Prov View Operational (Oper)"

Scope: Application

Description: *Prov View/<string>*
This component represents information about provisioning views.

Most of these views have been saved and can be activated or loaded. In this case, the format for <string> is
<name>.<type>.<number>
where <name> is the view's name; <type> is either ***full*** or ***part***, <number> is a unique sequence number generated by the system.

The ***current*** and ***edit*** views are not necessarily saved.

Common Verbs:

List
Display

## GROUP Prov View Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *View* component.

## ATTRIBUTE Prov View user

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the *userid* of the operator who first saved this view. It may be empty if unknown or if the view has not been saved. |
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE Prov View checkState

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the semantic check state of the view when it was saved. The values are described in worst to best order.<br><br>The ***failed*** state indicates that the view has failed a semantic check and cannot be activated.<br><br>The ***unknown*** state indicates that semantic checks have not been run and the view cannot be activated.<br><br>The ***partial*** state indicates that the view has passed incomplete checks, that is *Check -changed Prov* has succeeded. This is also the best state value for a partial view. Thew view cannot be activated until it has been fully checked.<br><br>The ***softwareChanged*** state indicates that the view has passed complete checks, but by software other than that to be activated, that is, either the application versions have changed, or features have been added. After activation, the new software may detect semantic errors. After correcting these errors, if any, the view will need to be re-saved or re-committed as appropriate.<br><br>The ***full*** state indicates that the view has passed complete checks, that is, it has been fully verified. It can be activated. |
| Values | failed (fail)<br>unknown (unk)<br>partial (part)<br>softwareChanged (sw)<br>full |
| Default | No default |

## ATTRIBUTE Prov View components (comps)

| | |
|---|---|
| Access | Read only |
| Description | This attributes indicates the number of provisioned components that have been (or could be) saved. |
| Values | Decimal (0..999999) |
| Default | No default |

## ATTRIBUTE Prov View formats

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the formats of the saved information. Each serves a different purpose.<br><br>The ***ascii*** format is readable by operators and can be easily parsed and generated by scripts. NMS makes use of this format. Note that the syntax is subject to change without notice. This format is generated via *Save -ascii Prov.* A view with an ascii format can be loaded and activated.<br><br>The ***commit*** format is generated via *Commit Prov* and allows for fast activation, that is, a shorter service outage time. The system will never leave a view with only this format, as it cannot be loaded.<br><br>The ***delta*** format contains the changes made between the current view and the edit view. It is, therefore, much smaller and faster to *Load* or *Save* than the other formats. A view containing this format can be loaded or have the changes applied to the edit view. This provides a mechanism to propagate a set of changes from one view to another. A view containing only this format can be activated if this would not require a system reload. To generate this format, issue *Save Prov* without the *-ascii* or *-portable* options.<br><br>The ***part*** format is generated via *Save -component() Prov.* The part format can be loaded. The syntax of this format is subject to change without notice. |

| | |
|---|---|
| | The ***portable*** format is a compact representation that can be quickly loaded. It can be transported from one Passport to another, or to an NMS. It is generated via *Save -portable Prov.* The portable format can be loaded and activated. |
| Set of | ascii<br>commit<br>delta<br>part<br>portable (port) |
| Default | No default |

### ATTRIBUTE Prov View baseView (base)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the name of the view upon which this view's changes are based (even if the ***delta*** format does not exists). In other words, it indicates the name of the current view that existed at the time that this view was saved. This may not be the name of the current view that is running now.<br><br>This attribute is empty when the view is unsaved or if the current view was saved. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Prov View version

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the version of base software that saved this view.<br><br>It is empty if unknown. |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE Prov View creationDate

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the creation date of this view. |
| Values | Time (DHMS) |
| Default | No default |

### COMPONENT Prov SoftwareMigration (Migration)

| | |
|---|---|
| Groups | "GROUP Prov Migration OsiState (State)" |
| Scope | Application |
| Description | *Prov SoftwareMigration*<br>This component coordinates the migration visible alarms generated by the migration shelf while a software migration activation is in progress. The *Migration* component is automatically created at the start of a software migration activation and is removed at the completion of a software migration activation, whether successful or unsuccessful. The presence of the *Migration* component indicates that a software migration activation is being performed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Prov Migration OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Prov Migration adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Prov Migration operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

## ATTRIBUTE Prov Migration usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

# COMPONENT RoutingGateway (RGty)

| | |
|---|---|
| Instance | Decimal (0..4294967295) |
| Groups | "GROUP RGty OsiState (State)"<br>"GROUP RGty Prov (Prov)"<br>"GROUP RGty Oper (Oper)"<br>"GROUP RGty CustomerIdentifierData (CidData)" |
| Scope | Network |
| Description | *RoutingGateway/n*<br>This component must be provisioned on nodes where calls cross boundaries between topology regions. It must also be provisioned on nodes where calls cross boundaries between cluster and non-cluster nodes. A *RGty* is responsible for bridging calls across these boundaries. A *RGty* upon the receipt of a call setup message terminates the existing segment of the call coming from the direction of its source and originates a new path segment of the call towards its destination. This means that each call handled by the *RGty* consists of two segments: one leading to the source of the call and the other leading to the destination of the call.<br><br>The *RGty* may be provisioned on one or more logical processors (*Lp*s). If an *RGty* is provisioned on a single *Lp*, all calls bridged across the above mentioned boundaries through this node will have their path segments terminated and originated on this *Lp*. If a single *Lp* does not have sufficient capacity to bridge all of the calls then multiple *RGty*s may be provisioned on multiple *Lp*s and the calls will be equally shared among all the *RGty*s.<br><br>For more information as to which *Lp* to choose for the *RGty*, or |

for information as to how many *RGty*s should be provisioned on a node please refer to the Engineering Guidelines.

## GROUP RGty OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE RGty adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE RGty operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE RGty usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in

use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE RGty availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot

operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE RGty proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE RGty controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

| | |
|---|---|
| | The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE RGty alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. |

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE RGty standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE RGty unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP RGty Prov (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes of the *RGty.* |

### ATTRIBUTE RGty logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies a logical processor (*Lp*) on which the *RGty* resides. The *RGty* may reside on any *Lp* simply by pointing this attribute to the *Lp/n* component. Only one *RGty* may reside on an *Lp*.<br><br>For more information as to which *Lp* to choose for the *RGty,* or for information as to how many *RGty*s should be provisioned on a node please refer to the Engineering Guidelines. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE RGty maxCalls (maxc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum number of calls that the *RGty* can handle, thus the attribute is used to limit resource (CPU and memory) usage by the *RGty.* The attribute is also used to control the spreading of calls among multiple *RGty*s. When a call needs to cross a topology region or cluster boundary, the *RGty* selected to handle the call is the one which has the smallest ratio of *currentCalls* to *maxCalls*. For example, assume there are two *RGty*s, first with *currentCalls* = 1 and *maxCalls* = 10, second with *currentCalls* = 1 and *maxCalls* = 100. New calls will go to the second *RGty* until it has *currentCalls* = 11 at which time the first *RGty* will take one call giving it the ratio of 2 *currentCalls* to 10 *maxCalls*. Then, 10 more calls will go to the second *RGty* and the next call to the first *RGty*, and so on.<br><br>Note that the spreading algorithm is approximate and does not yield exact results due to latency in the delivery and caching of the required distributed data.<br><br>It is important to note that this attribute does not guarantee enough resources are available to handle the maximum number of calls. It simply guarantees that no more than the maximum number of calls will be handled by the *RGty.* |
| Values | Decimal (0..1000) |
| Default | 100 |

### GROUP RGty Oper (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *RGty.* |

### ATTRIBUTE RGty currentCalls (curc)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the number of calls that the *RGty* is currently handling. Note that *currentCalls* may exceed *maxCalls* when *maxCalls* was decreased at the time when the *RGty* had *currentCalls* greater than the new *maxCalls*. For example, if the *RGty* has *currentCalls* = 70 and *maxCalls* = 100 when *maxCalls* is decreased to 50 then until 20 calls are cleared *currentCalls* will be greater than *maxCalls*. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty setupFromGateway (sfg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the call setup messages that the *RGty* has received across the topology region or cluster boundary. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty setupToGateway (stg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the call setup messages that the *RGty* has sent across the topology region or cluster boundary. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty connectFromGateway (cfg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the call connect messages that the *RGty* has received across the topology region or cluster boundary. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty connectToGateway (ctg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the call connect messages that the *RGty* has sent across the topology region or cluster boundary. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty releaseFromGateway (rfg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the call release messages that the *RGty* has received across the topology region or cluster boundary. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty releaseToGateway (rtg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the call release messages that the *RGty* has sent across the topology region or cluster boundary. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty rerouteFromGateway (rrfg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Passport proprietary reroute messages that the *RGty* has received across the topology region or cluster boundary. This reflects the number of times a call handled by the *RGty* has been moved from one boundary (inter-region or cluster) link to another. The call is moved as a result of a successful reroute due to link failure, or as a result of call balancing or optimization occurring on the local node or node across the boundary. |
| Values | Decimal (0..65535) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE RGty rerouteToGateway (rrtg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Passport proprietary reroute messages that the *RGty* has sent across the topology region or cluster boundary. This reflects the number of times a call handled by the *RGty* has been moved from one path to another within the *RGty*'s topology region or cluster. The call is moved as a result of a successful reroute due to a link failure within the *RGty*'s topology region or cluster, or as a result of call balancing or optimization occurring within this region or cluster. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty failedCallAttempts (fc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the calls handled by the *RGty* that have failed during their establishment phase (setup and connect). |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty localResourceExhaustionReleases (lr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the call release messages that the *RGty* has generated due to a lack of resources required to process a call setup or connect message. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty lastFailedAttemptCalledAddress (fcda)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the final destination NSAP address of the last call handled by the *RGty* which failed in its establishment phase. An empty string implies that there has been no call establishment failure so far. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE RGty lastFailedAttemptCallingAddress (fcca)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the initial source NSAP address of the last call handled by the *RGty* which failed in its establishment phase. An empty string implies that there has been no call establishment failure so far. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE RGty lastFailedAttemptReleaseCause (fcrc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Q.2931 release cause for the last call handled by the *RGty* which failed in its establishment phase. A value of 0 implies that there has been no call establishment failure so far. The most common release causes are as follows:<br><br>3 = No Route To Destination, (routing system cannot get there)<br>17 = User Busy, (called party already has a call up)<br>18 = No User Response, (called party not responding)<br>21 = Call Rejected, (called party not accepting call)<br>37 = Cell Rate Unavailable (network congestion upstream)<br>41 = Temporary Failure (upstream card failure, etc.)<br>45 = No VPI VCI Available (got route but no B/W or VCC upstream)<br>47 = Resource Unavailable (got route but no resources upstream)<br>88 = Incompatible destination (called party not compatible)<br>102 = Timer Recovery (control or data congestion upstream) |

| | |
|---|---|
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty lastFailedAttemptReleaseDiag (fcrd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Q.2931 release diagnostic for the last call handled by the *RGty* which failed in its establishment phase. An empty string implies that there has been no call establishment failure so far. |
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE RGty lastFailedAttemptTime (fct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time at which the *RGty* processed the last call that failed in its establishment phase. If no call establishment failures have occurred then it gives the time the *RGty* was created. |
| Values | Time (DHMS) |
| Default | No default |

### GROUP RGty CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE RGty customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; |

otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

## COMPONENT RGty Call (Call)

| | |
|---|---|
| Instance | Decimal (0..65534) |
| Groups | "GROUP RGty Call Oper (Oper)" |
| Scope | Network |
| Description | *RGty/n Call/n*<br>This component represents a call from source to destination that is handled by the *RGty*. The *RGty* upon the receipt of a call setup message terminates the existing path segment of the call coming from the direction of its source and originates a new path segment of the call towards the destination. This means that each *RGtyCall* consists of two path segments: one leading to the source of the call and the other leading to the destination of the call. |
| Dyn. Subcomp. | "COMPONENT RGty Call Segment (Seg)" |
| Common Verbs | Help<br>List<br>Display |

### VERB CLEAR RGty Call

| | |
|---|---|
| Impact | Service |
| Description | Clearing a *RoutingGatewayCall* causes the termination of the entire call handled by *RGty*. That is, path segments leading to both the source and destinaiton are terminated. |

### GROUP RGty Call Oper (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *RGtyCall*. |

### ATTRIBUTE RGty Call stateToSource (sts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current state of the path segment of the *RGtyCall* leading towards the source of the call. See the *state* attribute of *RGtyCallSegment* component for more details. |
| Values | String (0..30, ASCII) |
| Default | No default |

### ATTRIBUTE RGty Call stateToDestination (std)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current state of the path segment of the *RGtyCall* leading towards the destination of the call. See the *state* attribute of *RGtyCallSegment* component for more details. |
| Values | String (0..30, ASCII) |
| Default | No default |

### ATTRIBUTE RGty Call calledAddress (cda)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the final destination NSAP address of the *RGtyCall*. |
| Values | String (0..40, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE RGty Call callingAddress (cga)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the initial source NSAP address of the *RGtyCall*. |
| Values | String (0..40, ASCII) |
| Default | No default |

### COMPONENT RGty Call Segment (Seg)

| | |
|---|---|
| Instance | toSource (s)<br>toDestination (d) |
| Groups | "GROUP RGty Call Seg Oper (Oper)" |
| Scope | Network |
| Description | *RGty/n Call/n Segment/n*<br>This component represents one of the two path segments of the call handled by the *RGty*: the one leading to the source of the call or the one leading to the destination of the call. Under each *RGtyCallSegment* is the *LogicalConnection* component for the routing system which is responsible for the management of that path segment. |
| Dyn. Subcomp. | "COMPONENT RGty Call Seg AtmConnection (AtmCon)"<br>"COMPONENT RGty Call Seg LogicalConnection (LCo)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP RGty Call Seg Oper (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *RGtyCallSegment*. |

### ATTRIBUTE RGty Call Seg state (st)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current state of the *RGtyCallSegment*. |
| Values | String (0..15, ASCII) |
| Default | No default |

### COMPONENT RGty Call Seg AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP RGty Call Seg AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP RGty Call Seg AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE RGty Call Seg AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

## COMPONENT RGty Call Seg LogicalConnection (LCo)

| | |
|---|---|
| Groups | "GROUP RGty Call Seg LCo PathData"<br>"GROUP RGty Call Seg LCo Statisitics (Stats)" |
| Scope | Application |
| Description | ...*Lc*<br>This component contains all of the operation attributes for a Path Oriented Logical Connection. |
| Common Verbs | Help<br>List<br>Display |

## VERB RERoute RGty Call Seg LCo

| | |
|---|---|
| Impact | Service |
| Description | RERoute ..Lc<br>This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified.<br>This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively.<br><br>When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path.<br><br>If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent. |

### GROUP RGty Call Seg LCo PathData

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all operational attributes for the path oriented LCo. |

### ATTRIBUTE RGty Call Seg LCo state

| | |
|---|---|
| Access | Read only |
| Description | This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again. |
| Values | pathDown<br>selectingRoute<br>connecting<br>pathUp<br>pathDownRetrying |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo overrideRemoteName (orn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost. |
| Values | String (0..40, ASCII) |

| | |
|---|---|
| Default | "" |

### ATTRIBUTE RGty Call Seg LCo end

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies whether this is the calling or called end of the path. |
| Values | calling<br>called |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo costMetric (cost)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo delayMetric (delay)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond.<br>For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic.<br>For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC.<br>When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond. |
| Values | Decimal (0..200000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo setupPriority (spri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo holdingPriority (hpri)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path |

can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType***,** will be candidates for this connection.

Values

voice
data
video
trafficType1 (tt1)
trafficType2 (tt2)
trafficType3 (tt3)
trafficType4 (tt4)
trafficType5 (tt5)

Default

No default

## ATTRIBUTE RGty Call Seg LCo permittedTrunkTypes (pttyp)

Access

Read only

Description

This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.

| | |
|---|---|
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo requiredSecurity (rsec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.* |
| Values | Decimal (0..7) |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo requiredCustomerParameter (rcparm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks |

whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.

Values: Decimal (0..7)

Default: No default

### ATTRIBUTE RGty Call Seg LCo emissionPriority (epri)

Access: Read only

Description: This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).

Values: Decimal (0..2)

Default: No default

### ATTRIBUTE RGty Call Seg LCo discardPriority (dpri)

Access: Read only

Description: This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).

Values: Decimal (1..3)

Default: No default

### ATTRIBUTE RGty Call Seg LCo pathType (pType)

Access: Read only

Description: This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other

*pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).

The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.

Values
normal
manual
forced

Default
No default

## ATTRIBUTE RGty Call Seg LCo retryCount (rcount)

Access
Read only

Description
This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology.
This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.

Values
Decimal (0..255)

Default
No default

### ATTRIBUTE RGty Call Seg LCo pathFailureCount (pfcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo reasonForNoRoute (rnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes. |
| Values | none<br>destinationNameTooLong<br>destinationNotSpecified<br>unknownDestinationName<br>incorrectDestination<br>incorrectDestinationEndPoint<br>unknownSource<br>unknownDestination<br>sameNode<br>routeCostTooMuch<br>routesDelayTooLong<br>attributesNotMet<br>anError |

| | |
|---|---|
| | attributeProfileProblem<br>manualPathIndexProblem |
| Default | none |

### ATTRIBUTE RGty Call Seg LCo lastTearDownReason

| | |
|---|---|
| Access | Read only |
| Description | This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:<br>***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up.<br>***normalShutDown*** - This path has gone down due to normal call termination.<br>***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.<br>***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.<br>***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.<br>***trunkCardFailure***- A trunk FP card has failed along the path.<br>***accessCardFailure***- The FP on which the peer access service was running has failed.<br>***operatorForced***- The path has terminated due to the operator locking a trunk along the path.<br>***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.<br>***networkCongestion*** - The path has failed due to control |

information being lost and not recoverable.
***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name.
***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid.
***unknownReason*** - The failure was not resolved.
***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled.
***remoteNameMismatch*** - The remote end has alarmed and rejected this setup due to remoteName provisioning.
***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.
***reconnectFromFarEnd*** - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
***bumped*** - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
***optimized*** - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
***trunkOrFarEndDidNotSupportMode*** - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

### ATTRIBUTE RGty Call Seg LCo pathFailureAction

Access

Read only

Description

This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is

allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Values
reRoutePath
disconnectConnection

Default
No default

### ATTRIBUTE RGty Call Seg LCo bumpPreference (bpref)

Access
Read only

Description
This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority*. A connection may also always bump in order to obtain the best route.

Values
bumpWhenNecessary
bumpToObtainBestRoute

Default
No default

### ATTRIBUTE RGty Call Seg LCo optimization (opt)

Access
Read only

Description
This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

Values
disabled
enabled

| | |
|---|---|
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo pathUpDateTime

| | |
|---|---|
| Access | Read: Service<br>Write: Illegal |
| Description | This is the time stamp when the current path was established or reestablished. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo path

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the trunk component names over which the path has been instantiated and the remote end point name terminating the path. |
| List of | String (0..40, ASCII) |
| List Size | 21 |
| Default | No default |

### GROUP RGty Call Seg LCo Statisitics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics attributes for the path oriented LCo. |

### ATTRIBUTE RGty Call Seg LCo pktsToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets transmitted to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo bytesToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo pktsFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote LCo via the network. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE RGty Call Seg LCo bytesFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the remote LCo via the network. |
| Values | Long Integer |
| Default | No default |

# COMPONENT RncInterfaceNode (RncIn)

| | |
|---|---|
| Groups | "GROUP RncIn Provisioned (Prov)"<br>"GROUP RncIn OsiState (State)" |
| Scope | Network |
| Description | *RncInterfaceNode*<br>This component represents system level information related to a passport configured either as a classic I-Node in an RNC or as a RNC Compact. |
| Common Verbs | Help<br>List<br>Display |

## GROUP RncIn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes of the *RncInterfaceNode* component. |

## ATTRIBUTE RncIn primaryOmuIpAddress (priOmuAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP address of the primary Omu in the Control Node. This IP address is used to establish a link between the I-Node and the C-Node in the RNC. This address must be the same as the C-Node primary OmuIP address configured in the CT-2000. If the value of this attribute is changed, the Master and |

| | |
|---|---|
| | Standby APs must be reset after the *Activate Prov* command has completed. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE RncIn secondaryOmuIpAddress (secOmuAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Ip Address of the secondary Omu in the Control Node. This attribute is used to establish a link between the I-Node and the C-Node in the case where the primary Omu is not active. This address must be the same as the secondary OMU IP address configured in the CT-2000. If the value of this attribute is changed, the Master and Standby APs must be reset after the *Activate Prov* command has completed. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE RncIn protocolConverterResources (pcRes)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This value represents the percentage of processing resources for Protocol Converters (PC). When this value increases, more resources will be devoted to Protocol converters. When this value decreases, more resources will be devoted to Radio Access Bearer services. If you change this value, the new value takes effect as new processing resources come into service. To force the new percentage to be effective immediately, either reset the whole shelf or enough processing resources. The processing resources for protocol converters will be allocated based on the nearest percentage possible to the specified one. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 17 |

## ATTRIBUTE RncIn mode (mode)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Module |
| Description | This attribute specifies the mode of RNC configuration. A value of *InodeClassic* indicates a normal Classic configuration. A value of *RncCompact* indicates a complete RNC Compact configuration. |
| Values | inodeClassic<br>rncCompact |
| Default | inodeClassic |

## GROUP RncIn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE RncIn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE RncIn operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE RncIn usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

| | |
|---|---|
| | The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

# COMPONENT RemoteServerAgent (Rsa)

| | |
|---|---|
| Instance | String (1..8, ASCII) |
| Groups | "GROUP Rsa Options"<br>"GROUP Rsa OsiState (State)"<br>"GROUP Rsa Operational" |
| Scope | Network |
| Description | *RemoteServerAgent/<string>*<br>The *Rsa* component provides non-Passport based applications access to Passport servers via a Frame Relay SVC connection. The *Rsa* component can be provisioned on any Passport module in the network. Multiple *Rsa* components can be provisioned for load sharing and/or backup purposes. The component instance value is a unique string within the module. |
| Subcomponents | "COMPONENT Rsa DataNetworkAddress (Dna)" |
| Opt. Subcomp. | "COMPONENT Rsa VncsAccess" |
| Dyn. Subcomp. | "COMPONENT Rsa Connection" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Rsa Options

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | The *Options* group defines provisionable attributes associated with the *Rsa* component. |

### ATTRIBUTE Rsa logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the logical processor on which the RSA process will execute. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### GROUP Rsa OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Rsa adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Rsa operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)

Default
disabled

### ATTRIBUTE Rsa usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Rsa Operational

| | |
|---|---|
| Properties | Operational |
| Description | The *Operational* group defines operational attributes associated with the *Rsa* component. |

### ATTRIBUTE Rsa maxRsiConnections

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the maximum number of RSI connections which can be supported by this *Rsa*. |
| Values | Decimal (1000) |
| Default | No default |

### ATTRIBUTE Rsa rsiConnections

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of active RSI connections currently supported by the *Rsa* component. |
| Values | Decimal (0..1000) |
| Default | No default |

### COMPONENT Rsa DataNetworkAddress (Dna)

| | |
|---|---|
| Groups | "GROUP Rsa Dna Address"<br>"GROUP Rsa Dna OutgoingOptions"<br>"GROUP Rsa Dna IncomingOptions" |
| Scope | Network |
| Description | *Rsa/n DataNetworkAddress*<br>This is the description of the Remote Server Agent *Dna* |

component. It includes the attributes which apply to a *Vc* between the RSI and RSA.

Opt. Subcomp. "COMPONENT Rsa Dna ClosedUserGroup (Cug)"

Common Verbs
Help
List
Display

## GROUP Rsa Dna Address

Properties Provisioned

Description The *Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 attributes. The string of address digits is complemented by the type of address or Npi. These attributes are used to interpret the format of the address digits.

## ATTRIBUTE Rsa Dna numberingPlanIndicator (npi)

Access Read and write

Description This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. An address may belong to the X.121 or E.164 numbering plans. X.121 is used in packet switched data networks.

Values
x121
e164

Default x121

## ATTRIBUTE Rsa Dna dataNetworkAddress (dna)

Access Read and write

Description The *Dna* attribute contains digits which form a unique identifier of the customer interface. It can be compared (approximation only) to a telephone number where each phone number identifies a unique telephone set. *Dna* digits are selected and assigned by network operators.

Values BCD (1..15)

| | |
|---|---|
| Default | No default |

### GROUP Rsa Dna OutgoingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | The *OutgoingOptions* group defines call options of a *Dna* for calls which are made out of the interface represented by the *Dna*. These options are not used for calls arriving to the interface represented by the *Dna*. |

### ATTRIBUTE Rsa Dna outCalls (ouc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) can be made using this particular *D*na. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for *Dnas* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### GROUP Rsa Dna IncomingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | *IncomingOptions* defines the set of options for incoming calls. These options are used for calls arriving to the interface represented by the *Dna*. For calls originated from the interface, *IncomingOptions* attributes are not used. |

### ATTRIBUTE Rsa Dna incCalls (inc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If |

set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for *Dna's* in that incoming calls are barred if this attribute is set to a value of ***disallowed***.
Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.

Values: disallowed
allowed

Default: allowed

## ATTRIBUTE Rsa Dna incAccess (ina)

Access: Read and write

Description: This attribute is an extension of the Closed User Group (CUG) facility, as follows:
This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTEs that have Outgoing Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.
This attribute corresponds to the ITU-T 'Closed User Group with Incoming Access' feature for *Dnas* in that incoming access is granted if this attribute is set to a value of ***allowed***.

Values: disallowed
allowed

Default: disallowed

## COMPONENT Rsa Dna ClosedUserGroup (Cug)

Instance: Decimal (0..255)

Groups: "GROUP Rsa Dna Cug CugOptions"

Scope: Network

Description: *Rsa/n Dna ClosedUserGroup*
*ClosedUserGroup* defines options associated with a national or international *Cug* Identifier. Other *Dna*s in the network can have

*Cug*s defined which group these *Dna*s by *Cug interlockCode*. If *Dna*s are defined with *Cugs*, calls from *Dna*s which do not have the same *interlockCode* defined are refused. Attributes *incAccess* and *outAccess* can override this rule.

## GROUP Rsa Dna Cug CugOptions

Properties: Provisioned

Description: Attributes in this group define *ClosedUserGroup* options associated with this particular *interlockCode*. *Dna's* with the same *Cug* (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same *Cug* group are defined here.

## ATTRIBUTE Rsa Dna Cug type

Access: Read and write

Description: This attribute specifies the Cug type - the Cug is either a national Cug, or an international Cug. International closed user groups are usually established between DTEs for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTEs for which there is no X.75 Gateway between. (National Cugs cannot normally traverse an X.75 Gateway).
If this attribute is set to ***national***, then the *Cug* is a national *Cug*, in which case, the *dnic* should be left at its default value since it is not part of a national *Cug*. If this attribute is set to ***international***, then the *Cug* is an international *Cug*, in which case, the *dnic* should be set appropriately as part of the *Cug interlockCode*.

| | |
|---|---|
| Values | national<br>international |
| Default | national |

### ATTRIBUTE Rsa Dna Cug dnic

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *dnic* (Data Network ID Code) of the *Cug* by which packet networks are identified. This attribute is not applicable if the *Cug* is a ***national*** *Cug*, as specified by the Cug *type* attribute. There are usually 1 or 2 *dnics* assigned per country, for public networks. The U.S. is an exception where each BOC has a *dnic*. Also, a group of private networks can have its own *dnic*.<br>*dnic* value is not an arbitrary number. It is assigned by international agreement and controlled by ITU-T. |
| Values | BCD (4) |
| Default | 0000 |

### ATTRIBUTE Rsa Dna Cug interlockCode (ilc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *Cug* identifier of a national or international *Cug* call. It is an arbitrary number and it also can be called Cug in some descriptions. Interfaces (*Dna's*) defined with this number can make calls to *Dna's* with the same *interlockCode*. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Rsa Dna Cug preferential (pre)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to ***yes*** indicates that this *Cug* is the preferential *Cug*, in which case it will be used during the call establishment phase if the DTE has not explicitly specified a *Cug* index in the call request packet. If set to ***no***, then this *Cug* is not |

| | |
|---|---|
| | the preferential *Cug*.<br>Only one of the *Cugs* associated with a particular *Dna* can be the preferential *Cug* - only one *Cug* can have this attribute set to ***yes***. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Rsa Dna Cug outCalls (ouc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to ***allowed*** indicates that outgoing calls (from the DTE into the network) can be made using this particular *Cug*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.<br>This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for *Cugs* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### ATTRIBUTE Rsa Dna Cug incCalls (inc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular *Cug*. If set to ***disallowed***, then incoming calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.<br>This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for *Cugs* in that incoming calls are barred if this attribute is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | allowed |

## ATTRIBUTE Rsa Dna Cug privileged (pri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to ***yes*** indicates that this *Cug* is a privileged *Cug*. In DPN, at least one side of a call setup within a *Cug* must have the *Cug* as a privileged *Cug*. If set to ***no***, then the *Cug* is not privileged.<br>If both the local DTE and the remote DTE subscribe to the *Cug*, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTEs in which case the other DTEs cannot call one another, but can call the host. In this example, the host would have the privileged *Cug*, and the other DTEs would belong to the same *Cug*, but it would not be privileged. |
| Values | no<br>yes |
| Default | yes |

## COMPONENT Rsa VncsAccess

| | |
|---|---|
| Groups | "GROUP Rsa VncsAccess Provisioned"<br>"GROUP Rsa VncsAccess OsiState (State)"<br>"GROUP Rsa VncsAccess Operational" |
| Scope | Network |
| Description | *Rsa/<string> VncsAccess*<br>The *VncsAccess* component provides access to the Passport Voice Networking Call Server. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Rsa VncsAccess Provisioned

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | The *Provisioned* group defines provisioned attributes associated with the *VncsAccess* component. |

### ATTRIBUTE Rsa VncsAccess timeToLive

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the length of time VNCS requests are allowed to remain queued for transmission before they are considered too old and are discarded. This attribute should be set in consideration with the voice application timeout interval. |
| Values | Decimal (1..5) |
| Units | seconds |
| Default | 2 |

### GROUP Rsa VncsAccess OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Rsa VncsAccess adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Rsa VncsAccess operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Rsa VncsAccess usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

| | |
|---|---|
| | The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Rsa VncsAccess Operational

| | |
|---|---|
| Properties | Operational |
| Description | The *Operational* group defines operational attributes associated with the *VncsAccess* component. |

### ATTRIBUTE Rsa VncsAccess requestsSent (sent)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of translation requests sent to VNCS. This counter wraps to zero when it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Rsa VncsAccess repliesReceived (received)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of translation replies received from VNCS. This counter wraps to zero when it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Rsa VncsAccess requestsQueued (queued)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of translation requests queued for transmission to VNCS. |

| | |
|---|---|
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Rsa VncsAccess requestsDiscarded (discarded)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of translation requests discarded before being sent to VNCS. Requests are discarded if the queue becomes too large or the VNCS server is unavailable. This counter wraps to zero when it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Rsa Connection

| | |
|---|---|
| Instance | Decimal (1..1000) |
| Groups | "GROUP Rsa Connection Operational"<br>"GROUP Rsa Connection ServerStatistics (ServerStats)"<br>"GROUP Rsa Connection LapfStatus (LapfStatus)"<br>"GROUP Rsa Connection LapfStatistics (LapfStats)" |
| Scope | Network |
| Description | *Rsa/<string> Connection/n*<br>*Rsi Connection/n*<br>The *Connection* component contains information relating to the connection between the RSA and RSI. This component is named by the logical channel number of the connection. |
| Dyn. Subcomp. | "COMPONENT Rsa Connection Vc" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Rsa Connection Operational

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | The *Operational* group defines operational attributes associated with the *Connection* component. |

### ATTRIBUTE Rsa Connection remoteName

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies an ASCII string identifier for the remote module which is retrieved from the call request as user data. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Rsa Connection callState

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the connection. The normal state for the connection is ***dataTransfer***. The other states are transient states used to setup or clear the connection. |
| Values | initializing<br>creatingVc<br>calling<br>acceptingCall<br>registeringFmo<br>establishingLapf<br>dataTransfer<br>clearingCall<br>terminating<br>terminatingVc<br>terminated |
| Default | No default |

### GROUP Rsa Connection ServerStatistics (ServerStats)

| | |
|---|---|
| Properties | Operational |
| Description | The *ServerStatistics* group provides individual server usage statistics for the connection. |

### ATTRIBUTE Rsa Connection vncsRequests

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of VNCS translation requests sent or received on this connection. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Rsa Connection vncsReplies

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of VNCS translation replies sent or received on this connection. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Rsa Connection LapfStatus (LapfStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the LAPF status. |

### ATTRIBUTE Rsa Connection lapfState

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the current state of the LAPF interface. The normal states are ***informationTransfer*** and ***waitingAck***. Since the LAPF interface is not over a physical link the other states are transitional. |
| Values | disconnected<br>linkSetup<br>disconnectRequest<br>informationTransfer<br>waitingAck |
| Default | No default |

### ATTRIBUTE Rsa Connection lapfQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of frames in the LAPF transmit queue. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Rsa Connection LapfStatistics (LapfStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the LAPF statistics. |

### ATTRIBUTE Rsa Connection lapfStateChanges

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the LAPF interface has changed state. While the LAPF interface is in ***informationTransfer*** state, this counter will increment on each expiry of *idleProbeTimer* as its state goes from ***informationTransfer*** to ***waitingAck*** and back. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Rsa Connection lapfRemoteBusy

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times transmission of an I-frame was unsuccessful due to a perceived remote busy condition (window closed or remote busy). When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Rsa Connection lapfAckTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the *ackTimer* has expired. Frequent increments of this counter indicate improper values have been chosen for *ackTimer* and *ackDelayTimer* |

between the local and remote ends. When this count reaches maximum, it wraps to zero.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Rsa Connection lapfRejectFramesRx

Access Read only

Description

This attribute counts the number of REJ frames received. When this count reaches maximum, it wraps to zero.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Rsa Connection lapfIFramesTx

Access Read only

Description This attribute counts the number of I-frames transmitted. An I-frame may be counted more than once if there are retransmissions. When this count reaches maximum, it wraps to zero.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Rsa Connection lapfIFramesTxDiscarded

Access Read only

Description This attribute counts the number of transmit I-frames that have been discarded. Discard reasons may be one of the following:
1.The frame length is beyond allowed limit.
2.The LAPF interface is in ***disconnected*** state.
3.The transmit queue has been purged because the queue length has reached the reset threshold.
When this count reaches maximum, it wraps to zero.

Values Decimal (0..4294967295)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Rsa Connection lapfIFramesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of I-frames received. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Rsa Connection lapfIFramesRxDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of received I-frames that have been discarded. The discard reasons are:<br>1.Incorrect frame size.<br>2.Frame is out of sequence.<br>3.Frame received while not in ***informationTransfer*** or ***waitingAck*** state.<br>When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Rsa Connection Vc

| | |
|---|---|
| Groups | "GROUP Rsa Connection Vc CallData (Cad)"<br>"GROUP Rsa Connection Vc IntervalData (Intd)"<br>"GROUP Rsa Connection Vc FrameRelayData (Frd)" |
| Scope | Application |
| Description | This component defines attributes collected by Frame Relay *Vc*. |
| Common Verbs | Help<br>List<br>Display |

## VERB Ping Rsa Connection Vc

Impact: Passive

Description: *Ping [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] FrUni/<n> Dlci/<n> Vc*

*Ping* causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the *ping* query packet will be the same as that of the Frame Relay data except at the source and destination module. The *ping* packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the *roundTripDelay* option is specified, the command reports the time taken to reach the destination and back. For the *roundTripDelay* option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the *ping* packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The *ping* command supports the following options:

*-roundTripDelay (-rtd):* If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

*-sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is

less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

### GROUP Rsa Connection Vc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application. |

### ATTRIBUTE Rsa Connection Vc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***. |
| Values | pvc<br>svc<br>spvc<br>frf10spvc |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***. |

| | |
|---|---|
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc callingNpi

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc fastSelectCall

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc segmentSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum packet size allowed on the *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc rcosToNetwork (rcosto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the routing metric routing class of service to<br>the network. |
| Values | throughput<br>delay<br>multimedia |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc rcosFromNetwork (rcosfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the routing metric Routing Class of Service from the Network. |
| Values | throughput<br>delay<br>multimedia |

Default No default

### ATTRIBUTE Rsa Connection Vc emissionPriorityToNetwork (epto)

Access Read only

Description This attribute displays the network internal emission priority to the
network.

Values normal
high
interrupting

Default No default

### ATTRIBUTE Rsa Connection Vc emissionPriorityFromNetwork (epfrom)

Access Read only

Description This attribute displays the network internal emission priority from the network.

Values normal
high
interrupting

Default No default

### ATTRIBUTE Rsa Connection Vc dataPath (dapa)

Access Read only

Description

This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value.

If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system)

If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed.

If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed.

Values: String (0..32, ASCII)

Default: No default

### ATTRIBUTE Rsa Connection Vc dprsMcsEndPoint (dmep)

Access: Read only

Description: This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components.

If the connection is using ***dprsOnly*** data path, this attribute is empty.

If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint.

List of: The name of the component

Default: No default

### GROUP Rsa Connection Vc IntervalData (Intd)

Properties: Operational

Description: This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.

### ATTRIBUTE Rsa Connection Vc elapsedTimeTillNow

Access: Read only

Description: This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.

Values: Decimal (0..16777215)

Default: No default

### ATTRIBUTE Rsa Connection Vc segmentsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc segmentsSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. |

| | |
|---|---|
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc callReferenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Rsa Connection Vc FrameRelayData (Frd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines Frame Relay attributes collected by Frame Relay *Vc*.<br>The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.<br>Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.<br>Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers |

### ATTRIBUTE Rsa Connection Vc frmCongestedToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc cannotForwardToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc notDataXferToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc outOfRangeFrmFromSubnet

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc combErrorsFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc* |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc duplicatesFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc notDataXferFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery. |

| | |
|---|---|
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc frmLossTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc ooSeqByteCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc peakOoSeqPktCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc sendSequenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame. |
| Values | Decimal (0..1048575) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc pktRetryTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc subnetRecoveries

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of successful *Vc* recovery attempts. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc ooSeqPktCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Rsa Connection Vc peakOoSeqByteCount

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the frame relay peak byte count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..50000) |
| Default | No default |

## GROUP Rtg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data for the routing system. |

## ATTRIBUTE Rtg tandemTraffic

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether tandem traffic is permitted through the node. |

Tandem traffic is traffic that arrives at the node on a trunk and leaves the node on another trunk.

The default value of this attribute is ***allowed***, which permits tandem traffic to pass through the node. When this attribute is set to ***denied***, DPRS and PORS traffic is not permitted to tandem through the node in most circumstances.

However, there are some exceptions on DPRS gateway nodes, backbone border nodes, and cluster border nodes. For DPRS, traffic is allowed to tandem through these nodes with this attribute set to ***denied*** in the following situations:

1) On a DPRS gateway node, DPRS traffic that flows out of the subnet or enters the subnet is allowed to tandem through the node, even if this attribute is set to ***denied***. Traffic that is from one node and destined to another node in the same subnet is not allowed to tandem through the gateway node when this attribute is set to ***denied***. DPRS gateway nodes include RID gateway nodes (the nodes that are connected to another Passport RID subnet or to DPN-100 RMs) and MID gateway nodes (the nodes that are connected to DPN-100 AM clusters).

2) On a backbone border node, DPRS traffic that is destined to either leave the backbone (to a cluster) or enter the backbone (from a cluster) is allowed to tandem through the node, even if this attribute is set to ***denied***. Traffic that is from one backbone node and destined to another backbone node in the same RID subnet is not allowed to tandem through the backbone border node when this attribute is set to ***denied***.

3) On a cluster border node, DPRS traffic that is destined to either leave the cluster (to the backbone or to another cluster) or enter the cluster is allowed to tandem through the node, even if this attribute is set to ***denied***. Intra-cluster DPRS traffic is generally not allowed to tandem through any cluster border node which has this attribute set to ***denied***. However, setting the attribute to ***denied*** on a cluster border node could cause that some nodes in the cluster become unreachable, from the source cluster node, through all paths inside the cluster. In this case, intra-cluster

DPRS traffic between these nodes would be attempted to route through the default route. A cluster border node that is on the default route of a cluster node allows intra-cluster DPRS traffic to tandem through it, even if this attribute is set to ***denied***.

Changing this attribute has no effect on PORS calls that were set up before the change. These calls can be manually forced to reroute using the new setting by clearing the calls or locking the trunks on which they are routed.

Values
allowed
denied

Default
allowed

### ATTRIBUTE Rtg clusterNode

Access
Read and write

Description
This attribute identifies whether a Passport module is a cluster node in a Passport network. The default value of ***no*** indicates that this node is not a cluster node. When this attribute is provisioned to ***yes***, this node becomes a cluster node.

One or more Passport cluster nodes interconnected with each other forms a Passport cluster. Deploying Passport clusters in a Topology Region reduces the memory, CPU and control traffic bandwidth required to maintain the topology database in the Topology Region and thus improves network scaling. This is because only minimum routing information is exchanged between a Passport cluster and other Passport non-cluster nodes in a topology region.

Cluster nodes are typically used to support Passport access services. A Passport cluster must be connected to other Passport nodes located in the backbone of the Passport network within the same RID subnet. It cannot be connected to nodes with different region identifiers (provisioned in the *regionId* attribute under the *ModuleData* component).

Values
no
yes

Default no

### ATTRIBUTE Rtg fullTopExchgOnClusterLinks (fullTopExchg)

Access Read and write

Description This attribute specifies whether this Passport node wishes to exchange full topological information across its cluster-backbone links. A cluster-backbone link is a link between a cluster node and a backbone node. A cluster node is a Passport with the *rtg clusterNode* attribute set to the value of ***yes***. A backbone node is a non-cluster node.

If this attribute is set to the value of ***disabled*** on at least one Passport node connected with cluster-backbone links, then only summarized topological information is propagated across those links. If this attribute is set to the value of ***enabled*** on two Passport nodes connected with cluster-backbone links, then summarized and full topological information is propagated across those links.

This attribute should only be set to the value of ***enabled*** during a clusters migration. During normal operation, this attribute should be set to the value of ***disabled*** in order to avoid accidental exchange of full topological information across the cluster-backbone boundary.

Values disabled
enabled

Default disabled

### ATTRIBUTE Rtg splittingRegionIds

Access Read and write

Description This attribute specifies which connected neighbour nodes, in different topology regions, are allowed to exchange topological information with this node. It should be used only when splitting or merging existing topology regions. This node only exchanges topological information with a connected node under either of the following conditions: (i) this node and the neighbor node are in the same topology region. That is, this node's *regionId* attribute

and the neighbor's *regionId* attribute (under *Mod* component) are provisioned with the same value, or (ii) this node and the neighbor node are in different topology regions, and this node's *splittingRegionIds* attribute is provisioned to contain the neighbor's *regionId*, and the neighbour's *splittingRegionIds* attribute is provisioned to contain this node's *regionId*.

When this attribute is used during migration of topology regions, values provisioned for the attribute are normally the old and new *regionIds* of the node. Use of this attribute makes it possible to migrate existing topology regions in the following cases: (i) splitting a topology region into two without isolating a node, and (ii) merging two different topology regions into one without introducing an extra topological barrier.

The attribute should be cleared when all migration activities are complete. At this point, the region boundary takes effect.

List of: Decimal (0..126)

Default: No default

## COMPONENT Rtg RouteSelector (Rs)

Groups:
"GROUP Rtg Rs SelectedRoute"
"GROUP Rtg Rs RouteSelectorControls (Controls)"
"GROUP Rtg Rs PathAttributes"
"GROUP Rtg Rs Statistics (Stats)"

Scope: Application

Description:
*Routing RouteSelector*
This component sits directly under the *Routing* component. It is dynamically created by Routing System and thus is always present when PORS software is loaded on a Passport node. *RouteSelector* is used by PORS services for the following purposes:
- Selecting a route to a destination through the current topology region. The route may be directly to the destination node or to a gateway node through which the destination can be reached.
- Returning a manual route stored as part of manual path profile.

*RouteSelector* is invoked with a route request data containing one

of the following:
- Parameters which must be met by the selected route.
- Parameter profile reference where parameters which must be met by the selected route are stored.
- Manual path profile reference.

When the route request data contains a manual path profile reference then *RouteSelector* returns the manual path route associated with that reference. The manual path route is returned in the selected route description data. *RouteSelector* does not verify the manual path route.

When the route request data contains parameter profile reference then *RouteSelector* obtains route request data parameters associated with that reference and then proceeds as though the parameters were contained in the route request data.

Using the route request data parameters, *RouteSelector* uses a route selection algorithm, based on Dijkstra's Shortest-Path-First algorithm, to select the best route to the destination. That route may be directly to the destination node or to a gateway node through which the destination can be reached. The selected route must satisfy all the route request data parameters. The route selection is done against the current view of the topological database maintained by Routing Topology System of the current topology region. Once the route is selected, selected route description data is returned by *RouteSelector.*

*RouteSelector* can be used in two modes: automatic and manual.

In the automatic mode, a route request message containing the route request data is originated by a PORS VC and sent to *RouteSelector. RouteSelector* then selects a route or gets a manual route and returns its description in the selected route description data in the selected route message back to the PORS VC.

In the manual mode, *RouteSelector* allows the operator to modify the parameters in the route request data (except for the manual path profile reference), and to initiate route selection using that

data. When *RouteSelector* selects the route it displays its description to the operator.

### GROUP Rtg Rs SelectedRoute

Properties: Operational

Description: This group contains operational attributes describing the last selected or manual route returned by *RouteSelector.* These attributes form selected route description data.

### ATTRIBUTE Rtg Rs routeCostMetric (rcm)

Access: Read only

Description: This attribute indicates the sum of cost metrics of trunks that make up the selected route returned by *RouteSelector.* If the cost metrics at both ends of a trunk differ, the larger metric is used for that trunk. If a route could not be selected for whatever reason then the *routeCostMetric* is set to a value 999999 intended to symbolize unknown cost. For manual routes the value of *routeCostMetric* is also 999999. This is because *RouteSelector* does not verify manual routes thus *routeCostMetric* is unknown.

Values: Decimal (0..999999)

Default: 999999

### ATTRIBUTE Rtg Rs routeDelayMetric (rdm)

Access: Read only

Description: This attribute indicates the sum of delay metrics of trunks that make up the selected route returned by *RouteSelector.* The delay metric of a trunk is equal to half the *measuredRoundTripDelay* operational attribute of the trunk. If the delay metrics at both ends of a trunk differ, the larger metric is used for that trunk. If a route could not be selected for whatever reason then the *routeDelayMetric* is set to a value 999999 intended to symbolize unknown delay. For manual routes the value of *routeDelayMetric*

is also 999999. This is because *RouteSelector* does not verify manual routes, thus *routeDelayMetric* is unknown.

Values: Decimal (0..999999)

Units: msec

Default: 999999

### ATTRIBUTE Rtg Rs routeBumpingPriority (rbp)

Access: Read only

Description: This attribute indicates the priority at which a route has been selected, or a value of 4 for manual routes since no route selection was made. Since *RouteSelector* does not verify manual routes the value of 4 for *routeBumpingPriority* symbolizes an unknown value for manual routes. The remainder of the description is not applicable to manual routes.

The bumping priority of a route specifies a priority at which a path along that route can be established. The lowest bumping priority is 4, the highest bumping priority is equal to a setup priority contained in the route request data. If a route is selected at bumping priority 4, then no paths will be bumped since there appears to be enough free bandwidth on selected trunks, and also since this bumping priority is not better than the lowest holding priority (4) of any path.

If a route cannot be selected at bumping priority 4 and a setup priority is 3 or better, then a route may be selected at bumping priority 3. This means that paths at holding priority 4 may be bumped if currently there is not enough free bandwidth on selected trunks to establish the new path with setup priority 3.

If a route cannot be selected at bumping priority 3 and a setup priority is 2 or better, then a route may be selected at bumping priority 2. In this case paths with holding priority 4 and 3 may be bumped if there is not enough free bandwidth on selected trunks to establish the new path with setup priority 2.

If a route cannot be selected at bumping priority 2 and a setup priority is 1 or better, then a route may be selected at bumping

priority 1. In this case paths with holding priority 4, 3, and 2 may be bumped if there is not enough free bandwidth on selected trunks to establish the new path with setup priority 1.

If a route cannot be selected at bumping priority 1 and a setup priority is 0, then a route may be selected at bumping priority 0. In this case paths with holding priority 4, 3, 2, and 1 may be bumped if there is not enough free bandwidth on selected trunks to establish the new path with setup priority 0.

Values — Decimal (0..4)

Default — No default

### ATTRIBUTE Rtg Rs reasonForNoRoute (rnr)

Access — Read only

Description — This attribute indicates the reason for which a route was not selected by *RouteSelector.*

If the route was selected then *reasonForNoRoute* has a value of ***none***.

If the destination in the form of ASCII name was specified (see *destination*) and the name of node is too long (more than 12 characters) then *reasonForNoRoute* has a value of ***destinationNameTooLong***. Check and correct node name in the *destination* attribute.

If the destination was not specified, that is *destination* is blank, then *reasonForNoRoute* has a value of ***destinationNotSpecified***. *Destination* attribute should not be blank.

If the destination in the form of ASCII name was specified (see *destination*) and the name of node cannot be found in topological database then *reasonForNoRoute* has a value of ***unknownDestinationName***. Check and correct node name in the *destination* attribute. If it is correct then this node does not appear in local topological database as this node may lie across the topology region or cluster boundary.

If the destination cannot be found in the topological database or cannot be reached through any gateway node then *reasonForNoRoute* has a value of ***unknownDestination***. Ensure the destination specified in *destination* attribute resides in the topology region, or can be reached through a Routing Gateway. That is, at least one reachable address provisioned under a *Trunk Address* component representing a gateway link can reach the destination NSAP address.

If the destination was specified using an incorrect format (see *destination*) then *reasonForNoRoute* has a value of ***incorrectDestination***. Use the correct format for *destination* attribute.

If there is no physical connectivity to the destination or gateway node, or number of hops to such node exceeds a limit of 20 hops, or a route to such node cannot satisfy all the parameters in the route request data then *reasonForNoRoute* has a value of ***attributeNotMet***. Set *operationMode* to ***manual*** and issue *d rtg rs* command and inspect *attributeNotMet* to determine which attribute could not be satisfied.

If the route to the destination could not be selected for some internal reason then *reasonForNoRoute* has a value of ***internalReason***. A Software Alarm generated in association with this situation should be reported to Nortel Networks technical support.

If the route to the destination could not be selected because of profile reference problem then *reasonForNoRoute* has a value of ***attributeProfileProblem***.

If the route to the destination could not be selected because of manual path reference problem then *reasonForNoRoute* has a value of ***manualPathIndexProblem***.

The following values of *reasonForNoRoute* are no longer generated: ***routeCostTooMuch***, ***routeDelayTooMuch***, ***incorrectDestinationEndPoint***, and ***sameNode***.

Values
none
destinationNameTooLong
destinationNotSpecified
unknownDestinationName
incorrectDestination
incorrectDestinationEndPoint
unknownSource
unknownDestination
sameNode
routeCostTooMuch
routeDelayTooLong
attributesNotMet
internalReason
attributeProfileProblem
manualPathIndexProblem

Default
none

### ATTRIBUTE Rtg Rs attributeNotMet (anm)

Access
Read only

Description
This attribute indicates the name of a possible route request data parameter which prevents *RouteSelector* from selecting the route. This attribute always has a value of ***allAttributesMet*** for manual routes since *RouteSelector* does not verify manual routes. This attribute has a meaningful value if *reasonForNoRoute* attribute has a value of ***attributesNotMet***. The value of *attributeNotMet* is only computed when *RouteSelector* operates in manual mode. That is, when route selection has been initiated by the operator in which case *operationMode* has a value of ***manual***.

*RouteSelector* determines which of the attributes: *requiredRxBandwidth*, *requiredTxBandwidth*, *requiredTrunkModes*, *maximumAcceptableCost*, *maximumAcceptableDelay*, *maximumAcceptableGatewaCost*, *requiredTrafficType*, *permittedTrunkTypes*, *requiredSecurity*, *requiredCustomerParameter*, and *maximumTransmissionUnit* prevents successful route selection by dropping the constraints associated with that attribute and reselecting the route. If that route can be successfully selected then the attribute for which the constraints were dropped is the attribute preventing successful

route selection.

For example, *RouteSelector* drops bandwidth constraints by selecting a route with *requiredRxBandwidth* or *requiredTxBandwidth* of 0. If the route can be selected then bandwidth is preventing successful route selection.

A value of ***unknownAttributeNotMet*** indicates that *RouteSelector* cannot determine why route cannot be selected. Constraints for all attributes are dropped yet successful route cannot be computed. This usually indicates a lack physical connectivity to the destination or gateway node. Alternatively, this may indicate that destination or gateway node is more than 20 hops away where 20 hops is the maximum number of hops in the route.

Values

unknownAttributeNotMet
allAttributesMet

### ATTRIBUTE Rtg Rs routeGatewayCostMetric (rgcm)

Access

Read only

Description

This attribute indicates the cost metric associated with reaching the destination indirectly through a gateway node or gateway link that is part of the selected route If the selected route leads directly to the destination node then the *routeGatewayCostMetric* is set to a value 0. If a route could not be selected for whatever reason

then the *routeGatewayCostMetric* is set to a value 999999 intended to symbolize unknown cost. For manual routes the value of *routeGatewayCostMetric* is also 999999. This is because *RouteSelector* does not verify manual routes thus *routeGatewayCostMetric* is unknown.

Values: Decimal (0..999999)

Default: 0

### ATTRIBUTE Rtg Rs routeType (rtyp)

Access: Read only

Description: This attribute indicates the type of route that was selected by *RouteSelector.*

If no route was selected then *routeType* has a value of ***noRoute***.

If the destination resides on the current node then *routeType* has a value of ***sameNode***.

If the destination resides on a different node and can be reached directly as opposed to indirectly through a gateway node then *routeType* has a value of ***destinationNode*** or ***destinationNodeLegacy*** with the latter only possible when legacy gateway selection algorithm was used (see *gatewaySelectionAlgorithm*).

If the destination can be reached indirectly through a gateway node with the gateway node being different from the current node then *routeType* has a value of ***gatewayNode*** or ***gatewayLink*** depending on whether or not the route consists of a single gateway link. A route consists of a single gateway link only when the route requestor (see *routeRequestor*) is a Routing Gateway (in inbound or outbound direction) and the route leads immediately across topology region or cluster boundary.

If the destination can be reached indirectly through a gateway node with the gateway node being the current node and the route requestor (see *routeRequestor*) is an application service as opposed to a Routing Gateway then *routeType* has a value of

***routingGateway***.

If selected route is a manual route then *routeType* has a value of ***manual***.

Note that the type of route, except for manual route, depends on who is the route requestor (application service, Routing Gateway serving as inbound or outbound gateway), where it resides (gateway or non-gateway node), how the destination can be reached (directly or indirectly through a gateway node), and what is the gateway selection algorithm (cost-based, random or legacy).

Values

noRoute
sameNode
destinationNode
destinationNodeLegacy
gatewayNode
gatewayLink
routingGateway
manual

Default

noRoute

### ATTRIBUTE Rtg Rs routeDescription (rd)

Access

Read only

Description

This attribute indicates a vector of strings describing the selected or manual route returned by *RouteSelector*. Each entry in the vector describes one hop of the route. The hops are identified using a node name and either
- a TRM allocated trunk identification or exit number (TRM uses a component ‘link’, or ‘Lk’ in short form, to refer to trunks), or
- a trunk name,
which is local to that node. TRM allocated exit number is used for routes selected by *RouteSelector*. Trunk name is used for manual routes.

For example, a hop out of node StarBase using exit number 99 is described as “EM/STARBASE Trm Lk/99” for the selected route. A hop out of node StarBase using trunk name 123 is described as

| | |
|---|---|
| | "EM/STARBASE TRK/123" for the manual route. A command *display Trm Lk/99* on node StarBase can be used to find out the trunk name corresponding to exit number 99. |
| Vector of | String (0..40, ASCII) |
| Index | Decimal (1..20) |
| Default | No default |

### ATTRIBUTE Rtg Rs destinationOrGatewayNodes (dgn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a set of node IDs of destination or gateway nodes which directly or indirectly support the destination and to which *RouteSelector* attempted to find a route. Node to which the *RouteSelector* selected the route is also included in *destinationOrGatewayNodes*. |
| List of | Decimal (0..4095) |
| List Size | 10 |
| Default | No default |

### GROUP Rtg Rs RouteSelectorControls (Controls)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes used to control *RouteSelector.* |

### ATTRIBUTE Rtg Rs operationMode (om)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the mode in which the *RouteSelector* is currently operating. The two possible modes are automatic and manual.<br><br>In the automatic mode, a route request message containing the route request data is originated by a PORS VC and sent to the *RouteSelector. RouteSelector* then selects a route or gets a manual route and returns its description in the selected route description data in the selected route message back to the PORS VC. |

In the manual mode, the *RouteSelector* allows the operator to modify the parameters in the route request data (except for the manual path profile reference), and to initiate route selection using that data. When *RouteSelector* selects the route it displays its description to the operator.

Note that even when *operationMode* is set to ***manual***, *RouteSelector* handles route request messages originated by services' VCs in the same way as it does when *operationMode* is set to ***automatic***.

Values: automatic
manual

Default: automatic

### ATTRIBUTE Rtg Rs lastRouteSelectionTime (lrst)

Access: Read only

Description: This attribute indicates the time when *RouteSelector* last handled a route request message.

Values: Time (DHMS)

Default: No default

### GROUP Rtg Rs PathAttributes

Properties: Operational

Description: This group contains parameters in route request data that govern the route selection. Values of these parameters are obtained either from an operator or from the last route request message from a PORS VC that contained such parameters or a reference to such parameters (parameter profile reference) as part of the route request data. Route request messages from a PORS VC that ask for a manual route do not contain such parameters or reference to such parameters. All other route request messages either explicitly contain route request data parameters or a reference to a profile containing such parameters.

This group of attributes is therefore not applicable to manual routes.

### ATTRIBUTE Rtg Rs sourceNodeId (snid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the node ID of the source node from which a route to the destination is to be found. It is typically the current node. The term ‘source’ is used in relation to the route selection process and not the node where *RouteSelector* resides, that is the current node. That is, the source node need not be the current node although the selected route will be based on the topological database of the current node. |
| Values | Decimal (1..16777215) |
| Default | 1 |

### ATTRIBUTE Rtg Rs setupPriority (sp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the required priority for path establishment along the selected. Zero is the highest priority and four is the lowest. This attribute is closely related to *bumpingPriority* attribute. |
| Values | Decimal (0..4) |
| Default | 2 |

### ATTRIBUTE Rtg Rs requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the required transmit bandwidth in bits per second to send data to the destination. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE Rtg Rs requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute indicates the required receive bandwidth in bits per second to receive data from the destination. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE Rtg Rs maximumTransmissionUnit (maxtu)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the size of the largest packet that can be transported along the selected route. It is used by *RouteSelector* to select a route which avoids trunks whose maximum transmission unit is less than *maximumTransmissionUnit* and as a result would be unable to transport packets of this size. The default value of 0 permits all trunks to be eligible with respect to this attribute. |
| Values | Decimal (0..8192) |
| Default | 0 |

### ATTRIBUTE Rtg Rs requiredSecurity (rsec)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the required minimum level of security of the trunks along the selected route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the *Trunk PathAdministrator (Trk Pa)* component. *RouteSelector* ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.* |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Rtg Rs requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read and write |

Description

This attribute indicates the required type of traffic that can be transported along the selected route. There are eight possible traffic types, and only one type can be transported. The ***voice***, ***data,*** and ***video*** traffic types are already defined, and five other traffic types can be defined by the network administrator. The *supportedTrafficType* attribute of the *Trunk PathAdministrator (Trk Pa)* component lists all the types of traffic allowed on the trunk. When selecting a route, *RouteSelector* only chooses trunks whose *supportedTrafficType* contains the *requiredTrafficType*.

Values

voice
data
video
trafficType1 (tt1)
trafficType2 (tt2)
trafficType3 (tt3)
trafficType4 (tt4)
trafficType5 (tt5)

Default

voice

### ATTRIBUTE Rtg Rs permittedTrunkTypes (pttyp)

Access

Read and write

Description

This attribute indicates a maximum of eight types of trunks that can be part of the selected route. The ***terrestrial*** and ***satellite*** trunk types have been defined already, leaving six remaining types that can be defined by the network administrator. The *trunkType* attribute of the *Trunk PathAdministrator (Trk Pa)* component specifies the type of the trunk. When selecting a route, *RouteSelector* only chooses trunks whose *trunkType* is one of the *permittedTrunkTypes*.

Set of

terrestrial
satellite
trunkType1 (tt1)
trunkType2 (tt2)
trunkType3 (tt3)
trunkType4 (tt4)
trunkType5 (tt5)
trunkType6 (tt6)

| | |
|---|---|
| Default | (terrestrial, satellite, trunkType1, trunkType2, trunkType3) |

### ATTRIBUTE Rtg Rs requiredCustomerParm (rcpar)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the mechanism to customize the usage of trunks. Any trunk, whose *customerParameter* attribute under the *Trunk PathAdministrator (Trk Pa)* component is larger than the *requiredCustomerParameter* is not eligible to become part of the selected route. |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Rtg Rs pathAttributeToMinimize (pamin)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates whether a route should be selected on the basis of minimizing the route cost or the route delay. Each trunk has a cost and a delay metric associated with it. The cost of a route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a route is the sum of the trunk delay metrics for all trunks included in the route. The delay metric of a trunk is equal to half the *measuredRoundTripDelay* operational attribute of the trunk. |
| Values | cost<br>delay |
| Default | cost |

### ATTRIBUTE Rtg Rs maximumAcceptableCost (maxCost)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the upper bound on the cost metric of the selected route, which is the sum of the cost metrics of all trunks on the route. *RouteSelector* ensures the cost metric of the selected route does not exceed the *maximumAcceptableCost*. |
| Values | Decimal (0..65535) |
| Default | 1280 |

### ATTRIBUTE Rtg Rs maximumAcceptableDelay (maxDelay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the upper bound on the delay metric of the selected route, which is the sum of the delay metrics of all trunks on the route. *RouteSelector* ensures the delay metric of the selected route does not exceed the *maximumAcceptableDelay.* The delay metric of a trunk is equal to half the *measuredRoundTripDelay* operational attribute of the trunk. |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | 100000 |

### ATTRIBUTE Rtg Rs bumpPreference (bprf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates whether bumping may be considered when selecting a route. By default, bumping may be considered only when it is necessary. That is, only when no other route to the destination or gateway node can be found An indication to always bump in order to find the best route may be set. In this case an absolutely best route to the destination or gateway node is found even if other paths along that route would need bumping. |
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | bumpWhenNecessary |

### ATTRIBUTE Rtg Rs requiredTrunkModes (rtmod)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates which trunk modes to consider during route selection. The operational *mode* attribute of the *Trunk PathAdministrator (Trk Pa)* component specifies the mode of the trunk. When selecting a route, *RouteSelector* can either consider trunks with any mode, or only trunks with *mode* set to ***mapping***. That is, the selected route may contain trunks with any mode, or all trunks with *mode* set to ***mapping***. |

| | |
|---|---|
| Values | any<br>mapping |
| Default | any |

### ATTRIBUTE Rtg Rs maximumAcceptableGatewayCost (maxGCost)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the upper bound on the cost metric associated with reaching the destination along the selected route and through a gateway node. Such cost metrics are provisioned under *Trunk Address* component on a gateway node specifying costs of reaching an address through the gateway node and more accurately through the gateway link represented by the *Trunk* component. |
| Values | Decimal (0..65535) |
| Default | 2048 |

### ATTRIBUTE Rtg Rs routeRequestor (rreq)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the type of entity that makes a request for a route (route requestor). Three types of entities can make route requests: application service, Routing Gateway serving as inbound gateway at a gateway node, or Routing Gateway serving as outbound gateway at a gateway node. |
| Values | applicationService<br>inboundRGty<br>outboundRGty |
| Default | applicationService |

### ATTRIBUTE Rtg Rs gatewaySelectionAlg (gsalg)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the type of algorithm to use when a route to the destination has to be selected indirectly through a gateway node. The following types of algorithms are available: cost based, random, and legacy. |

For cost based algorithm, *RouteSelector* selects gateway node that advertised it can reach the destination at the smallest cost.

For random algorithm, *RouteSelector* selects randomly any gateway node that advertised it can reach the destination.

For legacy algorithm, *RouteSelector* selects a complete route to the destination without attempting to route through gateway nodes. This is only possible during single to multi topology region migration, or cluster migration but before such migration is complete. During such migrations routing to the destination is initially attempted through gateway nodes, but if such routing fails then legacy routing is attempted.

Values: costBased
random
legacy

Default: costBased

### ATTRIBUTE Rtg Rs destination (dest)

Access: Read and write

Description: This attribute indicates either the ASCII name, node ID, or NSAP address of the destination node to which a route needs to be found. The format for *destination* is either
1. “EM/nodeName serviceName/instance”, for ASCII name, for example “EM/MoonBase VS/3”, or
2. “NID/nodeId”, for node ID, for example “NID/1226”, or
3. “NSAP/nsapAddress”, for NSAP address, for example “NSAP/12234001”.

For NSAP address formats a full ATM End System Address, node summary, or reachable address can be specified, as well as a node prefix.

Values: String (0..45, ASCII)

Default: No default

## GROUP Rtg Rs Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics gathered by *RouteSelector* and relating to route selections. |

## ATTRIBUTE Rtg Rs routeStatistics

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a table (or an array) of the number of route requests and the number of routes selected. There are six rows and five columns in the table. The first row contains a number of route requests in a column. Each column corresponds to a value of *setupPriority* (= 0,1,2,3,4). An element in the first row gives a number of route request per given *setupPriority.* The five subsequent rows provide numbers of routes selected at *bumpingPriority* 0,1,2,3,4. The second row provides numbers of route selections at *bumpingPriority* 0. Only route requests of *setupPriority* 0 could be given routes of the *bumpingPriority* 0. By virtue of the property of *bumpingPriority* that it cannot be better than the *setupPriority* the rows two to six form a lower triangular matrix. Route selections performed upon operator request (manual route requests) are not counted. |
| Array of | Decimal (0..4294967295) |
| Row | setupPriority [routesRequested<br>routesSelectedAtBp_0<br>routesSelectedAtBp_1<br>routesSelectedAtBp_2<br>routesSelectedAtBp_3<br>routesSelectedAtBp_4] |
| Column | statisticsTable [Decimal (0..4)] |
| Default | No default |

## COMPONENT Rtg DpnAddressPlan (Dpn)

| | |
|---|---|
| Groups | "GROUP Rtg Dpn Provisioned (Prov)"<br>"GROUP Rtg Dpn Operational (Oper)" |

| | |
|---|---|
| | "GROUP Rtg Dpn ControlStatistics (ConStats)"<br>"GROUP Rtg Dpn ForwardingStatistics (FwdStats)" |
| Scope | Network |
| Description | *Routing DpnAddressPlan*<br>This component is a subcomponent of *Routing*. It resides on all Passport nodes that carry DPN traffic and is responsible for maintaining the routing information required to route this traffic.<br><br>It is required on nodes that (i) support gateways to RMs and/or AMs, (ii) nodes that source and/or sink DPN traffic (for example, nodes which support VC end points), and (iii) intermediary nodes that simply carry DPN traffic. |
| Subcomponents | "COMPONENT Rtg Dpn AutomaticRouteTester (Art)"<br>"COMPONENT Rtg Dpn PerformanceStatistics (PerfStats)" |
| Opt. Subcomp. | "COMPONENT Rtg Dpn RidFilterInfo (RidFilter)" |
| Dyn. Subcomp. | "COMPONENT Rtg Dpn ReachableRidInfo (Rid)"<br>"COMPONENT Rtg Dpn ReachableMidInfo (Mid)"<br>"COMPONENT Rtg Dpn ReachableCallServerInfo (Cs)"<br>"COMPONENT Rtg Dpn LocalLinkGroups (Lg)"<br>"COMPONENT Rtg Dpn LpStatistics (LpStats)"<br>"COMPONENT Rtg Dpn DefaultRoute (DefRoute)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Rtg Dpn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data for the *DpnAddressPlan*. Attributes in this group must be set to allow the *DpnAddressPlan* component to function properly. |

## ATTRIBUTE Rtg Dpn logicalNetworkNumber (lnn)

| | |
|---|---|
| Access | Read only |
| Criticality | Module |

| | |
|---|---|
| Description | This attribute specifies the Logical Network Number for the *DpnAddressPlan*. Since only one instance of this component can exist, this value is always set to one. It is provided here to be consistent with other address plans and so that it can be queried. |
| Values | Decimal (1..1) |
| Default | 1 |

### ATTRIBUTE Rtg Dpn routingId

| | |
|---|---|
| Access | Read and write |
| Criticality | Module |
| Description | This attribute specifies the Routing Identifier (RID) associated with the Passport node.<br><br>The RID is used to identify a group of one or more interconnected Passport nodes (called a subnet) supporting the transport of DPN traffic. Its value must be the same as that of the other Passport nodes in this subnet and different from that of all RMs and other Passport subnets in the network.<br><br>The *routingId* must be set when a *DpnAddressPlan* component is configured on an Passport node.<br><br>Changing the value of the *routingId* will cause the node to restart. |
| Values | Decimal (1..126) |
| Default | No default |

### ATTRIBUTE Rtg Dpn moduleId

| | |
|---|---|
| Access | Read and write |
| Criticality | Module |
| Description | This attribute specifies the Module Identifier (MID) associated with the Passport node.<br><br>The MID is used to identify an Passport node supporting the transport of DPN traffic. Its value must be different from that of all MIDs assigned to Passport nodes in this RID subnet |

(interconnected Passport nodes sharing a RID) and AMs in clusters supported by this subnet. If routing zones are used, it must also be unique from all other MIDs in this zone.

The *moduleId* must be set when a *DpnAddressPlan* component is configured on an Passport node.

Changing the value of the *moduleId* will cause the node to restart.

Values: Decimal (1..1909)

Default: No default

### ATTRIBUTE Rtg Dpn delayMetricCutOff (delayC)

Access: Read and write

Description: This attribute specifies the delay metric value beyond which a destination RID should be considered unreachable. That is, if a delay metric to a RID is equal to or greater than this value then the RID is considered to be unreachable in the delay class of service.

Lowering this value has the effect of speeding up the detection of the loss of reachability to a RID. It also reduces the amount of Routing Table Update (RTU) traffic generated in this scenario. Care must be taken to ensure that the value chosen is big enough for the longest delay path in the network.

This attribute is optional; a default of 128 is used when it is not set. It is recommended that all nodes in the network be provisioned with the same cut off value.

Values: Decimal (64..250)

Default: 128

### ATTRIBUTE Rtg Dpn throughputMetricCutOff (tputC)

Access: Read and write

Description: This attribute specifies the throughput metric value beyond which a destination RID should be considered unreachable. That is, if a throughput metric to a RID is equal to or greater than this value

then the RID will be considered to be unreachable in the throughput class of service.

Lowering this value has the effect of speeding up the detection of the loss of reachability to a RID. It also reduces the amount of Routing Table Update (RTU) traffic generated in this scenario.Care must be taken to ensure that the value chosen is big enough for the longest throughput path in the network.

This attribute is optional; a default of 245 is used when it is not set. It is recommended that all nodes in the network be provisioned with the same cut off value.

| | |
|---|---|
| Values | Decimal (128..245) |
| Default | 245 |

### ATTRIBUTE Rtg Dpn forwardingPolicy

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the forwarding policy used by packet forwarding to handle DPN traffic on a Passport module.<br><br>When this attribute is set to ***loadshare***, DPN traffic is shared among preferred links in a link group in proportion to the available bandwidth on each link; the traffic is not forwarded in an order-preserved manner and needs resequencing at the destination, but the available bandwidth in a link group is utilized efficiently.<br><br>When this attribute is set to ***loadspread***, DPN traffic is forwarded in an order-preserved manner along a randomly selected route; the traffic sticks to a particular link in a link group, and will not spill over to other links in the link group unless there is congestion on the selected link.<br><br>When this attribute is set to ***loadspreadFast***, DPN traffic is forwarded in an order-preserved manner along a randomly selected route; the traffic sticks to a particular link in a link group, and will not spill over to other links in the link group. Choosing this value may improve throughput but traffic may be discarded in |

the presence of congestion.

It is recommended that all nodes in the network be provisioned with the same forwarding policy.

Note that though ***loadshare***, ***loadspread*** and ***loadspreadFast*** are all supported on Passport 7000 switches, ***loadspreadFast*** is the only forwarding policy that is supported on Passport 15000 and Passport 20000 switches. On a Passport 15000 or Passport 20000, if the *forwardingPolicy* attribute is set to either ***loadshare*** or ***loadspread***, the provisioning check will pass, but the underlying forwarding policy defaults to the value of ***loadspreadFast***.

A change in this attribute will not take effect on any already established Frame Relay (FR) connections. The existing FR connections should be restarted to adopt the new forwarding policy.

Values: loadspread (spread)
loadshare (share)
loadspreadFast (spFast)

Default: loadspread

### ATTRIBUTE Rtg Dpn delayMetricRangeBoundary (delayR)

Access: Read and write

Description: This attribute specifies the total path delay metric below which the *variance* value specified for delay COS and a low metric range is used, and at or above which the *variance* value specified for delay COS and a high metric range is used.

This attribute defaults to 0, so that the *variance* value specified for delay COS and a high metric range is used for all delay paths. If this attribute is set to 2147483647, the *variance* value specified for delay COS and a low metric range is used for all delay paths.

Values: Decimal (0..2147483647)

Default: 0

### ATTRIBUTE Rtg Dpn tputMetricRangeBoundary (tputR)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the total path throughput metric below which the *variance* value specified for throughput COS and a low metric range is used, and at or above which the *variance* value specified for throughput COS and a high metric range is used.<br><br>This attribute defaults to 0, so that the *variance* value specified for throughput COS and a high metric range is used for all delay paths. If this attribute is set to 2147483647, the *variance* value specified for throughput COS and a low metric range is used for all throughput paths. |
| Values | Decimal (0..2147483647) |
| Default | 0 |

### ATTRIBUTE Rtg Dpn variance

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the variance values for high and low metric ranges, for each class of service (COS). A variance value is the maximum allowed difference in metric between the best path and the second path, as a percentage of the best path metric. High and low metric ranges are defined for each COS by the *delayMetricRangeBoundary* and *tputMetricRangeBoundary* attributes, and refer to total path metrics.<br><br>When a variance value for a certain COS and metric range is set to the default value of 0, only equal metric paths can be used under that COS when the best path metric is in that range. When it is set to a value greater than 0, an alternate path which is safe (that is, non-looping) and which has a metric within this percentage of the best path metric can be used as a multipath.<br><br>The special value of 9999 signifies an infinite variance, so that any safe alternate path may be used in addition to the single best path, regardless of its metric. |
| Array of | Decimal (0..500; 9999) |

| | | |
|---|---|---|
| Units | % | |
| Row | cos [delay throughput] | |
| Column | metricRange [low high] | |
| Default | ([2 * 2] 0) | |

### ATTRIBUTE Rtg Dpn csrmRoute

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the loadsharing mechanism for CSRM routing (csrmRoute). When this attribute is set to ***share***, all call request packets that originate from or transit through the node will be forwarded to the two active CSRM's on a round-robin basis. When this attribute is set to ***closest***, all the call request packets will be forwarded to the closest CSRM. The default behavior is set to forward the calls to the closest CSRM. |
| Values | closest (cl)<br>shared (sh) |
| Default | closest |

### GROUP Rtg Dpn Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes provides information about the functioning of the *DpnAddressPlan* component. |

### ATTRIBUTE Rtg Dpn callServerModuleRids

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the RIDs of the Call Server Resource Modules (CSRMs) currently in use to support Call Server functions, such as SCR and DCR, for the Passport subnet. Up to two CSRMs can be in use to support such Call Server functions.<br><br>Note that packets destined to Call Server functions are routed to the closest CSRM supporting the required server functionality. |

| | |
|---|---|
| List of | Decimal (1..126) |
| Default | No default |

### GROUP Rtg Dpn ControlStatistics (ConStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes provides statistics about the behavior of the *DpnAddressPlan* component. The statistics concern the distribution of routing information, required to support the routing of DPN traffic, to all Passport nodes in the RID subnet. |

### ATTRIBUTE Rtg Dpn controlPktTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of internal Passport DPN control packets, originating from this node, sent to other Passport nodes in the RID subnet. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. The Packets received from a neighbor node and forwarded to other neighbors are not counted. The counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Rtg Dpn controlPktRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of internal Passport DPN control packets received from other Passport nodes in the RID subnet. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. The counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Rtg Dpn controlBytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of internal Passport DPN control packet bytes, originating from the node, sent to other Passport nodes in the RID subnet. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. Packet bytes received from a neighbor node and forwarded to other neighbors are not counted. The counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Rtg Dpn controlBytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of internal Passport DPN control packet bytes received from other Passport nodes in the RID subnet. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. The counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Rtg Dpn outOfSequencePkt

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of internal Passport DPN control packets received and rejected. These packets contained old sequence numbers. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. The counter wraps around to zero when the maximum value is reached. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Rtg Dpn ForwardingStatistics (FwdStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes provides statistics for the traffic handled by DPN packet forwarding on this module. The statistics can be used to monitor the connectionless traffic profile on this module. |

### ATTRIBUTE Rtg Dpn totalPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the delay and throughput packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast.*** It is the aggregate of *totalPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn throughputPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the throughput packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *throughputPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn delayPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the delay packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *delayPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn normalReliabilityPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the normal reliability packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *normalReliabilityPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn highReliabilityPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the high reliability packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *highReliabilityPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the |

network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.

Values: Long Integer

Default: No default

### ATTRIBUTE Rtg Dpn discardNoRoute

Access: Read only

Description: This attribute counts the packets that have been discarded by packet forwarding due to failure to find a route to forward the packets on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *discardNoRoute* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.

Values: Long Integer

Default: No default

### ATTRIBUTE Rtg Dpn interruptingPackets

Access: Read only

Description: This attribute counts the multimedia packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *interruptingPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.

Values: Long Integer

Default: No default

### ATTRIBUTE Rtg Dpn discardLpCongested

Access: Read only

| | |
|---|---|
| Description | This attribute counts the packets that have been discarded by packet forwarding due to LP congestion on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. A packet encounters LP congestion when there is insufficient shared memory. This attribute is the aggregate of *discardLpCongested* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

## COMPONENT Rtg Dpn ReachableRidInfo (Rid)

| | |

## VERB Ping Rtg Dpn Rid

| | |
|---|---|
| Impact | Passive |
| Description | *Ping [-sensitivity(throughput/delay\|multimedia)] [-reliability(high/normal)] [-priority(normal/high)] [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] [-allPaths] Routing Dpn Rid/<rid>* |

*Ping* causes a query packet to be sent to the RID destination. It can be used to either find a path to a destination or to measure the round trip delay to reach the destination.

The *ping* command can also be used to ensure that the destination is reachable. If the destination is unreachable or the network is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path used to reach the destination. When *ping* is used to find a path, it displays the RID and MID of each module that the query packet passes through on its way to the destination.

The *ping* command supports the following options:

-*sensitivity:* This option specifies the sensitivity for the route to be taken by the *ping* packet. If ***delay*** sensitivity is specified, the packet is routed on the minimum delay path. If ***throughput*** sensitivity is specified, the packet is routed on the highest bandwidth route. If ***multimedia*** sensitivity is specified, the packet is routed on the minimum delay path using the highest emission priority link transmit queue available. If this option is not selected, ***throughput*** sensitivity is used.

-*reliability:* This option specifies the reliability for the route to be taken by the *ping* packet. If ***high*** reliability is specified, the packet is routed on an overflow path if the primary path is congested. If ***normal*** reliability is specified, the ping packet is discarded if the primary path is congested. If this option is not selected, ***high*** reliability is used.

*-priority:* This option influences the priority of the *ping* packet. If ***high*** priority is specified, the packet is less likely to be discarded in the network. If this option is not selected, ***normal*** priority is used.

*-roundTripDelay (-rtd):* If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. This option is ignored if the *allPaths* option is selected. If this option is not selected, the path taken to the destination is displayed.

*-sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. This option is ignored if the *-rtd* option is not specified.

The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response.

If this option is not selected the default value is 64 octets if ***multimedia*** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. This option is ignored if the *-rtd* option is not specified.

The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is

less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response.

If this option is not selected the default value is 64 octets if ***multimedia*** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-allPaths (-all)*: If this option is selected, 16 query packets will be sent to the destination, and all possible paths (up to 16) to reach the destination will be reported. Since there are 16 path selection values used in the DPRS packet forwarding system, 16 query packets that each carry a different path selector will collect path information for all possible paths. All query packets which return to the source node within the timeout period are included in the response. The response indicates how many query packets were sent, how many were returned, and how many unique paths were taken.

## GROUP Rtg Dpn Rid Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes is maintained by the *DpnAddressPlan* component to provide information about the RIDs reachable in the network. |

## ATTRIBUTE Rtg Dpn Rid dpnDelayMetric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum DPN delay metric to the destination RID. The delay metric associated with a path is computed by the routing system by translating the smallest *delayMetric* calculated for the destination. A path with a lower metric value is preferable to one with a higher value as it is associated with lower delay facilities. The metric displayed is that of the best path to the destination. This metric is advertised to neighbor RMs and Passports in a different RID subnet.<br><br>A metric value of 255 means the RID is unreachable in the delay |

class of service. A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's RID. A metric value of 252 indicates that the destination RID is that of a Network Module (NM).

Values — Decimal (0..255)

Default — No default

### ATTRIBUTE Rtg Dpn Rid dpnTputMetric

Access — Read only

Description — This attribute indicates the minimum DPN throughput metric to the destination RID. The throughput metric associated with a path is computed by the routing system by translating the smallest *tputMetric* calculated for the destination. A path with a lower metric value is preferable to one with a higher value as it is associated with higher bandwidth facilities. The metric displayed is that of the best path to the destination. This metric is advertised to neighbor RMs and Passports in a different RID subnet.

A metric value of 255 means the RID is unreachable in the throughput class of service. A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's RID.

Values — Decimal (0..255)

Default — No default

### ATTRIBUTE Rtg Dpn Rid routeType

Access — Read only

Description — This attribute indicates whether the paths in use to reach the destination RID are learned or default routes. When the paths in use are learned paths, the attribute value is ***learned***. When the paths are default routes, the attribute value is ***default***.

The paths in use are always learned when this node is not a Passport cluster node. There are up to two paths to reach a destination RID for each delay and throughput class of service. The paths displayed are the best and next best paths among all

available paths to the destination.

The paths in use are default routes only when this node is a cluster node. A cluster node has no knowledge about RID subnets other than its own. All packets destined to unknown RIDs, i.e. RIDs other than its own RID, will first be sent out of the cluster in which this node is located, and further forwarded by the nodes outside of the cluster to reach the destination. Therefore, the delay and throughput paths in use to reach a RID other than the cluster node's own RID are the two best and next best delay or throughput paths to get out of the cluster, and are called the default routes.

Values
learned
default

Default
learned

### ATTRIBUTE Rtg Dpn Rid delayNextHopLinkGroups

Access
Read only

Description
This attribute indicates the delay link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the destination RID. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest delay metrics to the destination.

The link group can be that of either a Passport node interconnection or a gateway to an RM.

If no link groups are listed then the destination is not reachable in the delay class of service (except in the case of the local node's RID).

Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it.

Values
The name of the component

Replication
Decimal (0..1)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Rtg Dpn Rid tputNextHopLinkGroups

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the throughput link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the destination RID. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest throughput metrics to the destination.<br><br>The link group can be that of either a Passport node interconnection or a gateway to an RM.<br><br>If no link groups are listed then the destination is not reachable in the throughput class of service (except in the case of the local node's RID).<br><br>Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it. |
| Values | The name of the component |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Rid delayPathTrafficProportions

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the target percentages of the total delay traffic flows to the destination which are sent over each delay path. These percentages are achieved when there is a large number of virtual circuits (VCs). |
| Values | Decimal (0..100) |
| Units | % |
| Replication | Decimal (0..1) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Rtg Dpn Rid tputPathTrafficProportions

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the target percentages of the total throughput traffic flows to the destination which are sent over each throughput path. These percentages are achieved when there is a large number of virtual circuits (VCs). |
| Values | Decimal (0..100) |
| Units | % |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Rid delayMetric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the delay metrics of up to two paths to the destination RID. The delay metric associated with a path is computed by the routing system based on the sum of the delays associated with the links in the path to the destination. A path with a lower metric value is preferable to one with a higher value as it is associated with lower delay facilities. The metrics displayed are those of the paths being used to reach the destination.<br><br>Metric values of 2147483647 for both paths means the RID is unreachable in the delay class of service. A metric value of 2147483647 for the second path only means that there is only one viable delay path to the destination. A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's RID. Metric values of 2147483646 indicate that the destination RID is that of a Network Module (NM). |
| Values | Decimal (0..2147483647) |
| Replication | Decimal (0..1) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Rtg Dpn Rid tputMetric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the throughput metrics of up to two paths to the destination RID. ## VERB Ping Rtg Dpn Rid Mid

Impact

Passive

Description

*Ping [-sensitivity(throughput/delay|multimedia)] [-reliability(high/normal)] [-priority(normal/high)] [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] [-allPaths] Routing Dpn Rid/<rid> Mid/<mid>*

*Ping* causes a query packet to be sent to the RID MID destination. It can be used to either find a path to a destination or to measure the round trip delay to reach the destination.

The *ping* command can also be used to ensure that the destination is reachable. If the destination is unreachable or the network is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path used to reach the destination. When *ping* is used to find a path, it displays the RID and MID of each module that the query packet passes through on its way to the destination.

The *ping* command supports the following options:

*-sensitivity:* This option specifies the sensitivity for the route to be taken by the *ping* packet. If ***delay*** sensitivity is specified, the packet is routed on the minimum delay path. If ***throughput*** sensitivity is specified, the packet is routed on the highest bandwidth route. If ***multimedia*** sensitivity is specified**,** the packet is routed on the minimum delay path using the highest emission priority link transmit queue available. If this option is not selected, ***throughput*** sensitivity is used.

*-reliability:* This option specifies the reliability for the route to be taken by the *ping* packet. If ***high*** reliability is specified, the packet is routed on an overflow path if the primary path is congested. If ***normal*** reliability is specified, the ping packet is discarded if the primary path is congested. If this option is not selected, ***high*** reliability is used.

*-priority:* This option influences the priority of the *ping* packet. If ***high*** priority is specified, the packet is less likely to be discarded in the network. If this option is not selected, ***normal*** priority is used.

*-sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. This option is ignored if the *-rtd* option is not specified.

The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response.

If this option is not selected the default value is 64 octets if ***multimedia*** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. This option is ignored if the *-rtd* option is not specified.

The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response.

If this option is not selected the default value is 64 octets if ***multimedia*** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-allPaths (-all)*: If this option is selected, 16 query packets will be sent to the destination, and all possible paths (up to 16) to reach the destination will be reported. Since there are 16 path selection values used in the DPRS packet forwarding system, 16 query packets that each carry a different path selector will collect path information for all possible paths. All query packets which return to the source node within the timeout period are included in the response. The response indicates how many query packets were sent, how many were returned, and how many unique paths were taken.

## COMPONENT Rtg Dpn ReachableMidInfo (Mid)

| | |
|---|---|
| Instance | Decimal (0..2046) |
| Groups | "GROUP Rtg Dpn Mid Operational (Oper)" |
| Scope | Network |
| Description | *Routing Dpn ReachableMidInfo/<mid>*<br>This component is a dynamic subcomponent of the *DpnAddressPlan*. It provides information about the MIDs supported by the local RID subnet that are, or were once, reachable.<br><br>If the node is not a Passport cluster node, an instance of this component represents the MID of any one of the nodes supported in the RID subnet. These includes Passport nodes located inside or outside a Passport cluster, DPN-100 AMs subtended off a Passport cluster, and DPN-100 AMs connected to a Passport node outside of a Passport cluster.<br><br>If the node is a Passport cluster node, an instance of this component represents the MID of any one of the nodes supported by the local cluster in the subnet. These include only Passport |

modules in the local cluster and DPN-100 AMs subtended off the cluster. In other words, MIDs located outside of the cluster are not shown.

Note that the node is in a Passport cluster and is a Passport cluster node when the *clusterNode* attribute under the *Routing* component is provisioned as ***yes***.

## VERB Ping Rtg Dpn Mid

Impact

Passive

Description

*Ping [-sensitivity(throughput/delay/multimedia)] [-reliability(high/normal)] [-priority(normal/high)] [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] [-allPaths] Routing Dpn Mid/<mid>*

*Ping* causes a query packet to be sent to the MID destination. It can be used to either find a path to a destination or to measure the round trip delay to reach the destination.

The *ping* command can also be used to ensure that the destination is reachable. If the destination is unreachable or the network is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path used to reach the destination. When *ping* is used to find a path, it displays the RID and MID of each module that the query packet passes through on its way to the destination.

The *ping* command supports the following options:

*-sensitivity:* This option specifies the sensitivity for the route to be taken by the *ping* packet. If ***delay*** sensitivity is specified, the packet is routed on the minimum delay path. If ***throughput***

sensitivity is specified, the packet is routed on the highest bandwidth route. If ***multimedia*** sensitivity is specified**,** the packet is routed on the minimum delay path using the highest emission priority link transmit queue available. If this option is not selected, ***throughput*** sensitivity is used.

-*reliability:* This option specifies the reliability for the route to be taken by the *ping* packet. If ***high*** reliability is specified, the packet is routed on an overflow path if the primary path is congested. If ***normal*** reliability is specified, the ping packet is discarded if the primary path is congested. If this option is not selected, ***high*** reliability is used.

-*priority:* This option influences the priority of the *ping* packet. If ***high*** priority is specified, the packet is less likely to be discarded in the network. If this option is not selected, ***normal*** priority is used.

-*roundTripDelay (-rtd):* If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. This option is ignored if the *allPaths* option is selected. If this option is not selected, the path taken to the destination is displayed.

-*sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. This option is ignored if the -*rtd* option is not specified.

The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response.

If this option is not selected the default value is 64 octets if ***multimedia*** sensitivity has been specified, and 128 octets

otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. This option is ignored if the *-rtd* option is not specified.

The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response.

If this option is not selected the default value is 64 octets if ***multimedia*** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-allPaths (-all)*: If this option is selected, 16 query packets will be sent to the destination, and all possible paths (up to 16) to reach the destination will be reported. Since there are 16 path selection values used in the DPRS packet forwarding system, 16 query packets that each carry a different path selector will collect path information for all possible paths. All query packets which return to the source node within the timeout period are included in the response. The response indicates how many query packets were sent, how many were returned, and how many unique paths were taken.

### ATTRIBUTE Rtg Dpn Mid substituteRid

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the substitute RID in use for the MID. This RID will be substituted for the RID in DPN packets destined to the local node's RID and the MID in question when the MID is unreachable (when, for example, all links to an AM from the Passport subnet are down). It will also be used in the case where the path through the substitute RID is better than that available through the subnet's connection to the cluster containing the AM MID.<br><br>Substitute RIDs are learned from AM clusters that are supported by two RIDs (the Passport subnet's RID and another one). The operator can check this value to determine if a possible back up route to an AM exists. When there are no *delayNextHopLinkGroups* or *tputNextHopLinkGroups* shown to reach the MID, the substitute RID will be used.<br><br>A value of 128 indicates that no substitute RID is known. |
| Values | Decimal (1..128) |
| Default | 128 |

### ATTRIBUTE Rtg Dpn Mid delayNextHopLinkGroups

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the delay link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the destination MID. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest delay metrics to the destination. |

The link group can be that of either a Passport node interconnection or a gateway to an AM.

If no link groups are listed then the destination is not reachable in the delay class of service (except in the case of the local node's MID, or when a substitute RID path is available).

Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it.

| | |
|---|---|
| Values | The name of the component |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Mid tputNextHopLinkGroups

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the throughput link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the destination MID. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest throughput metrics to the destination.<br><br>The link group can be that of either a Passport node interconnection or a gateway to an AM.<br><br>If no link groups are listed then the destination is not reachable in the throughput class of service (except in the case of the local node's MID, or when a substitute RID path is available).<br><br>Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it. |
| Values | The name of the component |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Mid delayMetric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the delay metrics of up to two paths to the destination MID. The delay metric associated with a path is computed by the routing system based on the sum of the delays associated with the links (or estimated delays for links to AMs) in the path to the destination. It is computed for every possible path to the destination and is used by the *DpnAddressPlan* component for path comparison purposes. A path with a lower metric value is preferable to one with a higher value as it is associated with lower delay facilities. The metrics displayed are those of the paths being used to reach the destination.<br><br>Metric values of 2147483647 for both paths means the MID is unreachable in the delay class of service (though it might still be reachable via its substitute RID). A metric value of 2147483647 for the second path only means that there is only one viable delay path to the destination.A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's MID. |
| Values | Decimal (0..2147483647) |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Mid tputMetric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the throughput metrics to the destination MID. The throughput metric associated with a path is computed by the routing system based on the sum of the bandwidth associated with the links (or estimated bandwidth for links to AMs) in the path to the destination. It is computed for every possible path to the destination and is used by the *DpnAddressPlan* component for path comparison purposes. A path with a lower metric value is preferable to one with a higher value as it is associated with higher bandwidth facilities. The metrics displayed are those of the paths being used to reach the |

destination.

Metric values of 2147483647 for both paths means the MID is unreachable in the throughput class of service (though it might still be reachable via its substitute RID). A metric value of 2147483647 for the second path only means that there is only one viable throughput path to the destination. A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's RID.

| | |
|---|---|
| Values | Decimal (0..2147483647) |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Mid delayPathTrafficProportions

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the target percentages of the total delay traffic flows to the destination which are sent over each delay path. These percentages are achieved when there is a large number of virtual circuits (VCs). |
| Values | Decimal (0..100) |
| Units | % |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Mid tputPathTrafficProportions

## GROUP Rtg Dpn Cs Operational (Oper)

Properties: Operational

Description: This group of attributes is maintained by the *DpnAddressPlan* component to provide information about the Call Server functions reachable on the Call Server Resource Modules.

## ATTRIBUTE Rtg Dpn Cs routeType

Access: Read only

Description: This attribute indicates whether the paths in use to reach the destination call server is learned or default routes. When the paths in use are learned paths, the attribute value is ***learned***. When the paths are default routes, the attribute value is ***default***.

The paths in use are always learned when this node is not a Passport cluster node. There are up to two paths to reach a destination call server for each delay and throughput class of service. The paths displayed are the best and next best paths among all available paths to the destination.

The paths in use can be learned or default routes when this node is a cluster node. The paths are learned when the call server in use is in the same cluster where this node is located. When the call server in use is located outside of the cluster, all packets destined to that call server will first be sent out of the cluster, and further forwarded by the nodes outside of the cluster to reach the module supporting the call server. Therefore, the delay and throughput paths in use to send packets to all call servers located outside of the cluster are the two best and next best delay or throughput paths to get out of the cluster, and are called the default routes.

| | |
|---|---|
| Values | learned<br>default |
| Default | learned |

### ATTRIBUTE Rtg Dpn Cs delayNextHopLinkGroups

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the delay link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the Call Server Resource Module (CSRM) supporting the server. DPN server traffic will be load shared across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest delay metrics to the destination.<br><br>The link group can be that of either a Passport node interconnection or a gateway to a CSRM.<br><br>If no link groups are listed then the server is not reachable in the delay class of service.<br><br>Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it. |
| Values | The name of the component |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Cs tputNextHopLinkGroups

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the throughput link group, or groups, that are being used to reach a neighbor which is either the next hop in the path to the Call Server Resource Module (CSRM) supporting the server. DPN server traffic will be load shared across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest throughput metrics to the destination. |

The link group can be that of either a Passport node interconnection or a gateway to the CSRM.

If no link groups are listed then the server is not reachable in the throughput class of service.

Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it.

Values: The name of the component

Replication: Decimal (0..1)

Default: No default

### ATTRIBUTE Rtg Dpn Cs delayMetric

Access: Read only

Description: This attribute indicates the delay metrics of up to two paths to the server supported on a Call Server Resource Module (CSRM). The delay metric associated with a path is computed by the routing system based on the sum of the delays associated with the links in the path to the CSRM supporting the server. It is computed for every possible path to the server and is used by the *DpnAddressPlan* component for path comparison purposes. A path with a lower metric value is preferable to one with a higher value as it is associated with lower delay facilities. The metrics displayed are those of the paths being used to reach the destination.

Metric values of 2147483647 for both paths means the server is unreachable in the delay class of service. A metric value of 2147483647 for the second path only means that there is only one viable delay path to the destination. A value of 0 indicates that no cost is associated with the path to the destination.

Values: Decimal (0..2147483647)

Replication: Decimal (0..1)

Default: No default

### ATTRIBUTE Rtg Dpn Cs tputMetric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the throughput metrics of up to two paths to reach the server supported on a Call Server Resource Module (CSRM). The throughput metric associated with a path is computed by the routing system based on the sum of the bandwidth associated with the links in the path to the CSRM supporting the server. It is computed for every possible path to the server and is used by the *DpnAddressPlan* component for path comparison purposes. A path with a lower metric value is preferable to one with a higher value as it is associated with higher bandwidth facilities. ## COMPONENT Rtg Dpn LocalLinkGroups (Lg)

| | |
|---|---|
| Instance | String (1..12, ASCII) |
| Groups | "GROUP Rtg Dpn Lg Operational (Oper)" |
| Scope | Network |
| Description | *Routing Dpn LocalLinkGroups/<neighborNodeName>*<br>This component is a dynamic subcomponent of the *DpnAddressPlan*. It provides information about the support of external gateways to RMs and AMs connected to this Passport node. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Rtg Dpn Lg Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes provides information about the gateways in use to reach Passports, RMs and AMs connected to this Passport node. |

### ATTRIBUTE Rtg Dpn Lg farEndType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the far end module (EM, AM or RM). |
| Values | em<br>rm<br>am |
| Default | No default |

### ATTRIBUTE Rtg Dpn Lg farEndRid

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the far end neighbor RID. If the neighbor is an AM then the RID is that of the Passport node. |
| Values | Decimal (1..126) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Lg farEndMid

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the far end neighbor MID. |
| Values | Decimal (1..1910) |
| Default | No default |

### ATTRIBUTE Rtg Dpn Lg delayMetric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the delay metric calculated for the link group.<br><br>If the type of the far end switch is AM, the delay metric is calculated for MID routing, ranging from 1 to 2147483647.<br><br>If the type of the far end switch is EM or RM, the delay metric, ranging from 1 to 255, is based on the measured round trip delay |

of the delay preferred links in the group. A link group with a low metric value is preferable to one with a higher value as it is associated with lower delay facilities.

Values: Decimal (1..2147483647)

Default: No default

### ATTRIBUTE Rtg Dpn Lg tputMetric

Access: Read only

Description: This attribute indicates the throughput metric calculated for the link group.

If the type of the far end switch is AM, the throughput metric is calculated for MID routing, ranging from 1 to 2147483647.

If the type of the far end switch is EM or RM, the throughput metric, ranging from 1 to 255, is based on the sum of the bandwidth available for all links in the group. A link group with a low metric value is preferable to one with a higher value as it is associated with higher bandwidth facilities.

Values: Decimal (1..2147483647)

Default: No default

### COMPONENT Rtg Dpn LpStatistics (LpStats)

Instance: Decimal (0..15)

Groups: "GROUP Rtg Dpn LpStats ForwardingStatistics (FwdStats)"

Scope: Network

Description: *Routing Dpn LpStatistics/n*
This component provides DPN packet forwarding statistics for the
LP identified by this component instance.

## GROUP Rtg Dpn LpStats ForwardingStatistics (FwdStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes provides DPN packet forwarding statistics<br>for this LP. The statistics can be used to monitor the connectionless<br>traffic profile on this LP. |

## ATTRIBUTE Rtg Dpn LpStats totalPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the delay and throughput packets handled by DPN packet forwarding on this LP when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. Note that DPRS packets leaving the network at this LP are not counted. Also, if the card type of this LP is PQC, and the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to the value of ***loadspreadFast***, DPRS packets that are tandem through the module at this LP are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Rtg Dpn LpStats throughputPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the throughput packets handled by DPN packet forwarding on this LP when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. Note that DPRS packets leaving the network at this LP are not counted. Also, if the card type of this LP is PQC, and the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to the value of ***loadspreadFast,*** DPRS packets that are tandem through the module at this LP are not counted. The counter wraps to zero when the maximum value is exceeded. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn LpStats delayPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the delay packets handled by DPN packet forwarding on this LP when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. Note that DPRS packets leaving the network at this LP are not counted. Also, if the card type of this LP is PQC, and the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to the value of ***loadspreadFast,*** DPRS packets that are tandem through the module at this LP are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn LpStats normalReliabilityPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the normal reliability packets handled by DPN packet forwarding on this LP when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. Note that DPRS packets leaving the network at this LP are not counted. Also, if the card type of this LP is PQC, and the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to the value of ***loadspreadFast,*** DPRS packets that are tandem through the module at this LP are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn LpStats highReliabilityPackets

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the high reliability packets handled by DPN packet forwarding on this LP when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. Note that DPRS packets leaving the network at this LP are not counted. Also, if the card type of this LP is PQC, and the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to the value of ***loadspreadFast,*** DPRS packets that are tandem through the module at this LP are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn LpStats discardNoRoute

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets that have been discarded by packet forwarding due to failure to find a route to forward the packets on this LP when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. Note that DPRS packets leaving the network at this LP are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn LpStats interruptingPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the multimedia packets handled by DPN packet forwarding on this LP when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. Note that DPRS packets leaving the network at this LP are not counted. Also, if the card type of this LP is PQC, and the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to the value of ***loadspreadFast***, DPRS packets |

| | |
|---|---|
| | that are tandem through the module at this LP are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Rtg Dpn LpStats discardLpCongested

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets that have been discarded by DPN packet forwarding, on the entire module, due to congestion on this LP when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. This value is the sum of the packets discarded by all LPs due to insufficient shared memory on this one. Note that DPRS packets leaving the network at this LP are not counted. Also, if the card type of this LP is PQC, and the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to the value of ***loadspreadFast***, DPRS packets that are tandem through the module at this LP are not counted. The counter wraps to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Rtg Dpn RidFilterInfo (RidFilter)

| | |

## GROUP Rtg Dpn RidFilter Provisioned (Prov)

Properties: Provisioned

Description: This group of attributes specifies the criteria for filtering Routing Table Updates (RTUs) sent to and received from a neighboring RID.

## ATTRIBUTE Rtg Dpn RidFilter importRidList

Access: Read and write

Description: This attribute specifies the list of RIDs whose reachability information will be accepted from the instance RID. Information about RIDs which do not appear in this list will be ignored and this node considers those RIDs to be unreachable from the instance RID. Note that this also applies to the instance RID itself, that is, if the instance RID does not appear in the import list, this node considers the instance RID to be unreachable from the instance RID.

By default this list contains all valid RIDs, meaning that information about all RIDs will be accepted from the instance RID.

When this list is empty, no RID information is accepted from the instance RID, therefore, no RID traffic will be routed to it. A warning is generated when an empty import list is detected.

RID 127 is the Network Services Sharing (NSS) RID, used to identify DPN-100 nodes running call servers which can be used

for remote call processing. This RID can be filtered like any other using the import RID list.

List of Decimal (1..127)

Default (1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127)

### ATTRIBUTE Rtg Dpn RidFilter exportRidList

Access Read and write

Description This attribute specifies the list of RIDs whose true reachability is advertised to the instance RID. RIDs which do not appear in this list are advertised to the instance RID as being unreachable from this node.

By default, this list contains all valid RIDs, meaning that true reachability information for all RIDs is advertised to the instance RID.

When this list is empty, all RIDs will be advertised to the instance RID as unreachable, including this node's own RID, therefore the instance RID will not route any RID traffic to this RID. A warning is generated when an empty export list is detected.

RID 127 is the Network Services Sharing (NSS) RID, used to identify DPN-100 nodes running call servers which can be used for remote call processing. This RID can be filtered like any other using the import RID list.

List of Decimal (1..127)

Default (1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74,

## COMPONENT Rtg Dpn DefaultRoute (DefRoute)

| | |
|---|---|
| Groups | "GROUP Rtg Dpn DefRoute Operational (Oper)" |
| Scope | Network |
| Description | *Routing Dpn defaultRoute*<br>This is a dynamic subcomponent of *DpnAddressPlan*. It has only one instance and only resides on a Passport node when the *clusterNode* under the *Routing* component is provisioned as ***yes*** meaning the node is a Passport cluster node. It provides information about the default paths in use to any RID, MID or Call Server unknown to the Passport cluster node. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Rtg Dpn DefRoute Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes is maintained by the *DpnAddressPlan* component to provide information about the default routes to any unknown RID, MID or Call Server from a Passport cluster node. |

## ATTRIBUTE Rtg Dpn DefRoute delayNextHopLinkGroups

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the delay link group, or groups, that are being used at a cluster node to reach a neighbor which is the next hop in the default path to an unknown RID, MID, or Call Server. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest delay metrics to the backbone. |

If no link groups are listed then the backbone and thus all RIDs, MIDs, and Call Servers outside of the local cluster are not reachable in the delay class of service.

Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it.

Values: The name of the component

Replication: Decimal (0..1)

Default: No default

### ATTRIBUTE Rtg Dpn DefRoute tputNextHopLinkGroups

Access: Read only

Description: This attribute indicates the throughput link group, or groups, that are being used at a cluster node to reach a neighbor which is the next hop in the default route to an unknown RID, MID, or Call Server. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest throughput metrics to the backbone.

If no link group is listed then the backbone and thus all RIDs, MIDs and Call Servers outside of the local cluster are not reachable in the throughput class of service.

Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it.

Values: The name of the component

Replication: Decimal (0..1)

Default: No default

### ATTRIBUTE Rtg Dpn DefRoute delayPathTrafficProportions

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the target percentages of the total delay traffic flows over each delay default path from the cluster node to reach a RID, MID, or Call Server outside of the cluster. These percentages are achieved when there is a large number of virtual circuits (VCs). |
| Values | Decimal (0..100) |
| Units | % |
| Replication | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE Rtg Dpn DefRoute tputPathTrafficProportions

### ATTRIBUTE Rtg Dpn DefRoute delayMetric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the delay metrics of up to two paths in use at a cluster node for forwarding packets to any unknown RID, MID, or Call server. The paths in use are the paths towards the backbone of the Passport network. Packets destined to any unknown RID, MID, or Call Server are forwarded to a non-cluster node outside of the cluster and further handled by the node outside of the cluster to reach their destinations.<br><br>Paths from the local cluster node to all connected non-cluster |

Passport nodes in the RID subnet are found by the Routing System. The delay metric displayed is computed based on the sum of the delays associated with the links in a path from the local node to one of those non-cluster nodes. A path with a lower metric value is preferable to one with a higher value as it is associated with lower delay facilities.

Metric values of 2147483647 for both paths means no default paths are in use and thus all unknown RIDs, MIDs, and Call Servers are unreachable in the delay class of service. A metric value of 2147483647 for the second path only means that there is only one viable delay path to get off the cluster.

| | |
|---|---|
| Values | Decimal (0..2147483647) |
| Replication | Decimal (0..1) |
| Default | No default |

## COMPONENT Rtg Dpn AutomaticRouteTester (Art)

| | |
|---|---|
| Groups | "GROUP Rtg Dpn Art Provisioned (Prov)"<br>"GROUP Rtg Dpn Art Operational (Oper)" |
| Scope | Network |
| Description | *Rtg Dpn AutomaticRouteTester*<br>This component is a subcomponent of *DpnAddressPlan*. It provides the DPN automatic route testing capability by periodically sending DPN Ping packets to each reachable RID and MID destination in the DPN routing table. It monitors if these Ping packets are returned in a reasonable period of time (about 15 seconds), and analyzes the route information collected in these packets.<br><br>An alarm will be raised if one or more of the following problems are detected to at least one of the destinations in the DPN routing table:<br>(1) “Timeout”<br>After sending three Ping packets (one round-trip-delay Ping packet and two path Ping packets) to a destination, none of them return back in a reasonable period of time. This is referred to as a “timeout” problem to this destination.<br>(2) “Routing Loop”<br>After analyzing the route information collected in the path Ping packet(s) that have returned in time ( a path Ping packet logs the route information (forward direction only) of all the tandem node(s) this Ping packet has traversed before it reached the destination), a routing loop is detected if a specific node appears more than once on the route. This is referred to as a "routing loop" (sometimes simply “loop”) problem to this destination.<br><br>Information about each error destination is accessible via a |

dynamic sub-component under this component. If the destination is a RID destination, it will be *ErrorRid/x* (where x is the RID value of the RID destination). For MID destination, it will be *ErrorMid/y* (where y is the MID value of the MID destination). The maximum number of error destinations (counting both the RID and the MID destinations) that can be simultaneously tracked (and thus appear here) is 10.

Please note that *ErrorRid/x* or *ErrorMid/y only* exist as long as there is a problem to this destination. If the problem no longer exist or this error destination becomes unreachable, the component (*ErrorRid/x* or *ErrorMid/y)* that keeps track of this error destination will be automatically removed.

## GROUP Rtg Dpn Art Provisioned (Prov)

Properties Provisioned

Description This group of attributes provides information about the option(s) and parameter(s) that the operator can set to control the behavior of automatic route tester.

## ATTRIBUTE Rtg Dpn Art cosUnderTest

Access Read and write

Description This attribute specifies the COS type(s) (delay, throughput, delay and throughput) for which the automatic route testing is conducted.

A description of possible values for this attribute follows:
***none***: Do not conduct route testing for any COS type (essentially the automatic route tester is turned off).
***delayCosOnly***: Conduct route testing to each reachable RID and MID destination for delay COS only.

***tputCosOnly***: Conduct route testing to each reachable RID and MID destination for throughput COS only.
***delayAndTputCos***: Conduct route testing to each reachable RID and MID destination for delay and throughput COSs.

Setting this attribute to "***none***" allows the operator to turn off the automatic route tester. Using value "***delayCosOnly***" or "***tputCosOnly***" tells the automated route tester to only work on one COS of the operator's choice. Choosing value "***delayAndTputCos***" when both the delay and throughput COSs are to be tested.

The network resources consumption (such as CPU, memory, link bandwidth) of the automatic route tester working on two COSs will roughly be two times as much as working on only one COS. The time to complete a full cycle of route testing to every reachable destination is also expected to be twice as long when working on two COSs.

Values
none
delayCosOnly
tputCosOnly
delayAndTputCos

Default
none

## ATTRIBUTE Rtg Dpn Art testInterval (interval)

Access
Read and write

Description
This attribute specifies the time interval between the successive tests on different destinations. The automatic route tester periodically tries to test the route to a different reachable destination (RID or MID). In order not to put too heavy a load on the network, it will wait for a period of time equal to this interval before it will start working on another destination.

The smaller the value of this attribute, the more frequently the automatic route tester gets invoked to work on route testing. On one hand, doing so will reduce the amount of time needed to complete a fully cycle of route testing to every reachable destination. One the other hand, this will increase the resource

consumption of the automatic route tester accordingly.

During each testInterval, the automatic route tester will first retry the routes to each error destination, if any, to see if they have recovered. After the retries of all these error destinations, another RID/MID destination from the DPN routing table (not in the error destination list) will be chosen to conduct route testing only if the current number of error destinations is less than 10. If the number of error destinations has reached 10, no other destinations will be chosen and the automatic route tester will focus on retrying only these error destinations at each testInterval. However, if the routes to at least one error destination has recovered or has become unreachable, the number of error destinations will fall below 10, and the selection and conducting of route testing on another destination from the DPN routing table will resume.

### COMPONENT Rtg Dpn PerformanceStatistics (PerfStats)

| | |
|---|---|
| Scope | Network |

Description

*Rtg Dpn PerfStats*
This component is a subcomponent of *Rtg Dpn* component. It is responsible for monitoring the performance of *Dpn* component by recording statistics. Statistics maintained by this component include (1) number of routing control packets and bytes that are transmitted and received by the *Dpn* component, and (2) RID subnet statistics (such as number of MIDs, number of gateway nodes etc.) that are stored in the database and maintained by the *Dpn* component.

Routing control packets (also known as routing protocol packets), which are sent and received by the *Dpn* component, can be categorized into two types: intra subnet protocol packets and inter subnet protocol packets. Intra subnet protocol packets are also called broadcast packets, and are used to advertise reachable RID, MID, Call Server functions, Call Server Resource Module (CSRM) RID, and substitute RID information in a subnet. Inter subnet protocol packets are used to convey routing information between RID subnets and to inter-network with DPN-100 networks. The packet statistics provided by this component include only broadcast packets that are transmitted to and received from other Passport nodes in the subnet in which this node resides.

The subnet statistics (*DpnRidSubnetStatistics*), maintained by this component, provide subnet characteristics from this node's view. When there are no Passport clusters being deployed in a RID subnet, the *PerfStats DpnRidSubnetStatistics* provided by each node in the subnet should be identical. If there exist Passport clusters in a RID subnet, the subnet statistics provided by subnet backbone nodes and cluster nodes would be different. However, the *PerfStats DpnRidSubnetStatistics* provided by each subnet backbone node should be identical; the *PerfStats*

*DpnRidSubnetStatistics* provided by each cluster node in the same cluster should be identical.

## COMPONENT Rtg Dpn PerfStats LinkGroupStatistics (LgStats)

Instance String (1..12, ASCII)

Scope Network

Description *Rtg Dpn PerfStats LgStats/<aNeighborNodeName>*
This component is a dynamic subcomponent of *Rtg Dpn PerfStats* component. It provides statistics of broadcast packets that are transmitted to and received from the neighbor Passport node identified by the *LgStats* component.

Note that there is one *LgStats* instance per spanning tree link group (also known as spanning tree neighbor), and that not all physical link groups staged on this node are present as *LgStats* instances. This is because a spanning tree forwarding algorithm is used by the *Dpn* component to perform broadcasting (that is, broadcast packets are forwarded only along the spanning tree branches, not forwarded on every physical link groups staged on a Passport node) in order to achieve broadcast efficiency and lower broadcast traffic. The spanning tree is computed by the *Rtg Top* component, and is computed on a per RID subnet basis upon topology change. Even though the spanning tree spans and covers every node, including cluster nodes, in the subnet, the *Dpn* component is informed only the local link groups that are on the spanning tree, as only these spanning tree link groups are needed to perform the broadcasting. Therefore, for each local spanning tree link group inside the subnet in which this node locates, there is an *LgStats* instance added to record the statistics of broadcast packet that are transmitted to and received from the spanning tree neighbor.

Note also that some *Dpn* broadcasts in a subnet do go across backbone and cluster border. Therefore, on a backbone or cluster border node, a spanning tree link group, identified by an *LgStats* instance, may be a backbone cluster border link group.

An *LgStats* instance also represents a broadcast neighbor. When the link group to a broadcast neighbor goes down and then comes back, statistics maintained by the *LgStats* instance will be reset and restart from zero.

## COMPONENT Rtg Topology (Top)

Groups "GROUP Rtg Top Statistics (Stats)"

Scope Network

Description

*Rtg Topology*
This component is a subcomponent of *Routing*. It resides on all Passport modules and is responsible for maintaining a topological database describing the Passport network topology in terms of nodes and connectivity between them in a topology region. Note that a topology region is an autonomous groups of Passport modules, in which each of the Passport nodes has its *regionId* (attribute of *ModuleData* component) set to the same value. A Passport module only exchanges topology information with connected nodes in the same region.

This component also computes the reachability costs to each Passport node within the topology region for multiple address plans taking into account the underlying transport attributes of interest to them.

### COMPONENT Rtg Top Node

| | |
|---|---|
| Instance | String (1..12, ASCII) |
| Groups | "GROUP Rtg Top Node Operational (Oper)" |
| Scope | Network |
| Description | *Rtg Top Node/<neighborNodeName>*<br>This component is a dynamic subcomponent of *Topology*. It describes the existence of a Passport module whose *clusterNode* (attribute under the *Routing* component) is provisioned the same value as that of this node, and indicates this node's view of interconnections to the Passport module.<br><br>If this node is a cluster node, that is the attribute *clusterNode* for this node is provisioned with the value ***yes***, then this component provides reachability information for each Passport module supported in the cluster in which this node is located. Note that a Passport cluster, consisting of one or more interconnected cluster nodes, is typically deployed at the edge of a topology region to |

provide access services. Therefore, in other words, if this node is in a cluster of a topology region, there is one instance of this component for each Passport module in the cluster topology.

Similarly, if this node is a non-cluster node, that is the attribute *clusterNode* for this node is provisioned with the value ***no***, then this component provides reachability information for each Passport module supported in the topology region but excluding all cluster nodes. Note that, in contrast, a non-cluster node typically provides transportation for traffic flows originating or terminating on cluster nodes. A group of interconnected non-cluster nodes is typically located in the center of a topology region to connect clusters. To simplify the description of all subcomponents of *Node* component as well as their attributes in the following text, this group of interconnected non-cluster nodes in a topology region is referred as the backbone or a topology region's backbone, and a non-cluster node in the backbone is referred as a backbone node. Therefore, if this node is in the backbone of a topology region, there is one instance of this component for each Passport module located in the backbone.

Properties: Operational

Description: *Rtg Top Node/<neighborNodeName> LinkGroup/ <neighborNodeName> Trunk/<Trm Lk Id> Operational*
This group contains the operational data stored and maintained by the *PorTrunkObject* component.

### ATTRIBUTE Rtg Top Node Lg TrkObj maxReservableBwOut (mrbwo)

Access: Read only

Description: This attribute displays trunk bandwidth which can be used for reservations on behalf of connections requiring path oriented routing. This bandwidth is displayed in bit/s and has been calculated by concerned trunk path administrator from the trunk bandwidth and from the percentage of trunk bandwidth provisioned for reservations by PORS.

Values: Decimal (0..4294967295)

Units: bit/s

Default: No default

### ATTRIBUTE Rtg Top Node Lg TrkObj trunkCost (cost)

Access: Read only

Description: This attribute displays trunk cost metric provisioned as *trunkCost* attribute of a concerned trunk path administrator.

Values: Decimal (1..255)

Default: No default

### ATTRIBUTE Rtg Top Node Lg TrkObj trunkDelay (delay)

Access: Read only

| | |
|---|---|
| Description | This attribute displays one-directional trunk delay measured by trunk during staging. This is half (rounded down to an integer) of the delay displayed by attribute *delay* under *Trm Link*. |
| Values | Decimal (0..65535) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Rtg Top Node Lg TrkObj trunkSecurity (sec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays trunk security metric provisioned as *trunkSecurity* attribute under the trunk path administrator. |
| Values | Decimal (0..7) |
| Default | No default |

### ATTRIBUTE Rtg Top Node Lg TrkObj supportedTrafficTypes (sttyp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of traffic that can be transmitted on the trunk. There are eight possible traffic types and the trunk can transmit all of them if desired. The voice, data and video traffic types are defined, and five other traffic types can be defined in using *supportedTrafficTypes* under the trunk path administrator. This attribute is used in the route selection process to limit the route to trunks that support the traffic to be carried by the path. |
| Set of | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | No default |

### ATTRIBUTE Rtg Top Node Lg TrkObj trunkType (typ)

| | |
|---|---|
| Access | Read only |
| Description | This attribute lists the type of the trunk. There can be up to eight types of trunks. The terrestrial and satellite trunk types have been defined, leaving six remaining types that can be defined by the network administration. The set of allowed trunk types for a path is indicated in the *permittedTrunkTypes* attribute of the *PLC*. When selecting a route, PORS only chooses trunks whose *Pa trunkType* is in the *permittedTrunkTypes* set of the path. |
| Values | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | No default |

### ATTRIBUTE Rtg Top Node Lg TrkObj customerParameter (cpar)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the customer defined parameter for the trunk. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary *PLC* attribute, *requiredCustomerParam*, also has a value from zero to seven. The Route Selector does not consider trunks whose *Pa customerParameter* is greater than the *requiredCustomerParam* of the path. |
| Values | Decimal (0..7) |
| Default | No default |

### ATTRIBUTE Rtg Top Node Lg TrkObj farEndTrmLkInstance (far)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates identification of the corresponding trunk providing the reverse direction of transmission. |

| | |
|---|---|
| Values | Decimal (1..1023) |
| Default | No default |

### ATTRIBUTE Rtg Top Node Lg TrkObj mapMode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the trunk is in Map Mode or not. A value of ***yes*** indicates that the trunk is in Map mode and ***no*** if it is not. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE Rtg Top Node Lg TrkObj unreservedBwOut (unres)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays a table. In the first row there are setup priorities. In the second row there are numerators of parts of unreserved bandwidth corresponding to setup priority 0 (first column) through 4 (fifth column). The denominator is 255. |
| Array of | Decimal (0..255) |
| Row | setupPriority [bwPartOver255] |
| Column | unreservedBwParts [Decimal (0..4)] |
| Default | No default |

### COMPONENT Rtg Top Node ClusterNode

| | |
|---|---|
| Instance | String (1..12, ASCII) |
| Groups | "GROUP Rtg Top Node ClusterNode Operational (Oper)" |
| Scope | Network |
| Description | *Rtg Top Node/<backboneBorderNodeName> ClusterNode/ <clusterNodeName>*<br><br>*Rtg Top BorderLinkGroup/<neighborNodeName> ClusterNode/ <clusterNodeName>* |

This component is a dynamic subcomponent of both the *Node* and *BorderLinkGroup* components. It exists only on a non cluster node (also referred as a backbone node), that is, this component is present under *Node* and/or *BorderLinkGroup* only if the attribute *clusterNode* for this node is provisioned with ***no***. This component does not exist on any cluster node.

If this node is a backbone node, this component, under *Node*, describes the reachability from a border node in the backbone to a cluster node. Note that a border node refers to the node that is connected by cluster border link groups. Therefore, this component provides information, in this backbone node's view, about all cluster nodes (which might be located in multiple clusters) reachable through all border nodes in the backbone. There is one instance of this component for each cluster node reachable through a border node.

If this node is also a border node in the backbone, that is, this node is a backbone node and has at least one cluster border link group staged on it. Then, this component, under the *BorderLinkGroup*, describes the reachability to a cluster node through a local cluster border link group. There is one instance of this component for each cluster node in a cluster that can be reached through a cluster border link group. Note that this information (reachable cluster nodes through a cluster border link group) is only known to the local Passport module, and is not shared with the other nodes in the backbone.

## COMPONENT Rtg Top Node ReachableAddr (RAddr)

Instance

address [String (1..40, ASCII)]
linkId [Decimal (0..9999)]

Groups

"GROUP Rtg Top Node RAddr Operational (Oper)"

Scope

Network

Description

*Rtg Top Node/<nodeName> ReachableAddr/ <reachableAddr>,<linkId>*
This component represents an NSAP address (or prefix) as well as the associated link ID which can be reached from the node identified by the instance of the *Node* component. Actually , an instance of this component really represents either an *Address* component provisioned under a *Trunk* component or a *SummaryAddress* component provisioned under the *Routing* component on the Passport node identified by the instance of the *Node* component.

Instances of this component associated with a remote node are learned from the topology information broadcast sent by the remote node. Topology information is exchanged only between Passport nodes within the same topology region's backbone or cluster. Instances of this component under all *Node* components represent the set of all reachable addresses stored in the topology database maintained by the local node.

If a *SummaryAddress* component, provisioned under the *Routing*

component, is the prefix of an *Address* component provisioned under a *Trunk* component on the same node, the *Address* component will be removed from the list of *ReachableAddr* instances associated with and broadcast by that node. This behavior is also referred as reachable addresses summarization. That is, if an *Address* component is summarized by a *SummaryAddress* component provisioned on the same node, the *Address* component will not be broadcast by that node, therefore, it will not be displayed through a *ReachableAddr* component instance associated with that node.

## GROUP Rtg Top Node RAddr Operational (Oper)

Properties: Operational

Description: *Rtg Top Node/<aNodeName> ReachableAddr/<anAddress> Operational*
This group contains the operational data stored and maintained by a *ReachableAddr* component in the topology database of the local node.

## ATTRIBUTE Rtg Top Node RAddr cost

Access: Read only

Description: This attribute indicates the cost to reach the *ReachableAddr* component from the node identified by the instance of the *Node* component. The value of this attribute associated with a *ReachableAddr* component provisioned on a remote Passport node is learned from the topology information exchange protocol packets sent by the remote node.

If the *ReachableAddr* represents a *Trunk Address* component on a node (which could be either a remote node or the local node), the value displayed in this attribute is actually the cost provisioned in the *cost* attribute under the *Trunk Address* component on the node. If the *ReachableAddr* represents a *Routing SummaryAddress* component on a node, then the value displayed

in this attribute is the cost provisioned in the *cost* attribute under the *Routing SummaryAddress* on the node.

Values: Decimal (0..2147483647)

Default: No default

### ATTRIBUTE Rtg Top Node RAddr porsReachable (prsR)

Access: Read only

Description: This attribute indicates whether the *Trunk* component under which the *ReachableAddr* is provisioned is able to carry PORS traffic or not. In other words, this attribute indicates whether there is a *PathAdmin* component present under the *Trunk* Component which is also the parent component of the *ReachableAddr* component.The value of this attribute associated with a *ReachableAddr* component provisioned on a remote node is learned from the topology information exchange protocol packets sent by the remote node.

The value of this attribute is ***yes*** if there is a *PathAdmin* component existing under the *ReachableAddr* component's parent - the *Trunk* component, and is ***no*** otherwise.

Values:
no
yes

Default: No default

### ATTRIBUTE Rtg Top Node RAddr clusterBorderNode (cbn)

Access: Read only

Description: This attribute indicates whether the *ReachableAddr* is provisioned on a backbone-cluster border node or not. The value of this attribute associated with a *ReachableAddr* component provisioned on a remote Passport node is learned from the topology information exchange protocol packets sent by the remote node.

The value of this attribute is ***yes*** if the node on which the *ReachableAddr* is provisioned is a backbone border node or a cluster border node, and is ***no*** otherwise.

## GROUP Rtg Top BLg ClusterNode Operational (Oper)

Properties

Operational

Description

*Rtg Top Node/<backboneBorderNodeName> ClusterNode/ <clusterNodeName> Operational*

*Rtg Top BorderLinkGroup/<neighborNodeName> ClusterNode/ <clusterNodeName> Operational*

*Rtg Top Node/<clusterBorderNodeName> PeerBorderNode/ <backboneBorderNodeName> Operational*

This group contains the operational data stored and maintained by the *ClusterNode* component on a backbone node and/or the *PeerBorderNode* component on a cluster node.

## ATTRIBUTE Rtg Top BLg ClusterNode nodeId

Access

Read only

Description

This attribute is a number that uniquely identifies the *ClusterNode* and/or the *PeerBorderNode* instance in Passport topology region. It is the identifier used in the routing control packets sent by this node to other Passport nodes in the same topology region.

The *nodeId* for each node in a topology region is learned from the Passport routing protocol packets.

Values: Decimal (1..4095)

Default: No default

### ATTRIBUTE Rtg Top BLg ClusterNode delayMetric

Access: Read only

Description: This attribute indicates the outbound cost for the delay class of service to reach the destination (a cluster node or a peer border node in the backbone). It is the sum of delay metrics of multiple hops from the border node to reach the destination. A low outbound cost is preferable to a higher value as it is associated with higher speed facilities.

A metric value of 2147483647 means that the destination is unreachable for the delay class of service.

Values: Decimal (1..2147483647)

Default: No default

### ATTRIBUTE Rtg Top BLg ClusterNode tputMetric

Access: Read only

Description: This attribute indicates the outbound cost for the throughput class of service to reach the destination (a cluster node or a peer border node in the backbone). It is the sum of throughput metrics of multiple hops from the border node to reach the destination. A low outbound cost is preferable to a higher value as it is associated with higher speed facilities.

A metric value of 2147483647 means that the destination is unreachable for the throughput class of service.

Values: Decimal (1..2147483647)

Default: No default

## COMPONENT Rtg Top PerformanceStatistics (PerfStats)

Scope: Network

Description

*Rtg Top PerfStats*
This component is a subcomponent of *Rtg Top* component. It is responsible for monitoring the performance of *Top* component by recording statistics. Statistics maintained by this component include the number of (1) routing control packets and (2) various information fragments (also known as database entries) that are stored and maintained in the topology database by the *Top* component.

Routing control packets (also known as routing protocol packets), sent and received by the *Top* component, can be categorized into two types: topology protocol packets and cluster protocol packets. Topology protocol packets are used to advertise topology information and are exchanged only between Passport nodes in the same flat topology region, region's backbone, or cluster. Therefore, the topology database, maintained by the *Top* component, contains only information of Passport nodes in the same flat topology region, region's backbone, or cluster. Cluster protocol packets are used to convey routing information across the backbone-cluster boundary and are exchanged only between backbone and cluster border nodes.

If clusters are not deployed, the packet statistics provided by this component include only topology protocol packets that are transmitted to and received from other Passport nodes in the same topology region. The database statistics maintained by this component provides information of the topology database that contains all nodes in the same topology region in which this node resides.

If clusters are deployed in the topology region, on a backbone node, the packet statistics provided by this component include only topology protocol packets that are transmitted to and received from other Passport nodes in the backbone. On a backbone border node, the packet statistics provided by this component also include the cluster protocol packets that are sent to and received from the connected cluster border nodes. Since the topology database, maintained by a *Top* component, is the same on either a backbone node or a backbone border node, the database statistics provided by this component should be identical on all nodes in the backbone.

Similarly, on a cluster node, the packet statistics provided by this component include only topology protocol packets that are transmitted to and received from other Passport node in the cluster. On a cluster border node, the packet statistics provided by this component also include the cluster protocol packets that are sent to and received from the connected backbone border nodes. Since the topology database, maintained by a *Top* component, is the same on either a cluster node or a cluster border node, the database statistics provided by this component should be identical on all nodes in the same cluster.

Scope Network

Description *Rtg Top PerfStats LgStats/<aNeighborNodeName>*
This component is a dynamic subcomponent of *Rtg Top PerfStats* component. It provides statistics of topology protocol packets that are transmitted to and received from the neighbor Passport node identified by the *LgStats* component.

Note that there is one *LgStats* instance per locally staged *Lg* on this node. Topology protocol packets are exchanged only between neighbor Passport nodes that are in the same flat topology region, region's backbone, or cluster, they are not sent across a topology region border nor a backbone-cluster border. Therefore, for each locally staged *Lg* that is in the same flat topology region, region's backbone, or cluster in which this node resides, there is one *LgStats* instance added to record the statistic of topology protocol packets that are transmitted to and received from the neighbor Passport node.

Statistics maintained by an *LgStats* instance only exist for the duration of the *Lg* component. When the *Lg* to a neighbor goes down and then comes back, statistics maintained by the corresponding *LgStats* instance will be reset and restart from zero.

## COMPONENT Rtg PathOrientedRoutingSystem (Pors)

Groups

"GROUP Rtg Pors Provisioned (Prov)"
"GROUP Rtg Pors Information (Info)"

Scope

Application

Description

This is the *Routing PathOrientedRoutingSystem* Component. It is used to display attributes of the PORS connections on a module and attributes for setting optimization timing for PORS connections. The *PathOrientedRoutingSystem* component also optimizes PORS connections on this module.

Opt. Subcomp.

### VERB Optimize (Opt) Rtg Pors

| | |
|---|---|
| Impact | Service |
| Description | Optimize [-segmented] Rtg Pors<br><br>If this module is not optimizing, this command forces an optimization process to begin immediately. Optimization is carried out on each active connection, on the module, at a rate of one per second.<br><br>If no option is specified, all unsegmented PORS connections sourced on the module that allow optimization will attempt to optimize.<br><br>If the -segmented option is specified, disruptive optimization will be triggered for segmented calls. Calls sourced on the module that are specified in the *optimizationScope* attribute and that allow optimization will be selected. Simultaneous optimization of segmented and unsegmented call types is not permitted.<br><br>This command may be used regardless of whether periodic optimization has been disabled by setting the *optimizationInterval* to zero. |

### GROUP Rtg Pors Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all provisionable attributes for the *Routing PathOrientedRoutingSystem* component. |

### ATTRIBUTE Rtg Pors optimizationInterval

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval at which periodic optimization occurs. The time defined is from the end of one optimization pass until the start of another pass. Periodic optimization has no effect on segmented calls.<br><br>If an interval of zero is specified periodic optimization is disabled on this module. |

| | |
|---|---|
| Values | Decimal (0; 1..1440) |
| Units | minutes |
| Default | 30 |

### ATTRIBUTE Rtg Pors optimizationScope (opts)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of routing point that is considered for segmented optimization. Note that only routing points that are sourcing call segments can be considered. Segmented optimization occurs when the destination node of the call segment is switched, or when an alternate path to the existing call segment destination node has at least a 10% improvement in path cost over the current path. Segmented optimization is disruptive to the call or calls being optimized. Three types of routing points can be selected as candidates for segmented optimization.<br><br>***applicationService***:<br>The source application. Enabling this routing point selects all calls sourced on the node. Call disruption will affect all call segments.<br><br>***outboundRGty***:<br>The outbound gateway that is leaving the region or cluster. Enabling this routing point selects all calls leaving the region or cluster from this node. Call disruption is from the outbound link to the destination node.<br><br>***inboundRGty***:<br>The inbound gateway that is entering a new region or cluster. Enabling this routing point will select all calls that enter the region or cluster through this node. Call disruption is from the current node to the destination node. |
| Set of | applicationService<br>inboundRGty<br>outboundRGty |

| | |
|---|---|
| Default | No default |

### GROUP Rtg Pors Information (Info)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational information for the *PathOrientedRoutingSystem* component. |

### ATTRIBUTE Rtg Pors activeConnections

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the current number of active PORS connections on this module. Active connections are connections that are in the Logical Connection component ***pathUp*** *state*.<br><br>This value is updated when requested and represents the current number of active PORS connections. During *Pors* optimization this number represents all the connections that receive optimization requests. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Rtg Pors optimizationState

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the current state of the *Pors* optimization. The ***disabled*** state means that the *optimizationInterval* has been set to zero. The ***scheduled*** state means that the optimization will be started at the *nextOptimizationTime.* The optimizing state means that *Pors* is currently attempting to optimize all connections on the module. |
| Values | disabled<br>scheduled<br>optimizing |
| Default | No default |

### ATTRIBUTE Rtg Pors lastOptimizationTime

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the time that the last optimization started. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Rtg Pors nextOptimizationTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the time the next optimization process will begin.<br><br>In the event that *optimizationInterval* is set to zero this value is also set to 0. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Rtg Pors optimizationPasses

| | |
|---|---|
| Access | Read only |
| Description | This is the number of optimization passes for the PORS connection manager. An optimization pass consists of a notification to each active PORS connection to attempt to optimize.<br>All types of optimization passes are included in this statistic. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Rtg Pors optimizationProgress

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the percentage of active connections that have been sent an optimization request. A message is sent to each *Pors* component LC requesting it to optimize its route.<br><br>This value is cleared at the beginning of each optimization pass. |
| Values | Decimal (0..100) |

| | |
|---|---|
| Units | % |
| Default | No default |

### ATTRIBUTE Rtg Pors pathsOptimized

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of successfully optimized paths for the latest optimization pass. Successfully optimized paths are paths that switched to a better route.<br><br>This value is cleared at the beginning of each optimization pass. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Rtg Pors totalPathsOptimized

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of successfully optimized paths on this module since the CP became active. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Rtg Pors Profile (Prof)

| | |
|---|---|
| Instance | Decimal (1..255) |
| Groups | "GROUP Rtg Pors Prof Provisioned (Prov)" |
| Scope | Application |
| Description | *Rtg Pors Prof/n*<br>This component includes all attributes which may generically apply to a set of *LogicalConnections*. It is basically identical to the *PermanentLogicalConnection* except it does not include a *remoteName* or *manualPath* attribute. The specification of emission and discard priority is also a bit different in that they may be left unspecified in which case the emission and discard priority of the connection will be selected by the application. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Rtg Pors Prof Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all provisionable attributes for a PORS profile.. |

### ATTRIBUTE Rtg Pors Prof setupPriority (spri)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, specifies the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | 2 |

### ATTRIBUTE Rtg Pors Prof holdingPriority (hpri)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the priority that a path holds once it is established. Zero is the highest priority and four is the lowest. A path's *holdingPriority* determines this path's likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing |

path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.*

Values: Decimal (0..4)

Default: 2

### ATTRIBUTE Rtg Pors Prof requiredTxBandwidth (tbw)

Access: Read and write

Description: This attribute specifies the bandwidth (in bits per second) reserved by a path on each of the trunks of its route.This attribute represents the bandwidth for traffic outgoing to the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced but is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value. A value of 0 (the default) means that the bandwidth will be the Peak Cell Rate for CLP0+1 as chosen by the user. A non zero value overrides this reservation.

Values: Decimal (0..155520000)

Units: bit/s

Default: 0

### ATTRIBUTE Rtg Pors Prof requiredRxBandwidth (rbw)

Access: Read and write

Description: This attribute specifies the bandwidth (in bits per second) reserved by a path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced but is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for

the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value. A value of 0 (the default) means that the bandwidth will be the Peak Cell Rate for CLP0+1 as chosen by the user. A non zero value overrides this reservation.

Values: Decimal (0..155520000)

Units: bit/s

Default: 0

### ATTRIBUTE Rtg Pors Prof requiredTrafficType (rttyp)

Access: Read and write

Description: This attribute specifies the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection.

Values:
voice
data
video
trafficType1 (tt1)
trafficType2 (tt2)
trafficType3 (tt3)
trafficType4 (tt4)
trafficType5 (tt5)

Default: data

### ATTRIBUTE Rtg Pors Prof permittedTrunkTypes (pttyp)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies up to eight types of trunk that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the *Trunk* component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | (terrestrial, satellite, trunkType1, trunkType2, trunkType3) |

### ATTRIBUTE Rtg Pors Prof requiredSecurity (rsec)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the required minimum level of security of the trunks on the route. A value of zero represents the most secure while seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the *Trunk* component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.* |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Rtg Pors Prof requiredCustomerParm (rcparm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the allowed customer defined parameter of the trunks on the route. Its value, a number from zero to seven, is chosen by network administration to have a meaning specific to their network, thus allowing them to customize the use of their |

trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.

Values: Decimal (0..7)

Default: 4

### ATTRIBUTE Rtg Pors Prof pathAttributeToMinimize (pamin)

Access: Read and write

Description: This attribute specifies whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a selected route is the sum of the trunk delay metric for all trunks included in the route.

Values: cost
delay

Default: cost

### ATTRIBUTE Rtg Pors Prof maximumAcceptableCost (maxCost)

Access: Read and write

Description: This attribute specifies an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done regardless of the value of *pathAttributeToMinimize*. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.

Values: Decimal (0..65535)

Default: 1280

### ATTRIBUTE Rtg Pors Prof maximumAcceptableDelay (maxDelay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies an upper bound on the delay of a route, which is the sum of the delay of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512 byte packet. Remember, that during its staging, the trunk measures a *measuredRoundTripDelay.* This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512 byte data packet is used to perform the measurement.<br>If for any trunk, half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection.<br>While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay.* |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | 100000 |

### ATTRIBUTE Rtg Pors Prof emissionPriority (epri)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the urgency with which packets on the path are emitted by the trunks on the route. An *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher). The default value for this attribute *(sameAsApplication)* will cause the connection's emissionPriority to be inherited from the user of the profile. In other words, setting this attribute to |

anything other than the default acts as an override to the priority normally used by the application linked to this profile.

Values
sameAsApplication
ep0
ep1
ep2

Default
sameAsApplication

### ATTRIBUTE Rtg Pors Prof discardPriority (dpri)

Access
Read and write

Description
This attribute specifies the importance of the packets on the path. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority* (numerically lower) are discarded after packets with a higher *discardPriority* (numerically higher). The default value for this attribute *(sameAsApplication)* will cause the connection's discardPriority to be inherited from the user of the profile. In other words, setting this attribute to anything other than the default acts as an override to the priority normally used by the application linked to this profile.

Values
sameAsApplication
dp1
dp2
dp3

Default
sameAsApplication

### ATTRIBUTE Rtg Pors Prof pathFailureAction (pfa)

Access
Read and write

Description
This attribute specifies whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30

seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

Values: reRoutePath
disconnectConnection

Default: reRoutePath

### ATTRIBUTE Rtg Pors Prof bumpPreference (bpref)

Access: Read and write

Description: This attribute specifies when bumping may be triggered as a result of this call being routed/rerouted or optimized. There are two possibilities:
***bumpWhenNecessary***: means that this call will only trigger the bumping of another call (subject to setup/holding priority restrictions) when there is no other way to establish a route for this call.
***bumpToObtainBestRoute***: means that this call may trigger the bumping of other calls (subject to setup/holding priority restrictions) if doing so would result in this call obtaining a better (lower cost/delay) route.
Since bumping to obtain the best route can be somewhat intrusive the default is only to bump when there is no other way to route the call.

Values: bumpWhenNecessary
bumpToObtainBestRoute

Default: bumpWhenNecessary

### ATTRIBUTE Rtg Pors Prof optimization (opt)

Access: Read and write

Description: If this attribute is ***enabled***, this connection will be optimized periodically as specified by the *Rtg Pors* attribute *optimizationInterval*. If this attribute is ***disabled***, the connection will use the route it was given for the life of the connection or until a failure or *lock* results in the call being rerouted.

| | |
|---|---|
| Values | disabled<br>enabled |
| Default | enabled |

### ATTRIBUTE Rtg Pors Prof users (usr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies all of the components which are associated with this *Profile*. Users of this profile will select and instantiate routes based on the attributes of this profile when PORS is used to choose and instantiate the route. If IISP or PNNI are used to choose and instantiate the route these attributes are ignored since they have no counterparts in IISP or PNNI routing. |
| List of | Link (Service, profile) |
| Default | No default |

### COMPONENT Rtg Pors ManualPath (Mpath)

| | |
|---|---|
| Instance | Decimal (1..255) |
| Groups | "GROUP Rtg Pors Mpath Provisioned (Prov)"<br>"GROUP Rtg Pors Mpath Operational (Oper)" |
| Scope | Application |
| Description | *Rtg Pors ManualPath/n*<br>This component specifies the sequence of *Trunk*s used by a service as the route between source and destination nodes. Services with a link to this component bypass PORS automatic route selection in favor of the route specified in the *route* attribute. This component, along with the *Rtg Pors Profile/n* component and the signaled called party NSAP address, determine the end to end path. An instance of this component should be provisioned for every unique list of *Trunks* used as a route by a service bypassing PORS automatic routing. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Rtg Pors Mpath Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all provisionable attributes for a PORS manual path. |

## ATTRIBUTE Rtg Pors Mpath route

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sequence of trunks used as the route for a path. If any trunk in the sequence does not meet the requirements (bandwidth, permittedTrunkType, security, customerParm, etc.) for a component listed in *users*, path validation fails and no path is instantiated for that user.<br>Changing this attribute will cause active connections of users of this *ManualPath* to move to the new route only if the users have *optimization* ***enabled*** and *Rtg Pors optimizationInterval* > 0. Otherwise, changing this attribute will cause the users' current connections to stay on the old *route* with all new calls instantiating their paths with the new *route*. Optimization can be disabled by having the application use a *Rtg Pors Prof/n* component with *optimization* ***disabled*** or by setting *Rtg Pors optimizationInterval* ***0***.<br>As an example, the trunk component name for the trunk instance 10 on node MoonBase is *EM/MoonBase Trk/10*. These strings are case insensitive but the complete component name must be input.<br>Note 1: the trunk designation must be in the 3-letter form 'trk'.<br>Note 2: only the outbound trunk component names are used to provision the *route*. |

| | |
|---|---|
| Vector of | String (0..40, ASCII) |
| Index | Decimal (0..19) |
| Default | ([20] "") |

### ATTRIBUTE Rtg Pors Mpath users (usr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies all of the components that will use this *ManualPath* to instantiate a path. Users of this component have paths that follow the sequence of *Trunks* specified in the *route* attribute of this component when PORS is used to choose and instantiate the route. |
| List of | Link (Service, porsManualPath) |
| List Size | 30 |
| Default | No default |

### GROUP Rtg Pors Mpath Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational information for the *Rtg Pors ManualPath/n* component. |

### ATTRIBUTE Rtg Pors Mpath lastSetupFailureReason (lfr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason for the most recent failure for an attempted connection using this *ManualPath*'s *route*. The following is a brief description of the reasons:<br>***none*** - This path has no information for the teardown.<br>***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the *Trunks* for this path in the transmit direction. If a trunk in the *route* attribute was previously locked, or has a *Trk PA* subcomponent that is not in the ***up*** *state* , that *Trunk* is considered as having no available bandwidth. If the *Trunk PA* is |

in ***mapped*** *mode*, the inability to allocate an *Atmif Vcc* also results in this failure reason.
***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the *Trunks* for this path in the receive direction. If a trunk in the *route* attribute was previously locked, or has a *Trk PA* subcomponent that is not in the ***up*** *state* , that *Trunk* is considered as having no available bandwidth.
***trunkFailure***- A *Trunk* on the path has failed or has gone down, due to a provisioning change of a critical attribute, as the path was being established.
***trunkCardFailure***- A *Trunk* FP card has failed along the path as the path was being established.
***accessCardFailure***- The FP on which the peer access service was running has failed as the path was being established.
***operatorForced***- The path has terminated due to the operator locking a *Trunk* along the path as the path was being established.
***lostLcnClash***- The path has terminated because the *Trk PA*'s at both ends of an intermediate trunk have allocated the same *Trk LC* to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different *Trk LC*'s). It is normal to get the odd clash especially when the *Trk PA usedLC* is approaching the *Trk PA maxLC*. An LCN clash results in the path failing to instantiate only if the application disabled rerouting. By default rerouting is enabled for all applications. Applications can disable rerouting by using a *Rtg Pors Prof/n* component with *pathFailureAction* set to ***disconnectConnection***.
***networkCongestion*** - The path has failed to establish due to control information being lost and not being recoverable.
***trunkNotFound*** - Check for *Trunks* not up or names provisioned incorrectly in *route* attribute .
***farEndNotFound*** - The far end is not provisioned or is not up. The called NSAP address cannot be reached through the last node in the *Rtg Pors ManualPath path*.
***farEndBusy*** - The far end has been reached but it is busy. Check remote end provisioning.
***unknownReason*** - The failure was not resolved.
***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled.

***serviceTypeMismatch*** - The remote service type does not match this service type. Check provisioning.
***bumped*** - Another call bumped this path, as it was being established, from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path. A manual path that is bumped fails to instantiate if it cannot bump another path along the same *route*, or if it has *pathFailureAction* set to ***disconnectConnection***.
***trunkOrFarEndDidNotSupportMode*** - This call was unable to complete because a *mode* required by the service was not supported by one of the *Trunks* the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on *Trk Pa Atm* component.

## ATTRIBUTE Rtg Pors Mpath lastSetupFailurePoint (lfp)

Access

Read only

Description

This attribute indicates the point in the *route* at which the path failed to establish. A failure at either end of a trunk will result in the display of the name of the trunk nearer the calling end.

| | |
|---|---|
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Rtg Pors Mpath lastSetupFailedUser (lfu)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the component in the *users* attribute that last failed to instantiate a path based on the *route*. |
| Values | The name of the component |
| Default | No default |

### COMPONENT Rtg SummaryAddress (SumAddr)

| | |
|---|---|
| Instance | String (0..40, ASCII) |
| Groups | "GROUP Rtg SumAddr Prov" |
| Scope | Application |
| Description | *Rtg SummaryAddress/<sumAddr>*<br>This is an optional subcomponent of the *Routing* component. It is used to summarize a set of addresses provisioned as the *Trunk/<n> Address/<addr>* components. When one or more of those addresses have a prefix in common, an instance of this component can be added using the common prefix as the instance value.<br><br>If this node is not a Passport cluster node, the summary address identified by this component will be distributed to all nodes but not to any cluster node in the Topology region.<br><br>If this is a Passport cluster node, this summary address will be distributed to all cluster nodes located in the local cluster only. That is, the address will not be distributed outside of this cluster. |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## GROUP Rtg SumAddr Prov

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes specifies the provisionable characteristics of the *Routing SummaryAddress* component. |

## ATTRIBUTE Rtg SumAddr cost (cost)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a cost of reaching the addresses summarized by the *Routing SummaryAddress/<sumAddr>* component. The value is assigned by the network administrator to represent the network cost of reaching the summarized address through this node. It can be related to distance, speed, dollars, or any other factor that could be taken into consideration. |
| Values | Decimal (0..65435) |
| Default | 200 |

Passport 7400, 15000, 20000

# COMPONENT SaalNni (SaalNni)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP SaalNni Provisioned (Prov)"<br>"GROUP SaalNni SscopProv (Sscop)"<br>"GROUP SaalNni SscfProv (Sscf)"<br>"GROUP SaalNni OsiState (State)"<br>"GROUP SaalNni Operational (Oper)"<br>"GROUP SaalNni WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS SaalNni"

| | |
|---|---|
| Scope | Application |
| Description | *SaalNni/n*<br><br>This component represents the SAAL-NNI layer that provides an adaptation layer to run signalling traffic over ATM using AAL5. |
| Subcomponents | "COMPONENT SaalNni NailedupAdaptationPoint (Nap)"<br>"COMPONENT SaalNni MemoryPoolManager (Mpm)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP SaalNni Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes of this component. |

### ATTRIBUTE SaalNni linkToPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies a link to *Gips IpAddr UDP Port* component on an IP Server. This determines the Ip Address and UDP port that the SAAL NNI user uses to address the *SaalNni* component.<br><br>Changing this value will cause the ATM link to be restarted. |
| Values | Link (Service, linkToApplication) |
| Default | No default |

### ATTRIBUTE SaalNni layer3IpAddress (l3IpAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the IP address of the SAAL-NNI user. This address must match the IP address provisioned in the corresponding *Mtp3/n* component specified by its *linkToPort* attribute.<br><br>Changing this attribute will cause the ATM link to be restarted. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE SaalNni layer3Port (l3Port)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the remote UDP port of the SAAL-NNI user. This value must match the port provisioned in the corresponding *Mtp3/n* component specified by its *linkToPort* attribute.<br><br>Changing this attribute will cause the ATM link to be restarted. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE SaalNni linkToApplications

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute specifies a list of components started on the same hardware as this *Saal* instance. The specified components are started on all *Lp* instances with which this *Saal* instance is associated via the *atmConnection* attribute of its *Nap* subcomponent.<br><br>At this time, this attribute is used to specify the *Gips* component that will serve this *Saal* instance. In the future up to 10 components can be linked to a *Saal* instance and thereby started on its hardware. |
| List of | Link |
| List Size | 10 |
| Default | No default |

### GROUP SaalNni SscopProv (Sscop)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes needed by the SSCOP sub-layer of SAAL-NNI. |

### ATTRIBUTE SaalNni maxPdusBetweenPolls (maxPdus)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the maximum number of Signalling Data PDUs that can be sent without sending a POLL PDU, as defined in ITU-T recommendation Q.2110. |
| Values | Decimal (1..1000) |
| Default | 500 |

### ATTRIBUTE SaalNni ccTimer (cc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time between transmissions of ‘BGN’, ‘END’, ‘RS’ and ‘ER’ PDUs, as defined in ITU-T recommendation Q.2110.<br><br>The timer is started when any one of these PDUs is transmitted.<br><br>The timer is stopped when a proper acknowledgement is received (e.g. BGNAK, ENDAK, RSACK, or ERACK).<br><br>Upon timer expiry the PDU will be retransmitted. The PDU is transmitted a maximum of *maxCc* times.<br><br>If the timer expires *maxCc* times, the link will be released, and the and the number of times this happens will be indicated by the attribute *maxCcReached.*<br><br>Layer 3 will attempt to bring the link back up. |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 200 |

### ATTRIBUTE SaalNni maxCc

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of allowed unacknowledged transmissions of ‘BGN’, ‘END’, ‘ER’ or ‘RS’ |

Protocol Data Units (PDUs) as defined in ITU-T recommendation Q.2110.

If the number of unacknowledged transmissions exceeds this value, the link will be released, and the number of times this happens will be indicated by the attribute *maxCcReached*.

Values: Decimal (1..1000)

Default: 4

### ATTRIBUTE SaalNni keepAliveTimer (tKeepAl)

Access: Read: All
Write: All

Description: This attribute specifies the time between sending of POLL PDUs when there is no activity on the link, as defined in ITU-T recommendation Q.2110.

The timer is started when either the *pollTimer* or the *keepAliveTimer* expires and there are no PDUs queued for sending.

The timer is stopped when a data request (SD PDU) is ready to be sent.

Upon expiry this timer sends a POLL PDU.

The value of *keepAliveTimer* should be set to a value greater that *pollTimer* and greater than the round-trip delay of a PDU.

Values: Decimal (100..1000)

Units: msec

Default: 100

### ATTRIBUTE SaalNni noResponseTimer (noResp)

Access: Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies the time interval during which at least one STAT PDU should be received.<br><br>The timer is started when a POLL PDU is sent.<br><br>The timer is stopped when a STAT PDU is received.<br><br>Upon timer expiry, the link is released, that is, brought out of service. Layer 3 will then attempt to bring it back to service.<br><br>The value of the *noResponseTimer* must not be less than the sum of the *keepAliveTimer* and one round-trip delay of a Protocol Data Unit (PDU).<br><br>The number of expiries of this timer is indicated by the attribute *noResponseTimeouts*. |
| Values | Decimal (500..2000) |
| Units | msec |
| Default | 1500 |

### ATTRIBUTE SaalNni pollTimer

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time between sending of POLL PDUs when the link has traffic, as defined in ITU-T recommendation Q.2110.<br><br>The timer is started when the link enters the Data Transfer Ready State.<br><br>The timer is stopped when the link is released.<br><br>Upon expiry, a POLL PDU is sent and *pollTimer* is restarted if the link has traffic. |
| Values | Decimal (100..1000) |
| Units | msec |

| | |
|---|---|
| Default | 100 |

### ATTRIBUTE SaalNni idleTimer

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the idle time after receipt of a STAT PDU, as defined in ITU-T recommendation Q.2110.<br><br>The timer is started when a STAT PDU is received.<br><br>The timer is stopped when data is sent or received on the link.<br><br>Upon expiry, a POLL PDU is sent and the *noResponseTimer* is started.<br><br>The value of the *idleTimer* must be greater that the sum of the *pollTimer* and the maximum round trip delay of a PDU. |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 100 |

### GROUP SaalNni SscfProv (Sscf)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes needed by the SSCF sub layer of SAAL-NNI. |

### ATTRIBUTE SaalNni provingMode

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute allows the operator to place the link into one of the link proving modes defined in ITU-T recommendation Q.2140.<br><br>***normal*** - This mode corresponds to the MAAL-FORCE_PROVING-request. It forces the SAAL-NNI layer to utilize proving when bringing up the link. |

***neutral*** - This mode corresponds to the MAAL-CLEAR_FORCE_MODES-request.It specifies that the layer using SAAL-NNI will select the proving mode.

***emergency*** - This mode corresponds to the MAAL-FORCE_EMERGENCY-request. It causes proving to be skipped.

When this attribute is set to ***neutral,*** the layer that uses SAAL_NNI (MTP3) selects the proving mode, but when the attribute is set to ***normal*** or ***emergency***, instructions from the entity which uses SAAL-NNI are ignored.

Values
normal
neutral
emergency

Default
neutral

### ATTRIBUTE SaalNni linkReEstablishTimer (t1)

Access
Read: All
Write: All

Description
This attributes specifies the time between the link release action and the next link re-establish action during alignment, as defined in ITU-T recommendation Q.2140.

This timer is started when a release indication or confirmation is received while the link is in the Alignment or InService state.

This timer is stopped in one of two cases:

If the SAAL-NNI layer successfully receives an establish request or establish confirm from the peer SAAL-NNI layer.
If the SAAL_NNI layer receives a stop indication or release request from the layer 3 user or layer management respectively.

Upon timer expiration, link alignment and proving is re-started.

Values
Decimal (0..30)

Units
seconds

Default 5

### ATTRIBUTE SaalNni alignmentAcceptTimer (t2)

Access
Read: All
Write: All

Description
This attributes specifies the total time to attempt alignment and is defined in ITU-T recommendation Q.2140.

This timer is started when a start request is received. If the link is put in service before the expiry of this timer, no action is performed.

This timer is stopped in one of two cases.
If the SAAL-NNI layer successfully passes from the link proving state to the InService state.

If the SAAL-NNI layer receives a stop indication from the layer 3, or a release request from layer management.

Upon timer expiration, link establishment is cancelled and link is taken out of service. Layer 3 will attempt to bring the link back in service.

The value of this timer can be adjusted if link proving fails due to an inability to send the target number proving PDUs indicated by the attribute *targetProvingPdus.* The current number of proving PDUs sent successfully is indicated by the attribute *currentProvingPdus*.

Values Decimal (5..150)

Units seconds

Default 30

### GROUP SaalNni OsiState (State)

Properties Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE SaalNni adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE SaalNni operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available

for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SaalNni usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP SaalNni Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes of this component.

### ATTRIBUTE SaalNni state (provSt)

Access
Read: All
Write: Illegal

Description
This attribute indicates the proving state of the link. The different states are:
***notStarted*** - Proving has not started.
***incomplete*** - Proving is in progress, but not completed yet.

***completeSuccess* -** Proving has been completed successfully.
***completeFailed* -** This proving attempt failed.

Values
notStarted
inComplete
completeSuccess
completeFailed

Default
No default

### ATTRIBUTE SaalNni targetProvingPdus (n1)

Access
Read: All
Write: Illegal

Description
This attribute indicates the target number of proving PDUs to be sent across the link during the proving period.

The current number of proving PDUs that have been sent is indicated by the attribute *currentProvingPdus*.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE SaalNni currentProvingPdus (c1)

Access
Read: All
Write: Illegal

Description
This attribute indicates the number of proving PDUs that have been sent across the link during this proving period.

The target number of proving PDUs that must be sent is indicated by the attribute *targetProvingPdus*

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE SaalNni inSrvDuration (inSrvDur)

Access
Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates the time that the signalling link has remained in the in-service state since it was most recently brought in service. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE SaalNni maxCcReached (maxCcR)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the signalling link has been released because the number of unacknowledeged transmissions of ‘BGN’, ‘END’, ‘ER’ or ‘RS’ Protocol Data Units (PDUs) has exceeded the value provisioned in the attribute *maxCc*.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SaalNni noResponseTimeouts (noRespTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the No Response timer, specified by the attribute *noResponseTimer.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SaalNni pdusTx (pduTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the protocol data units transmitted.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SaalNni pdusRx (pduRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the protocol data units received.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SaalNni pduOctetsTx (pduOctTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload PDU octets transmitted.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SaalNni pduOctetsRx (pduOctRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload PDU octets received over the collection interval. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SaalNni insvFailures (insvFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the in-service link outages. It does not include failures which occur during the alignment process.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP SaalNni WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE SaalNni customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SaalNni customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE SaalNni customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COLLECTED STATS SaalNni

| | |
|---|---|
| Description | The statistics record generated by the SaalNni component. |

### ATTRIBUTE SaalNni insvFailures

| | |
|---|---|
| Description | This attribute indicates the number of in-service link outages over the collection interval. It does not include failures which occur during the alignment process. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SaalNni pdusTx

| | |
|---|---|
| Description | This attribute indicates the number of protocol data units transmitted over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SaalNni pdusRx

| | |
|---|---|
| Description | This attribute indicates the number of protocol data units received over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SaalNni pduOctetsTx

| | |
|---|---|
| Description | This attribute indicates the number of payload PDU octets transmitted over the collection interval. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SaalNni pduOctetsRx

| | |
|---|---|
| Description | This attribute indicates the number of payload PDU octets received over the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT SaalNni NailedupAdaptationPoint (Nap)

| | |
|---|---|
| Groups | "GROUP SaalNni Nap Provisioned (Prov)"<br>"GROUP SaalNni Nap WlcCustomCounters (WlcCustomCntr)" |

## GROUP Sas Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes of the *SgsnAccountingServer (Sas)*. |

### ATTRIBUTE Sas linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor (LP) that the *SgsnAccountingServer (Sas)* and its subcomponents are provisioned on. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Sas linkToPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP address and UDP port number that the *SgsnAccountingServer (Sas)* uses to communicate with the Charging Gateway Functionality (CGF). |
| Values | Link (Service, linkToApplication) |
| Default | No default |

### GROUP Sas Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of the *SgsnAccountingServer (Sas)*. |

### ATTRIBUTE Sas openScdrs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the SGSN Packet Data Protocol Call Detail Records (S-CDRs) which have been opened by the SGSN Accounting Server (SAS). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sas openMcdrs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobility Call Detail Records (M-CDRs) which have been opened by the SGSN Accounting Server (SAS). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sas closedScdrs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the SGSN Packet Data Protocol Call Detail Records (S-CDRs) which have been closed by the SGSN Accounting Server (SAS). Closed S-CDRs are the CDRs which have been written to the disk. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sas closedMcdrs

Description This attribute counts the unsuccessful GPRS Tunnelling Protocol (GTP) message transfers to the secondary Charging Gateway Functionality (CGF).

The value is incremented whenever a GTP message is rejected or unacknowledged by the secondary CGF. Multiple attempts to send a GPT message increment the statistic only once. The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Sas dataVolumeLimitPartialScdrs (dvlPartialScdrs)

Access Read: All
Write: Illegal

Description This attribute counts the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) generated in the SGSN Accounting Server (SAS) when the threshold of the *dataVolumeLimit* attribute (defined in the *Usgsn* and *Sgsn* components for UMTS and GPRS, respectively) is reached.

The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Sas timeDurationLimitPartialScdrs (timePartialScdrs)

Access Read: All
Write: Illegal

Description This attribute counts the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) generated in the SGSN Accounting Server (SAS) due to the expiry of the

*scdrPartialRecordInterval* attribute.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Sas maxChargingConditionPartialScdrs (maxCondPartialScdrs)

Access: Read: All
Write: Illegal

Description: This attribute counts the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) generated in the SGSN Accounting Server (SAS) when the maximum number of charging condition changes, as specified by the *scdrMaxContainers* attribute, is reached.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Sas qosChangeScdrContainers (qosScdrContainers)

Access: Read: All
Write: Illegal

Description: This attribute counts the SGSN Packet Data Protocol (PDP) Call Detail Record (S-CDR) “List of Traffic Data Volumes” containers closed in the SGSN Accounting Server (SAS) due to a QoS change.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Sas tariffTimeChangeScdrContainers (ttcScdrContainers)

### GROUP Sas OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Sas adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Sas operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Sas usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### COLLECTED STATS SgsnAccountingServer

| | |
|---|---|
| Description | The statistics record generated by the SgsnAccountingServer component. |

### ATTRIBUTE Sas openScdrs

| | |
|---|---|
| Description | This attribute indicates the open SGSN Packet Data Protocol Call Detail Records (S-CDRs) in the SGSN Accounting Server (SAS) during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sas openMcdrs

| | |
|---|---|
| Description | This attribute indicates the open Mobility Call Detail Records (M-CDRs) in the SGSN Accounting Server (SAS) during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sas closedScdrs

Description

This attribute indicates the closed SGSN Packet Data Protocol Call Detail Records (S-CDRs) in the SGSN Accounting Server (SAS). Closed S-CDRs are the CDRs that are written to the disk and no longer exist in RAM.

This value reported is the value at the end of the collection interval.

Values

Decimal (0..4294967295)

### ATTRIBUTE Sas closedMcdsr

Description

This attribute indicates the closed M-CDRs in the SGSN Accounting Server (SAS). Closed S-CDRs are the CDRs that are written to the disk and no longer exist in RAM.

This value reported is the value at the end of the collection interval.

Values

Decimal (0..4294967295)

### ATTRIBUTE Sas scdrsUpdated

Description

This attribute counts the SGSN Packet Data Protocol Call Detail Records (S-CDRs) updated in the SGSN Accounting Server (SAS). Updated means that an open CDR was modified due to some external event. A S-CDR may be updated more than once, and this attribute is incremented for each update.

This counter counts the events in the collection interval.

Values

Decimal (0..4294967295)

### ATTRIBUTE Sas mcdrsUpdated

Description

This attribute counts the Mobility Call Detail Records (M-CDRs) updated in the SGSN Accounting Server (SAS). Updated means that an open CDR was modified due to some external event. A M-CDR may be updated more than once, and this attribute is incremented for each update.

This counter counts the events in the collection interval.

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sas smoCdrs

| | |
|---|---|
| Description | This attribute counts the Mobile-Originated Short Message Service (SMS) Call Detail Records (CDRs) generated in the SGSN Accounting Server (SAS). The SMS CDRs do not have states (eg. opened, closed) like other CDR types.When SAS receives a message that a SMS CDR message is sent through the network, SAS writes the SMS CDR directly to disk, which means a SMS CDR is generated.<br><br>This counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sas smtCdrs

| | |
|---|---|
| Description | This attribute counts the Mobile Terminated Short Message Service (SMS) Call Detail Records (CDRs) generated in the SGSN Accounting Server (SAS). The SMS CDRs do not have states (eg. opened, closed) like other CDR types.When SAS receives a message that a SMS CDR message is sent through the network, SAS writes the SMS CDR directly to disk, which means a SMS CDR is generated.<br><br>This counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sas cdrsXferCgf1

| | |
|---|---|
| Description | This attribute counts the Call Detail Records (CDRs) successfully transferred from the SGSN Accounting Server (SAS) to the primary Charging Gateway Functionality (CGF). This attribute is incremented each time a CDR is transferred to the CGF.<br><br>This counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sas cdrsXferCgf1Fail

Description

This attribute counts the unsuccessful Call Detail Record (CDR) transferred from the SGSN Accounting Server (SAS) to the primary Charging Gateway Functionality (CGF).

This value is incremented whenever a CDR fails to get transferred to the primary CGF. Multiple attempts to send a CDR increment the statistic only once.

This counter counts the events in the collection interval.

Values

Decimal (0..4294967295)

### ATTRIBUTE Sas cdrsXferCgf2

Description

This attribute counts the Call Detail Records (CDRs) successfully transferred from the SGSN Accounting Server (SAS) to the secondary Charging Gateway Functionality (CGF). This attribute is incremented each time a CDR is transferred to the CGF.

This counter counts the events in the collection interval.

Values

Decimal (0..4294967295)

### ATTRIBUTE Sas cdrsXferCgf2Fail

Description

This attribute counts the unsuccessful Call Detail Record (CDR) transfers from the SGSN Accounting Server (SAS) to the secondary Charging Gateway Functionality (CGF).

The value is incremented whenever a CDR fails to get transferred to the secondary CGF. Multiple attempts to send a CDR increment the statistic only once.

This counter counts the events in the collection interval.

Values

Decimal (0..4294967295)

### ATTRIBUTE Sas gtpMsgXferCgf1

Description

This attribute counts the GPRS Tunnelling Protocol (GTP) messages successfully transferred to the primary Charging Gateway Functionality (CGF) during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sas gtpMsgXferCgf1Fail

Description This attribute counts the unsuccessful GPRS Tunnelling Protocol (GTP) message transfers to the primary Charging Gateway Functionality (CGF) during the collection interval.

The value is incremented whenever a GTP message is rejected or unacknowledged by the primary CGF. Multiple attempts to send a GPT message increment the statistic only once.

Values Decimal (0..4294967295)

### ATTRIBUTE Sas gtpMsgXferCgf2

Description This attribute counts the GPRS Tunnelling Protocol (GTP) messages successfully transferred to the secondary Charging Gateway Functionality (CGF) during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sas gtpMsgXferCgf2Fail

Description This attribute counts the unsuccessful GPRS Tunnelling Protocol (GTP) message transfers to the secondary Charging Gateway Functionality (CGF) during the collection interval.

The value is incremented whenever a GTP message is rejected or unacknowledged by the secondary CGF. Multiple attempts to send a GPT message increment the statistic only once.

Values Decimal (0..4294967295)

### ATTRIBUTE Sas dataVolumeLimitPartialScdrs (dvlPartialScdrs)

Description This attribute counts the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) generated in the SGSN Accounting Server (SAS) when the threshold of the *dataVolumeLimit* attribute (defined in the *Usgsn* and *Sgsn* components for UMTS and GPRS, respectively) is reached.

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sas timeDurationLimitPartialScdrs (timePartialScdrs)

Description: This attribute counts the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) generated in the SGSN Accounting Server (SAS) due to the expiry of the *scdrPartialRecordInterval* attribute.

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Sas maxChargingConditionPartialScdrs (maxCondPartialScdrs)

Description: This attribute counts the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) generated in the SGSN Accounting Server (SAS) when the maximum number of charging condition changes, as specified by the *scdrMaxContainers* attribute, is reached.

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Sas qosChangeScdrContainers (qosScdrContainers)

Description: This attribute counts the SGSN Packet Data Protocol (PDP) Call Detail Record (S-CDR) “List of Traffic Data Volumes” containers closed in the SGSN Accounting Server (SAS) due to a QoS change.

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Sas tariffTimeChangeScdrContainers (ttcScdrContainers)

Description: This attribute counts the SGSN Packet Data Protocol (PDP) Call Detail Record (S-CDR) “List of Traffic Data Volumes” containers closed in the SGSN Accounting Server (SAS) due to a tariff time change.

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Sas timeDurationLimitPartialMcdrs (timePartialMcdrs)

| | |
|---|---|
| Description | This attribute counts the partial Mobility Call Detail Records (M-CDRs) generated in the SGSN Accounting Server (SAS) due to the expiry of the *mcdrPartialRecordInterval* attribute.<br><br>This counter counts the events in the collection interval. |

|---|---|
| Description | This attribute counts the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) generated in the SGSN Accounting Server (SAS) with a partial record reason of “management intervention”.<br><br>This counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Sas MemoryPoolManager (Mpm)

| | |
|---|---|
| Scope | Application |

Description

*Gsc/n MemoryPoolManager*
*Gsd/n MemoryPoolManager*
*Gtl/n MemoryPoolManager*
*DnsAgent/<vr>,n MemoryPoolManager*

This component represents the memory resources of a given GPRS application that are managed as pools of objects.

Dyn. Subcomp. "COMPONENT Sas Mpm MemoryPoolClient (Mpc)"

Common Verbs

Help
List
Display

## COMPONENT Sas Mpm MemoryPoolClient (Mpc)

Instance String (1..30, ASCII)

Scope Application

Description

*Gsc/n Mpm MemoryPoolClient/<name>*
*Gsd/n Mpm MemoryPoolClient/<name>*
*SgGtl/n Mpm MemoryPoolClient/<name>*
*DnsAgent/<vr>,n Mpm MemoryPoolClient/<name>*

This component represents a pool of objects of a particular class that a GPRS application currently owns as well as all the objects that could be owned by that application. All the objects in the pool are of the same class. The instance value of this component is a string which is the class name of the objects in the pool.

# COMPONENT SignallingConnControlPart (Sccp)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP Sccp Provisioned (Prov)"<br>"GROUP Sccp OsiState (State)"<br>"GROUP Sccp Operational (Oper)"<br>"GROUP Sccp WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS SignallingConnControlPart"

| | |
|---|---|
| Scope | Application |
| Description | *SignallingConnControlPart/n*<br><br>This component represents the SCCP layer of the SS7 stack. |
| Subcomponents | "COMPONENT Sccp Mtp3Connection (Mtp3Conn)"<br>"COMPONENT Sccp MemoryPoolManager (Mpm)" |
| Opt. Subcomp. | "COMPONENT Sccp LocalSubsystem (Loc)"<br>"COMPONENT Sccp RemoteSubsystem (Rem)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Sccp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of this component. |

## ATTRIBUTE Sccp linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor (LP) that this component and its subcomponents are provisioned on. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

## ATTRIBUTE Sccp maxConnections (maxC)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of signalling connections supported by an SCCP instance across all the local subsystems.<br><br>The current number of open signalling connections is indicated by the attribute *activeConnections.* The number of times a signalling connection establishment was refused because the number of open connections has reached the maximum value is indicated by the attribute *rejectedConnections.*<br><br>Changes to this attribute affect only new connections. No existing connections will be affected by any changes made to this attribute. |
| Values | Decimal (1000..200000) |
| Default | 16000 |

### ATTRIBUTE Sccp timerConnEst (tConnEst)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the TConnEst timer defined in the ITU-T spec Q.714. This is the period of time to wait for a CONNECTION CONFIRM message from the remote user of SCCP.<br><br>This timer is started when a CONNECT REQUEST message is sent to the remote SCCP layer.<br><br>This timer is stopped when either a CONNECT CONFIRM, RELEASED, or CONNECT REFUSED message is received, or when a routing failure happens.<br><br>Upon timer expiration, the resources associated with the connection are released and a disconnect message is sent to the local user(s).<br><br>The number of timeouts of this timer is indicated by the attribute *connEstTmouts*. |
| Values | Decimal (60..120) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE Sccp timerInactivitySend (tIas)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the Tias timer defined in Q.714. This is the period of time to wait before sending an INACTIVITY TEST message for a connection when there are no messages to send.<br><br>The timer is started when a CONNECT CONFIRM or CONNECT RESPONSE message is received. |

The timer is restarted if a DATA FORM 1 message is transmitted.

This timer is stopped when a DISCONNECT, RELEASE COMPLETE or ERROR message is received, or when a routing failure occurs.

If the timer expires on an open connection, an INACTIVITY TEST message is sent.

It is recommended that the timer be set to a value that is half as long as the *tIarTimer.*

| | |
|---|---|
| Values | Decimal (300..600) |
| Units | seconds |
| Default | 300 |

### ATTRIBUTE Sccp timerInactivityReceive (tIar)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the inactivity receive timer defined in Q.714. This is the period of time to wait on receiving a message for a connection, before releasing the connection.<br><br>This timer is started when a CONNECT CONFIRM or CONNECT RESPONSE message is received.<br><br>This timer is restarted if a DATA FORM 1 or INACTIVITY TEST message is received.<br><br>This timer is stopped when a DISCONNECT, RELEASED, or ERROR message is received, or when a routing failure occurs.<br><br>If this timer expires on an open connection, a DISCONNECT message is sent and the resources are released.<br><br>It is recommended that the timer be set to a value that is twice as long as *tIasTimer.* |

The number of timeouts of this timer is indicated by the attribute *inactivityReceiveTimeouts*.

Values: Decimal (660..1260)

Units: seconds

Default: 660

### ATTRIBUTE Sccp timerRel (tRel)

Access: Read: All
Write: All

Description: This attribute specifies the value of the release timer defined in Q.714. This is the period of time to wait for a RELEASE COMPLETE message in response to the initial release attempt.

This timer is started when a RELEASED message is sent.

This timer is stopped when a RELEASE COMPLETE or ERROR message is received, or on a routing failure.

Upon timer expiration, a RELEASE message is sent and the *tRepeatRelTimer* is started.

The number of timeouts of this timer is indicated by the attribute *tRelTimeouts*.

Values: Decimal (10..20)

Units: seconds

Default: 10

### ATTRIBUTE Sccp timerRepeatRel (tRepeatRel)

Access: Read: All
Write: All

Description: This attribute specifies the value of the repeat release timer. This is the period of time to wait for a RELEASE COMPLETE message after *tRelTimer* has expired. This timer determines the interval between successive release retries.

This timer is started when *tRelTimer* expires.

This timer is stopped when a RELEASE COMPLETE or an ERROR message is received, or when a routing failure occurs.

Upon timer expiration, the timer is restarted for a maximum of ten times. Upon the tenth timer expiration, the resources are released.

The number of timeouts of this timer is indicated by the attribute *tRepeatRelTimeouts*.

Values: Decimal (10..20)

Units: seconds

Default: 10

### ATTRIBUTE Sccp classOfService (classOfServ)

Access: Read: All
Write: All

Description: This attribute specifies the type of service provided by the SCCP layer.
The different service classes are:
***0*** - This class represents basic connectionless service.
***2***- This class represents basic connection-oriented service.

Any combination of these classes can be provisioned by the user, but at least one class must be specified.

Set of: 0
2

Default: (0, 2)

### GROUP Sccp OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Sccp adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Sccp operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available

for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Sccp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Sccp Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes of the *Sccp* component.

### ATTRIBUTE Sccp timerConnEstTimeouts (tConnEstTo)

Access
Read: All
Write: Illegal

Description
This attribute counts the timeouts of the *tConnEstTimer*.

The counter wraps to zero when it exceeds the maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp timerInactivityReceiveTimeouts (tIarTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of the timer specified by the attribute *timerInactivityReceive.*<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp timerRelTimeouts (tRelTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of the timer specified by the attribute *tRelTimer.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp timerRepeatRelTimeouts (repRelTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of the timer specified by the attribute *tRepeatRelTimer.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp activeConnections (actConn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current open signalling connections for the *Sccp c*omponent. The maximum number of open signalling connections is set by the attribute *maxConnections.* |
| Values | Decimal (0..1000000) |
| Default | No default |

### ATTRIBUTE Sccp rejectedConnections (rejConn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a signalling connection establishment request by the application was refused. The reasons include the subsystem being down, the number of open connections exceeding the limit specified by the attribute *maxConnections* and so on. This includes the number of rejected connections indicated by the attribute *maxConnExhausted*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp maxConnectionsExhausted (maxConnEx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a signalling connection establishment request by the application was refused because the number of open connections reached the limit specified by the attribute *maxConnection.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Sccp lostConnections (lostConn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the open signalling connections lost due to unavailability of the SCCP Subsystem.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp unsupportedMessages (unsuppMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of unsupported (class1, class3) messages received.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp gttRequests (gttRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of messages received that require Global Title Translation.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp segmentationRequests (segRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of messages received that require segmentation.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp reassemblyRequests (reassemblyRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of messages received that require reassembly.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp localRoutingFailures (localRoutFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the routing failures to the local subsystem. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp remoteRoutingFailures (remRoutFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the routing failures to the remote subsystem. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Sccp messagesTx (msgsTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the messages sent to layer 3. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp payloadMessagesTx (plMsgsTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of payload messages transmitted. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp messagesRx (msgsRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the messages received from layer 3. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp payloadMessagesRx (plMsgsRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of payload messages received from layer 3. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp invalidMessages (invMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of invalid (syntax error or undecodable) messages received.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp attemptedConnections (attCon)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of signalling connections that this *Sccp c*omponent has attempted to establish. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Sccp WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sccp customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS SignallingConnControlPart

| | |
|---|---|
| Description | The statistics record generated by the SignallingConnControlPart component. |

### ATTRIBUTE Sccp activeConnections

| | |
|---|---|
| Description | This attribute indicates the number of the current open signalling connections for the *Sccp c*omponent at the end of the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp rejectedConnections

| | |
|---|---|
| Description | This attribute indicates the number of rejected signalling connections for the SCCP component over the collection interval. The reasons include the subsystem being down, the number of open connections exceeding the limit specified by the attribute *maxConnections* and so on, at the end of the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp maxConnectionsExhausted

| | |
|---|---|
| Description | This attribute indicates the number of times a signalling connection establishment request by the application was refused because the number of open connections reached the limit specified by the attribute *maxConnections,* over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp lostConnections

| | |
|---|---|
| Description | This attribute indicates the number of the open signalling connections lost due to unavailability of the SCCP Subsystem over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp invalidMessages

| | |
|---|---|
| Description | This attribute indicates the number of invalid (syntax error or undecodable) messages received over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp messagesTx

| | |
|---|---|
| Description | This attribute indicates the number of the messages sent to layer 3 over the collection interval. This includes maintenance messages. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp payloadMessagesTx

| | |
|---|---|
| Description | This attribute indicates the number of payload messages transmitted over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp messagesRx

| | |
|---|---|
| Description | This attribute indicates the number of the messages received from layer 3 over the collection interval. This includes maintenance messages. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp payloadMessagesRx

| | |
|---|---|
| Description | This attribute indicates the number of payload messages received over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp localRoutingFailures

| | |
|---|---|
| Description | This attribute indicates the number of the routing failures to the local subsystem over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp remoteRoutingFailures

| | |
|---|---|
| Description | This attribute indicates the number of the routing failures to the remote subsystem over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sccp attemptedConnections (attCon)

| | |
|---|---|
| Description | This attribute indicates the number of signalling connections that this *Sccp c*omponent has attempted to establish during the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Sccp LocalSubsystem (Loc)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP Sccp Loc Provisioned (Prov)"<br>"GROUP Sccp Loc OsiState (State)"<br>"GROUP Sccp Loc WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Sccp/n LocalSubsystem*<br><br>This component represents a local subsystem that is providing services using this *Sccp* component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Sccp Loc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of this component. |

### ATTRIBUTE Sccp Loc linkToSccpConnection (lToSccpConn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies a link to the local subsystem represented by this component. |

This attribute must be set to ***Sg/n RncIf SccpConn*** if the parent *Sccp/n* component is part of the SS7 stack on the Iu interface.

This attribute must be set to ***Sg/n CsDomain SccpConn*** if the parent *Sccp/n* component is part of the SS7 stack on the interface to the Call Server.

If this attribute is changed, it will result in a loss of service for the *Loc* component.

Values: Link (Service, linkToLocalSubsystem)

Default: No default

### ATTRIBUTE Sccp Loc subsystemNumber (ssn)

Access: Read: All
Write: All

Description: This attribute specifies the subsystem number of the local subsystem represented by this component.

Values: ranap

Default: ranap

### GROUP Sccp Loc OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Sccp Loc adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Sccp Loc operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Sccp Loc usageState (osiUsage)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Sccp Loc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sccp Loc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp Loc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a |

| | |
|---|---|
| | mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp Loc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Sccp RemoteSubsystem (Rem)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP Sccp Rem Provisioned (Prov)"<br>"GROUP Sccp Rem OsiState (State)"<br>"GROUP Sccp Rem WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Sccp/n RemoteSubsystem*<br><br>This optional component represents a remote subsystem that can be accessed by this *Sccp* component. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Sccp Rem Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes of this component. |

### ATTRIBUTE Sccp Rem subsystemNumber (subsNum)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the subsystem number of the remote subsystem represented by this component. |
| Values | ranap |
| Default | ranap |

### GROUP Sccp Rem OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Sccp Rem adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Sccp Rem operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Sccp Rem usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Sccp Rem WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sccp Rem customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sccp Rem customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |

## COMPONENT ScpSim Profile Subscriber (Subs)

Instance BCD (5..15)

Scope Application

Description *ScpSim Profile/n Subscriber/<imsi>*

This component represents a single subscriber that is provisioned for CAMEL service and is set up for automatic message processing. In automatic message processing, CAMEL dialogues are simulated by the *ScpSim* based on the values specified in the attributes of the profile to which the subscriber has been assigned. The instance value of the *ScpSimSubscriber* component is the International Mobile Subscriber Identity (IMSI) for the Mobile Station (MS) being simulated.

## GROUP SgGtl Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes of the *SgGprsTransportLayer (SgGtl).* |

### ATTRIBUTE SgGtl linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor that the *SgGprsTransportLayer (SgGtl)* and its subcomponents are provisioned on. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE SgGtl bvcBlockedTimer (tBvcBlocked)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time that a BSS GPRS Virtual Connection (BVC) can remain blocked without generating an alarm condition.<br><br>A timer starts with the *bvcBlockedTimer* attribute value when the Serving GPRS Support Node (SGSN) receives a BVC_BLOCK Protocol Data Unit (PDU) from the Packet Control Unit (PCU). The timer stops when the SGSN receives a BVC_UNBLOCK PDU from the PCU. If the timer expires, the Network Service Entity (NSE) is notified that the BVC is unavailable.<br><br>The *bvcBlockedTimeouts* attribute indicates the number of times the timer timed out. |
| Values | Decimal (1..200) |
| Units | minutes |
| Default | 10 |

### ATTRIBUTE SgGtl bvcBmaxTimer (tBvcBmax)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the time that the BSS GPRS Virtual Connection (BVC) flow control parameter Bmax can remain at value 0 without generating an alarm condition.<br><br>A timer starts with the *bvcBmaxTimer* attribute value when the Serving GPRS Support Node (SGSN) receives a BVC_FLOW_CONTROL Protocol Data Unit (PDU) with a Bmax value of 0 from the Packet Control Unit (PCU). The timer stops when the SGSN receives a BVC_FLOW_CONTROL PDU from the PCU with a Bmax value greater than 0. If the timer expires, the Network Service Entity (NSE) is notified that the BVC is unavailable.<br><br>The *bvcBmaxTimeouts* attribute indicates the number of times the timer timed out. |
| Values | Decimal (1..200) |
| Units | minutes |
| Default | 10 |

### ATTRIBUTE SgGtl bvcLeakRateTimer (tBvcLeakRate)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time that the BSS GPRS Virtual Connection (BVC) Leak Rate flow control parameter can remain at value 0 without generating an alarm condition.<br><br>A timer starts with the *bvcLeakRateTimer* attribute value when the Serving GPRS Support Node (SGSN) receives a BVC_FLOW_CONTROL Protocol Data Unit (PDU) with a Leak Rate value of 0 from the Packet Control Unit (PCU). The timer stops when the SGSN receives a BVC_FLOW_CONTROL PDU from the PCU with a Leak Rate value greater than 0. If the timer expires, the Network Service Entity (NSE) is notified that the BVC is unavailable.<br><br>The *bvcLeakRateTimeouts* attribute indicates the number of times the timer timed out. |

| | |
|---|---|
| Values | Decimal (1..200) |
| Units | minutes |
| Default | 10 |

### ATTRIBUTE SgGtl bvcBlockedSetThreshold (bvcBlockedSet)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the threshold at which the BVC Blocked alarm is set. The value of the attribute is the number of unavailable BSS GPRS Virtual Connections (BVC) associated with a Network Service Entity (NSE) that is deemed acceptable.<br><br>The Packet Control Unit (PCU) can render a BVC unavailable by sending a BVC_BLOCK Protocol Data Unit (PDU) or a BVC_FLOW_CONTROL PDU to the Serving GPRS Support Node (SGSN). When the number of unavailable BVCs exceeds the value of the *bvcBlockedSetThreshold* attribute, the BVC Blocked alarm is set.<br><br>The value of the *bvcBlockedSetThreshold* attribute must be greater than or equal to the *bvcBlockedClrThreshold* attribute value. |
| Values | Decimal (1..600) |
| Default | 10 |

### ATTRIBUTE SgGtl bvcBlockedClrThreshold (bvcBlockedClr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the threshold at which the BVC Blocked alarm is cleared.<br><br>The Packet Control Unit (PCU) can render a BSS GPRS Virtual Connections (BVC) unavailable by sending a BVC_BLOCK Protocol Data Unit (PDU) or a BVC_FLOW_CONTROL PDU to the Serving GPRS Support Node (SGSN). If the BVC Blocked alarm is active and the number of Network Service Entity (NSE) |

| | |
|---|---|
| | unavailable BVCs drops below the value of the *bvcBlockedClrThreshold* attribute, the BVC Blocked alarm is cleared.<br><br>The value of the *bvcBlockedClrThreshold* attribute must be less than or equal to the *bvcBlockedSetThreshold* attribute value. |
| Values | Decimal (1..600) |
| Default | 5 |

### ATTRIBUTE SgGtl associatedGtl (aGtl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the paired *SgGprsTransportLayer (SgGtl)* instance used to enable load sharing. Both *SgGtl* instances must have the same *SgGtl/n Nse/<nsei>* components provisioned. If this attribute is not set, then load sharing is disabled for the Network Service Entities (NSE) on this GPRS Transport Layer (GTL). |
| Values | Link (Service, associatedGtl) |
| Default | No default |

### GROUP SgGtl WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE SgGtl customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE SgGtl customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT SgGtl NetworkServiceEntity (Nse)

| | |

## GROUP SgGtl Nse NseStatistics (NseStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the Network Service Entity (NSE). |

## ATTRIBUTE SgGtl Nse octetsToPcu (octsTxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets sent to the Packet Control Unit (PCU) by all the Network Service Virtual Connections (NS-VCs) served by this Network Service Entity (NSE). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse octetsFromPcu (octsRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets received from the Packet Control Unit's (PCU) Network Service Virtual Connections (NS-VCs) served by the peer Network Service Entity (NSE). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP SgGtl Nse OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE SgGtl Nse adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE SgGtl Nse operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SgGtl Nse usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values idle
active (activ)
busy

Default idle

## COLLECTED STATS SgGprsTransportLayer NetworkServiceEntity

Description The statistics record generated by the SgGprsTransportLayer NetworkServiceEntity component.

### ATTRIBUTE SgGtl Nse currentBvcs (curBvcs)

Description This attribute indicates the current number of BSS GPRS Virtual Connections (BVCs) on this Network Service Entity (NSE) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SgGtl Nse octetsToPcu (octsTxPcu)

Description This attribute counts the octets sent to the Packet Control Unit (PCU) by all the Network Service Virtual Connections (NS-VCs) served by this Network Service Entity (NSE). This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SgGtl Nse octetsFromPcu (octsRxPcu)

Description This attribute counts the octets received from the Packet Control Unit’s (PCU) Network Service Virtual Connections (NS-VCs) served by the peer Network Service Entity (NSE). This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### COMPONENT SgGtl Nse PointToPointBvc (PtpBvc)

Instance Decimal (1..65535)

Groups "GROUP SgGtl Nse PtpBvc Operational (Oper)"

## GROUP SgGtl Nse PtpBvc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the BSS GPRS Virtual Connection (BVC) operational information. |

## ATTRIBUTE SgGtl Nse PtpBvc state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state for a BSS GPRS Virtual Connection (BVC). A BVC can be in one of the following possible states:<br>***blocked***, Indicates that the BVC is blocked by the Packet Control Unit (PCU). In this state it can neither send nor receive data.<br>***unblockedNoTx***, Indicates that the BVC can receive data from the PCU, but is not allowed to transmit data to the PCU.<br>***unblocked***, Indicates that the BVC is active and data can be sent and received to (and from) the PCU.<br>***resetReqPending***, Indicates that the BVC-RESET request was sent to the PCU and that the BVC is awaiting a BVC-RESET-ACK confirmation. |
| Values | blocked<br>unblockedNoTx |

| | |
|---|---|
| | unblocked<br>resetReqPending |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc flowCntlBucketSize (bmax)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum bucket size for the BSS GPRS Virtual Connection (BVC) sent by the Packet Control Unit (PCU). This parameter is used by the BVC flow control algorithm. The unit is 100 bytes. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc leakRate (leakRt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the leak rate for the BSS GPRS Virtual Connection (BVC), sent by the Packet Control Unit (PCU). This parameter is used by the BVC flow control algorithm. The unit is 100 bit/s. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc availabilityStatus (availStatus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current status of a BSS GPRS Virtual Connection (BVC). The BVC availability status can either be ***bvcAvailable,*** meaning that the BVC is available, or one or more of the other three conditions listed below:<br><br>A value of ***bvcBlocked*** indicates that the BVC is blocked by the Packet Control Unit (PCU) and is unavailable. The amount of |

time the BVC is blocked before it is marked as unavailable, is provisionable through the *bvcBlockedTimer* attribute of the *SgGtl* component.

A value of ***bvcBmax0*** indicates that the maximum bucket size flow control parameter for the BVC sent by the PCU is 0 and the BVC is unavailable. The amount of time the bucket size is 0 before it is marked as unavailable, is provisionable through the *bvcBmaxTimer* attribute of the *SgGtl* component.

A value of ***bvcLeakRate0*** indicates that the leak rate flow control parameter for the BVC sent by the PCU is 0 and the BVC is unavailable. The amount of time the leak rate is 0 before it is marked as unavailable, is provisionable through the *bvcLeakRateTimer* attribute of the *SgGtl* component.

Set of
bvcAvailable
bvcBlocked
bvcBmax0
bvcLeakRate0

Default

## ATTRIBUTE SgGtl Nse PtpBvc bvcGlobalCellId (bvcCellId)

Access
Read: All
Write: Illegal

Description
This attribute indicates the current Global Cell ID of the BSS GPRS Virtual Connection (BVC). The format of the Global Cell ID is “<MCC>.<MNC>.<LAC>.<RAC>.<CellID>”.

Values
String (1..30, ASCII)

Default
No default

## ATTRIBUTE SgGtl Nse PtpBvc bvcBlockedTimeouts (bvcBlockedT)

Access
Read: All
Write: Illegal

Description
This attribute counts the number of times the BVC has been blocked for a span of minutes defined by the *bvcBlockedTimer*

attribute. The counter wraps to 0 when the maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE SgGtl Nse PtpBvc bvcBmaxTimeouts (bvcBmaxT)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of times the BVC Bmax flow control parameter is 0 for a span of minutes defined by the *bvcBmaxTimer* attribute. The counter wraps to 0 when the maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE SgGtl Nse PtpBvc bvcLeakRateTimeouts (bvcLeakRateT)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of times the BVC Leak Rate flow control parameter is 0 for a span of minutes defined by the *bvcLeakRateTimer* attribute. The counter wraps to 0 when the maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE SgGtl Nse PtpBvc fullRatio (fullRt)

Access: Read: All
Write: Illegal

Description: This attribute indicates the percentage of the bucket that is filled with data for a BSS GPRS Virtual Connection (BVC).

This attribute is used by the BVC bucket flow control algorithm if the Current Bucket Level feature is negotiated between the Packet Control Unit (PCU) and the Serving GPRS Support Node

(SGSN). The result of this negotiation is reflected in the *currentBucketLevelFeature* attribute.

A value of ***0*** means that the bucket is empty, while a value of ***100*** means that the bucket is exactly full. A value greater than ***100*** means that the bucket is full and overflowing by that percentage. For example, a value of ***150*** means the bucket is full and overflowing by 50%. A value of ***disabled*** means that this attribute is not used by the flow control algorithm because the Current Bucket Level feature is not negotiated.

## GROUP SgGtl Nse PtpBvc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the BSS GPRS Virtual Connection (BVC) statistical information. |

## ATTRIBUTE SgGtl Nse PtpBvc pdusFromPcu (pdusRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Protocol Data Units (PDUs) received from the Packet Control Unit (PCU) by the Point To Point BSS GPRS Virtual Connection (BVC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE SgGtl Nse PtpBvc pdusToPcu (pdusTxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the Protocol Data Units (PDUs) transmitted to the Packet Control Unit (PCU) by the Point To Point BSS GPRS Virtual Connection (BVC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc octetsFromPcu (octsRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets received from the Packet Control Unit (PCU) by the BSS GPRS Virtual Connection (BVC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc octetsToPcu (octsTxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets transmitted to the Packet Control Unit (PCU) from the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc blocksFromPcu (blksRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BVC-BLOCK PDUs received from the Packet Control Unit (PCU) for this BSS GPRS Virtual Connection (BVC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc unblocksFromPcu (unblksRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BVC-UNBLOCK PDUs received from the Packet Control Unit (PCU) for this BSS GPRS Virtual Connection (BVC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc resetsFromPcu (rstsRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BVC-RESET PDUs received from the Packet Control Unit (PCU) for this BSS GPRS Virtual Connection (BVC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc resetsToPcu (rstsTxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BVC-RESET PDUs sent to the Packet Control Unit (PCU) for this BSS GPRS Virtual Connection (BVC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc statusFromPcu (statusRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NM-STATUS PDUs received from the Packet Control Unit (PCU). The PCU sends an NM-STATUS PDU<br>when it receives an invalid packet or a packet that has undergone corruption over the Gb interface in the SGSN-PCU direction. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse PtpBvc statusToPcu (statusTxPcu)

| | |
|---|---|

| Default | No default |

## COLLECTED STATS SgGprsTransportLayer NetworkServiceEntity PointToPointBvc

| | |
|---|---|
| Description | The statistics record generated by the SgGprsTransportLayer NetworkServiceEntity PointToPointBvc component. |

### ATTRIBUTE SgGtl Nse PtpBvc pdusFromPcu (pdusRxPcu)

| | |
|---|---|
| Description | This attribute counts the number of protocol data units (PDUs) received from the Packet Control Unit (PCU) by the BSS GPRS Virtual Connection (BVC) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SgGtl Nse PtpBvc pdusToPcu (pdusTxPcu)

| | |
|---|---|
| Description | This attribute counts the number of protocol data units (PDUs) transmitted to the Packet Control Unit (PCU) by the BSS GPRS Virtual Connection (BVC) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SgGtl Nse PtpBvc octetsFromPcu (octsRxPcu)

| | |
|---|---|
| Description | This attribute counts the number of octets received from the Packet<br>Control Unit (PCU) by the BSS GPRS Virtual Connection (BVC) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SgGtl Nse PtpBvc octetsToPcu (octsTxPcu)

Description: This attribute counts the number of octets transmitted to the Packet Control Unit (PCU) from the Serving GPRS Support Node (SGSN) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE SgGtl Nse PtpBvc bvcFlowCntlFromPcu (bvcFlRxPcu)

Description: This attribute counts the FLOW-CONTROL-BVC Protocol Data Units (PDUs) received for this BSS GPRS Virtual Connection (BVC) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE SgGtl Nse PtpBvc msFlowCntlFromPcu (msFlRxPcu)

Description: This attribute counts the BSSGP-FLOW-CONTROL-MS Protocol Data Units (PDUs) received for this BSS GPRS Virtual Connection (BVC) in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT SgGtl Nse NetworkServiceVirtualConnection (Nsvc)

Instance: Decimal (1..65535)

Groups: "GROUP SgGtl Nse Nsvc Provisioned (Prov)"
"GROUP SgGtl Nse Nsvc Operational (Oper)"
"GROUP SgGtl Nse Nsvc Statistics (Stats)"

"COLLECTED STATS SgGprsTransportLayer NetworkServiceEntity NetworkServiceVirtualConnection"

Scope: Application

Description: *SgGtl/n Nse/<nsei> Nsvc/<nsvci>*

This component represents the Network Service Virtual Connection (NS-VC) functionality of the Network Service (NS) protocol layer. Each instance provides a virtual connection between the NS peer entities. An NS-VC is unique across all instances of this Network Service Entity Identifier (NSEI).

An NS-VC is associated with a single Frame Relay Data Link Connection Identifier (DLCI). The Frame Relay port and the NS-VC must be located on the same Logical Processor.

Dyn. Subcomp. "COMPONENT SgGtl Nse Nsvc AtmConnection (AtmCon)"

## GROUP SgGtl Nse Nsvc Provisioned (Prov)

Properties Provisioned

Description This group contains provisionable attributes to associate a Network Service Virtual Connection (NS-VC) with a Frame Relay Data Link Connection Identifier (DLCI). The FR interface is provided by the *FrAtm* component which must be provisioned on the same Logical Processor as this NS-VC.

## ATTRIBUTE SgGtl Nse Nsvc localFrAddress (frAddr)

Access Read: All
Write: All

Criticality Component

Description This attribute specifies the local Frame Relay address (native E.164, native x.121) to be used for this connection. This is the address defined at the peer *FrAtm/n Address* component. The peer *FrAtm* component must be provisioned on the same Logical Processor as this Network Service Virtual Connection (NS-VC).

Values String (1..17, NativeAddress)

Default No default

### ATTRIBUTE SgGtl Nse Nsvc localFrDlci (frDlci)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the local Frame Relay connection identifier. This identifier is a Frame Relay Data Link Connection Identifier (DLCI) logical channel number. There must be a matching DLCI value at the peer *FrAtm* component. The combination of FrAtm and DLCI value must be unique across all instances of NS-VC for this NSEI. |
| Values | Decimal (16..1007) |
| Default | No default |

### GROUP SgGtl Nse Nsvc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains Network Service Virtual Connection (NS-VC) operational information. |

### ATTRIBUTE SgGtl Nse Nsvc state (st)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the Network Service Virtual Connection (NS-VC).<br>***idle*** **-** This is the initial state of the NS-VC upon activation.<br>***unBlocked*** **-** Indicates that this NS-VC is unblocked and is now available for traffic.<br>***localInitiatedBlocked*** **-** This state indicates that the NS-VC is blocked by a locally initiated Block Request. NS-UNITDATA Protocol Data Units (PDUs) received in this state are discarded.<br>***netInitiatedBlocked*** **-** This state indicates that this NS-VC has been blocked by the remote node. NS-UNITDATA PDUs received in this state are discarded.<br>***dead*** **-** This state indicates that the NS-VC is unavailable. This can be because the Frame Relay (FR) link is dead or if an operator locks the Data Link Connection Identifier (DLCI). |

| | |
|---|---|
| Values | idle<br>unBlocked<br>localInitiatedBlocked<br>netInitiatedBlocked<br>dead |
| Default | No default |

### GROUP SgGtl Nse Nsvc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Network Service Virtual Connection (NS-VC) statistical information. |

### ATTRIBUTE SgGtl Nse Nsvc blocksFromPcu (blksRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-BLOCK requests received from the Packet Control Unit (PCU). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SgGtl Nse Nsvc statusIndications (statusInds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NS-STATUS Indications formatted by the Network Service (NS) for this Network Service Virtual Connection (NS-VC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse Nsvc fecnBitSet (fecnBit)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the frames received from the network that contain the Forward Explicit Congestion Notification (FECN) bit set to 1. Setting of the FECN bit to 1 indicates that frames received from the network can experience congestion. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse Nsvc becnBitSet (becnBit)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the frames received from the network that contain the Backward Explicit Congestion Notification (BECN) bit set to 1. Setting of the BECN bit to 1 indicates that frames transmitted to the network may experience congestion. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE SgGtl Nse Nsvc octetsFromPcu (octsRxPcu)

Access Read: All
Write: Illegal

Description This attribute counts the octets the Network Service Virtual Connection (NS-VC) has processed that were received from the Packet Control Unit (PCU). The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE SgGtl Nse Nsvc octetsToPcu (octsTxPcu)

Access Read: All
Write: Illegal

Description This attribute counts the octets the Network Service Virtual Connection (NS-VC) has processed that were received from the Packet Control Unit (PCU). The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS SgGprsTransportLayer NetworkServiceEntity NetworkServiceVirtualConnection

Description The statistics record generated by the SgGprsTransportLayer NetworkServiceEntity NetworkServiceVirtualConnection component.

### ATTRIBUTE SgGtl Nse Nsvc unitDatasFromPcu (unitDataRxPcu)

Description This attribute counts the NS-UNITDATA Protocol Data Units (PDUs) received from the Packet Control Unit (PCU) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SgGtl Nse Nsvc unitDatasToPcu (unitDataTxPcu)

| | |

| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse SigBvc octetsToPcu (octsTxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the octets transmitted to the Packet Control Unit (PCU) from the Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse SigBvc blocksFromPcu (blksRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BVC-BLOCK Protocol Data Units (PDU) received from the Packet Control Unit (PCU) for all the BSS GPRS Virtual Connections (BVC). The *blocksFromPcu* gives the total count of requests for all the Point To Point (PTP) BVCs for that Network Service Entity (NSE) recognized by this FP. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse SigBvc unblocksFromPcu (unblksRxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BVC-UNBLOCK Protocol Data Units (PDU) received from the Packet Control Unit (PCU) for all the BSS GPRS Virtual Connections (BVCs). The *unblocksFromPcu* gives the total count of requests for all the Point To Point (PTP) BVCs for that Network Service Entity (NSE) recognized by this |

FP. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE SgGtl Nse SigBvc resetsFromPcu (rstsRxPcu)

Access: Read: All
Write: Illegal

Description: This attribute counts the BVC-RESET Protocol Data Units (PDU) received from the Packet Control Unit (PCU) for all the BSS GPRS Virtual Connections (BVCs). The *resetsFromPcu* gives the total count of requests for all the BVCs for that Network Service Entity (NSE) recognized by this FP. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE SgGtl Nse SigBvc resetsToPcu (rstsTxPcu)

Access: Read: All
Write: Illegal

Description: This attribute counts the BVC-RESET Protocol Data Units (PDU) sent to the Packet Control Unit (PCU) for a particular BSSGP Virtual Connection (BVC). The *resetsToPcu* gives the total count of requests for all BVCs for that Network Service Entity (NSE) recognized by this FP. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE SgGtl Nse SigBvc statusFromPcu (statusRxPcu)

Access: Read: All
Write: Illegal

Description: This attribute counts the NM-STATUS PDUs received from the Packet Control Unit (PCU). The PCU sends an NM-STATUS

| | |
|---|---|
| | PDU when it receives an invalid packet or a packet that has undergone corruption over the Gb interface in the SGSN-PCU direction. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl Nse SigBvc statusToPcu (statusTxPcu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NM-STATUS PDUs sent to the Packet Control Unit (PCU). The SGSN sends an NM-STATUS PDU when it receives an invalid packet or a packet that has undergone corruption over the Gb interface in the PCU-SGSN direction. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP SgGtl Nse SigBvc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the BSS GPRS Virtual Connection (BVC) operational information. |

### ATTRIBUTE SgGtl Nse SigBvc packetFlowContextFeature (pfc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Packet Flow Context feature is enabled or disabled. The Packet Flow Context feature is negotiated during the reset of the Signalling BSS GPRS Virtual Connection (BVC) as part of the negotiation of the Feature Bitmap Information Element between the Packet Control Unit (PCU) and the Serving GPRS Support Node (SGSN). |
| Values | disabled<br>enabled |

Default No default

### ATTRIBUTE SgGtl Nse SigBvc currentBucketLevelFeature (cbl)

Access Read: All
Write: Illegal

Description This attribute indicates whether the Current Bucket Level feature is enabled or disabled. The Current Bucket Level feature is negotiated during the reset of the Signalling BSS GPRS Virtual Circuit (BVC) as part of the negotiation of the Feature Bitmap Information Element between the Packet Control Unit (PCU) and the Serving GPRS Support Node (SGSN).

If the value is ***enabled***, the information in the *fullRatio* attribute in the *SgGtl Nse PtpBvc* component and the *bucketFullRatio* attribute in the *Gsd Tlli Llc* component are used in the flow control algorithms for the BVC and mobile.

Values disabled
enabled

Default No default

## COLLECTED STATS SgGprsTransportLayer NetworkServiceEntity SignalingBvc

Description The statistics record generated by the SgGprsTransportLayer NetworkServiceEntity SignalingBvc component.

### ATTRIBUTE SgGtl Nse SigBvc pdusFromPcu (pdusRxPcu)

Description This attribute counts the number of protocol data units (PDUs) received from the Packet Control Unit (PCU) by the BSS GPRS Virtual Connection (BVC) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SgGtl Nse SigBvc pdusToPcu (pdusTxPcu)

Description This attribute counts the number of protocol data units (PDUs) transmitted to the Packet Control Unit (PCU) by the BSS GPRS Virtual Connection (BVC) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SgGtl Nse SigBvc octetsFromPcu (octsRxPcu)

| | |
|---|---|
| Description | This attribute counts the number of octets received from the Packet<br>Control Unit (PCU) by the BSS GPRS Virtual Connection (BVC) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE SgGtl Nse SigBvc octetsToPcu (octsTxPcu)

| | |
|---|---|
| Description | This attribute counts the number of octets transmitted to the Packet Control Unit (PCU) from the Serving GPRS Support Node (SGSN) in the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT SgGtl MemoryPoolManager (Mpm)

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n MemoryPoolManager*<br>*Gsd/n MemoryPoolManager*<br>*Gtl/n MemoryPoolManager*<br>*DnsAgent/<vr>,n MemoryPoolManager*<br><br>This component represents the memory resources of a given GPRS application that are managed as pools of objects. |
| Dyn. Subcomp. | "COMPONENT SgGtl Mpm MemoryPoolClient (Mpc)" |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT SgGtl Mpm MemoryPoolClient (Mpc)

| | |
|---|---|
| Instance | String (1..30, ASCII) |
| Scope | Application |
| Description | *Gsc/n Mpm MemoryPoolClient/<name>*<br>*Gsd/n Mpm MemoryPoolClient/<name>*<br>*SgGtl/n Mpm MemoryPoolClient/<name>* |

*DnsAgent/<vr>,n Mpm MemoryPoolClient/<name>*

This component represents a pool of objects of a particular class that a GPRS application currently owns as well as all the objects that could be owned by that application. All the objects in the pool are of the same class. The instance value of this component is a string which is the class name of the objects in the pool.

## COMPONENT SgGtl RemoteApplicationConnection (RaConn)

Instance

appType [String (1..8, ASCII)]
shelfid [Decimal (0..50)]
instance (n) [Decimal (1..15)]

Groups

"GROUP SgGtl RaConn OsiState (State)"
"GROUP SgGtl RaConn WlcCustomCounters (WlcCustomCntr)"

Scope

Application

Description

*... RemoteApplicationConnection/<appType, shelfId, n>*

This component represents the Remote Application Connection information of an application that talks to applications on other shelves. For each application that it can communicate with, one of these connection components is created and is instantiated with the name of the remote application, the Id of the shelf on which the application runs, and the instance number of the application. ShelfId ***0*** represents the Master shelf.

## GROUP SgGtl RaConn OsiState (State)

Properties

Operational

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE SgGtl RaConn adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE SgGtl RaConn operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE SgGtl RaConn usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP SgGtl RaConn WlcCustomCounters (WlcCustomCntr)

Properties: Operational

Description: This group contains the spare counters that can be dynamically patched.

### ATTRIBUTE SgGtl RaConn customCounter1 (customCntr1)

Access: Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl RaConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SgGtl RaConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT SgGtl RaConn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP SgGtl RaConn AtmCon Operational (Oper)" |
| Scope | Device |

| | |
|---|---|
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

## GROUP SgGtl RaConn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

## ATTRIBUTE SgGtl RaConn AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

# COMPONENT ServingGprsSupportNode (Sgsn)

| | |
|---|---|
| Groups | "GROUP Sgsn Provisioned (Prov)"<br>"GROUP Sgsn VolumeCounts (Vc)" |
| Scope | Application |
| Description | *ServingGprsSupportNode*<br><br>This component represents the Serving GPRS Support Node (SGSN) functionality of the GPRS. It is to be added on both the Master shelf (*Sgsn* with only the *Gsc* components) and the Slave shelves (*Sgsn* with only *Gsd* and *Gtl* components). |

| | |
|---|---|
| Subcomponents | "COMPONENT Sgsn GprsSubscriberControl (Gsc)"<br>"COMPONENT Sgsn GprsTransportLayer (Gtl)"<br>"COMPONENT Sgsn GprsSubscriberDatapath (Gsd)"<br>"COMPONENT Sgsn DnsAgent (DnsAg)"<br>"COMPONENT Sgsn Shelf (Sh)" |
| Opt. Subcomp. | "COMPONENT Sgsn PlmnImsiRange (Pir)"<br>"COMPONENT Sgsn MobileCountryCode (Mcc)"<br>"COMPONENT Sgsn GprsVisitorLocationRegister (GprsVlr)"<br>"COMPONENT Sgsn TieredSubscription (Ts)"<br>"COMPONENT Sgsn Accounting (Acct)"<br>"COMPONENT Sgsn PrepaidShortMessageService (PSms)"<br>"COMPONENT Sgsn EquivalentPlmn (EquivPlmn)" |
| Dyn. Subcomp. | "COMPONENT Sgsn TemporaryLogicalLinkId (Tlli)"<br>"COMPONENT Sgsn InternationalMobileSubscriberId (Imsi)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Sgsn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains general provisioning data for *ServingGprsSupportNode (Sgsn)* and to provide Software Optionality Control (SOC). |

## ATTRIBUTE Sgsn resetTimer (rstTim)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the reset timer used for a *GprsSubscriberControl (Gsc)*. This timer is started when an FP on which a *Gsc* component is provisioned comes up. During the reset timer period, the *Gsc* is considered to have recently |

experienced a restart, and the GPRS Mobility Management (GMM) ignores and discards messages from the mobile (except ATTACH Requests and ROUTING AREA UPDATE Requests). If the reset timer has expired, and the mobile subscriber has not performed a subsequent GPRS-Attach, any received messages are considered a protocol violation and responded to with the appropriate reject or a GMM STATUS message, until the mobile performs another GPRS-Attach.

Values: Decimal (0..255)

Units: minutes

Default: No default

## ATTRIBUTE Sgsn maxSubscribers (maxSubs)

Access: Read: All
Write: All

Description: This attribute specifies the total number of 'GPRS-Attached' subscribers this Serving GPRS Support Node (SGSN) can support simultaneously. It does this by limiting the total of all the individual *maxAttachedSubscribers* attribute in all the *GprsSubscriberControl (Gsc)* components.

For example, if this SGSN has two FP *GprsSubscriberControl* provisioned, the first *GprsSubscriberControl* provisioned to support ***5000*** subscribers and the second to support ***2500*** subscribers, this attribute must be provisioned with a value of ***7500*** or greater. The value of this attribute cannot be greater than the number authorized by the access code. The access code (attribute *maxSubsAccessCode*) is unique for each SGSN. Please contact your local Nortel Networks Customer Service representative for more information.

The current number of 'GPRS-Attached' subscribers can be obtained from the sum of the *currentlyAttached* attribute defined in the *Gsc GprsMobilityManagement* component for all the *Gsc* instances.

Values: Decimal (1000..5000000)

| | |
|---|---|
| Default | 1000 |

### ATTRIBUTE Sgsn maxSubsAccessCode (mSubsCode)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the access code that allows the *maxSubscribers* attribute to be changed to a higher value. The access code must be obtained from an authorized Nortel Networks representative. Each Serving GPRS Support Node (SGSN) requires a unique access code for each and every increase to the *maxSubscribers* attribute. |
| Values | BCD (0..18) |
| Default | No default |

### ATTRIBUTE Sgsn maxNseSupported (maxNse)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Module |
| Description | This attribute specifies the maximum Network Service Entities (NSEs) supported on this SGSN. The value provisioned for *maxNseSupported* affects the allowed value for *maxBvcPerNse*, and vice versa. The higher the value for *maxNseSupported*, the lower the allowed value for *maxBvcPerNse*.<br><br>The product of *maxNseSupported* and *maxBvcPerNse* should not exceed 51200. Changing the value of *maxNseSupported* will result in a system reload. |
| Values | Decimal (1..256) |
| Default | 256 |

### ATTRIBUTE Sgsn maxBvcPerNse (maxBvc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Module |

| | |
|---|---|
| Description | This attribute specifies the maximum BSS GPRS Virtual Connections (BVCs) supported per Network Service Entity (NSE). The value provisioned for *maxNseSupported* affects the allowed value for *maxBvcPerNse*, and vice versa. The higher the value for *maxNseSupported*, the lower the allowed value for *maxBvcPerNse*.<br><br>The product of *maxNseSupported* and *maxBvcPerNse* should not exceed 51200. Changing the value of *maxBvcPerNse* will result in a system reload. |
| Values | Decimal (1..600) |
| Default | 200 |

### ATTRIBUTE Sgsn networkOpId (nwOpId)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Network Operator Identity, and identifies the operator of the SGSN to external devices (for example, Lawful Intercept Gateway). |
| Values | String (1..37, ASCII) |
| Default | "Nortel Networks" |

### ATTRIBUTE Sgsn longMncMccs (longMnc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies which Mobile Country Codes (MCC) use a three digit Mobile Network Code (MNC). All MCCs not in this list are assumed to use a two digit MNC.<br><br>This information is used to construct an APN-Operator Identity in the format mnc<MNC digits>.mcc<MCC digits>.gprs for APN translations during DNS queries.<br><br>An operator would need to add entries to this list, if he has |

| | |
|---|---|
| | roamers from another PLMN with 3 digit MNCs for whom he needs to do APN translations. |
| List of | BCD (3) |
| Default | No default |

### GROUP Sgsn VolumeCounts (Vc)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *ServingGprsSupportNode (Sgsn)* component to provide traffic volume control. |

### ATTRIBUTE Sgsn tariffTimeChangeTrigger (ttcTrig)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether the Tariff Time Change Trigger (TTCT) feature is ***enabled*** or ***disabled***. When enabled, SGSN Accounting Server closes existing Change of Charging Condition containers and opens new containers in SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) to indicate to the down stream billing device that a Tariff Time Change event has occurred. This enables the down stream billing system to use different billing rates for different time containers.<br><br>TTCT relies on Time of Day Accounting (TODA) for provisioning the tariff periods. Both the SGSN Accounting Server and the Subscriber Data applications register with TODA for notification of tariff time changes.<br><br>When the *tariffTimeChangeTrigger* attribute is enabled, the *collectionTimes* attribute (defined in the *Collector/Accounting* component) must not specify more than 6 periods with no period closer than 4 hours. |
| Values | disabled<br>enabled |
| Default | disabled |

## ATTRIBUTE Sgsn dataVolumeLimit (dvl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies when partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) are generated with a partial record reason of “data volume limit” based upon the number of combined uplink and downlink kilobytes that have been transferred by the active session.<br><br>If this attribute is set to ***disabled***, then a default value of 2 gigabytes for the volume limit is used to trigger the generation of partial S-CDRs. |
| Values | Decimal (128..5120)<br>disabled |
| Units | kbyte |
| Default | disabled |

## COMPONENT Sgsn GprsSubscriberControl (Gsc)

| | |
|---|---|
| Groups | "GROUP Sgsn Gsc MapClientProv (Mc)"<br>"GROUP Sgsn Gsc GmmProv (Gmm)"<br>"GROUP Sgsn Gsc HlrCacheProv (HlrC)"<br>"GROUP Sgsn Gsc SmProv (Sm)"<br>"GROUP Sgsn Gsc GtpProv (Gtp)"<br>"GROUP Sgsn Gsc GtpPathMgmtProv (GtpPm)"<br>"GROUP Sgsn Gsc BssapProv (Bssap)"<br>"GROUP Sgsn Gsc SmsProv (Sms)"<br>"GROUP Sgsn Gsc BssapSccpUserInfoProv (BssapSccp)"<br>"GROUP Sgsn Gsc SsfGlobalProv (Ssf)"<br>"GROUP Sgsn Gsc MobileSubscriberPurge (MsPurge)" |
| Scope | Application |
| Description | *Sgsn GprsSubscriberControl*<br><br>This component represents the GPRS Mobility Management (GMM), the Session Management (SM), the GPRS Tunneling |

Protocol (GTP) control path protocol layers of GPRS, the *MapClient* entity, and the *HlrCache* entity.

Common Verbs

List
Display

## GROUP Sgsn Gsc MapClientProv (Mc)

Properties: Provisioned

Description: This group contains the common provisionable attributes for the *MapClient* subcomponents of *GprsSubscriberControl* on the FPs. The *MapClient* subcomponent provides Mobile Application Part (MAP) over SS7 to interact with the Home Location Register (HLR) via the SS7-IP Gateway.

## ATTRIBUTE Sgsn Gsc mcTimer (tMc)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time the *MapClient* allows for a response from the Home Location Register (HLR). The timer is started when messages MAP-SEND AUTHENTICATION INFO, stand-alone MAP-INSERT SUBSCRIBER DATA, MAP-UPDATE GPRS LOCATION, MAP-PURGE MS, or READY-FOR-SMS are sent to the HLR.

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU) and greater than all the timers provisioned in the *MapStack* component for messages sent to the HLR.

Values: Decimal (1..32)

Units: seconds

Default: 27

## ATTRIBUTE Sgsn Gsc uglRetries (nUgl)

Access: Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies the times the Serving GPRS Support Node (SGSN) can send the MAP-UPDATE GPRS LOCATION to the Home Location Register (HLR) upon no reception of the MAP-UPDATE GPRS LOCATION ACK. |
| Values | Decimal (0..4) |
| Default | 1 |

### ATTRIBUTE Sgsn Gsc saiRetries (nSai)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the times the Serving GPRS Support Node (SGSN) can send the MAP-SEND AUTHENTICATION INFO to the Home Location Register (HLR) upon no reception of the MAP-SEND AUTHENTICATION INFO ACK. |
| Values | Decimal (0..4) |
| Default | 1 |

### ATTRIBUTE Sgsn Gsc mcFallbackTimer (tFbMc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Client allows to reset the MAP Client Fallback Table. The Fallback Table is used by the MAP Client to track the messaging version supported by each Home Location Register (HLR). If the *mcFallbackTimer* attribute changes or the timer expires, the Fallback Table is deleted and the messaging version is renegotiated with each HLR. The timer is also restarted with either the existing timeout value if the timer expired or the modified value if the value was modified.<br><br>If the timer is set to ***disabled***, the timer is not started and the Fallback Table is not deleted. Message version renegotiation with the HLR does not take place until the timer is set to a value other than ***disabled***. |

| | |
|---|---|
| Values | Decimal (1..365)<br>disabled |
| Units | days |
| Default | 30 |

### ATTRIBUTE Sgsn Gsc mscEmulationMode (mscEmMode)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether the SGSN should emulate an MSC when messaging with the Short Message Service Center (SMSC). Currently the MAP specification requires that the MSC SubSystem Number (SSN) be used in the Calling Party Address (CgPA) when the SGSN addresses an entity that does not support inter-working with the SGSN.<br><br>When this attribute is set to ***on***, the SGSN emulates an MSC when messaging with the SMSC. The SMSC is either the Short Message Service Interworking MSC (SMS-IWMSC) or the Short Message Service Gateway MSC (SWS-GMSC).<br><br>When this attribute is set to ***off***, the SGSN's SSN is used when messaging with the SMSC. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Sgsn Gsc mscSubsystemNumber (mscSubsysNum)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the MAP SGSN SSN. This SSN is only used if the *mscEmulationMode* attribute is set to ***on***. Otherwise this attribute is ignored.<br><br>If this attribute is changed after the MAP Client has registered with the MAP Stack, any outstanding MAP transactions is lost. |

| | |
|---|---|
| Values | Decimal (1..255) |
| Default | 8 |

### GROUP Sgsn Gsc GmmProv (Gmm)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains system-wide provisionable attributes to provide the GPRS Mobility Management (GMM) functionality of *GprsSubscriberControl (Gsc)*. |

### ATTRIBUTE Sgsn Gsc readyTimer (t3314)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the READY Timer (T3314) for GPRS Mobility Management (GMM) state transition. The timer is restarted whenever a signaling or data Protocol Data Unit (PDU) is received from the Mobile Station (MS). In the event of *readyTimer* expiry, the *gmmState* (defined in *MobilityContext*) transitions to ***standby*** state.<br><br>The value of the READY Timer is used by both the MS and the Serving GPRS Support Node (SGSN). It is negotiated between the MS and the SGSN. There are three possible values of the READY Timer: ***useMsValue***, ***forceStandby***, and normal timer values. The normal timer values<br>should be a multiple of 2(seconds),60 (1 minute) or 360(6 minutes)<br>which are the only units supported for READY Timer.<br><br>If the value is set to the ***useMsValue***, the value sent by the MS is used as the READY Timer. However, if the value is set to ***useMsValue*** and the MS attempts to cancel the READY Timer, the SGSN overrides the cancel attempt by using the ***forceStandby*** value. The ***forceStandby*** value causes the *gmmState* attribute to immediately transition to ***standby*** state after the Attach Complete message is received by the SGSN. For all transactions that follow, the default value for this attribute is used.<br><br>All other values of this attribute cause both the SGSN and MS to |

use this value. The MS cannot negotiate it. The *readyTimer* value should be at least 10% greater than the *t200RetransmitTimer* provisioned in the *SapiControl* component.,except when *readyTimer* is set to ***forceStandby*** or ***useMsValue***.

The negotiated value for the *readyTimer* for an MS can be displayed in the *MobilityContext* component.

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).

Values: Decimal (1..11160)
useMsValue
forceStandby

Units: seconds

Default: 44

### ATTRIBUTE Sgsn Gsc mobileReachableTimer (tReachable)

Access: Read: All
Write: All

Description: This attribute specifies the MOBILE REACHABLE Timer for the GPRS Mobility Management (GMM) state transition. The timer value must be at least four minutes longer than the longest *periodicRaUpdateTimer* (defined in component *Sgsn MobileCountryCode/<Mcc> MobileNetworkCode/<Mnc> LocationAreaCode/<Lac> RoutingAreaCode/<Rac>)*. The MOBILE REACHABLE Timer is started when the Mobile Station (MS) drops from Ready state to Standby state or when the MS is forced to Standby state. In the event of *mobileReachableTimer* expiry, the GMM starts the *implicitDetachTimer.*

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).

Values: Decimal (0..255)

| | |
|---|---|
| Units | minutes |
| Default | 58 |

### ATTRIBUTE Sgsn Gsc implicitDetachTimer (tImplicit)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value used by the GPRS Mobility Management (GMM) for the removal of GMM context in an implicit detach after the *mobileReachableTimer* has expired.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (0..255) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Sgsn Gsc pagingTimer (t3313)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used for the GPRS Paging procedure. Upon expiry of the *pagingTimer*, if the Paging procedure is not completed, the GPRS Paging procedure is restarted for a maximum of *pagingRetries (n3313)*.<br><br>The value of the attribute *rpResponseTimer* cannot be less than the sum of the maximum number of *cpResponseRetries(tc1nRet)* multiplied by the *cpResponseTimer(tc1n)* value plus the maximum number of *pagingRetries (n3313)* multiplied by the *pagingTimer (t3313)* value.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |

| | |
|---|---|
| Units | seconds |
| Default | 8 |

### ATTRIBUTE Sgsn Gsc pagingRetries (n3313)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *pagingTimer (t3313)* expires.<br><br>The value of the attribute *rpResponseTimer* cannot be less than the sum of the maximum number of *cpResponseRetries(tc1nRet)* multiplied by the *cpResponseTimer(tc1n)* value plus the maximum number of *pagingRetries (n3313)* multiplied by the *pagingTimer (t3313)* value. |
| Values | Decimal (0..4) |
| Default | 1 |

### ATTRIBUTE Sgsn Gsc nwkInitiatedDetachTimer (t3322)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used in the Network-Initiated Detach procedure. Upon expiry of *nwkInitiatedDetachTimer*, if the Detach procedure is not completed, the Network-Initiated Detach procedure is restarted for a maximum of *nwkInitDetachRetries (n3322)*.<br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 6 |

### ATTRIBUTE Sgsn Gsc nwkInitDetachRetries (n3322)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *nwkInitiatedDetachTimer (t3322)* expires. |
| Values | Decimal (0..8) |
| Default | 4 |

### ATTRIBUTE Sgsn Gsc idRequestTimer (t3370)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used in Identification procedure. Upon expiry of the *idRequestTimer*, if the Identification procedure is not finished, the identification procedure is restarted for a maximum of *idRequestRetries (n3370)*.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 6 |

### ATTRIBUTE Sgsn Gsc idRequestRetries (n3370)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *idRequestTimer (t3370)* expires. |
| Values | Decimal (0..8) |
| Default | 4 |

### ATTRIBUTE Sgsn Gsc ptmsiReallocTimer (t3350)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used in the Packet-Temporary Mobile Subscriber Identity (P-TMSI) Reallocation procedure. The P-TMSI reallocation procedure can also be performed within the Attach or Routing Area Update procedures, as well. Upon expiry of the *ptmsiReallocTimer*, if the P-TMSI Reallocation procedure is not finished, P-TMSI Reallocation procedure is restarted for a maximum of *ptmsiReallocRetries (n3350)*.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 6 |

### ATTRIBUTE Sgsn Gsc ptmsiReallocRetries (n3350)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *ptmsiReallocTimer (t3350)* expires. |
| Values | Decimal (0..8) |
| Default | 4 |

### ATTRIBUTE Sgsn Gsc authCipheringTimer (t3360)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used in Authentication and Ciphering procedure. Upon expiry of the *t3360* timer, if the Authentication and Ciphering procedure is not finished, this procedure is restarted for a maximum of *authCipheringRetries* |

*(n3360)*.

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).

| | |
|---|---|
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 6 |

### ATTRIBUTE Sgsn Gsc authCipheringRetries (n3360)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *authCipheringTimer (t3360)* expires. |
| Values | Decimal (0..8) |
| Default | 4 |

### ATTRIBUTE Sgsn Gsc authEvents (authEvents)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number, N, which indicates that at every<br>Nth event requiring authentication, the Authentication procedure is<br>initiated with the mobile subscriber.<br>For example, when this value is set to ***never***, the Authentication procedure is never performed, when the value is set to ***1***, the Authentication procedure is performed every time an event that triggers authentication occurs. The provisioning of any other value N for this attribute indicates that every Nth event that can be authenticated undergoes this Authentication procedure. This parameter is not per Mobile Station (MS); rather, it is used to count events over all the affected procedures per *GprsSubscriberControl (Gsc)*. |

| | |
|---|---|
| Values | Decimal (1..255)<br>never |
| Default | 20 |

### ATTRIBUTE Sgsn Gsc subsRegisterRecoveryUpdateTimer (tSubsReg)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum recovery delay time used by the SGSN to re-create the association between the Home Location Register (HLR), in the case of the HLR Reset, or VLR, in the case of VLR Reset, and a Mobile Station (MS). The timer is started on a receipt of a valid LLC frame from the MS following the Reset HLR or VLR to which this MS is attached. When the timer expires the appropriate procedure is initiated by the GPRS Mobility Management (GMM). The actual timer used is a randomized value less than this value in order to distribute the traffic to HLR or VLR after an HLR or VLR Reset.<br><br>In the case of an HLR Reset, a MAP-UPDATE GPRS LOCATION (UGL) is performed and in the case of a VLR Reset a MAP-LOCATION UPDATE is performed. |
| Values | Decimal (0..10) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Sgsn Gsc t3TunnelTimer (t3Tunnel)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time that the old SGSN will continue to forward packets to the new SGSN during an Inter SGSN Routing Area Update (IRAU). The timer is started in the old SGSN when it receives a GTP SGSN CONTEXT REQUEST message and there is at least one active Packet Data Protocol (PDP) context. |
| Values | Decimal (1..40) |

| | |
|---|---|
| Units | seconds |
| Default | 20 |

### ATTRIBUTE Sgsn Gsc cipheringAlgorithms (ciphAlgo)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Ciphering Algorithms supported on this<br>Serving GPRS Support Node (SGSN) in descending order of preference. The mobile provides a list of the ciphering algorithms it supports to the SGSN. The SGSN compares the mobile provided values with the values listed in this attribute. The first value provisioned in this attribute that is also in the mobile provided list is chosen as the ciphering algorithm for use in communicating with this mobile.<br>The ciphering algorithms supported are:<br>***noCiphering*** - No ciphering is used.<br>***geav1*** - GPRS algorithm is performed. |
| Vector of | noCiphering<br>geav1 |
| Index | Decimal (1..2) |
| Default | (noCiphering, noCiphering) |

### GROUP Sgsn Gsc HlrCacheProv (HlrC)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains system-wide provisioning data for the *HlrCache* functionality of the *GprsSubscriberControl (Gsc)*. |

### ATTRIBUTE Sgsn Gsc authTripletsReuse (authTrip)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of times each Authentication Triplet can be reused when authenticating a subscriber. The reuse of the Authentication Triplets is done only in abnormal situations, when new triplets cannot be received from |

| | |
|---|---|
| | the Home Location Register (HLR) due to connectivity breakdown between the Serving GPRS Support Node (SGSN) and the HLR. |
| Values | Decimal (0..5000) |
| Default | 5000 |

### GROUP Sgsn Gsc SmProv (Sm)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains system-wide provisioning data for the Session<br>Management (SM) functionality of the *GprsSubscriberControl (Gsc)*. |

### ATTRIBUTE Sgsn Gsc nwkPdpDeactTimer (t3395)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value used in the Serving GPRS Support Node (SGSN) or in the Gateway GPRS Support Node (GGSN) initiated Packet Data Protocol (PDP) Context Deactivation procedures.<br><br>This timer is started when a DEACTIVATE PDP CONTEXT REQUEST message is sent to the Mobile Station (MS) and is stopped when a DEACTIVATE PDP CONTEXT ACCEPT message is received from the MS. If this timer expires before the receipt of a DEACTIVATE PDP CONTEXT ACCEPT message, the SGSN or GGSN initiated PDP Context deactivation procedure is retried for a maximum of *nwkPdpDeactRetries*.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 8 |

### ATTRIBUTE Sgsn Gsc nwkPdpDeactRetries (t3395Retry)

Access
Read: All
Write: All

Description
This attribute specifies the number of retry attempts after the *nwkPdpDeactTimer (t3395)* expires during a Serving GPRS Support Node (SGSN) or a Gateway GPRS Support Node (GGSN)-initiated PDP Context Deactivation procedure.

Values
Decimal (0..4)

Default
4

### ATTRIBUTE Sgsn Gsc defApnOperatorId (defApnOp)

Access
Read: All
Write: All

Description

This attribute specifies the default Access Point Name (APN) Operator Identifier for this Public Land Mobile Network (PLMN). It is a fully qualified domain name according to the Domain Name System (DNS) naming conventions and consists of three labels (that is, <DNS-label>.<DNS-label>.gprs). It is expected that the operator uses this attribute to fill in a human-readable format of the APN Operator Identifier (that is, an APN Operator Identifier not in the mnc<MNC digits>.mcc<MCC digits>.gprs format).

Its use includes being the VPLMN APN Operator Identifier as defined in specification 23.060 Annex A or any other text clarifying its use.

A value of *defApnOperatorId* is used when an ACTIVATE PDP CONTEXT REQUEST message is received from an MS. If the MS sends an APN Operator Identity that is not in the format “mnc<MNC>.mcc<MCC>.gprs” and if it is not the same as the provisioned *defApnOperatorId* then it is assumed that the received APN Operator Identifier does not belong to this PLMN. The ACTIVATE PDP CONTEXT REQUEST message is then rejected.

The selected APN Operator identifier for a particular session can be displayed as part of the *selectedApnOperatorId* attribute (defined in *SessionContext*).

Values: String (1..37, ASCII)

Default: " "

### ATTRIBUTE Sgsn Gsc nwkPdpModifyTimer (t3386)

Access: Read: All
Write: All

Description: This attribute specifies the timer value used in the Serving GPRS Support Node (SGSN) initiated Packet Data Protocol (PDP) Context Modification procedures.

This timer is started when a MODIFY PDP CONTEXT REQUEST message is sent to the Mobile Station (MS) and is stopped when a MODIFY PDP CONTEXT ACCEPT message is received from the MS. If this timer expires before the receipt of a MODIFY PDP CONTEXT ACCEPT message, the PDP Context modification procedure is retried for a maximum of *nwkPdpModifyRetries*.

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).

Values: Decimal (1..255)

Units: seconds

Default: 8

### ATTRIBUTE Sgsn Gsc nwkPdpModifyRetries (n3386)

Access: Read: All
Write: All

Description: This attribute specifies the number of times the SGSN, while acting as the new SGSN, resends a MODIFY PDP CONTEXT REQUEST message to the Mobile Station (MS) if the *nwkPdpModifyTimer* expires while the MS is undergoing an

Inter-SGSN Routing Area Update (IRAU). If this attribute is exhausted, the *nwkPdpModifyRetriesExhausted* attribute will be incremented.

Values: Decimal (1..20)

Default: 4

### ATTRIBUTE Sgsn Gsc defApnNetworkId (defApnNwk)

Access: Read: All
Write: All

Description: This attribute specifies the default Access Point Name (APN) Network Identifier for different Packet Data Protocol (PDP) types. It is a label (for example “corporation”) or a set of labels separated by dots, which is a fully qualified domain name according to the Domain Name System (DNS) naming conventions (for example, “company.com”).

The *defApnNetworkId* must not start with the strings “rac”, “lac” or “sgsn” and it must not end in “.gprs”. It must also not take the value “*”. In order to guarantee uniqueness of the APN Network Identifier across all GPRS PLMNs, an APN Network Identifier containing more than one label corresponds to an Internet domain name. This name must only be allocated by the Public Land Mobile Network (PLMN) to an organization that has officially reserved this name in the Internet domain. Other types of APN Network Identifiers are not guaranteed to be unique within the GPRS PLMN(s).

This *defApnNetworkId* is used if the Mobile Station (MS) does not send the APN Network Identifier as part of the ACTIVATE PDP CONTEXT REQUEST and if its subscription record received from the HLR has a wildcard (*) APN. If the defApnNetworkId is not entered in such a case, the ACTIVATE PDP CONTEXT REQUEST
message is then rejected.

The selected APN Network Identifier for a particular session can

| | |
|---|---|
| | be displayed as part of the *selectedApnNetworkId* attribute (defined in *SessionContext*). |
| Vector of | String (0..63, ASCII) |
| Index | x25<br>ip<br>ppp |
| Default | ([0] "", [1] "", [2] "") |

### GROUP Sgsn Gsc GtpProv (Gtp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes to define the GPRS Tunneling Protocol (GTP) provisioning function of the Serving GPRS Support Node (SGSN). |

### ATTRIBUTE Sgsn Gsc n3CreateRequest (n3CrReq)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of attempts made by the GPRS Tunneling Protocol (GTP) to send the CREATE PDP CONTEXT REQUEST message to a Gateway GPRS Support Node<br>(GGSN). It is recommended that the total wait time (that is, the product of *n3CreateRequest* and *t3CreateResponse*) is to be shorter than the Mobile Station (MS) wait time between retries of ATTACH and RA-UPDATE messages. |
| Values | Decimal (1..10) |
| Default | 5 |

### ATTRIBUTE Sgsn Gsc t3CreateResponse (t3CrResp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum wait time for a response of a CREATE PDP CONTEXT REQUEST message. It is recommended that the total wait time (that is, the product of |

*n3CreateRequest* and *t3CreateResponse*) is to be shorter than the Mobile Station (MS) wait time between retries of ATTACH and RA-UPDATE messages.

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU) from this Serving GPRS Support Node (SGSN) to any Gateway GPRS Support Node (GGSN).

Values: Decimal (1..30)

Units: seconds

Default: 5

### ATTRIBUTE Sgsn Gsc n3DeleteRequest (n3DelReq)

Access: Read: All
Write: All

Description: This attribute specifies the maximum number of attempts made by the GPRS Tunneling Protocol (GTP) to send the DELETE PDP CONTEXT REQUEST message to the Gateway GPRS Support Node (GGSN). It is recommended that the total wait time (that is, the product of *n3DeleteRequest* and *t3DeleteResponse*) is to be shorter than the Mobile Station (MS) wait time between retries of ATTACH and RA-UPDATE messages.

Values: Decimal (1..10)

Default: 5

### ATTRIBUTE Sgsn Gsc t3DeleteResponse (t3DelResp)

Access: Read: All
Write: All

Description: This attribute specifies the maximum wait time for a response of a DELETE PDP CONTEXT REQUEST message from the Gateway GPRS Support Node (GGSN). It is recommended that the total wait time (that is, the product of *n3DeleteRequest* and *t3DeleteResponse*) is to be shorter than the Mobile Station (MS) wait time between retries of ATTACH and RA-UPDATE

| | |
|---|---|
| | messages.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Sgsn Gsc n3EchoRequest (n3EcReq)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of attempts made by the GPRS Tunneling Protocol (GTP) to send the ECHO REQUEST message to the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (1..10) |
| Default | 5 |

### ATTRIBUTE Sgsn Gsc t3EchoResponse (t3EcResp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum wait time for a response of a ECHO REQUEST message from the Gateway GPRS Support Node (GGSN).<br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (5..600) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE Sgsn Gsc n3SgsnContextRequest (n3CntxtReq)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times that this SGSN, while acting as the new SGSN, sends the SGSN CONTEXT REQUEST message while the Mobile Station (MS) is undergoing an Inter-SGSN Routing Area Update (IRAU). |
| Values | Decimal (1..20) |
| Default | 5 |

### ATTRIBUTE Sgsn Gsc t3SgsnContextResponse (t3CntxtResp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attributes specifies the time that this SGSN, while acting as the new SGSN, waits for an SGSN CONTEXT RESPONSE message from the SGSN which is acting as old SGSN while the Mobile Station (MS) is undergoing an Inter-SGSN Routing Area Update (IRAU).<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Sgsn Gsc n3UpdateRequest (n3UpdateReq)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times that this SGSN, while acting as the new SGSN, sends an UPDATE PDP CONTEXT REQUEST message to the Gateway GPRS Support Node (GGSN) while the Mobile Station (MS) is undergoing an Inter-SGSN Routing Area Update (IRAU). |

| | |
|---|---|
| Values | Decimal (1..20) |
| Default | 5 |

### ATTRIBUTE Sgsn Gsc t3UpdateResponse (t3UpdateResp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attributes specifies the time that this SGSN, while acting as the new SGSN, waits for an UPDATE PDP CONTEXT REPONSE message from the Gateway GPRS Support Node (GGSN) while the Mobile Station (MS) is undergoing an Inter-SGSN Routing Area Update (IRAU).<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Sgsn Gsc gtpV0Version (gtpVer)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the version of 3GPP specification 09.60 GPRS Tunnelling Protocol (GTP) across the Gn and Gp interfaces that the Serving GPRS Support Node (SGSN) is compliant with.<br><br>This attribute is applicable only to GTP version 0, which is used if the Release 99 compliant GTP version 1 cannot be negotiated with a neighboring Gprs Support Node (GSN). This attribute is important for network operators because SGSNs that support v7.6 cannot perform Inter SGSN Routing Area Updates (IRAUs) with SGSNs that support version v7.3 due to non-backwards compatible changes present in the GTP specification.<br><br>If the value of this attribute is set to ***ver7-3,*** this SGSN supports |

version 7.3 of 09.60 and can perform IRAUs with other SGSNs supporting this same version of the specification.

If the value of this attribute is set to ***ver7-6***, this SGSN supports version 7.6 of 09.60 and can perform IRAUs with other SGSNs supporting this same version of the specification.

Values
ver7-3
ver7-6

Default
ver7-3

### GROUP Sgsn Gsc GtpPathMgmtProv (GtpPm)

Properties
Provisioned

Description
This group contains provisionable attributes to define the GPRS Tunneling Protocol (GTP) provisioning function of the Serving GPRS Support Node (SGSN). This includes the Tunnel Management and the Path Management functionalities.

### ATTRIBUTE Sgsn Gsc echoRequest (echoReq)

Access
Read: All
Write: All

Description
This attribute specifies whether the ECHO REQUEST message is to be sent out for signaling path to the Gateway GPRS Support Node (GGSN) node.

Values
disable
enable

Default
disable

### ATTRIBUTE Sgsn Gsc echoTimeInterval (echoInt)

Access
Read: All
Write: All

Description
This attribute specifies the time interval at which ECHO REQUESTS are sent on a signaling path in use from the Serving GPRS Support Node (SGSN) to the Gateway GPRS Support Node (GGSN).

| | |
|---|---|
| Values | Decimal (1..300) |
| Units | minutes |
| Default | 10 |

### ATTRIBUTE Sgsn Gsc maxGgsnPaths (maxPaths)

| | |
|---|---|
| Access | Read: All<br>Write: Debug |
| Description | This attribute specifies the maximum number of managed paths that<br>can be setup between this Serving GPRS Support Node (SGSN) and the Gateway GPRS Support Nodes (GGSNs). Each path contains one or more tunnels which may be used by, for example, PDP Contexts.<br>It is possible to have more paths than specified by the *maxGgsnPaths*, but those exceeded are not managed paths (for example, cannot do echo).<br><br>The peak number of transactions can be obtained from the attribute<br>*peakGgsnPaths* (defined in *Gsc GtpMgmt*). |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Sgsn Gsc pathHistoryExpireTimeInterval (pathHistExpInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time interval at which the path history is reset. When the value is set to ***disabled***, it is never reset. |
| Values | Decimal (1..300)<br>disabled |
| Units | minutes |
| Default | 10 |

### ATTRIBUTE Sgsn Gsc strictPathSupervision (stPathSup)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether the GPRS Tunnelling Protocol (GTP) will declare path failure if a response to any message to a GPRS Support Node (GSN) is not received, or if an echo-request goes unanswered. When a link failure is detected between the Serving GPRS Support Node (SGSN) and a GSN, the GSN is marked as unreachable.<br><br>If the value of the attribute is set to ***enabled***, failure of the remote end to respond to any GTP request will result in path failure being declared.<br><br>If the value of this attribute is set to ***disabled***, then failure of the remote end to respond to an echo request will be marked as a path failure, but all other failures will not be detected.<br><br>The number of link failures detected is indicated by the attribute *pathFailures*, in the *Gsc GtpM* component. |
| Values | disabled<br>enabled |
| Default | disabled |

### GROUP Sgsn Gsc BssapProv (Bssap)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the Base Station System Application Part + (BSSAP+) provisioning data of the Serving GPRS Support Node (SGSN). |

### ATTRIBUTE Sgsn Gsc locationUpdateTimer (tLocUpd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the Base Station System Application Part + (BSSAP+) allows for a response from the Visitor Location Register (VLR) when |

BSSAP+_LOCATION_UPDATE_REQUEST messages are sent to the VLR.

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).

| | |
|---|---|
| Values | Decimal (10..90) |
| Units | seconds |
| Default | 15 |

### ATTRIBUTE Sgsn Gsc explicitGprsDetachTimer (t8)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the Base Station System<br>Application Part + (BSSAP+) allows for a response from the Visitor Location Register (VLR) when BSSAP+_GPRS_DETACH_INDICATION messages are sent to the VLR.<br><br>The count of timeouts can be viewed in the *t8Timeouts* attribute (defined in *Gsc Bssap*).<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE Sgsn Gsc explicitGprsDetachRetries (n8)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times the Serving GPRS Support Node (SGSN) can send the |

BSSAP+_GPRS_DETACH_INDICATION to the Visitor Location Register (VLR) upon no reception of the BSSAP+_GPRS_DETACH_ACK.

If the maximum number of retries is reached, BSSAP+ increments the *gprsDetachMaxAttempts* attribute (defined in *Gsc BaseStationSystemApplPart*).

Values: Decimal (0..8)

Default: 2

### ATTRIBUTE Sgsn Gsc explicitImsiDetachTimer (t9)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time the Base Station System
Application Part + (BSSAP+) allows for a response from the Visitor
Location Register (VLR) when explicit BSSAP+_IMSI_DETACH_INDICATION messages are sent to the VLR.

The count of timeouts can be viewed in *t9Timeouts* attribute (defined in *Gsc Bssap*).

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).

Values: Decimal (1..30)

Units: seconds

Default: 4

### ATTRIBUTE Sgsn Gsc explicitImsiDetachRetries (n9)

Access: Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies the number of times the Serving GPRS Support Node (SGSN) can send the explicit BSSAP+_IMSI_DETACH_INDICATION to the Visitor Location Register (VLR) upon no reception of the BSSAP+_IMSI_DETACH_ACK.<br><br>If the maximum number of retries is reached, BSSAP+ increments the *explicitImsiDetachMaxAttempts* attribute (defined in *Gsc BaseStationSystemApplPart*). |
| Values | Decimal (0..9) |
| Default | 2 |

### ATTRIBUTE Sgsn Gsc implicitImsiDetachTimer (t10)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the Base Station System Application Part + (BSSAP+) allows for a response from the Visitor Location Register (VLR) when implicit BSSAP+_IMSI_DETACH_INDICATION messages are sent to the VLR.<br><br>The count of timeouts can be viewed in *t10Timeouts* attribute (defined in *Gsc Bssap*).<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE Sgsn Gsc implicitImsiDetachRetries (n10)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the number of times the Serving GPRS Support Node (SGSN) can send the BSSAP+_IMSI_DETACH_INDICATION to the Visitor Location Register (VLR) upon no reception of the BSSAP+_IMSI_DETACH_ACK.<br><br>If the maximum number of retries is reached, BSSAP+ increments the *implicitImsiDetachMaxAttempts* attribute (defined in *Gsc BaseStationSystemApplPart*). |
| Values | Decimal (0..10) |
| Default | 2 |

### ATTRIBUTE Sgsn Gsc sgsnResetTimer (t12)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the T12-2 Timer that is the amount of time the Base Station System Application Part + (BSSAP+) allows for a response from the Visitor Location Register (VLR) when BSSAP+_RESET_INDICATION messages are sent to the VLR. This message is sent when a *Gsc* recovers following a card failure.<br><br>The count of timeouts can be viewed in *t12Timeouts* attribute (defined in *Gsc Bssap*).<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..120) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE Sgsn Gsc sgsnResetRetries (n12)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times the Base Station System<br>Application Part + (BSSAP+) can send the BSSAP+_RESET_INDICATION to the Visitor Location Register (VLR) upon no reception of the BSSAP+_RESET_ACK.<br><br>If the maximum number of retries is reached, BSSAP+ increments the *sgsnResetMaxAttempts* attribute (defined in *Gsc BaseStationSystemApplPart*). |
| Values | Decimal (0..12) |
| Default | 2 |

### GROUP Sgsn Gsc SmsProv (Sms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the Short Message Service (SMS) provisioning data of the Serving GPRS Support Node (SGSN). |

### ATTRIBUTE Sgsn Gsc cpResponseTimer (tc1n)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the TC1N timer that is the amount of time the Short Message Service (SMS) allows for a CP-ACK or CP-ERROR response from the Mobile Station (MS) when a CP-DATA message is sent to the MS. This timer is used in mobile originated and mobile terminated transactions.<br><br>When this timer expiries, the SMS re-sends the CP-DATA message up to the maximum number of *cpResponseRetries*. Once the maximum number of *cpResponseRetries* is reached, the outstanding transaction is aborted.<br><br>The value of the attribute *rpResponseTimer* cannot be less than the sum of the maximum number of *cpResponseRetries(tc1nRet)* |

multiplied by the *cpResponseTimer(tc1n)* value plus the maximum number of *pagingRetries (n3313)* multiplied by the *pagingTimer (t3313)* value.

The count of the *cpResponseTimer* expiries due to the maximum number of *cpResponseRetries* can be viewed in *cpResponseExhaust* attribute (defined in *Gsc ShortMessageService*).

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU) but less than the *rpResponseTimer.*

| | |
|---|---|
| Values | Decimal (1..60) |
| Units | seconds |
| Default | 20 |

### ATTRIBUTE Sgsn Gsc cpResponseRetries (tc1nRet)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times the Short Message Service (SMS) sends the CP-DATA message to the Mobile Station (MS) when a CP-ACK or CP-ERROR message is not received.<br><br>The value of the attribute *rpResponseTimer* cannot be less than the sum of the maximum number of *cpResponseRetries(tc1nRet)* multiplied by the *cpResponseTimer(tc1n)* value plus the maximum number of *pagingRetries (n3313)* multiplied by the *pagingTimer (t3313)* value. |
| Values | Decimal (1..3) |
| Default | 3 |

### ATTRIBUTE Sgsn Gsc rpResponseTimer (tr1n)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the amount of time the Short Message Service (SMS) allows for a RP-ACK or RP-ERROR response from the Mobile Station (MS) when a CP-DATA message is sent to the MS in a Mobile Terminated (MT) transaction. When this timer expiries, the MT transaction is aborted.<br><br>The value of this attribute cannot be less than the sum of the maximum number of *cpResponseRetries(tc1nRet)* multiplied by the *cpResponseTimer(tc1n)* value plus the maximum number of *pagingRetries (n3313)* multiplied by the *pagingTimer (t3313)* value. |
| Values | Decimal (8..333) |
| Units | seconds |
| Default | 79 |

### ATTRIBUTE Sgsn Gsc iwmscResponseTimer (tr2n)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the TR2N timer that is the amount of time the Short Message Service (SMS) allows for a MOBILE ORIGINATED (MO)-FORWARD SHORT MESSAGE ACK response from the Service Center when a MO-FORWARD SHORT MESAGE message is sent to the Mobile Station (MS) in a MO transaction. When this timer expiries, the MO transaction is aborted.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (33..1803) |
| Units | seconds |
| Default | 33 |

### GROUP Sgsn Gsc BssapSccpUserInfoProv (BssapSccp)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains provisionable attributes that applied to all instances of the *Bssap* component. These attributes specify SCCP user information. |

### ATTRIBUTE Sgsn Gsc bssapCgpaRoutingIndicator (bssapRtInd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether routing is performed using the Global Title (GT) only or Subsytem Number (SSN) and Point Code (PC). The value of this attribute must match the Routing Indicator of the VLR.<br><br>The CgPA (Calling Party Address) routing indicator values supported are:<br><br>***globalTitle-*** BSSAP subsystem sets the CgPA routing Indicator to route on Global Title and supplies Global Title information.<br><br>***pointCode -*** BSSAP subsystem sets the CgPA routing Indicator to route on Point Code and supplies the Subsystem Number and Point Code in the CgPA. |
| Values | globalTitle (gt)<br>pointCode (pc) |
| Default | globalTitle |

### ATTRIBUTE Sgsn Gsc bssapSubsystemNumber (bssapSsn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the BSSAP client subsystem number used in SCCP message headers. This attribute can be changed if the operator wants to isolate his network. The value of this attribute must match the Subsystem Number of the VLR and MSC. |
| Values | Decimal (1..255) |
| Default | 254 |

### ATTRIBUTE Sgsn Gsc bssapNatureOfAddress (bssapNatOfAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Nature of Address for Global Titles used in the CgPA (Calling Party Address) and CdPA (Called Party Address) fields of SCCP message headers. This attribute directly maps to the Nature of Address parameter of the SCCP CgPA or CdPA described in SCCP specifications and located in ITU-T Q.713 section 3.4.2.3.1 (7-1996). It is used to qualify the type of Global Title address digits.<br><br>The values supported for the Nature of Address are:<br><br>***subscriberNumber* -** [1] corresponding to the ITU value 1.<br><br>***reserveNationalUse* -** [2] corresponding to the ITU value 2.<br><br>***nationalSpecificNumber* -** [3] corresponding to the ITU value 3.<br><br>***internationalNumber* -** [4] corresponding to the ITU value 4.<br><br>The values 5-255 are currently not defined by ITU standards but future standards may define them. |
| Values | Decimal (5..255)<br>subscriberNumber<br>reserveNationalUse<br>nationalSpecificNumber<br>internationalNumber |
| Default | internationalNumber |

### ATTRIBUTE Sgsn Gsc bssapE164TransType (bssapE164)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Global Title translation type used for E.164 Numbering Plan global titles.<br><br>The Global Title translation types supported are: |

***ituNetwork-*** The Global Title translation type is ITU or ITU Chinese. [0] corresponding to the ITU value 0.

***ansiNetwork-*** The Global Title translation type is ANSI Network. [10] corresponding to the ANSI value 10.

The values 1-9 and 11-255 may be defined by future standards.

Values: Decimal (1..9; 11..255)
ituNetwork
ansiNetwork

Default: ituNetwork

### ATTRIBUTE Sgsn Gsc bssapReturnOption (bssapRetOp)

Access: Read: All
Write: All

Description: This attribute identifies the SCCP return option used by the BSSAP client.

The SCCP return options supported are:

***noRetUndeliverable -*** The sender is not notified if the message is undeliverable.

***retUndeliverable -***The sender is notified if the message is undeliverable.

Values: noRetUndeliverable
retUndeliverable

Default: retUndeliverable

### ATTRIBUTE Sgsn Gsc bssapHopCounter (bssapHopCntr)

Access: Read: All
Write: All

Description: This attribute is used for circular route prevention and is only supported by Whitebook/ANSI96 SCCP.

Each SS7 node decrements the hop counter by one. If the message makes more hops than is specified, the message is dropped at the node where the counter was exhausted.

Values: Decimal (1..15)

Default: 15

### ATTRIBUTE Sgsn Gsc bssapXudtOption (bssapXudt)

Access: Read: All
Write: All

Description: This attribute specifies whether or not XUDT (extended unitdata) messages can be used. The specified value is used to determine the type of message used for transmission of SCCP connectionless data.

***off-*** an SCCP XUDT (extended unitdata) message is transmitted only when the data size is such that segmentation is required, otherwise an SCCP UDT (unitdata) message is transmitted.

***on-*** an XUDT message is transmitted for all connectionless data regardless of data size.

Usually, this attribute should specify ***off*** so that XUDT is only used when needed. Because XUDT is only supported by Whitebook, an operator may desire to set this value to ***on*** so that this node supports Whitebook (ITU-T 96/ANSI-96) SCCP.

Values: on
off

Default: off

### ATTRIBUTE Sgsn Gsc bssapRegistrationRequestTimer (bssapRegTmr)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time the BSSAP Client waits for the REGISTRATION_ACK message after sending a REGISTRATION_REQUEST message to the SCCP Protocol Stack. Retries of the Registration Request are infinite since the

| | |
|---|---|
| | BSSAP Client cannot send or receive BSSAP messages until it is registered successfully with the SCCP stack.<br>The *reqTimeouts* attribute indicates the number of timeouts that have occurred. |
| Values | Decimal (1..60) |
| Units | seconds |
| Default | 10 |

### GROUP Sgsn Gsc SsfGlobalProv (Ssf)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains general provisioning data for all *Ssf* components on the shelf. |

### ATTRIBUTE Sgsn Gsc tssfTimer (tssf)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the SSF will wait for an SCP response while in the Waiting for Instructions state.<br><br>Each new CAP (CAMEL Application Part) message from an SCP stops the Tssf timer. The timer is started when the SSF enters the Waiting for Instructions state. If a response is not received in the amount of time specified by this attribute, the SSF will give up and use the Default GPRS Handling field of the related mobile's CAMEL Subscriber Info (CSI) to determine the appropriate action to take. |
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Sgsn Gsc ssfChargingGuardTimer (ssfCGuardTimer)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the amount of time the SSF will wait for a reply from an SCP once an ApplyChargingReportGPRS CAP message has been sent and successfully received by the SCP. Valid responses from the SCP are the ApplyCharging, ReleaseGPRS or CancelGPRS messages. If a response if not received in the amount of time specified by this attribute, the SSF will give up and used the Default GPRS Handling field of the related mobile's CAMEL Subscriber Info (CSI) to determine the appropriate action to take.<br><br>This attribute also specifies the amount of time the SSF will wait for a reply from an SCP indicating that one of the following SGSN initiated messages has been received: ApplyChargingReportGPRS, EventReportGPRS, EntityReleasedGPRS, and InitialDPGPRS.<br><br>If an acknowledgement is not received from the SCP in the amount of time specified by this attribute for any of the messages listed above, the message is sent again to the SCP. The SSF will continue to retransmit the previous CAP message after each timeout until the number of consecutive timeouts reaches the value specified by the *ssfCGuardRetryAtt* attribute. If the maximum number of timeouts is reached, the SSF will give up and use the DefaultGprsHandling field of the related mobile's CAMEL Subscriber Info (CSI) to determine the appropriate action to take. |
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Sgsn Gsc ssfTcapStackRegistrationTimer (ssfTcapRegTmr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the SSF will wait for a registration response from the TCAP Stack after sending a registration request. If the timer expires, the SSF sends another registration request. The SSF continues to send registration |

| | |
|---|---|
| | requests whenever the timer expires until registration is successful. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Sgsn Gsc ssfChargingGuardRetryAttempts (ssfCGuardRetryAtt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of retry attempts after the *ssfChargingGuardTimer* expires. |
| Values | Decimal (0..5) |
| Default | 0 |

### ATTRIBUTE Sgsn Gsc ssfCgpaRoutingIndicator (ssfCgpaRtInd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SCCP routing indicator used for SGSN Calling Party Addresses (CgPA). Two methods are supported.<br><br>***globalTitle***- CAP subsystem sets the CgPA routing Indicator to route on Global Title and supplies Global Title information.<br><br>***pointCode*** - CAP subsystem sets the CgPA routing Indicator to route on Point Code and supplies the Subsystem Number and Point Code in the CgPA. |
| Values | globalTitle (gt)<br>pointCode (pc) |
| Default | globalTitle |

### ATTRIBUTE Sgsn Gsc ssfCapSsn (ssfSsn)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the CAP (CAMEL Application Part) SGSN SubSystem Number (SSN). This SSN is used by SCCP for subsystem routing. The value of this attribute must match the value the corresponding subsystem number specified on the SS7 IP Gateway (SIG). |
| Values | Decimal (1..255) |
| Default | 146 |

### ATTRIBUTE Sgsn Gsc ssfRoamerService (ssfRoamServ)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies if CAMEL roaming subscribers are supported.<br><br>If *ssfRoamerService* is set to ***disabled*** and a CAMEL subscriber roams into an area served by this SGSN, active PDP (Packet Data Protocol) contexts are dropped and new contexts cannot be created.<br><br>If *ssfRoamerService* is set to ***enabled*** and a CAMEL subscriber roams into an area served by this SGSN, existing PDP Contexts are maintained and new contexts are created when requested.<br><br>***enabled***- enable roamer service, allowing roaming subscribers.<br><br>***disabled-*** disable roamer service, refusing roaming subscribers. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Sgsn Gsc ssfSupportedCamelPhase (ssfSupportedPhase)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the highest phase of CAMEL supported by the SGSN or USGSN. |

If ***notSupported*** is specified, it indicates to all *Ssf* components that CAMEL is not supported by the network.

Values
Decimal (3)
notSupported

Default
notSupported

## GROUP Sgsn Gsc MobileSubscriberPurge (MsPurge)

Properties
Provisioned

Description
This group contains provisionable attributes for the Mobile Subscriber (MS) Purge functionality on the (UMTS) Serving GPRS Support Node (USGSN or SGSN).

## ATTRIBUTE Sgsn Gsc msPurgeFunction (msPurge)

Access
Read: All
Write: All

Description
This attribute specifies whether Mobile Subscriber Purge function is enabled or disabled. If this attribute is set to ***disabled,*** then no purge shall be sent out of the (UMTS) Serving GPRS Support Node (USGSN or SGSN).

Values
disabled
enabled

Default
disabled

## ATTRIBUTE Sgsn Gsc purgeOnExplicitDetach (purgeExplicit)

Access
Read: All
Write: All

Description
This attribute specifies whether Mobile Subscribers are purged immediately upon an explicit detach.

The *msPurgeFunction* attribute must be set to ***enabled*** for this attribute to have an effect.

Values
disabled
enabled

Default
disabled

## ATTRIBUTE Sgsn Gsc purgeMinimumInactiveMobileAge (purgeMinAge)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the minimum time that a detached Mobile Subscriber's Data is kept on the (UMTS) Serving GPRS Support Node (USGSN or SGSN). Once a Mobile Subscriber remains detached beyond the specified value, the Mobile Subscriber becomes a candidate for purge during an audit.<br><br>The *msPurgeFunction* attribute must be set to ***enabled*** for this attribute to have an effect. |
| Values | Decimal (1..744)<br>disabled |
| Units | hours |
| Default | disabled |

## COMPONENT Sgsn GprsTransportLayer (Gtl)

| | |
|---|---|
| Groups | "GROUP Sgsn Gtl NsProv"<br>"GROUP Sgsn Gtl BssgpProv (Bssgp)" |
| Scope | Application |
| Description | *Sgsn GprsTransportLayer*<br><br>This component represents the Transport Layer functionality of the<br>Gb interface of the Serving GPRS Support Node (SGSN). The Transport Layer includes protocol layers such as the Network Service (NS) and the BSS GPRS Protocol (BSSGP). |
| Common Verbs | Help<br>List<br>Display |

## GROUP Sgsn Gtl NsProv

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains provisionable attributes for the Network Service (NS) protocol layer of GPRS. |

### ATTRIBUTE Sgsn Gtl nsBlockTimer (tnsBlk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) BLOCK and UNBLOCK procedures. This is the time interval between an NS-BLOCK and NS-BLOCK ACK, or between an NS-UNBLOCK and NS-UNBLOCK<br>ACK.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification. |
| Values | Decimal (1..120) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Sgsn Gtl nsBlockRetries (nBlk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times the NS-BLOCK message can be retried if NS-BLOCK ACK is not received before the *nsBlockTimer* expires. |
| Values | Decimal (0..10) |
| Default | 3 |

### ATTRIBUTE Sgsn Gtl nsUnBlockRetries (nUnBlk)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the number of times the NS-UNBLOCK message can be retried if NS-UNBLOCK ACK is not received before the *nsBlockTimer* expires. The default value is the value provided in the GPRS specification. |
| Values | Decimal (3..15) |
| Default | 3 |

### ATTRIBUTE Sgsn Gtl nsResetTimer (tnsReset)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) RESET procedure. This is the time interval between an NS-RESET and NS-RESET ACK.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification. |
| Values | Decimal (1..120) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Sgsn Gtl nsResetRetries (nReset)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the times the NS-RESET message can be retried if NS-RESET ACK is not received before the *nsResetTimer* expires. |
| Values | Decimal (3..10) |
| Default | 5 |

### ATTRIBUTE Sgsn Gtl nsTestTimer (tnsTest)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the periodicity of the Network Service Virtual Connection (NS-VC) TEST procedure which is the initiation of the NS-ALIVE Protocol Data Unit (PDU).<br>The range is the value provided in the GPRS specification. |
| Values | Decimal (1..60) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Sgsn Gtl nsAliveTimer (tnsAlive)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) ALIVE procedure. This is the time interval between an NS-ALIVE and NS-ALIVE ACK.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification. |
| Values | Decimal (1..10) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Sgsn Gtl nsAliveRetries (nAlive)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times the NS-ALIVE message can be retried if NS-ALIVE ACK is not received before the *nsAliveTimer* expires. |
| Values | Decimal (3..10) |
| Default | 10 |

## GROUP Sgsn Gtl BssgpProv (Bssgp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the BSS GPRS Protocol (BSSGP) layer of GPRS. |

## ATTRIBUTE Sgsn Gtl bvcResetTimer (tBvcReset)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value to guard the BVC-RESET procedure. The Serving GPRS Support Node (SGSN) sends a BVC-RESET Protocol Data Unit (PDU) to the Packet Control Unit (PCU) and starts the *bvcResetTimer* for a BSS GPRS Virtual Connection (BVC). The SGSN stops the timer upon reception of a BVC-RESET-ACK PDU from the PCU. If the timer expires, the SGSN retries the BVC-RESET procedure.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..120) |
| Units | seconds |
| Default | 60 |

## ATTRIBUTE Sgsn Gtl bvcResetRetries (nBvcReset)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of times the Serving GPRS Support Node (SGSN) can send the BVC-RESET Protocol Data Unit (PDU) in case a BVC-RESET-ACK is not received before the *bvcResetTimer* expiry. |
| Values | Decimal (0..6) |
| Default | 3 |

## COMPONENT Sgsn GprsSubscriberDatapath (Gsd)

| | |
|---|---|
| Groups | "GROUP Sgsn Gsd SndcpProv"<br>"GROUP Sgsn Gsd LlcCpProv" |
| Scope | Application |
| Description | *Sgsn GprsSubscriberDatapath*<br><br>This component represents the GPRS Subscriber Datapath functionality. |
| Subcomponents | "COMPONENT Sgsn Gsd SapiControl (SapiC)"<br>"COMPONENT Sgsn Gsd SapiData (SapiD)"<br>"COMPONENT Sgsn Gsd SapiShortMessageService (SapiS)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Sgsn Gsd SndcpProv

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the centralized provisionable parameters for the SubNetwork Dependent Convergence Protocol (SNDCP). |

## ATTRIBUTE Sgsn Gsd rfc1144Slots (slots)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute specifies the number of TCP state slots used for the RFC 1144 header compression. This is the value SNDCP uses to negotiate as part of the XID negotiation with the mobile. Either side can negotiate the value downward from this.<br><br>The actual negotiated value can be viewed in the component *SessionContext* attribute *slots*. |
| Values | Decimal (1..256) |
| Default | 16 |

## ATTRIBUTE Sgsn Gsd v42bisDictionary (p1)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies maximum number of V.42bis codewords the SGSN supports. A codeword is a binary number that represents a string of characters in compressed form. The V.42bis keeps a dictionary of codewords for each compression direction. During Exchange Identification (XID) negotiation of the parameter P1 (number of codewords), both sides (the SGSN to the mobile or the mobile to the SGSN) agree on the total number of codewords in the dictionaries. Changes to this attribute impacts the compression ratio for the encoder (component *Gsd Tlli SessionContext* attribute *compRatioEncoder*). Changes also impact the amount of memory used (more memory is used when increasing the attribute). The gain in performance obtained from the selection of a larger dictionary can be offset by the larger codeword size needed, and for certain types of data, better performance can be obtained by using a smaller dictionary.<br>The negotiated value can be viewed in the component *Gsd Tlli SessionContext* attribute *v42bisDictionary*. |
| Values | Decimal (512; 1024; 2048; 4096) |
| Default | 512 |

## ATTRIBUTE Sgsn Gsd v42bisMaxStringSize (p2)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of characters allowed in a string represented by a codeword that the SGSN supports. Each codeword in a V.42bis dictionary represents a string of characters. During Exchange Identification (XID) negotiation of the parameter P2 (maximum string size), both sides (the SGSN and the Mobile Station or the SGSN and the Public Switched Telephone Network (PSTN)) agree on the maximum string length to be used in the dictionaries. Changes to this attribute impact the compression ratio for the encoder (component *Gsd Tlli SessionContext* attribute *compRatioEncoder*). |

| | |
|---|---|
| | The negotiated value can be viewed in the component *Gsd Tlli SessionContext* attribute *v42bisMaxStringSize*. |
| Values | Decimal (6..250) |
| Default | 20 |

### ATTRIBUTE Sgsn Gsd snPduTimer (snPduT)

| | |
|---|---|
| Access | Read: All<br>Write: Debug |
| Description | This attribute specifies the timing when a complete Network Protocol Data Unit (N-PDU) is received by the SubNetwork Dependent Convergence Protocol (SNDCP). This attribute is used in N-PDU reassembly from SN-UNITDATA PDUs. It specifies the maximum time SNDCP waits for additional SN-UNITDATA PDUs for a given N-PDU. If this timer expires the partially reassembled N-PDU is discarded. This timer is restarted when each segment of the original N-PDU is received. This timer is only applicable to unacknowledged Logical Link Control (LLC) mode.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..60) |
| Units | seconds |
| Default | 5 |

### GROUP Sgsn Gsd LlcCpProv

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the system wide provisionable attributes for GPRS Subscriber Datapath (GSD) capacity enhancement. |

### ATTRIBUTE Sgsn Gsd cipheringHardwareAssist (ciphHwAssist)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies whether hardware assistance is to be used for Logical Link Control (LLC) layer encryption if supported by the card used by *GprsSubscriberDatapath (Gsd)*. If the value is ***disable***, hardware assistance is not used. If the value is ***autoConfigure***, hardware assistance is used if supported. |
| Values | disable<br>autoConfigure |
| Default | autoConfigure |

## COMPONENT Sgsn Gsd SapiControl (SapiC)

| | |
|---|---|
| Groups | "GROUP Sgsn Gsd SapiC Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn Gsd SapiControl*<br><br>This component represents the Service Access Point 1 (SAP-1) of the Logical Link Control (LLC) protocol layer. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Sgsn Gsd SapiC Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the Service Access Point 1 (SAP-1) specific system wide provisionable attributes. |

## ATTRIBUTE Sgsn Gsd SapiC t200RetransmitTimer (t200)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time within which an acknowledgment of an Exchange Information (XID) frame must be received by the Service Access Point 1 (SAP-1) LLC entity. During the XID negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for this timer. The Serving GPRS Support Node (SGSN) attempts |

to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station.

The *readyTimer* value provisioned in the *Sgsn GprsSubscriberControl* component should be at least 10% greater than the *t200RetransmitTimer* value, except when *readyTimer* is set to ***forceStandby*** or ***useMsValue***.

The timer must be provisioned to a value that is greater than the expected maximum expected round trip delay of a Protocol Data Unit (PDU).

| | |
|---|---|
| Values | Decimal (0.1..409.5) |
| Units | seconds |
| Default | 5.0 |

### ATTRIBUTE Sgsn Gsd SapiC n200MaxRetransmits (n200)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of times the Service Access Point 1 (SAPI-1) LLC entity retransmits an individual frame following the expiry of the *t200* timer. During the Exchange Information (XID) negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for *n200*. The SGSN attempts to negotiate to the value specified by this attribute.<br>Changes to this attribute do not trigger re-negotiation of this parameter with the mobile. |
| Values | Decimal (1..15) |
| Default | 3 |

### ATTRIBUTE Sgsn Gsd SapiC n201MaxUinfoFieldLength (n201U)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the maximum number of octets allowed in Unnumbered (U) and Unconfirmed Information (UI) frames for the Service Access Point 1 (SAP-1). During the Exchange Information (XID) negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for *n201U*. The Serving GPRS Support Node (SGSN) attempts to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station. |
| Values | Decimal (140..1520) |
| Units | octets |
| Default | 400 |

## COMPONENT Sgsn Gsd SapiData (SapiD)

| | |
|---|---|
| Instance | Decimal (3; 5; 9; 11) |
| Groups | "GROUP Sgsn Gsd SapiD Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn Gsd SapiData/<sapi>*<br><br>This component represents a Service Access Point (SAP) of the Logical Link Control (LLC) protocol layer, indexed by a Service Access Point Identifier (SAPI).<br><br>When an *Sgsn* is added, a *SapiData* instance is added automatically for each possible instance value. The attributes are set to default values, dependent on the SAPI value of the component instance. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Sgsn Gsd SapiD Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains system wide provisionable attributes for the Service Access Point 3, 5, 9, 11 (SAP-3, SAP-5, SAP-9 and SAP-11). |

## ATTRIBUTE Sgsn Gsd SapiD t200RetransmitTimer (t200)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time within which an acknowledgment of a Unnumbered (U) frame must be received by the Service Access Point (SAP) LLC entity. This attribute is only applicable for Exchange Information (XID) negotiations and for Asynchronous Balanced Mode (ABM) mode. During the XID negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for this timer. The Serving GPRS Support Node (SGSN) attempts to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (0.1..409.5) |
| Units | seconds |
| Default | No default |

## ATTRIBUTE Sgsn Gsd SapiD n200MaxRetransmits (n200)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of times Logical Link Entity (LLE) representing that Service Access Point (SAP) retransmits an individual frame following the expiry of *t200* timer. During the Exchange Information (XID) negotiation, both |

| | |
|---|---|
| | the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for *n200*. The SGSN attempts to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station. |
| Values | Decimal (1..15) |
| Default | No default |

### ATTRIBUTE Sgsn Gsd SapiD n201MaxUInfoFieldLength (n201U)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of octets allowed in Unnumbered (U) and Unconfirmed Information (UI) frames for that Service Access Point (SAP). During the Exchange Information (XID) negotiation, both the LLC entities (Mobile Station and SGSN) can agree to use a specific value for *n201U*. The SGSN attempts to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station. |
| Values | Decimal (140..1520) |
| Default | No default |

### ATTRIBUTE Sgsn Gsd SapiD n201MaxIinfoFieldLength (n201I)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of octets allowed in confirmed Information (I) frame for that Service Access Point (SAP). During the Exchange Information (XID) negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN)) can agree to use a specific value for *n201I*. The SGSN attempts to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station. |
| Values | Decimal (140..1520) |
| Default | No default |

### ATTRIBUTE Sgsn Gsd SapiD kWindowSizeDownlink (kD)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the Serving GPRS Support Node (SGSN) to the mobile for that Service Access Point (SAP). During the Exchange Information (XID) negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for *kD*. The SGSN attempts to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station. |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Sgsn Gsd SapiD kWindowSizeUplink (kU)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the mobile to the Serving GPRS Support Node (SGSN) for that Service Access Point (SAP). During the Exchange Information (XID) negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for *kU*. The SGSN attempts to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station. |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Sgsn Gsd SapiD pduUnconfirmedInformationLifetime (pduUnInfo)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Base Station Subsystem GPRS Protocol (BSSGP) Packet Data Unit (PDU) lifetime for Logical |

| | |
|---|---|
| | Link Control (LLC) Unconfirmed Information (UI) frames. This attribute is used by the Base Station Subsystem (BSS) to determine when to discard the PDU. |
| Values | Decimal (0.1..600.0) |
| Units | seconds |
| Default | No default |

### COMPONENT Sgsn Gsd SapiShortMessageService (SapiS)

| | |
|---|---|
| Groups | "GROUP Sgsn Gsd SapiS SapiSms (Prov)" |
| Scope | Application |
| Description | *Sgsn Gsd SapiShortMessageService*<br><br>This component represents the Service Access Point 7 (SAP-7) of the Logical Link Control (LLC) protocol layer. This SAP is the access point for Short Message Services (SMS). |
| Common Verbs | Help<br>List<br>Display |

### GROUP Sgsn Gsd SapiS SapiSms (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the Service Access Point-7 (SAP-7) specific system wide provisionable attributes. |

### ATTRIBUTE Sgsn Gsd SapiS t200RetransmitTimer (t200)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time within which an acknowledgment of an Exchange Information (XID) frame must be received by the Service Access Point 7 (SAP-7) LLC entity. During the XID negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for this timer. The Serving GPRS Support Node (SGSN) attempts |

to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station.

The *readyTimer* value provisioned in the *Sgsn GprsSubscriberControl* component should be at least 10% greater than the *t200RetransmitTimer* value.

The timer must be provisioned to a value that is greater than the expected maximum expected round trip delay of a Protocol Data Unit (PDU).

Values: Decimal (0.1..409.5)

Units: seconds

Default: 20.0

### ATTRIBUTE Sgsn Gsd SapiS n200MaxRetransmits (n200)

Access: Read: All
Write: All

Description: This attribute specifies the maximum number of times the Service Access Point 7 (SAPI-7) LLC entity retransmits an individual frame following the expiry of the *t200* timer. During the Exchange Information (XID) negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for *n200*. The SGSN attempts to negotiate to the value specified by this attribute.
Changes to this attribute do not trigger re-negotiation of this parameter with the mobile.

Values: Decimal (1..15)

Default: 3

### ATTRIBUTE Sgsn Gsd SapiS n201MaxUinfoFieldLength (n201U)

Access: Read: All
Write: All

Description: This attribute specifies the maximum number of octets allowed in Unnumbered (U) and Unconfirmed Information (UI) frames for

| | |
|---|---|
| | the Service Access Point 7 (SAP-7). During the Exchange Information (XID) negotiation, both the Logical Link Control (LLC) entities (the Mobile Station and the SGSN) can agree to use a specific value for *n201U*. The Serving GPRS Support Node (SGSN) attempts to negotiate to the value specified by this attribute. Changes to this attribute do not trigger re-negotiation of this parameter with the Mobile Station. |
| Values | Decimal (140..1520) |
| Units | octets |
| Default | 270 |

## COMPONENT Sgsn DnsAgent (DnsAg)

| | |
|---|---|
| Groups | "GROUP Sgsn DnsAg Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn DnsAgent*<br><br>This component represents the Domain Name System (DNS) Agent. |
| Opt. Subcomp. | "COMPONENT Sgsn DnsAg StaticCacheEntry (Static)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Sgsn DnsAg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the *DnsAgent* provisioning data of the Serving GPRS Support Node (SGSN). |

## ATTRIBUTE Sgsn DnsAg retryTimer (tRetry)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how long the *DnsAgent* waits for a response from a Domain Name System (DNS) Server following |

| | |
|---|---|
| | the initial query. Intervals for subsequent retries if required, are computed using an algorithm based on this attribute.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (2..20) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Sgsn DnsAg maxRetries (nRetry)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of retries for a Domain Name System (DNS) query. After *maxRetries* expiry, if there is no response from the DNS Server, the *DnsAgent* sends an error indication to the application. |
| Values | Decimal (0..5) |
| Default | 2 |

### ATTRIBUTE Sgsn DnsAg refreshTime (tRefresh)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how often a Domain Name System (DNS) cache table entries are refreshed. After the timer expires for a given entry, the next client query for that entry's Logical Name causes the DNS Name Server to be queried again to update the Logical Name information. |
| Values | Decimal (0..14400) |
| Units | minutes |
| Default | 10080 |

## ATTRIBUTE Sgsn DnsAg staleIpAddressReuse (staleIpReuse)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether the last stale Internet Protocol (IP) address for a given Access Point Name (APN) is reused by the *DnsAgent* component when all Domain Name System (DNS) query retries fail.<br><br>If a value of ***enabled*** is specified, the *DnsAgent* cache table is not emptied even if the *DnsAgent refreshTime* or *ttl* attribute values have expired for the cache entries. If all DNS query retries fail, the last dynamic entry in the *DnsAgent* cache table is reused. If a value of ***disabled*** is specified, the *DnsAgent* cache table behavior is unaffected. |
| Values | disabled<br>enabled |
| Default | disabled |

## COMPONENT Sgsn DnsAg StaticCacheEntry (Static)

| | |
|---|---|
| Instance | virtualRouter (vr) [String (1..8, ASCII)]<br>entryNum [Decimal (0..1000)] |
| Groups | "GROUP Sgsn DnsAg Static Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn DnsAg StaticCacheEntry/<vr>,n*<br><br>This component represents a Logical Name-IP Address mapping entry for the Serving GPRS Support Node (SGSN) in GPRS. An instance of this component is provisioned if a static Domain Name System (DNS) mapping is required. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Sgsn DnsAg Static Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains a Logical Name-IP Address mapping entry for the Serving GPRS Support Node (SGSN) in GPRS. |

## ATTRIBUTE Sgsn DnsAg Static logicalName (lName)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Name for this static entry. |
| Values | String (1..253, ASCII) |
| Default | No default |

## ATTRIBUTE Sgsn DnsAg Static mappedIpAddr (ipAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP addresses corresponding to a given Logical Name. One Logical Name can have up to ten IP addresses mapped to it. The order of the addresses is not important; successive queries of the Logical Name return the IP addresses in a round robin fashion.<br><br>This attribute must not specify the address ‘0.0.0.0’ or any address ending in ‘255’. |
| List of | IP address |
| List Size | 10 |

| | |
|---|---|
| Default | No default |

## COMPONENT Sgsn PlmnImsiRange (Pir)

| | |
|---|---|
| Instance | Decimal (1..1000) |
| Groups | "GROUP Sgsn Pir Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn PlmnImsiRange/n*<br><br>This component represents an entry in a table of the International Mobile Subscriber Identity (IMSI) digits ranges. If a particular IMSI has a digit range that does not match any entry in the table, then it does not belong to this Public Land Mobile Network (PLMN). |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Sgsn Pir Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the Mobile Country Code (MCC), Mobile Network Code (MNC) range for this Public Land Mobile Network (PLMN). All Mobile Stations (MS) whose MCC and MNC do not belong to the current PLMN are considered roamers.<br><br>The *fromPrefix* and *toPrefix* attributes represent decimal number value ranges that fit the IMSI specification of 15 digits. All digits must be 0 through 9 inclusive. When the *fromPrefix* or the *toPrefix* value is less than 15 digits, the value in attribute *fromPrefix* is always extended with 0's, and the value in attribute *toPrefix* is always extended with 9's.<br><br>A complete range (*fromPrefix* and *toPrefix* forming a range of IMSI digits) must not overlap any previously entered range. |

### ATTRIBUTE Sgsn Pir fromPrefix (frPrefix)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the lower limit of the range of the International Mobile Subscriber Identity (IMSI) digits which are considered as home subscribers. The value in attribute *fromPrefix* is always extended with 0's. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Sgsn Pir toPrefix

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the upper limit of the range of the International Mobile Subscriber Identity (IMSI) digits which are considered as home subscribers. The value in attribute *toPrefix* is always extended with 9's. |
| Values | BCD (1..15) |
| Default | No default |

### COMPONENT Sgsn MobileCountryCode (Mcc)

Properties Provisioned

Description This group contains general provisioning data for a Routing Area supported by the Serving GPRS Support Node (SGSN).

### ATTRIBUTE Sgsn Mcc Mnc Lac Rac periodicRaUpdateTimer (t3312)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Periodic Routing Area Update Timer (T3312) for be used by the Mobile Station (MS). The MS receives this timer from the network during GPRS Attach Accept and during the Periodic Routing Area Update Accepts. When this timer expires, the MS notifies the Serving GPRS Support Node (SGSN) of the current routing area of the MS. This timer value is per Routing Area. The value ***deactivate*** means that no periodic messages are sent.<br><br>The *mobileReachableTimer* provisioned in the *Sgsn GprsSubscriberControl* component must be at least four minutes longer than the longest *periodicRaUpdateTimer.*<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..31; 36; 42; 48; 54; 60; 66; 72; 78; 84; 90; 96; 102; 108; 114; 120; 126; 132; 138; 144; 150; 156; 162; 168; 174; 180; 186)<br>deactivate |
| Units | minutes |
| Default | 54 |

### ATTRIBUTE Sgsn Mcc Mnc Lac Rac ptmsiEvents

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number, N, which indicates that at every Nth event requiring Packet-Temporary Mobile Subscriber Identity (P-TMSI) reallocation, the P-TMSI Reallocation procedure is initiated with the mobile subscriber.<br><br>For example, when this value is set to ***never***, the P-TMSI Reallocation procedure is never performed on local P-TMSIs received from the mobile subscriber. Only, the non local P-TMSIs |

| | |
|---|---|
| | undergo P-TMSI reallocation. When the value is set to ***1***, P-TMSI Reallocation procedure is performed every time an event that triggers P-TMSI reallocation occurs. This means that the P-TMSI is reallocated whether it is local, foreign or random. This parameter is not per Mobile station (MS), rather it applies to events over an entire routing area. |
| Values | Decimal (1..255)<br>never |
| Default | 10 |

### ATTRIBUTE Sgsn Mcc Mnc Lac Rac linkToVlr (lToVlr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Visitor Location Register (VLR) that serves this Routing Area (RA).<br>Changing this value causes the outstanding transactions to be affected. |
| Values | Link (Service, linkToRoutingAreas) |
| Default | No default |

### ATTRIBUTE Sgsn Mcc Mnc Lac Rac networkServiceEntities (nse)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Network Service Entities (NSE) in this Routing Area (RA). Each NSE is identified by its Network Service Entity Identifier (NSEI) number. |
| List of | Decimal (1..65535) |
| Default | No default |

### COMPONENT Sgsn Mcc Mnc Lac Rac CellId (Cid)

Properties Provisioned

Description This group contains general provisioning data for a Cell supported by the Serving GPRS Support Node (SGSN).

## ATTRIBUTE Sgsn Mcc Mnc Lac Rac Cid directionLatitude (dirLat)

Access Read: All
Write: All

Description This attribute specifies the direction of the latitude coordinate of the cell position.

A value of ***north*** implies a position to the north of the Equator.

A value of ***south*** implies a position to the south of the Equator.

Values north (n)
south (s)

Default north

## ATTRIBUTE Sgsn Mcc Mnc Lac Rac Cid degreesLatitude (degLat)

Access Read: All
Write: All

Description This attribute specifies the degree of the latitude coordinate for the cell position. Zero degrees corresponds to the Equator. Angles

are either to the north or south of the Equator depending on the *directionLatitude* attribute. Approximately 5 decimal places are significant when the number is encoded in binary and sent to the Gateway Mobile Location Center (GMLC).

Values: Decimal (0.00000..90.00000)

Default: No default

### ATTRIBUTE Sgsn Mcc Mnc Lac Rac Cid directionLongitude (dirLong)

Access: Read: All
Write: All

Description: This attribute specifies the direction of the longitude coordinate of the cell position.

A value of ***east*** implies a position to the east of the Greenwich Meridian.

A value of ***west*** implies a position to the west of the Greenwich Meridian.

Values: east (e)
west (w)

Default: east

### ATTRIBUTE Sgsn Mcc Mnc Lac Rac Cid degreesLongitude (degLong)

Access: Read: All
Write: All

Description: This attribute specifies the degree of the longitude coordinate for the cell position. Zero degrees corresponds to the Greenwich Meridian. Angles are either to the east or west of the Greenwich Meridian, depending on the attribute *directionLongitude*. Approximately 5 decimal places are significant when the number is encoded in binary and sent to the Gateway Mobile Location Center (GMLC).

Values: Decimal (0.00000..180.00000)

Default: No default

### ATTRIBUTE Sgsn Mcc Mnc Lac Rac Cid cellRadius (cellRad)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the cell radius in meters. It is used to compute the uncertainty code of the latitude and longitude co-ordinates that are sent to the Gateway Mobile Location Center (GMLC). |
| Values | Decimal (0..1800000) |
| Units | metres |
| Default | 4000 |

### COMPONENT Sgsn TemporaryLogicalLinkId (Tlli)

| | |
|---|---|
| Instance | String (4, Hex) |
| Scope | Application |
| Description | *Sgsn TemporaryLogicalLinkId/<tlli>*<br><br>This component represents an instance of the Temporary Logical Link Identity (TLLI). The information includes subscription context, mobility management context, session contexts and logical<br>link context. Each instance is indexed by the TLLI of the mobile subscriber. A list of all current *Tlli* instances is not possible, but it is possible to display a specific instance of *Tlli*. |
| Dyn. Subcomp. | "COMPONENT Sgsn Tlli MobilityContext (Mc)"<br>"COMPONENT Sgsn Tlli SessionContext (Sc)"<br>"COMPONENT Sgsn Tlli HlrCacheRecord (HlrcRec)" |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Sgsn Tlli MobilityContext (Mc)

| | |
|---|---|
| Groups | "GROUP Sgsn Tlli Mc Operational (Oper)"<br>"GROUP Sgsn Tlli Mc WlcCustomCounters (WlcCustomCntr)" |

| | |
|---|---|
| Scope | Application |
| Description | *Sgsn Tlli/<tlli> MobilityContext*<br>*Sgsn Imsi/<imsi> MobilityContext*<br>*Gsc/n Tlli/<tlli> MobilityContext*<br>*Gsc/n Imsi/<imsi> MobilityContext*<br><br>This component represents the GPRS Mobility Management (GMM) context created for each mobile subscriber that is GPRS-Attached. The Mobility Context is an instance of the *InternationalMobileSubscriberId (Imsi)* and the *TemporaryLogicalLinkId (Tlli)* of the Serving GPRS Support Node (SGSN). |
| Common Verbs | Help<br>List<br>Display |

## GROUP Sgsn Tlli Mc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the GPRS Mobility Management (GMM) information for a subscriber. |

## ATTRIBUTE Sgsn Tlli Mc temporaryLogicalLinkId (tlli)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Temporary Logical Link Identifier (TLLI) used to identify the context of the Mobile Station (MS) within the Serving GPRS Support Node (SGSN). This is one of the main reference keys that is used to identify an MS in the SGSN. |
| Values | String (4, Hex) |
| Default | No default |

## ATTRIBUTE Sgsn Tlli Mc gmmState (gmmSt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the GPRS Mobility Management (GMM) state for a mobile. Upon initialization, this attribute value is in ***idle*** state. The states have the following meaning:<br>***idle*** - The Mobile Station (MS) is not attached to the GPRS Mobility Management (GMM). The MS and the SGSN context hold no valid location or routing area information for the mobile.<br>***standby*** - The MS is attached to the GMM.<br>***ready*** - MS is attached and can be sending or receiving the Point To Point Protocol Data Units (PTP PDUs). |
| Values | idle<br>standby<br>ready |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc routingAreaIdentifier (rai)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current routing area of the Mobile Station (MS). The routing area is transmitted to the Serving GPRS Support Node (SGSN) during a Routing Area Update procedure or Attach procedure. The routing area identifier includes the Mobile Country Code (MCC as first 3 digits), the Mobile Network Code (MNC as next 2 digits), the Location Area Code (LAC as next 4 digits), and the Routing Area Code (RAC as last 2 digits). |
| Values | String (5..6, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc cellId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current cell location of the Mobile Station (MS). |
| Values | String (2, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc cellEntryTime (cellEntry)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates when the Mobile Station (MS) entered the cell indicated by the *cellId*. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc sgsnClassmark (sgsnCm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network portion of the Mobile Station (MS) classmark. The classmark contains specific information about a Mobile Station (MS). |
| Values | String (1..2, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc drxParameters (drxParms)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates if the Mobile Station (MS) supports discontinuous reception or not. The DRX parameter is transmitted by the MS during an Attach Request procedure and a Routing Area Update procedure. |
| Values | supported<br>unsupported |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc readyTimer (t3314)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the negotiated value of the Ready Timer (T3314) for the GPRS Mobility Management (GMM) state transition. The Ready Timer is restarted whenever a signaling or a data Protocol Data Unit (PDU) is received from the Mobile Station (MS). In the event of the Ready Timer expiry, the attribute *gmmState* changes to ***standby***.<br><br>The negotiation of this value is based on the *readyTimer* provisioned in the *Sgsn GprsSubscriberControl* component. |
| Values | Decimal (1..11160)<br>forceStandby |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc pagingProceedFlag (ppf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the paging proceed flag. The flag indicates whether paging can be initiated. |
| Values | false<br>true |
| Default | No default |

### GROUP Sgsn Tlli Mc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sgsn Tlli Mc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a |

| | |
|---|---|
| | mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Mc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Sgsn Tlli SessionContext (Sc)

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Sgsn Tlli Sc SessionContextOp (ScOp)" |
| Scope | Application |
| Description | *Sgsn Tlli/<tlli> SessionContext/<nsapi>*<br><br>This component represents the Session Context information for a |

subscriber. The Session Contexts are created for each activated Packet Data Protocol (PDP) context of a subscriber. The instance value identifies a session for a mobile subscriber.

## GROUP Sgsn Tlli Sc SessionContextOp (ScOp)

Properties Operational

Description This group contains the Session Context information for a subscriber. The Session Contexts are created for each activated Packet Data Protocol (PDP) context of a subscriber.

## ATTRIBUTE Sgsn Tlli Sc selectedApnNetworkId (selApnNwkId)

Access Read: All
Write: Illegal

Description This attribute indicates the selected Access Point Name (APN) Network Identifier.

The APN Network Identifier can be the one received from the mobile as part of the ACTIVATE PDP CONTEXT REQUEST message or it can be selected from the subscription record against which this session has been activated or it can be the *defaultApnNetworkId* (defined in *Sgsn Gsc*) for the requested PDP type provisioned on the Serving GPRS Support Node (SGSN).

Values String (1..63, ASCII)

Default No default

## ATTRIBUTE Sgsn Tlli Sc selectedApnOperatorId (selApnOpId)

Access Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates the selected Access Point Name (APN) Operator Identifier.<br><br>The APN Operator Identifier can be the one received from the Mobile Station (MS) as part of the ACTIVATE PDP CONTEXT REQUEST message or it can be the one constructed from the subscriber's IMSI as mnc<3 MNC digits>.mcc<3 MCC digits>.gprs. |
| Values | String (1..37, ASCII) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc dataPathGgsnAddress (dGgsnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the IP address of the Gateway GPRS Support Node (GGSN) for the data path that is currently used by the activated Packet Data Protocol (PDP) context. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc signalingGgsnAddress (sGgsnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the IP address of the Gateway GPRS Support Node (GGSN) for the signaling path that is currently used by the activated Packet Data Protocol (PDP) context. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc pdpContextIdentifier (pdpCid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the subscription record against which this session has been activated. |

| | |
|---|---|
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Sgsn TIli Sc pdpType (pdpT)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute defines the end user protocol to be used between the external packet data network and the Mobile Station (MS) such as, X.25, IP, PPP.<br>For X.25 currently defined address format is X.121, for IP protocol currently defined address formats are IPV4, IPV6, and PPP protocol has no address format. |
| Values | x25<br>ip<br>ppp |
| Default | No default |

### ATTRIBUTE Sgsn TIli Sc ipv4PdpAddress (ipv4Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is IPv4. The address conforms to the standard addressing scheme of the IP version 4 address. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Sgsn TIli Sc x121PdpAddress (x121Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is X.121. |
| Values | BCD (1..14) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc otherPdpAddress (otherAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. The Packet Data Protocol (PDP) protocol type for the *otherPdpAddress* can be obtained from the attribute *pdpType* and the addressing type from *pdpAddressFormat*. |
| Values | String (1..16, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc pdpAddressFormat (pdpTnum)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the addressing type, such as, X.121, IPv4, IPv6. |
| Values | x121<br>ipv4<br>ipv6 |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc ggsnRemoteTeid (ggsnRemTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg that originates at the GPRS Serving GPRS Support Node (SGSN) and terminates at the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc ggsnLocalTeid (ggsnLocTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg that originates at the Gateway GPRS Support Node (GGSN) and terminates at the GPRS Serving GPRS Support Node (SGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc signallingGgsnTeid (sGgsnTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg endpoint of the control tunnel that runs between the GPRS Serving GPRS Support Node (SGSN) and the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Sgsn Tlli Sc RequestedQos (ReqQos)

| | |
|---|---|
| Groups | "GROUP Sgsn Tlli Sc ReqQos QosProfile (Qos)" |
| Scope | Application |
| Description | *Sgsn Imsi/<imsi> SessionContext/<nsapi> RequestedQos*<br>*Gsc/n Imsi/<imsi> SessionContext/<nsapi> RequestedQos*<br><br>This component represents the Quality of Service (QoS) profile requested by a mobile subscriber for this session. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Sgsn Tlli Sc ReqQos QosProfile (Qos)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group. |

## ATTRIBUTE Sgsn Tlli Sc ReqQos deliveryOrder (delOrd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed. |
| Values | withDeliveryOrder<br>withoutDeliveryOrder |
| Default | No default |

## ATTRIBUTE Sgsn Tlli Sc ReqQos deliveryOfErroneousSdus (delErrSdus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.<br><br>The erroneous SDUs can be handled in one of the following ways:<br><br>***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.<br><br>***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.<br><br>***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded. |
| Values | noDetect<br>errSdusDelivered<br>errSdusNotDelivered |

Default — No default

### ATTRIBUTE Sgsn TIli Sc ReqQos trafficClass (traffClass)

Access — Read: All
Write: Illegal

Description — This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational* -** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming* -** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive* -** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background* -** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). This is characterized by the destination not expecting the data within a certain time.

Values — conversational (conv)
streaming (strm)
interactive (int)
background (bkgr)

Default — No default

### ATTRIBUTE Sgsn Tlli Sc ReqQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc ReqQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc ReqQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc ReqQos residualBitErrorRate (resBer)

Access
Read: All
Write: Illegal

Description
This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.

This attribute can take up values ranging from 1 through 9, representing:

***1*** -> 5*10 -2
***2*** -> 1*10 -2
***3*** -> 5*10 -3
***4*** -> 4*10 -3
***5*** -> 1*10 -3
***6*** -> 1*10 -4
***7*** -> 1*10 -5
***8*** -> 1*10 -6
***9*** -> 6*10 -8

Values
Decimal (1..9)

Default
No default

### ATTRIBUTE Sgsn Tlli Sc ReqQos sduErrorRatio (sduErrRatio)

Access
Read: All
Write: Illegal

Description
This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4

5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values Decimal (1..7)

Default No default

### ATTRIBUTE Sgsn Tlli Sc ReqQos trafficHandlingPriority (traffHndlPr)

Access Read: All
Write: Illegal

Description This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***

A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest.

Values Decimal (0..3)

Default No default

### ATTRIBUTE Sgsn Tlli Sc ReqQos transferDelay (transfDelay)

Access Read: All
Write: Illegal

Description This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP.

Values Decimal (10..4100)

Units msec

Default No default

### ATTRIBUTE Sgsn Tlli Sc ReqQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc ReqQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### COMPONENT Sgsn Tlli Sc NegotiatedQos (NegQos)

| | |
|---|---|
| Groups | "GROUP Sgsn Tlli Sc NegQos QosProfile (Qos)" |
| Scope | Application |
| Description | *Sgsn Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos*<br>*Gsc/n Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos* |

This component represents the negotiated Quality of Service (QoS) profile received by a mobile subscriber for this session.

Common Verbs

List
Display

## GROUP Sgsn Tlli Sc NegQos QosProfile (Qos)

Properties: Operational

Description: This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group.

## ATTRIBUTE Sgsn Tlli Sc NegQos deliveryOrder (delOrd)

Access: Read: All
Write: Illegal

Description: This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed.

Values: withDeliveryOrder
withoutDeliveryOrder

Default: No default

## ATTRIBUTE Sgsn Tlli Sc NegQos deliveryOfErroneousSdus (delErrSdus)

Access: Read: All
Write: Illegal

Description: This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.

The erroneous SDUs can be handled in one of the following ways:

***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.

***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.

***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded.

Values
noDetect
errSdusDelivered
errSdusNotDelivered

Default
No default

## ATTRIBUTE Sgsn Tlli Sc NegQos trafficClass (traffClass)

Access
Read: All
Write: Illegal

Description
This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). This is characterized by the destination not expecting the data within a certain time.

| | |
|---|---|

### ATTRIBUTE Sgsn Tlli Sc NegQos residualBitErrorRate (resBer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.<br><br>This attribute can take up values ranging from 1 through 9, representing:<br><br>***1*** -> 5*10 -2<br>***2*** -> 1*10 -2<br>***3*** -> 5*10 -3<br>***4*** -> 4*10 -3<br>***5*** -> 1*10 -3<br>***6*** -> 1*10 -4<br>***7*** -> 1*10 -5<br>***8*** -> 1*10 -6<br>***9*** -> 6*10 -8 |
| Values | Decimal (1..9) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc NegQos sduErrorRatio (sduErrRatio)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.<br><br>This attribute can take up values between the numbers 1 - 7 |

representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4
5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values: Decimal (1..7)

Default: No default

### ATTRIBUTE Sgsn Tlli Sc NegQos trafficHandlingPriority (traffHndlPr)

Access: Read: All
Write: Illegal

Description: This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***

A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Sgsn Tlli Sc NegQos transferDelay (transfDelay)

Access: Read: All
Write: Illegal

Description: This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP.

| | |
|---|---|
| Values | Decimal (10..4100) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc NegQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli Sc NegQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

## COMPONENT Sgsn Tlli HlrCacheRecord (HlrcRec)

| | |
|---|---|
| Groups | "GROUP Sgsn Tlli HlrcRec Operational (Oper)"<br>"GROUP Sgsn Tlli HlrcRec WlcCustomCounters (WlcCustomCntr)" |

## ATTRIBUTE Sgsn Tlli HlrcRec internationalMobileSubscriberId (imsi)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the International Mobile Subscriber Identity (IMSI) of the Mobile Station (MS). |
| Values | BCD (5..15) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec hlrNumber (hlrNo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the HLR Number of the Home Location Register (HLR) to which the *HlrCache* record is currently associated. It is used to retrieve the *HlrCache* records to be restored after receipt of the RESET message from the HLR. |
| Values | String (1..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec msIsdnNumber (msIsdn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Integrated Service Digital Network (ISDN) number of the mobile subscriber. This is represented as an E.164 number in international format. |
| Values | String (1..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec subscriptionConfirmedByHlr (subsCByHlr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the subscription information in the Serving GPRS Support Node (SGSN) is known to be in agreement with the Home Location Register (HLR) when the SGSN successfully performs an UPDATE GPRS LOCATION to the HLR. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec locationInfoConfirmedInHlr (locCInHlr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Home Location Register (HLR) record of the Serving GPRS Support Node (SGSN) address for the Mobile Station (MS) has been confirmed by radio contact.<br><br>It is initially set to, ***no***, when the SGSN receives a ROUTING AREA UPDATE REQUEST, or an IMSI and a GPRS ATTACH-REQUEST, or if a RESET message is received from the HLR with which the MS is registered. The indicator is set to, ***yes***, when a successful UPDATE GPRS LOCATION is performed for the MS. |
| Values | no<br>yes |
| Default | No default |

### GROUP Sgsn Tlli HlrcRec WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sgsn Tlli HlrcRec customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |

| Common Verbs | Help<br>List<br>Display |

### GROUP Sgsn Tlli HlrcRec PdpC Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Packet Data Protocol (PDP) subscription data downloaded from the Home Location Register (HLR). |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC pdpContextIdentifier (pdpCid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates a Packet Data Protocol (PDP) Context in a subscription record. |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC pdpType (pdpT)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute defines the end user protocol to be used between the external packet data network and the Mobile Station (MS) such as, X.25, IP, PPP.<br>For X.25 currently defined address format is X.121, for IP protocol currently defined address formats are IPV4, IPV6, and PPP protocol has no address format. |
| Values | x25<br>ip<br>ppp |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC ipv4PdpAddress (ipv4Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is IPv4. The address conforms to the standard addressing scheme of the IP version 4 address. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC x121PdpAddress (x121Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is X.121. |
| Values | BCD (1..14) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC otherPdpAddress (otherAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. The Packet Data Protocol (PDP) protocol type for the *otherPdpAddress* can be obtained from the attribute *pdpType* and the addressing type from *pdpAddressFormat*. |
| Values | String (1..16, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC pdpAddressFormat (pdpTnum)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the addressing type, such as, X.121, IPv4, IPv6. |
| Values | x121<br>ipv4<br>ipv6 |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC apnNetworkIdentifier (apnNwkId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates an Access Point Name (APN) Network Identifier which is the Logical Name of the access point to the external packet data network. A Logical Name is a label or a fully qualified domain name according to the Domain Name System (DNS) naming conventions. |
| Values | String (1..63, ASCII) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC vplmnAddressAllowed (vplmnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Mobile Station (MS) is allowed to use the Access Point Name (APN) in the Visiting Public Land Mobile Network (VPLMN). |
| Values | no<br>yes |
| Default | No default |

### GROUP Sgsn Tlli HlrcRec PdpC WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Sgsn Tlli HlrcRec PdpC SubscribedQos (SubsQos)

| | |
|---|---|
| Groups | "GROUP Sgsn Tlli HlrcRec PdpC SubsQos QosProfile (Qos)" |
| Scope | Application |

Description

*Sgsn Imsi/<imsi> HlrcRec PdpContext/n SubscribedQos Gsc/n Imsi/<imsi> HlrcRec PdpContext/n SubscribedQos*

This component represents the Quality of Service (QoS) profile of the subscriber downloaded from the Home Location Register (HLR).

Common Verbs

Help
List
Display

## GROUP Sgsn Tlli HlrcRec PdpC SubsQos QosProfile (Qos)

Properties

Operational

Description

This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group.

## ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos deliveryOrder (delOrd)

Access

Read: All
Write: Illegal

Description

This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed.

Values

withDeliveryOrder
withoutDeliveryOrder

Default

No default

## ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos deliveryOfErroneousSdus (delErrSdus)

Access

Read: All
Write: Illegal

Description

This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.

The erroneous SDUs can be handled in one of the following ways:

***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.

***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.

***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded.

Values
noDetect
errSdusDelivered
errSdusNotDelivered

Default
No default

## ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos trafficClass (traffClass)

Access
Read: All
Write: Illegal

Description
This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads).

| | |
|---|---|
| | This is characterized by the destination not expecting the data within a certain time. |
| Values | conversational (conv)<br>streaming (strm)<br>interactive (int)<br>background (bkgr) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos residualBitErrorRate (resBer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.<br><br>This attribute can take up values ranging from 1 through 9, representing:<br><br>***1*** -> 5*10 -2<br>***2*** -> 1*10 -2<br>***3*** -> 5*10 -3<br>***4*** -> 4*10 -3<br>***5*** -> 1*10 -3<br>***6*** -> 1*10 -4<br>***7*** -> 1*10 -5<br>***8*** -> 1*10 -6<br>***9*** -> 6*10 -8 |
| Values | Decimal (1..9) |
| Default | No default |

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos sduErrorRatio (sduErrRatio)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description

This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4
5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values

Decimal (1..7)

Default

No default

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos trafficHandlingPriority (traffHndlPr)

Access

Read: All
Write: Illegal

Description

This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***

A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest.

Values

Decimal (0..3)

Default

No default

### ATTRIBUTE Sgsn Tlli HlrcRec PdpC SubsQos transferDelay (transfDelay)

Access

Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP. |
| Values | Decimal (10..4100) |

## VERB Clear Sgsn Imsi

Impact Service

Description *Clear InternationMobileSubscriberId/<imsi>*

This command clears the specified *Imsi* component.

If the *msPurgeFunction* provisionable attribute is enabled in SGSN GSC MsPurge, it will cause a Mobile Subscriber Purge request to be sent to the Home Location Register.

## COMPONENT Sgsn Imsi MobilityContext (Mc)

Groups "GROUP Sgsn Imsi Mc Operational (Oper)"
"GROUP Sgsn Imsi Mc WlcCustomCounters (WlcCustomCntr)"

| | |
|---|---|
| Scope | Application |
| Description | *Sgsn Tlli/<tlli> MobilityContext*<br>*Sgsn Imsi/<imsi> MobilityContext*<br>*Gsc/n Tlli/<tlli> MobilityContext*<br>*Gsc/n Imsi/<imsi> MobilityContext*<br><br>This component represents the GPRS Mobility Management (GMM) context created for each mobile subscriber that is GPRS-Attached. The Mobility Context is an instance of the *InternationalMobileSubscriberId (Imsi)* and the *TemporaryLogicalLinkId (Tlli)* of the Serving GPRS Support Node (SGSN). |
| Common Verbs | Help<br>List<br>Display |

## GROUP Sgsn Imsi Mc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the GPRS Mobility Management (GMM) information for a subscriber. |

## ATTRIBUTE Sgsn Imsi Mc temporaryLogicalLinkId (tlli)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Temporary Logical Link Identifier (TLLI) used to identify the context of the Mobile Station (MS) within the Serving GPRS Support Node (SGSN). This is one of the main reference keys that is used to identify an MS in the SGSN. |
| Values | String (4, Hex) |
| Default | No default |

## ATTRIBUTE Sgsn Imsi Mc gmmState (gmmSt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the GPRS Mobility Management (GMM) state for a mobile. Upon initialization, this attribute value is in ***idle*** state. The states have the following meaning:<br>***idle*** - The Mobile Station (MS) is not attached to the GPRS Mobility Management (GMM). The MS and the SGSN context hold no valid location or routing area information for the mobile.<br>***standby*** - The MS is attached to the GMM.<br>***ready*** - MS is attached and can be sending or receiving the Point To Point Protocol Data Units (PTP PDUs). |
| Values | idle<br>standby<br>ready |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Mc routingAreaIdentifier (rai)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current routing area of the Mobile Station (MS). The routing area is transmitted to the Serving GPRS Support Node (SGSN) during a Routing Area Update procedure or Attach procedure. The routing area identifier includes the Mobile Country Code (MCC as first 3 digits), the Mobile Network Code (MNC as next 2 digits), the Location Area Code (LAC as next 4 digits), and the Routing Area Code (RAC as last 2 digits). |
| Values | String (5..6, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Mc cellId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current cell location of the Mobile Station (MS). |
| Values | String (2, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Mc cellEntryTime (cellEntry)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates when the Mobile Station (MS) entered the cell indicated by the *cellId*. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Mc sgsnClassmark (sgsnCm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network portion of the Mobile Station (MS) classmark. The classmark contains specific information about a Mobile Station (MS). |
| Values | String (1..2, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Mc drxParameters (drxParms)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates if the Mobile Station (MS) supports discontinuous reception or not. The DRX parameter is transmitted by the MS during an Attach Request procedure and a Routing Area Update procedure. |
| Values | supported<br>unsupported |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Mc readyTimer (t3314)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the negotiated value of the Ready Timer (T3314) for the GPRS Mobility Management (GMM) state transition. The Ready Timer is restarted whenever a signaling or a data Protocol Data Unit (PDU) is received from the Mobile Station (MS). In the event of the Ready Timer expiry, the attribute *gmmState* changes to ***standby***.<br><br>The negotiation of this value is based on the *readyTimer* provisioned in the *Sgsn GprsSubscriberControl* component. |
| Values | Decimal (1..11160)<br>forceStandby |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Mc pagingProceedFlag (ppf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the paging proceed flag. The flag indicates whether paging can be initiated. |
| Values | false<br>true |
| Default | No default |

### GROUP Sgsn Imsi Mc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sgsn Imsi Mc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a |

| | |
|---|---|
| | mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## GROUP Sgsn Imsi Sc SessionContextOp (ScOp)

Properties Operational

Description This group contains the Session Context information for a subscriber. The Session Contexts are created for each activated Packet Data Protocol (PDP) context of a subscriber.

## ATTRIBUTE Sgsn Imsi Sc selectedApnNetworkId (selApnNwkId)

Access Read: All
Write: Illegal

Description This attribute indicates the selected Access Point Name (APN) Network Identifier.

The APN Network Identifier can be the one received from the mobile as part of the ACTIVATE PDP CONTEXT REQUEST message or it can be selected from the subscription record against which this session has been activated or it can be the *defaultApnNetworkId* (defined in *Sgsn Gsc*) for the requested PDP type provisioned on the Serving GPRS Support Node (SGSN).

Values String (1..63, ASCII)

Default No default

## ATTRIBUTE Sgsn Imsi Sc selectedApnOperatorId (selApnOpId)

Access Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates the selected Access Point Name (APN) Operator Identifier.<br><br>The APN Operator Identifier can be the one received from the Mobile Station (MS) as part of the ACTIVATE PDP CONTEXT REQUEST message or it can be the one constructed from the subscriber's IMSI as mnc<3 MNC digits>.mcc<3 MCC digits>.gprs. |
| Values | String (1..37, ASCII) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc dataPathGgsnAddress (dGgsnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the IP address of the Gateway GPRS Support Node (GGSN) for the data path that is currently used by the activated Packet Data Protocol (PDP) context. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc signalingGgsnAddress (sGgsnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the IP address of the Gateway GPRS Support Node (GGSN) for the signaling path that is currently used by the activated Packet Data Protocol (PDP) context. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc pdpContextIdentifier (pdpCid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the subscription record against which this session has been activated. |

| | |
|---|---|
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc pdpType (pdpT)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute defines the end user protocol to be used between the external packet data network and the Mobile Station (MS) such as, X.25, IP, PPP.<br>For X.25 currently defined address format is X.121, for IP protocol currently defined address formats are IPV4, IPV6, and PPP protocol has no address format. |
| Values | x25<br>ip<br>ppp |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc ipv4PdpAddress (ipv4Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is IPv4. The address conforms to the standard addressing scheme of the IP version 4 address. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc x121PdpAddress (x121Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is X.121. |
| Values | BCD (1..14) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc otherPdpAddress (otherAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. The Packet Data Protocol (PDP) protocol type for the *otherPdpAddress* can be obtained from the attribute *pdpType* and the addressing type from *pdpAddressFormat*. |
| Values | String (1..16, Hex) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc pdpAddressFormat (pdpTnum)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the addressing type, such as, X.121, IPv4, IPv6. |
| Values | x121<br>ipv4<br>ipv6 |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc ggsnRemoteTeid (ggsnRemTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg that originates at the GPRS Serving GPRS Support Node (SGSN) and terminates at the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Sgsn Imsi Sc ggsnLocalTeid (ggsnLocTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg that originates at the Gateway GPRS Support Node (GGSN) and terminates at the GPRS Serving GPRS Support Node (SGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Sgsn Imsi Sc signallingGgsnTeid (sGgsnTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg endpoint of the control tunnel that runs between the GPRS Serving GPRS Support Node (SGSN) and the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Sgsn Imsi Sc RequestedQos (ReqQos)

| | |

## GROUP Sgsn Imsi Sc ReqQos QosProfile (Qos)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group. |

## ATTRIBUTE Sgsn Imsi Sc ReqQos deliveryOrder (delOrd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed. |
| Values | withDeliveryOrder<br>withoutDeliveryOrder |
| Default | No default |

## ATTRIBUTE Sgsn Imsi Sc ReqQos deliveryOfErroneousSdus (delErrSdus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.<br><br>The erroneous SDUs can be handled in one of the following ways:<br><br>***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.<br><br>***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.<br><br>***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded. |
| Values | noDetect<br>errSdusDelivered<br>errSdusNotDelivered |

Default No default

### ATTRIBUTE Sgsn Imsi Sc ReqQos trafficClass (traffClass)

Access
Read: All
Write: Illegal

Description
This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). This is characterized by the destination not expecting the data within a certain time.

Values
conversational (conv)
streaming (strm)
interactive (int)
background (bkgr)

Default No default

### ATTRIBUTE Sgsn Imsi Sc ReqQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc ReqQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc ReqQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc ReqQos residualBitErrorRate (resBer)

Access
Read: All
Write: Illegal

Description
This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.

This attribute can take up values ranging from 1 through 9, representing:

***1*** -> 5*10 -2
***2*** -> 1*10 -2
***3*** -> 5*10 -3
***4*** -> 4*10 -3
***5*** -> 1*10 -3
***6*** -> 1*10 -4
***7*** -> 1*10 -5
***8*** -> 1*10 -6
***9*** -> 6*10 -8

Values
Decimal (1..9)

Default
No default

### ATTRIBUTE Sgsn Imsi Sc ReqQos sduErrorRatio (sduErrRatio)

Access
Read: All
Write: Illegal

Description
This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4

5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values Decimal (1..7)

Default No default

### ATTRIBUTE Sgsn Imsi Sc ReqQos trafficHandlingPriority (traffHndlPr)

Access Read: All
Write: Illegal

Description This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***

A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest.

Values Decimal (0..3)

Default No default

### ATTRIBUTE Sgsn Imsi Sc ReqQos transferDelay (transfDelay)

Access Read: All
Write: Illegal

Description This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP.

Values Decimal (10..4100)

Units msec

Default No default

### ATTRIBUTE Sgsn Imsi Sc ReqQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Sc ReqQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### COMPONENT Sgsn Imsi Sc NegotiatedQos (NegQos)

| | |
|---|---|
| Groups | "GROUP Sgsn Imsi Sc NegQos QosProfile (Qos)" |
| Scope | Application |
| Description | *Sgsn Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos*<br>*Gsc/n Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos* |

This component represents the negotiated Quality of Service (QoS) profile received by a mobile subscriber for this session.

## GROUP Sgsn Imsi Sc NegQos QosProfile (Qos)

Properties: Operational

Description: This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group.

## ATTRIBUTE Sgsn Imsi Sc NegQos deliveryOrder (delOrd)

Access: Read: All
Write: Illegal

Description: This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed.

Values: withDeliveryOrder
withoutDeliveryOrder

Default: No default

## ATTRIBUTE Sgsn Imsi Sc NegQos deliveryOfErroneousSdus (delErrSdus)

Access: Read: All
Write: Illegal

Description: This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.

The erroneous SDUs can be handled in one of the following ways:

***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.

***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.

***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded.

Values
noDetect
errSdusDelivered
errSdusNotDelivered

Default
No default

## ATTRIBUTE Sgsn Imsi Sc NegQos trafficClass (traffClass)

Access
Read: All
Write: Illegal

Description
This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). This is characterized by the destination not expecting the data within a certain time.

List
Display

## GROUP Sgsn Imsi HlrcRec PdpC SubsQos QosProfile (Qos)

Properties

Operational

Description

This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group.

## ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos deliveryOrder (delOrd)

Access

Read: All
Write: Illegal

Description

This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed.

Values

withDeliveryOrder
withoutDeliveryOrder

Default

No default

## ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos deliveryOfErroneousSdus (delErrSdus)

Access

Read: All
Write: Illegal

Description

This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.

The erroneous SDUs can be handled in one of the following ways:

***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.

***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.

***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded.

Values
noDetect
errSdusDelivered
errSdusNotDelivered

Default
No default

## ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos trafficClass (traffClass)

Access
Read: All
Write: Illegal

Description
This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads).

| | |
|---|---|
| | This is characterized by the destination not expecting the data within a certain time. |
| Values | conversational (conv)<br>streaming (strm)<br>interactive (int)<br>background (bkgr) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos residualBitErrorRate (resBer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.<br><br>This attribute can take up values ranging from 1 through 9, representing:<br><br>***1*** -> 5*10 -2<br>***2*** -> 1*10 -2<br>***3*** -> 5*10 -3<br>***4*** -> 4*10 -3<br>***5*** -> 1*10 -3<br>***6*** -> 1*10 -4<br>***7*** -> 1*10 -5<br>***8*** -> 1*10 -6<br>***9*** -> 6*10 -8 |
| Values | Decimal (1..9) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos sduErrorRatio (sduErrRatio)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description

This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4
5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values

Decimal (1..7)

Default

No default

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos trafficHandlingPriority (traffHndlPr)

Access

Read: All
Write: Illegal

Description

This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***

A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest.

Values

Decimal (0..3)

Default

No default

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos transferDelay (transfDelay)

Access

Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP. |
| Values | Decimal (10..4100) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Sgsn Imsi HlrcRec PdpC SubsQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |

| | |
|---|---|
| Default | No default |

### COMPONENT Sgsn Imsi Bssap

| | |
|---|---|
| Groups | "GROUP Sgsn Imsi Bssap Operational (Oper)"<br>"GROUP Sgsn Imsi Bssap WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Sgsn Imsi/<imsi> Bssap*<br>*Gsc/n Imsi/<imsi> Bssap*<br><br>This component represents the Base Station System Application Part + (BSSAP+) context information for each mobile subscriber that is IMSI attached to both GPRS and non-GPRS services.<br><br>The BSSAP+ layer is responsible for co-ordinating the location information for a mobile subscriber and conveying some Circuit Switched related procedures via the SGSN. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Sgsn Imsi Bssap Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the GPRS Base Station System Application Part+ (BSSAP+) context information. |

### ATTRIBUTE Sgsn Imsi Bssap vlrNumber (vlrNo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the E.164 number of the VLR that the Mobile Station (MS) uses for non-GPRS services. If there is no associated VLR, the value is empty. |
| Values | BCD (0..15) |
| Default | No default |

## ATTRIBUTE Sgsn Imsi Bssap gsState

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of the Gs interface in the SGSN. The states have the following meaning:<br>***null*** - There is no associated VLR for the Mobile station (MS).<br>***laUpdate*** - The SGSN has sent a BSSAP+_LOCATION_UPDATE_REQUEST to the VLR.<br>***associated*** - The MS is attached to both GPRS and non-GPRS services. |
| Values | null<br>laUpdate<br>associated |
| Default | No default |

## ATTRIBUTE Sgsn Imsi Bssap vlrReliable (vlrRel)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the reset status of the VLR that provides non-GPRS services to the MS.<br><br>If the value is ***false***, upon reception of any Routing Area Update or Combined Routing and Location Update, the SGSN requests the mobile to re-attach to non-GPRS services. If the value is ***true***, the SGSN proceeds with the Routing Area Update or Combined Routing and Location Update.<br><br>This value is set to ***true*** when the SGSN receives a BSSAP+_LOCATION_UPDATE_ACCEPT from the VLR. It is set to ***false***, when the SGSN has received a reset indication from the VLR. |
| Values | false<br>true |
| Default | No default |

### ATTRIBUTE Sgsn Imsi Bssap nonGprsAlertFlag (ngaf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the non-GPRS alert flag. If the value is ***true***, the VLR is notified of any activity on the mobile and if the value is ***false***, the VLR is not notified.<br><br>This value is set to ***true*** when the SGSN replies to a BSSAP+-ALERT-REQUEST with an ACK. It is set to ***false***, when the SGSN sends an BSSAP+-MS_ACTIVITY_INDICATION message to the VLR. |
| Values | false<br>true |
| Default | No default |

### GROUP Sgsn Imsi Bssap WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sgsn Imsi Bssap customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Sgsn Sh ConM OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Sgsn Sh ConM adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Sgsn Sh ConM operationalState (osiOper)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Sgsn Sh ConM usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Sgsn Sh ConM availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. ## ATTRIBUTE Sgsn Sh ConM proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

### ATTRIBUTE Sgsn Sh ConM controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

## ATTRIBUTE Sgsn Sh ConM alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

### ATTRIBUTE Sgsn Sh ConM standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Sgsn Sh ConM unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### COMPONENT Sgsn Sh ConM AtmConnection (AtmCon)

Groups

### GROUP Sgsn Sh ConS OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific |

information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Sgsn Sh ConS adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Sgsn Sh ConS operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Sgsn Sh ConS usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Sgsn Sh ConS availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Groups | "GROUP Sgsn Ts Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn TieredSubscription*<br>*Usgsn TieredSubscription*<br><br>This component represents the differentiated tiers of service on the (UMTS) Serving GPRS Support Node (SGSN or USGSN) on a per Packet Data Protocol (PDP) context basis for downlink traffic. The maximum average bandwidth associated with each tier is not guaranteed at all times but indicates the upper bound on the average data rate for the service. If this component is not provisioned, the data rate for every context will be best effort. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Sgsn Ts Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

Description

This group contains the *Tiered Subscription (Ts)* provisioning data of the (UMTS) Serving GPRS Support Node (SGSN or USGSN).

### ATTRIBUTE Sgsn Ts roamerTier

Access

Read: All
Write: All

Description

This attribute specifies the peak bit rate (tier) that can be assigned to a PDP context for mobiles that are not in their Home PLMN. Tier 0 through Tier 9 map to peak throughput classes 0 through 9. Peak throughput class 0 represents the subscribed peak throughput class for a PDP context. Peak throughput classes 1 through 9 represent peak bit rates of 8 kbit/s, 16 kbit/s, 32 kbit/s, 64 kbit/s, 128 kbit/s, 256 kbit/s, 512 kbit/s, 1024 kbit/s and 2048 kbit/s respectively. The Tiered Subscription service uses this information during a PDP context activation for a roamer to determine the maximum average throughput for the context.
If the *roamerTier* is provisioned as ***0***, then the peak throughput for the context is the lower of the peak throughput class of the mobile requested QoS and the mobile's subscribed QoS.
If the *roamerTier* is a value between ***1*** and ***9***, then the peak throughput class for the context is the peak throughput associated with that tier.

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Sgsn Acct Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

Description — This group contains the Accounting (Acct) provisioning data of the Serving GPRS Support Node (SGSN).

### ATTRIBUTE Sgsn Acct cdrCapture (cdrCap)

Access — Read: All
Write: All

Description — This attribute specifies which of the following Call Detail Records (CDRs) are generated:

***scdr:*** SGSN Packet Data Protocol (PDP) CDRs
***mcdr*** Mobility CDRs
***smoCdr***: SGSN Short Message Origination CDRs
***smtCdr***: SGSN Short Message Termination CDRs

Set of — sgsn
mobility
smo
smt

Default — No default

### ATTRIBUTE Sgsn Acct locationBasedBilling (lbb)

Access — Read: All
Write: All

Description — This attribute specifies whether location based billing for the generation of partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) upon routing area changes is ***enabled*** or ***disabled***. When ***enabled***, every S-CDR will contain only the traffic data volume counts for a single routing area, allowing the operator to bill based on geographic location.

Values — disabled
enabled

Default — disabled

### ATTRIBUTE Sgsn Acct transferInterval (trInt)

Access — Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies the interval at which currently spooled closed Call Detail Records (CDRs) are to be transferred to the Charging Gateway Functionality (CGF).<br><br>When set to ***noDelay,*** closed CDRs are transferred to the CGF with minimal delay. When set to a value between 15 and 1440 (minutes), the SGSN Accounting Server (SAS) starts a timer upon startup. At every expiration of this timer, closed CDRs on the hard disk are sent to the CGF.<br><br>The values that can be set are ***noDelay*** and multiples of 15 minutes. |
| Values | Decimal (15..1440)<br>noDelay |
| Units | minutes |
| Default | 30 |

### ATTRIBUTE Sgsn Acct updateInterval (updateInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the interval at which Session Management (SM) is queried for traffic data volume for all open SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs). It also specifies the interval at which GPRS Mobility Management (GMM) is queried to find out if the mobile is still attached for all open Mobility Call Detail Records (M-CDRs).<br><br>The *updateInterval* must be less than the *scdrPartialRecordInterval*.<br><br>Only values that are multiples of 15 minutes can be set for this attribute. |
| Values | Decimal (15..1440) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE Sgsn Acct scdrPartialRecordInterval (scdrInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the interval at which the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) are generated.<br><br>When set to a value other than ***noPartialRecords***, S-CDRs that have been open longer than *scdrPartialRecordInterval* are closed with a partial record reason of “time (duration) limit”.<br><br>The *scdrPartialRecordInterval* must be greater than or equal to the *updateInterval*.<br><br>The values that can be set are ***noPartialRecords*** and multiples of 15 minutes. |
| Values | Decimal (15..1440)<br>noPartialRecords |
| Units | minutes |
| Default | noPartialRecords |

### ATTRIBUTE Sgsn Acct mcdrPartialRecordInterval (mcdrInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the interval at which the partial Mobility Call Detail Records (M-CDRs) are generated.<br><br>When set to a value other than ***noPartialRecords***, M-CDRs that have been open longer than *mcdrPartialRecordInterval* are closed with a partial record reason of “time (duration) limit”.<br><br>The *mcdrPartialRecordInterval* must be greater than or equal to the *updateInterval*.<br><br>The values that can be set are ***noPartialRecords*** and multiples of 15 minutes. |

| | |
|---|---|
| Values | Decimal (15..1440)<br>noPartialRecords |
| Units | minutes |
| Default | noPartialRecords |

### ATTRIBUTE Sgsn Acct mcdrMaxContainers (mcdrMaxC)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of Change of Location Containers allowed in an Mobility Call Detail Record (M-CDR). Once this number of Containers is exceeded, a partial M-CDR is generated with a partial record reason of “maximum number mobility changes”. |
| Values | Decimal (1..10) |
| Default | 5 |

### ATTRIBUTE Sgsn Acct echoRequestInterval (echoReqInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the interval at which ECHO REQUEST messages are to be sent to the Charging Gateway Functionality (CGF). |
| Values | Decimal (1..60) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Sgsn Acct primaryCgfIpAddress (priCgfIp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Primary Charging Gateway Functionality (CGF) IP address for the SGSN. This is the address used by the SGSN Accounting Server (SAS) when transferring closed Call Detail Records (CDRs) to the CGF. If the primary |

| | |
|---|---|
| | CGF is not in service, the SGSN uses the provisioned Secondary CGF IP<br>Address. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Sgsn Acct secondaryCgfIpAddress (secCgfIp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Secondary Charging Gateway Functionality (CGF) IP address for the SGSN. In the event of failure of the primary provisioned CGF, the SGSN tries to send Call Detail Records (CDRs) to the secondary provisioned CGF. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Sgsn Acct cdrTransferTime (tCdrTr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the initial waiting time in seconds for the response message for a Call Detail Record (CDR) transfer request. The request message can contain one or more CDRs.<br><br>The timer doubles after each successive retransmission of the same CDR. |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Sgsn Acct cdrRetries (nCdr)

| | |
|---|---|
| Access | Read: All<br>Write: All |

Description

This attribute specifies the number of times the SGSN tries to resend a billing record to the Charging Gateway Functionality (CGF) when the SGSN does not get the acknowledgment before the *tCdrXfer* expires.

If maximum value of *nCdrRetries* is reached and there is no secondary CGF, the CDRs will be sent to the CGF whenever the CGF is back in service. The SGSN knows that the CGF is alive either by the ECHO REQUEST message or the NODE ALIVE message.

Values

Decimal (1..3)

Default

1

### ATTRIBUTE Sgsn Acct primaryCgfAsn1Encoding (priCgfAsn1Enc)

Access

Read: All
Write: All

Description

This attribute specifies the encoding for the GPRS Tunnelling Protocol (GTP) communications between the SGSN and the primary Charging Gateway Functionality (CGF). The following are the encodings supported:
***ber***: Basic Encoding Rules
***per***: Packed Encoding Rules

The encoding selected must match the encoding used by the CGF.

Values

ber
per

Default

ber

### ATTRIBUTE Sgsn Acct secondaryCgfAsn1Encoding (secCgfAsn1Enc)

Access

Read: All
Write: All

Description

This attribute specifies the encoding for the GPRS Tunnelling Protocol (GTP) communications between the SGSN and the secondary Charging Gateway Functionality (CGF). The following are the encodings supported:
***ber***: Basic Encoding Rules

***per***: Packed Encoding Rules

The encoding selected must match the encoding used by the CGF.

Values
ber
per

Default
ber

### ATTRIBUTE Sgsn Acct timeOffset (to)

Access
Read: All
Write: All

Description
This attribute specifies the time difference between the local time and the Universal time. The time is represented as minutes.
Eg. 105 represents an offset of 1 hr 45 min.

Values
Signed (-720..900)

Units
minutes

Default
0

### ATTRIBUTE Sgsn Acct genAuditFiles (genAf)

Access
Read: All
Write: All

Description
This attribute specifies whether the generation of CDR audit files is ***enabled*** or ***disabled***. When ***enabled***, files are created which can be used to audit the closed CDRs that were generated by this SGSN and transferred to a CGF.

Values
disabled
enabled

Default
disabled

### ATTRIBUTE Sgsn Acct auditFileLife (afLife)

Access
Read: All
Write: All

Description
This attribute specifies the number of days the CDR audit file will remain on the 2pGPDsk before being deleted.

| | |
|---|---|
| Values | Decimal (1..10) |
| Units | days |
| Default | 5 |

### ATTRIBUTE Sgsn Acct roamerCapture (roamCap)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether CDRs should be generated for all subscribers or only Roamers.<br><br>When set to ***all***, CDRs are captured without regard to the mobiles home GGSN. When set to ***roamers***, CDRs are only captured for mobile stations that are roaming outside their home GGSN.<br><br>The values that can be set are ***all*** and ***roamers***. |
| Values | all<br>roamers |
| Default | all |

### ATTRIBUTE Sgsn Acct asn1EncoderVersion (asn1EncoderVer)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the ASN.1 Encoder Version used by all *Sas* components on the shelf.<br><br>Modifying this attribute after the component is initially activated causes the new encoder version to be used on the next set of spooled and closed Call Data Records (CDR) to be transferred to the Call Gateway Function (CGF). If a *Sas* component is processing a set of CDRs when this attribute is changed the new encoder version does not take effect until the processing of the current set of CDRs is complete.<br><br>The version of the ASN1 Encoder should be changed to 3.6 when the downstream CGF is upgraded to handle the decoding of version 3.6 encoded CDRs. |

| | |
|---|---|
| Values | 3dot2<br>3dot6 |
| Default | 3dot2 |

### ATTRIBUTE Sgsn Acct scdrMaxContainers (scdrMaxC)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of Change of Charging Condition Containers allowed in an SGSN Packet Data Protocol Call Detail Record (S-CDR). Once this number of containers is exceeded, a partial S-CDR is generated with a partial record reason of “maximum number of charging condition changes”. |
| Values | Decimal (1..10) |
| Default | 5 |

### COMPONENT Sgsn PrepaidShortMessageService (PSms)

| | |
|---|---|
| Groups | "GROUP Sgsn PSms Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn PrepaidShortMessageService*<br><br>This component represents the Prepaid Short Message Service (PSMS) functionality of the Serving GPRS Support Node (SGSN). |
| Opt. Subcomp. | "COMPONENT Sgsn PSms ServiceControlPoint (Scp)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Sgsn PSms Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the *PrepaidShortMessageService(PSms)* provisioning data of the Serving GPRS Support Node (SGSN). |

### ATTRIBUTE Sgsn PSms currencyType (curT)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the ISO currency type that will be sent to the external Service Control Point (SCP) in the Prepaid-CTP INCREMENT DECREMENT messages. This is a three digit letter or a three digit decimal number. |
| Values | String (3, ASCII) |
| Default | No default |

### ATTRIBUTE Sgsn PSms currencyAmount (curAmt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the monetary amount, in the minor of the currency, that will be sent to the external Service Control Point (SCP) in the Prepaid-CTP INCREMENT DECREMENT messages. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Sgsn PSms transactionTimer (tTran)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum time the SGSN waits for a Prepaid-CTP transaction to complete. If the transaction is not completed within this time period, the Prepaid Short Message Service (PSMS) message will be discarded. |
| Values | Decimal (1..44) |
| Units | seconds |
| Default | 20 |

### ATTRIBUTE Sgsn PSms nccpLoginResponseTimer (tNccpLiR)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum time that the SGSN waits for a response from the external Service Control Point (SCP) to an NCCP (Network Connection Control Protocol) LOGIN REQUEST message. If the SCP fails to respond in this time period, the SGSN will consider the login attempt to have failed. If the login request for one Service Processor (SP) fails, the other SP of the SCP pair is tried.<br><br>The count of timeouts can be viewed in the *nccpLoginResponseTimeouts* attribute (defined in *Gsc PSms Scp*). |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 15 |

### ATTRIBUTE Sgsn PSms nccpLogoutResponseTimer (tNccpLoR)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum time that this SGSN waits for a response from the external Service Control Point (SCP) to an NCCP (Network Connection Control Protocol) LOGOUT REQUEST message. If the SCP fails to respond in this time period, the SGSN will consider the logout attempt to have failed.<br><br>The count of expirations can be viewed in the *nccpLogoutFailures* attribute (defined in *Gsc PSms Scp*). |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Sgsn PSms nccpRoundRobinTimer (tNccpRr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the SGSN waits between each connection attempt when it round robins between the two Service Processors (SPs) of the external Service Control Point (SCP) pair.<br><br>The count of expirations can be viewed in the *nccpRoundRobinTimeouts* attribute (defined in *Gsc PSms Scp*). |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Sgsn PSms nccpReconnectTimer (tNccpRec)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the SGSN will wait after a login attempt to an external Service Control Point (SCP) has been denied. Specifically, the SGSN will wait this amount of time after receiving a failed NCCP (Network Connection Control Protocol) LOGIN RESPONSE message from the external SCP before trying to reconnect to the SCP.<br><br>The count of expirations can be viewed in the *nccpReconnectTimeouts* attribute (defined in *Gsc PSms Scp*). |
| Values | Decimal (1..120) |
| Units | seconds |
| Default | 50 |

### COMPONENT Sgsn PSms ServiceControlPoint (Scp)

| | |
|---|---|
| Instance | Decimal (1..32) |
| Groups | "GROUP Sgsn PSms Scp Provisioned (Prov)" |

| | |
|---|---|
| Scope | Application |
| Description | *Sgsn Sms GprsServiceControlPointCp*<br><br>This component represents a Service Control Point (SCP) that the Serving GPRS Support Node (SGSN) uses to authorize subscriber SGSN Prepaid Short Message Service (PSMS) messages. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Sgsn PSms Scp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the *ServiceControlPoint* (*Scp)* provisioning data of the Serving GPRS Support Node (SGSN). |

## ATTRIBUTE Sgsn PSms Scp accessPointName (apn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Access Point Name (APN), found in the HLR context, that is used to identify the mobile as a Prepaid Short Message Service (PSMS) subscriber. Furthermore, this APN uniquely identifies that this external Service Control Point (SCP) should be used to authorize the subscribers message(s). |
| Values | String (1..63, ASCII) |
| Default | No default |

## ATTRIBUTE Sgsn PSms Scp spAddress1 (spAddr1)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP address of the first Service Processor (SP) of this external Service Control Point (SCP). |

Since the SCP is always deployed in a duplex configuration where one SP is the active SP and the other is the stand-by SP, the SGSN will alternate its login connection attempts between the SPs until a successful attempt is made. The IP address of the other SP is provisioned in the *spAddress2* attribute.

Both of these addresses must be unique and neither can be set to 0.0.0.0.

Values: IP address

Default: No default

### ATTRIBUTE Sgsn PSms Scp spAddress2 (spAddr2)

Access: Read: All
Write: All

Description: This attribute specifies the IP address of the second Service Processor (SP) of this external Service Control Point (SCP). Since the SCP is always deployed in a duplex configuration where one SP is the active SP and the other is the stand-by SP, the SGSN will alternate its login connection attempts between the SPs until a successful attempt is made. The IP address of the other SP is provisioned in the *spAddress1* attribute.

Both of these addresses must be unique and neither can be set to 0.0.0.0.

Values: IP address

Default: No default

### ATTRIBUTE Sgsn PSms Scp tcpPort

Access: Read: All
Write: All

Description: This attribute specifies the TCP port that the SGSN will attempt to establish a connection with for this external Service Control Point (SCP).

Values: Decimal (0..65535)

Default: No default

## ATTRIBUTE Sgsn PSms Scp password (passwd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the password that should be used when the SGSN logs into this Service Control Point (SCP). |
| Values | String (6..20, ASCII) |
| Default | No default |

## COMPONENT Sgsn EquivalentPlmn (EquivPlmn)

| | |
|---|---|
| Instance | Decimal (1..5) |
| Groups | "GROUP Sgsn EquivPlmn Provisioned (Prov)" |
| Scope | Application |
| Description | Sgsn EquivalentPlmn/n<br><br>This component collectively represents all Public Land Mobile Networks (PLMNs) that must be considered equivalent by the Mobile Station (MS) at PLMN selection, handover, cell re-selection, and so on. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Sgsn EquivPlmn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for one of the Public Land Mobile Network (PLMN) codes that must be considered equivalent.<br><br>PLMN codes consist of a Mobile Country Code (MCC) and a Mobile Network Code (MNC). |

## ATTRIBUTE Sgsn EquivPlmn mobileCountryCode (mcc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the three-digit Mobile Country Code (MCC) of a Public Land Mobile Network (PLMN). |
| Values | BCD (3) |
| Default | No default |

## ATTRIBUTE Sgsn EquivPlmn mobileNetworkCode (mnc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the two- or three-digit Mobile Network Code (MNC) of a Public Land Mobile Network (PLMN). |
| Values | BCD (2..3) |
| Default | No default |

# COMPONENT SignallingGateway (Sg)

| | |
|---|---|
| Instance | Decimal (1..15) |
| Groups | "GROUP Sg Provisioned (Prov)"<br>"GROUP Sg OsiState (State)"<br>"GROUP Sg WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *SignallingGateway/n* |

This component defines the signalling interface between a Radio Network Controller (RNC) and the Core Network in 3 possible configurations:

Circuit Switched (CS) domain only - In this configuration, the Signalling Gateway provides the interface between the RNC and the Call Server.

Packet Switched (PS) domain only - In this configuration, the Signalling Gateway provides the interface between the RNC and a UMTS Serving GPRS Support Node (USGSN).

Both domains: In this configuration, the Signalling Gateway provides the interface between the RNC and a UMTS Serving GPRS Support Node (USGSN), as well as an interface between the RNC and a Call Server(CS).

The Circuit Switched(CS) domain is supported if a *Sg/n CsDomain* component is provisioned. The Packet Switched (PS)

| | |
|---|---|
| | domain is supported if a *Sg/n PsDomain* component is provisioned. |
| Subcomponents | "COMPONENT Sg RncInterface (RncIf)"<br>"COMPONENT Sg MemoryPoolManager (Mpm)" |
| Opt. Subcomp. | "COMPONENT Sg CsDomain (Cs)"<br>"COMPONENT Sg PsDomain (Ps)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Sg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of this component. |

### ATTRIBUTE Sg linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor that this component and its subcomponents are provisioned on. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### GROUP Sg OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Sg adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Sg operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Sg usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Sg WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sg customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Sg customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Sg CsDomain (Cs)

| Groups | "GROUP Sg Cs Provisioned (Prov)"<br>"GROUP Sg Cs OsiState (State)"<br>"GROUP Sg Cs Stats"<br>"GROUP Sg Cs WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS SignallingGateway CsDomain"

| | |
|---|---|
| Scope | Application |
| Description | *Sg/n CsDomain*<br><br>This component represents the signalling between the RNC and a Call Server. It maintains the parameters and statistics for the reformatting of RANAP signalling in the circuit switched domain |

| | |
|---|---|
| | and connects the transport layers for communication between the RNC and the Call Server (MSC). |
| Subcomponents | "COMPONENT Sg Cs SccpConnection (SccpConn)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Sg Cs Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of this component. |

### ATTRIBUTE Sg Cs linkToVirtualMediaGateway (lToVmg)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute links the Signalling Gateway to a Virtual Media Gateway that provides a pool of media gateways for bearer connections. This attribute must be set for the *CsDomain* to activate properly. |
| Values | Link (Service, linkToCsDomain) |
| Default | No default |

### GROUP Sg Cs OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Sg Cs adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Sg Cs operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Sg Cs usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Sg Cs Stats

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of this component. |

### ATTRIBUTE Sg Cs uplinkMsgs (ulMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RANAP messages received from the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs downlinkMsgs (dlMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RANAP messages sent to the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs csRanapMsgsTx (csRanapTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RANAP messages sent to the Call Server.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs csRanapMsgsRx (csRanapRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RANAP messages received from the Call Server.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs bssmapMsgsTx (bssmapTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the BSSMAP messages sent to the Call Server.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs bssmapMsgsRx (bssmapRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSMAP messages received from the Call Server. This includes the faulty BSSMAP messages indicated by the attribute *bssmapMsgErrsRx*.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs bssmapMsgErrsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unrecognized or faulty BSSMAP messages that were received from the Call Server.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs invalidRabRequests (invRabReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Rab Assignment Requests from the Call Server that were rejected by the Signalling Gateway. |

The SG rejects a Rab Assignment Request from the Call Server when the request contains a CIC that is not found in the list of CICs derived from the *startingCic* attribute provisioned in the *Vmg MgIf TdmResource* component.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Sg Cs invalidRelocRequests (invRelocReq)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of Relocation Requests from the Call Server rejected be the Signalling Gateway (SG).

The SG rejects a Relocation Request from the Call Server when the request contains a CIC that is not found in the list of CICs derived from the *startingCic* attribute provisioned in the *Vmg MgIf TdmResource* component.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Sg Cs rabAssignRequests (rabAssgnRqsts)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of RAB ASSIGNMENT REQUEST messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Sg Cs relocRequests (relocRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION REQUEST messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs paging (paging)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of PAGING messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs iuReleaseCmds (iuRelCmds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IU RELEASE COMMAND messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocCmds (relocCmds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of RELOCATION COMMAND messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocPrepFailures (relocPrepFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION PREPARATION FAILURE messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocCancelAcks (relocCancAcks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION CANCEL ACKNOWLEDGE messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs commonIds (commIds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of COMMON ID messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs cnInvokeTraces

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of CN INVOKE TRACE messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs securityModeCmds (secModeCmds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of SECURITY MODE COMMAND messages that were sent to the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs directTransfers (dirTransf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of DIRECT TRANSFER messages between the RNC and the Core Network in either direction.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs resets

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total number of RESET messages between the RNC and the Core Network in either direction. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs resetAcks (resetAcks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of RESET ACKNOWLDEGE messages between the RNC and the Core Network in either direction. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs errorIndications (errorInd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of ERROR INDICATION messages between the RNC and the Core Network in either direction. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs initialUeMessages (inUeMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of INITIAL UE messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Sg Cs rabAssignResponses (rabAssignResps)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RAB ASSIGNMENT RESPONSE messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs rabReleaseRequests (rabRelRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RAB RELEASE REQUEST messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs iuReleaseRequests (iuRelRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Iu RELEASE REQUEST messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs iuReleaseCompletes (iuRelComps)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of Iu RELEASE COMPLETE messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocRqds (relocRqds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION REQUIRED messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocRequestAcks (relocRqstAcks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION REQUEST ACKNOWLEDGE messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocDetects (relocDet)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION DETECT messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocCompletes (relocComps)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION COMPLETE messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocFailures (relocFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION FAILURE messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs relocCancels (relocCancels)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RELOCATION CANCEL messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs securityModeComps (securityModeComps)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of SECURITY MODE COMPLETE messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs resetCircuits (resetCkts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of RESET CIRCUIT messages between the Core Network and the DMS Call Server. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs unequipCircuits (unequipCkts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of UNEQUIPPED CIRCUIT messages received from the DMS Call Server. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs blocks

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of BLOCK messages that were sent to the DMS Call Server. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs unblocks

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of UNBLOCK messages that were sent to the DMS Call Server. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs circuitGrpBlocks (cktGrpBl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of CIRCUIT GROUP BLOCK messages that were sent to the DMS Call Server. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs circuitGrpUnblocks (cktGrpUnbl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of CIRCUIT GROUP UNBLOCK messages that were sent to the DMS Call Server. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs securityModeRjcts (secModeRjcts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of SECURITY MODE REJECT messages that were received from the RNC. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Sg Cs WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sg Cs customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS SignallingGateway CsDomain

| | |
|---|---|
| Description | The statistics record generated by the SignallingGateway CsDomain component. |

### ATTRIBUTE Sg Cs rabAssignRequests

| | |
|---|---|
| Description | This attribute indicates the number of RAB ASSIGNMENT REQUEST messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs relocRequests

| | |
|---|---|
| Description | This attribute indicates the number of RELOCATION REQUEST messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs paging

| | |
|---|---|
| Description | This attribute indicates the number of PAGING messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs iuReleaseCmds

| | |
|---|---|
| Description | This attribute indicates the number of IU RELEASE COMMAND messages that were sent to the RNC over the collection interval. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs relocCmds

| | |
|---|---|
| Description | This attribute indicates the number of RELOCATION COMMAND messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs relocPrepFailures

| | |
|---|---|
| Description | This attribute indicates the number of RELOCATION PREPARATION FAILURE messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs relocCancelAcks

| | |
|---|---|
| Description | This attribute indicates the number of RELOCATION CANCEL ACKNOWLEDGE messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs commonIds

| | |
|---|---|
| Description | This attribute indicates the number of COMMON ID messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs cnInvokeTraces

| | |
|---|---|
| Description | This attribute indicates the number of CN INVOKE TRACE messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs securityModeCmds

| | |
|---|---|
| Description | This attribute indicates the number of SECURITY MODE COMMAND messages that were sent to the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs directTransfers

| | |
|---|---|
| Description | This attribute indicates the total number of DIRECT TRANSFER messages exchanged between the RNC and the Core Network in either direction over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs resets

| | |
|---|---|
| Description | This attribute indicates the total number of RESET messages between the RNC and the Core Network in either direction over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs resetAcks

| | |
|---|---|
| Description | This attribute indicates the total number of RESET ACKNOWLDEGE messages between the RNC and the Core Network in either direction over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs errorIndications

| | |
|---|---|
| Description | This attribute indicates the total number of ERROR INDICATION messages between the RNC and the Core Network in either direction over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs initialUeMessages

| | |
|---|---|
| Description | This attribute indicates the number of INITIAL UE messages that were received from the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs rabAssignResponses

| | |
|---|---|
| Description | This attribute indicates the number of RAB ASSIGNMENT RESPONSE messages that were received from the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs rabReleaseRequests

Description This attribute indicates the number of RAB RELEASE REQUEST messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs iuReleaseRequests

Description This attribute indicates the number of Iu RELEASE REQUEST messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs iuReleaseComps

Description This attribute indicates the number of Iu RELEASE COMPLETE messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs relocRqds

Description This attribute indicates the number of RELOCATION REQUIRED messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs relocRequestAcks

Description This attribute indicates the number of RELOCATION REQUEST ACKNOWLEDGE messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs relocDetects

Description This attribute indicates the number of RELOCATION DETECT messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs relocComps

Description This attribute indicates the number of RELOCATION COMPLETE messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs relocFailures

Description This attribute indicates the number of RELOCATION FAILURE messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs relocCancels

Description This attribute indicates the number of RELOCATION CANCEL messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs securityModeComps

Description This attribute indicates the number of SECURITY MODE COMPLETE messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs resetCircuits

Description This attribute indicates the number of RESET CIRCUIT messages between the Core Network and the DMS Call Server over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Sg Cs unequipCircuits

| | |
|---|---|
| Description | This attribute indicates the number of UNEQUIPPED CIRCUIT messages received from the DMS Call Server over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs blocks

| | |
|---|---|
| Description | This attribute indicates the number of BLOCK messages that were sent to the DMS Call Server over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs unblocks

| | |
|---|---|
| Description | This attribute indicates the number of UNBLOCK messages that were sent to the DMS Call Server over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs circuitGrpBlocks

| | |
|---|---|
| Description | This attribute indicates the number of CIRCUIT GROUP BLOCK messages that were sent to the DMS Call Server over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs circuitGrpUnblocks

| | |
|---|---|
| Description | This attribute indicates the number of CIRCUIT GROUP UNBLOCK messages that were sent to m the DMS Call Server over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs securityModeRjcts

| | |
|---|---|
| Description | This attribute indicates the number of SECURITY MODE REJECT messages that were received from the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs rabSetups

| | |
|---|---|
| Description | This attribute indicates the number of RAB SETUP messages that were received from the Virtual Media Gateway over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs rabSetupResps

| | |
|---|---|
| Description | This attribute indicates the number of RAB SETUP RESPONSE messages that were received from the RNC over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Sg Cs releases

| | |
|---|---|
| Description | This attribute indicates the number of RELEASE messages between RANAP-CS and the Virtual Media Gateway over the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Sg Cs SccpConnection (SccpConn)

| | |
|---|---|
| Groups | "GROUP Sg Cs SccpConn Provisioned (Prov)"<br>"GROUP Sg Cs SccpConn WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Sg/n CsDomain SccpConnection*<br>*Sg/n RncIf SccpConnection*<br><br>This component represents the connection to an SCCP layer used for signalling services between an RNC and a Signalling Gateway |
| Common Verbs | Help<br>List<br>Display |

### GROUP Sg Cs SccpConn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes of the *sccpConnection* component. |

### ATTRIBUTE Sg Cs SccpConn linkToLocalSubsystem (lToLocalSub)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to an *Sccp/n LocalSubsystem/n* component for SCCP services. |
| Values | Link (Service, linkToSccpConnection) |
| Default | No default |

### GROUP Sg Cs SccpConn WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sg Cs SccpConn customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs SccpConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a |

| | |
|---|---|
| | mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Cs SccpConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Sg RncInterface (RncIf)

| | |
|---|---|
| Groups | "GROUP Sg RncIf Provisioned (Prov)"<br>"GROUP Sg RncIf OsiState (State)"<br>"GROUP Sg RncIf Stats"<br>"GROUP Sg RncIf WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Sg/n RncInterface*<br><br>This component represents the signalling connection between an RNC and a Signalling Gateway. |
| Subcomponents | "COMPONENT Sg RncIf SccpConnection (SccpConn)" |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

### GROUP Sg RncIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of this component. |

### ATTRIBUTE Sg RncIf rncId

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the RNC ID of the Radio Network Controller (RNC) attached to the RNC Interface represented by this component.The *rncId* is a field of RNC-ID defined in 3G TS 25.413, that uniquely identifies an RNC in a network.<br><br>If the packet domain is supported, this RNC Id must also be included in the list of RNC Ids corresponding to a routing area, provisioned in the *rncIds* attribute of the *Usgsn Mcc Mnc Rac*(corresponding to the routing area) component. |
| Values | Decimal (0..4095) |
| Default | No default |

### ATTRIBUTE Sg RncIf rncAtmAddress (rncAtmAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the ATM Address of the RNC attached to the RNC interface represented by this component. |
| Values | String (1..44, AESANsapAddress) |
| Default | No default |

### GROUP Sg RncIf OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Sg RncIf adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Sg RncIf operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Sg RncIf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Sg RncIf Stats

Properties
Operational

Description
This group contains the statistical attributes of this component.

### ATTRIBUTE Sg RncIf uplinkMsgs (ulMsgs)

Access
Read: All
Write: Illegal

Description
This attribute counts the RANAP messages received from the RNC. This includes the invalid messages.

The counter wraps to 0 when it exceeds its maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg RncIf invalidUplinkMsgs (invUlMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the invalid RANAP messages received from the RNC.<br><br>This includes messages with errors such as syntax errors, decoding errors, contents not validated, unrecognized messages, etc. that have occurred.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Sg RncIf WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sg RncIf customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg RncIf customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg RncIf customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Sg RncIf SccpConnection (SccpConn)

| | |
|---|---|
| Groups | "GROUP Sg RncIf SccpConn Provisioned (Prov)"<br>"GROUP Sg RncIf SccpConn WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Sg/n CsDomain SccpConnection*<br>*Sg/n RncIf SccpConnection*<br><br>This component represents the connection to an SCCP layer used for signalling services between an RNC and a Signalling Gateway. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### GROUP Sg RncIf SccpConn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes of the *sccpConnection* component. |

### ATTRIBUTE Sg RncIf SccpConn linkToLocalSubsystem (lToLocalSub)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to an *Sccp/n LocalSubsystem/n* component for SCCP services. |
| Values | Link (Service, linkToSccpConnection) |
| Default | No default |

### GROUP Sg RncIf SccpConn WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sg RncIf SccpConn customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |

### GROUP Sg Ps Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for this component. |

### ATTRIBUTE Sg Ps maxSigConn

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the maximum number of simultaneous two-leg signalling connections from the Radio Network Controller. One signalling connection is established per user. Memory resources are reserved for signalling connections based on the value of this attribute.<br><br>The current number of active signalling connections used are displayed by the attribute *activeSigConnections.* |
| Values | Decimal (1..150000) |
| Default | 500 |

### ATTRIBUTE Sg Ps resetAckTimer (tRatR)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the value of the TRatR timer defined in 3G TS 25.413. *tRatR* specifies a guard period in the Core Network prior to the transmission of a reset acknowledge message.<br><br>This timer is started when a RESET message is received by the Signalling Gateway from the RNC.<br><br>This timer is stopped when a response from all the USCs is received by the Signalling Gateway.<br><br>Upon timer expiration, the reset procedure is terminated in the Signalling Gateway.<br><br>The value of this attribute can be increased when timeouts are seen, as indicated by the attribute *tRatRTimeouts*. |
| Values | Decimal (60..120) |
| Units | seconds |
| Default | 60 |

### GROUP Sg Ps Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of this component. |

### ATTRIBUTE Sg Ps activeSigConnections (actSigConn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of active signalling connections established between the Radio Network Controller (RNC) and the UMTS Subscriber Control (USC).<br><br>The maximum number of signalling connections is provisioned in the attribute *maxSigConnections*. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps maxSigConnectionsExhausted (maxSigConnExh)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times a connection was refused because the maximum number of signalling connections, specified by the attribute *maxSigConnections*, was reached.<br><br>The current number of signalling connections is indicated by the attribute *activeSigConnections*. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps rejectedConnections (rejConn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a USC rejects signalling connection requests from the RNC.<br><br>For all the USCs that the SG talks to, the *currentlyAttached* attribute of the *Usc/n Gmm* component can be checked against the *maxAttachedSubscribers* attribute of the parent *Usc/n* component to check if this failure is caused because all the allocated contexts have been used up.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps ranapMsgsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RANAP messages received from the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps uscConnectFailures (uscConnFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times a connection request to the USC failed.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps rncConnectFailures (rncConnFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times a connection request to the RNC failed.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps resetAckTimeouts (tRatRTm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times the *resetAckTimer* expired. If the value of this attribute increases consistently, the value of the *resetAckTimer* can be increased.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Sg Ps WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sg Ps customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

## COMPONENT Sg Ps RemoteApplicationConnection (RaConn)

| | |
|---|---|
| Instance | appType [String (1..8, ASCII)]<br>shelfId [Decimal (0..15)]<br>n [Decimal (1..15)] |
| Groups | "GROUP Sg Ps RaConn OsiState (State)"<br>"GROUP Sg Ps RaConn WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | ... *RemoteApplicationConnection/<appType, shelfId, n>*<br><br>This component represents the Remote Application Connection information of an application that talks to applications on other shelves. For each application that it can communicate with, one of these connection components is created and is instantiated with the name of the remote application, the Id of the shelf on which the application runs, and the instance number of the application. ShelfId ***0*** represents the Master shelf. |
| Dyn. Subcomp. | "COMPONENT Sg Ps RaConn AtmConnection (AtmCon)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Sg Ps RaConn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Sg Ps RaConn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Sg Ps RaConn operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Sg Ps RaConn usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Sg Ps RaConn WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Sg Ps RaConn customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps RaConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Sg Ps RaConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Sg Ps RaConn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Sg Ps RaConn AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Sg Ps RaConn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE Sg Ps RaConn AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

### COMPONENT Sg MemoryPoolManager (Mpm)

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n MemoryPoolManager*<br>*Gsd/n MemoryPoolManager*<br>*Gtl/n MemoryPoolManager*<br>*DnsAgent/<vr>,n MemoryPoolManager*<br><br>This component represents the memory resources of a given GPRS application that are managed as pools of objects. |
| Dyn. Subcomp. | "COMPONENT Sg Mpm MemoryPoolClient (Mpc)" |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Sg Mpm MemoryPoolClient (Mpc)

| | |
|---|---|
| Instance | String (1..30, ASCII) |
| Scope | Application |
| Description | *Gsc/n Mpm MemoryPoolClient/<name>*<br>*Gsd/n Mpm MemoryPoolClient/<name>*<br>*SgGtl/n Mpm MemoryPoolClient/<name>*<br>*DnsAgent/<vr>,n Mpm MemoryPoolClient/<name>*<br><br>This component represents a pool of objects of a particular class |

that a GPRS application currently owns as well as all the objects that could be owned by that application. All the objects in the pool are of the same class. The instance value of this component is a string which is the class name of the objects in the pool.

# COMPONENT Shelf

| | |
|---|---|
| Groups | "GROUP Shelf Provisioned (Prov)"<br>"GROUP Shelf Operational (Oper)" |
| Scope | Device |
| Description | *Shelf*<br>There is one *Shelf* component per module. It is the parent component of the hardware components (which include *Card* and *Bus* components). |
| Subcomponents | "COMPONENT Shelf Test" |
| Opt. Subcomp. | "COMPONENT Shelf Card" |
| Dyn. Subcomp. | "COMPONENT Shelf Bus"<br>"COMPONENT Shelf FabricCard" |
| Common Verbs | Help<br>List<br>Display |

## VERB RESET Shelf

| | |
|---|---|
| Impact | Service |
| Description | This command is used to simultaneously reset all processor cards on the shelf. The system behaves as if the shelf had just been powered on. |

## VERB RESTART Shelf

| | |
|---|---|
| Impact | Service |
| Description | This command restarts all processor cards on the shelf. A processor card restart reinitializes the software, making the card behave as if it has just been reloaded. |

## GROUP Shelf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Shelf* component. |

## ATTRIBUTE Shelf commentText (text)

| | |
|---|---|
| Access | Read and write |
| Description | This is an arbitrary string that can be used to specify the location of the module. It is not used by the system. |
| Values | String (0..80, ASCII) |
| Default | "" |

## ATTRIBUTE Shelf cpEquipmentProtection

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of Equipment Protection support provided by a spared CP configuration. The valid values are:<br>***hot***, enables delivery of provisioning data to standby CP and on CPSO allows switching to the current view.<br>***cold***, the default value which supports switchover to the committed view.<br><br>When the attribute is set to ***hot***, applications which provide hot or warm CP based services, receive the provisioning data during *activate prov*. The cold CP based services receive the provisioning data during CP switchover, when the standby CP is taking over as active. On CPSO, hot and warm services are activated first followed by the cold services. Hence the activation time of cold services is potentially extended which will increase the service outage, compared to when this attribute is set to ***cold***. |

It is important to note that this attribute does not make any service warm or hot; instead, CP based services are provided the ability to reduce or eliminate call-setup outage due to a CPSO and to ensure stable calls are unaffected by a CPSO.

The standby CP will be reset when the value of this attribute is changed. To set this attribute to ***hot***, the *maxNumberJournalFiles* attribute under the *ProvisioningSystem* component must be set to a value other than ***none***.

Values: cold
hot

Default: cold

### GROUP Shelf Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *Shelf* component.

### ATTRIBUTE Shelf hardwareFailures (hwFailures)

Access: Read only

Description: This attribute indicates which type of components have failed.The hardware's fault detection system can report the following kinds of component failures: card, power converter, cooling unit, terminator card, fan, input power feed or fabric card failures.
***card*** - The passport card has failed.
***powerConverter*** - The power converter has failed.
***coolingUnit*** - The cooling unit has failed.
***terminatorCard*** - The terminator card has failed.
The following types only apply to fabric-based shelf:
***fan*** - The fan has failed.
***inputPowerFeed*** - The input power feed has failed.
***fabricCard*** - The fabric card has failed.

macAddressCard - Mac address card has failed.
alarmBitsCard - Alarm bit card has failed.

Set of
card
powerConverter
coolingUnit
terminatorCard
fan
powerSupply
fabricCard
macAddressCard
alarmBitsCard

Default No default

### ATTRIBUTE Shelf numberOfSlots (slots)

Access Read only

Description This attribute specifies the number of slots for this shelf.

Values Decimal (1..16)

Default No default

### ATTRIBUTE Shelf shelfType

Access Read only

Description This attribute displays the shelf type:
***busBasedShelf***- bus-based backplane shelf.
***fabricBasedShelf***- fabric based backplane shelf.
***fabricBasedV2Shelf***- dual-speed configurable fabric-based backplane shelf.

Values
busBasedShelf
fabricBasedShelf
fabricBasedV2Shelf

Default No default

### ATTRIBUTE Shelf backplaneOperatingMode (backplaneMode)

Access Read only

Description

This attribute indicates the current backplane operating mode. On the fabric-based shelf:
***noFabric*** - No fabric is in service now.
***singleFabricX*** - The shelf is running on fabric X only.
***singleFabricY*** - The shelf is running on fabric Y only.
***dualFabric*** - The shelf is running on fabric X and fabric Y.
***dualFabricDegraded*** - The shelf is running on fabric X and fabric Y with some fabric Ports disabled.
On the bus-based shelf:
***noBus*** - No bus is in service now.
***singleBusX*** - The shelf is running on bus X only.
***singleBusY*** - The shelf is running on bus Y only.
***dualBus*** - The shelf is running on bus X and bus Y

Values

noBus
singleBusX
singleBusY
dualBus
noFabric
singleFabricX
singleFabricY
dualFabric
dualFabricDegraded

Default

No default

### ATTRIBUTE Shelf slotConfiguration (sConf)

Access

Read only

Description

This attribute indicates the slot configuration of the shelf with its associated fabric cards. A value of ***40G*** indicates a configuration in which all slots can accommodate 2.5 Gbit/s cards. A value of ***70G*** indicates a configuration in which all slots can accommodate 2.5 Gbit/s cards, and where slots 6, 7, 14, and 15 can accommodate 10 Gbit/s cards. A value of ***mismatched*** indicates a shelf where the two fabric cards support different configurations. The mismatched configuration should only occur during in-service upgrades. This attribute is not displayed when the attribute shelfType is of type ***busBasedShelf***.

| | |
|---|---|
| Values | mismatched<br>40G<br>70G |
| Default | No default |

## COMPONENT Shelf Card

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Shelf Card Provisioned (Prov)"<br>"GROUP Shelf Card OsiState (State)"<br>"GROUP Shelf Card Operational (Oper)"<br>"GROUP Shelf Card Properties (Prop)"<br>"GROUP Shelf Card Utilization (Util)"<br>"GROUP Shelf Card Capacity (Cap)" |
| Scope | Device |
| Description | *Shelf Card/n*<br>The *Card* component is a subcomponent of the *Shelf* component. There are a maximum of 16 *Card* components defined, one corresponding to each physical card slot. This is necessary in order to be able to reflect which processor card is present in each slot at any time.<br>For a Passport Shelf that does not contain 16 slots, the Card components only need to be defined for each of their physical card slots. This can be accomplished via the StartUp initial provisioning system. It is possible to add a Card component since it may be desirable to move a CP to a Passport Shelf that contains more physical card slots. This CP move would result in adding the provisioning information associated with the other processor cards instead of starting over.<br>It is not possible to delete a Card component, but its type can be changed to "None". |

| | |
|---|---|
| Subcomponents | "COMPONENT Shelf Card Diagnostics (Diag)" |
| Dyn. Subcomp. | "COMPONENT Shelf Card BusTap"<br>"COMPONENT Shelf Card Test"<br>"COMPONENT Shelf Card FabricPort"<br>"COMPONENT Shelf Card SparedServices (SpServ)"<br>"COMPONENT Shelf Card DaughterCard (Dcard)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>LOCK<br>Unlock |

## VERB RESET Shelf Card

| | |
|---|---|
| Impact | Service |
| Description | *Reset Shelf Card/n*<br>*Reset -force Shelf Card/n*<br>This command is used to reset a processor card. Resetting a processor card implies: (1) resetting the hardware (as if the card had just been powered on), (2) performing the card's self-tests, and (3) reloading the software (assuming an LP is configured to run on the card).<br><br>A *Reset* command issued against the CP causes it to reload from the committed provisioning data file.<br><br>A *Reset* command issued against an FP causes it to reload the same software it was already running. This is the software load that is derived from the provisioning data in the CP's current view |

(this may or may not be the committed view).

**Options:**
*-force*
If the card number of the active CP is specified, this option causes the reset to occur against the active cp even if the current or edit view differs from the committed view, or if the standby OAM Ethernet port is not available, or if the standby CP is currently loading the committed provisioning data file. Use of this option would cause the loss of data in any unsaved view, and any FPs running uncommitted data would restart. On any card other than the active CP, -force has no meaning.

### VERB RESTART Shelf Card

Impact: Service

Description:
*Restart Shelf Card/n*
*Restart -force Shelf Card/n*
This command is used to restart a processor card. Restarting a processor card causes the software to reinitialize itself and behave as if it had just been reloaded. A *Restart* command issued against a CP causes it to restart using the committed provisioning data.

**Options:**
*-force*
If the card number of the active CP is specified, this option causes the restart to occur against the active CP even if the current or edit view differs from the committed view, or if the standby OAM Ethernet port is not available, or if the standby CP is currently loading the committed provisioning data file. Use of this option would cause the loss of data in any unsaved view, and any FPs running uncommitted data would restart. On any card other than the active CP, -force has no meaning.

### GROUP Shelf Card Provisioned (Prov)

Properties: Provisioned

Description:
This group contains the provisionable attributes for the Card component.

## ATTRIBUTE Shelf Card cardType (card)

| | |
|---|---|
| Access | Read and write |
| Description | This is the type of card expected in this slot. Specifying a card type here has the effect of configuring a card to run in this slot. A value of ***none*** means that no card is configured to run in this slot. |
| Values | CP<br>V11<br>V35<br>DS1<br>DS1V<br>DS3<br>E1<br>E1V<br>E3<br>none<br>1pFddiMultiMode (FDDI)<br>4pTokenRing (TokenRing)<br>6pEth10BaseT (Ethernet)<br>DS1C<br>E1C<br>3pE3Atm (E3A)<br>3pDS3Atm (DS3A)<br>3pOC3MmAtm (OC3M)<br>3pOC3SmAtm (OC3S)<br>3pE1Atm<br>3pDS1Atm<br>J2MV<br>4pEthAui<br>1pFddiSingleMode<br>1pDS1V<br>1pE1V<br>2pJ6MAtm<br>HSSI<br>8pDS1<br>CFP1<br>DEV1<br>CFP2<br>DEV2<br>4pDS1Aal1 |

### ATTRIBUTE Shelf Card sparingConnection (sc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains the identification of the 1 for N sparing panel group of connectors to which the card is connected. This identification should coincide with the label located on the sparing panel. |
| Values | notApplicable<br>mainA<br>mainB<br>mainC<br>mainD<br>mainE<br>mainF<br>mainG<br>mainH<br>mainI<br>mainJ<br>mainK<br>mainL<br>mainM<br>spare |
| Default | notApplicable |

### ATTRIBUTE Shelf Card commentText (text)

| | |
|---|---|
| Access | Read and write |
| Description | This is an arbitrary string that can be used to specify the location of the sparing panel. |
| Values | String (0..80, ASCII) |
| Default | "" |

### ATTRIBUTE Shelf Card configuredLPs

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This is a read-only attribute that shows which LPs are currently configured to run on this card (it is the opposite side of the LP component's *mainCard* and *spareCard* link attributes). Note that there is only one case where more than one LP can be configured to run on a card. This is when the card is configured as an N+1 spare. If this is not the case, the card is configured as a main card or as a 1for1 spare, only one LP can appear in this list. |
| List of | Link |
| List Size | 16 |
| Default | No default |

### GROUP Shelf Card OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Shelf Card adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Shelf Card operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Shelf Card usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Shelf Card availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is

unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Shelf Card proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Shelf Card controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

| | |
|---|---|
| | The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Shelf Card alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. |

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Shelf Card standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Shelf Card unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Shelf Card Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that reflect the current status of the card. |

### ATTRIBUTE Shelf Card failureCause

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates why the card has failed. This attribute is meaningful when the OSI *AvailabilityStatus* attribute is set to ***failed***.<br>***none*** - The card is operational.<br>***wrongCardType*** - The wrong card type has been inserted.<br>***notConfigured*** - The card is not configured.<br>***cannotLoadSoftware*** - The card can not load software.<br>***failedSelfTests*** - The card failed itself test.<br>***notResponding*** - The card is not responding.<br>***backplaneConnectivityProblem*** - The card is not properly connected to the backplane.<br>***unsupportedPecCode*** - The card with unsupported PEC code is inserted. |

| | |
|---|---|
| Values | none<br>wrongCardType<br>notConfigured<br>cannotLoadSoftware<br>failedSelfTests<br>notResponding<br>backplaneConnectivityProblem<br>unsupportedPecCode |
| Default | No default |

### ATTRIBUTE Shelf Card selfTestFault

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the result of the processor card's self-tests that were performed when it initially came up. |
| Values | none |
| Default | No default |

### ATTRIBUTE Shelf Card sparingConnectionStatus (scstat)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the control signal received from a 1forN sparing panel or a 1for1 sparing panel is properly terminated.<br>***notApplicable*** - The card is not provisioned as part of a sparing configuration, and is not connected to any sparing panel.<br>***1for1Ok*** -The card is provisioned correctly for 1for1 sparing and is connected to the active relay of a 1for1 sparing panel.<br>***1forNOk*** -The card is provisioned correctly for either 1for1 or 1forN sparing and is connected to either the standby or active relay of a 1forN sparing panel.<br>***unconfirmed*** -The card is provisioned as part of a sparing configuration, but its connection status cannot be determined. This is expected for the standby card in a 1for1 sparing configuration.<br>To determine if the card is connected to a sparing panel, perform a switchover of the LP to see if the card will grab a relay when it is active. If the card has grabbed the relay, the sparing connection status should change from, ***unconfirmed***, to ***1for1Ok*** and the LED on the sparing panel corresponding to that relay should be |

illuminated.
Please note: Performing the switchover will disrupt traffic on the other card and this test should be conducted when no traffic is running on the active card.
***notConnected*** - The card is provisioned as part of a sparing configuration, but is not connected to a sparing panel.
Remedial Action: Check the cable connectivity between the card and the sparing panel.
***incorrectlyConnected*** - The card is provisioned as part of a sparing configuration, but is connected to the wrong port on a 1forN panel, or is connected to a 1for1 sparing panel while configured for 1forN.
Remedial Action: Connect the cable to the port that was specified by the *sparingConnection* attribute.
***inconsistentlyConnected*** - The card is provisioned as part of a 1forN sparing configuration, but is connected to a sparing panel which is not the same as the other cards sharing the same spare card.
Remedial Action: Ensure all cards that share the same spare card are connected to the same sparing panel.
This value is also used to indicate that two sparing panels with the same sparing panel IDs are being used by cards on the same shelf.
Remedial Action: Replace one of the sparing panels with another panel that has a different sparing panel ID. Sparing panel IDs are assigned at the time of manufacture and cannot be changed by the user.

Values
notApplicable
1for1Ok
1forNOk
unconfirmed
notConnected
incorrectlyConnected
inconsistentlyConnected

Default
No default

### ATTRIBUTE Shelf Card hardwareAlarm (hwAlarm)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates whether and why the card is generating a hardware alarm. |
| Values | none<br>batteryFeedFailure |
| Default | No default |

### ATTRIBUTE Shelf Card currentLP

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates which LPs are currently associated with this card. A card configured as a 1forN spare may be associated with more than one LP. |
| List of | The name of the component |
| List Size | 16 |
| Default | No default |

### GROUP Shelf Card Properties (Prop)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that specify the fixed characteristics of the card. |

### ATTRIBUTE Shelf Card insertedCardType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of card that is currently inserted in this slot. A value of ***none*** means that no card is configured to run in this slot. A value of ***unsupported*** means that the card type of the inserted card was not recognized and that this type of card is therefore not supported with the current release of software. |

### ATTRIBUTE Shelf Card pmRevisionCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the hardware revision level of the Processor Module (PM). |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE Shelf Card imRevisionCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the hardware revision level of the Interface Module (IM). |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE Shelf Card serialNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor card's serial number. |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE Shelf Card activeFirmwareVersion

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the firmware version of the currently active flash memory bank. |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE Shelf Card inactiveFirmwareVersion

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the firmware version of the currently inactive flash memory bank. |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE Shelf Card productCode (prc)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the product ordering code and release of the card. |
| Values | String (0..12, ASCII) |
| Default | No default |

### GROUP Shelf Card Utilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that specify the processor's utilization levels. When this group exists for an LP component, the attributes are representative of the active card. |

### ATTRIBUTE Shelf Card timeInterval

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time period (in minutes) for which the average, minimum and maximum utilization values are calculated. This attribute is reset to 0 every 15 minutes. |
| Values | Decimal (0..15) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Shelf Card cpuUtil

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates an approximation of the current processor utilization level (expressed as a percentage). |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Shelf Card cpuUtilAvg

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates an average processor utilization level over the specified time period, *timeInterval*. This average is calculated based on one minute CPU utilization averages. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Shelf Card cpuUtilAvgMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum processor utilization level over a specified time period, *timeInterval*. This is based on one minute CPU utilization averages. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Shelf Card cpuUtilAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum processor utilization level over a specified time period, *timeInterval*. This is based on one minute CPU utilization averages. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Shelf Card sharedMsgBlockUsage

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's current shared message block memory utilization. |
| Values | Decimal (0..2147483647) |

| | |
|---|---|
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Shelf Card sharedMsgBlockUsageAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's average memory utilization of shared message blocks, calculated over a specified time period, *timeInterval*. This utilization value is calculated using 15 second samples. At the start of each *timeInterval*, this average memory utilization is reset to the current usage, *sharedMsgBlockUsage*. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Shelf Card sharedMsgBlockUsageAvgMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's minimum memory utilization of shared message blocks, calculated over a specified time period, *timeInterval*. This utilization value is calculated using 15 second samples. At the start of each *timeInterval*, this minimum memory utilization is reset to the current usage, *sharedMsgBlockUsage*. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Shelf Card sharedMsgBlockUsageAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's maximum memory utilization of shared message blocks, calculated over a specified time period, *timeInterval*. This utilization value is calculated using 15 second samples. At the start of each *timeInterval*, this |

| | |
|---|---|
| | maximum memory utilization is reset to the current usage, *sharedMsgBlockUsage*. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Shelf Card localMsgBlockUsage

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's current memory utilization of message blocks which are used for local messaging on the card. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Shelf Card localMsgBlockUsageAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's average memory utilization of message blocks used for local messaging on the card, calculated over a specified time period, *timeInterval*. This utilization value is calculated using 15 second samples. At the start of each *timeInterval*, this average memory utilization is reset to the current usage, *localMsgBlockUsage.* |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Shelf Card localMsgBlockUsageMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's minimum memory utilization of message blocks used for local messaging on the card, calculated over a specified time period, *timeInterval*. This |

| | |
|---|---|
| | utilization value is updated at 15 second intervals. At the start of each *timeInterval*, this minimum memory utilization is reset to the current usage, *localMsgBlockUsage*. |

## COMPONENT Shelf Card BusTap

| | |
|---|---|
| Instance | x<br>y |
| Groups | "GROUP Shelf Card BusTap OsiState (State)"<br>"GROUP Shelf Card BusTap Operational (Oper)"<br>"GROUP Shelf Card BusTap Errors" |
| Scope | Device |
| Description | *Shelf Card/n BusTap/b*<br>A *BusTap* component represents a physical bus tap on a card. A bus tap is a card's interface to a bus; it provides a pathway for the card to send cells over the bus to the other cards in the module, and to receive cells sent to it over the bus by the other cards in the module.<br>A card's *BusTap* components are created automatically whenever the card begins acting as an active or standby LP, and remain in existence as long as the card remains operational; *BusTap* components cannot be added or deleted. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Shelf Card BusTap OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Shelf Card BusTap adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Shelf Card BusTap operationalState (osiOper)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Shelf Card BusTap usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Shelf Card BusTap availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Shelf Card BusTap proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Shelf Card BusTap controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Shelf Card BusTap alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Shelf Card BusTap standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Shelf Card BusTap unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Shelf Card BusTap Operational (Oper)

Properties
Operational

Description
This attribute group contains operational attributes of a bus tap. This information outlines what the bus tap is doing and why it is doing it, and is primarily intended for use in diagnosing the cause of a bus-related problem reported by the module.

### ATTRIBUTE Shelf Card BusTap failuresInEffect

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the hardware problems that prevent the bus tap from using the associated bus. It may contain any combination of the following values.<br>***selfTest***: the bus tap has failed its self-test<br>***clockSignal***: the bus tap is not receiving clock signals from the bus<br>***parityError***: the bus tap has detected too many parity errors on the bus |
| Set of | selfTest<br>clockSignal<br>parityError |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap dependenciesInEffect

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the non-hardware problems that prevent the bus tap from using the associated bus. It may contain any combination of the following values.<br>***busLocked***: the bus is locked<br>***busDisabled***: the bus is disabled |
| Set of | busLocked<br>busDisabled |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap cardsAvailable

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the slot numbers of the cards that the bus tap considers available on the bus—that is, the cards that have an operational bus tap connected to the bus. The value of this attribute is determined automatically by the bus tap by monitoring signals generated by each bus tap on the bus; it cannot be changed by the operator. Normally, every card in the module signals its availability on both buses; if a card does not signal its |

availability on a bus this indicates that the card is not present or that its bus tap has failed. By examining this attribute for both of a card's *BusTap* components, it is possible to determine which cards are present in the module and which buses each can use. Note: If *failuresInEffect* contains either ***selfTest*** or ***clockSignal*** the bus tap is unable to monitor the availability of the bus taps on the bus; *cardsAvailable* will indicate that no bus taps are available on the bus.

Set of: Decimal (0..15)

Default: No default

### ATTRIBUTE Shelf Card BusTap cardsTxTo

Access: Read only

Description: This attribute records the slot numbers of the cards which the bus tap is currently configured to transmit cells to. This configuration is managed automatically, and cannot be changed by the operator. By examining this attribute for both of a card's *BusTap* components, it is possible to determine which bus (if any) the card uses when it needs to transmits cells to a specific card in the module.

Set of: Decimal (0..15)

Default: No default

### GROUP Shelf Card BusTap Errors

Properties: Operational

Description: This attribute group records errors that the bus tap has detected since the card was last rebooted. This information is intended for use in detecting and diagnosing bus-related problems within a module.

### ATTRIBUTE Shelf Card BusTap selfTestErrorCode

Access: Read only

Description: This attribute records the error code generated by the most recent self-test of the bus tap. The value zero indicates that the self-test was successful. A non-zero value indicates that the self-test

failed, and is used by the service technician when a defective card is returned for repair.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap clockErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of times that the bus tap has detected a loss of the fundamental clock signal used by the bus. Each occurrence may result in the loss of one or more cells or frames. This type of event may occur during normal operation of the module, for example when switching from one of the bus's clock sources to the other; it may also be caused by a hardware fault.<br>The attribute's value wraps around to zero when it exceeds the maximum permitted value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap endOfCellErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of times that the bus tap has detected a loss of the end-of-cell timing signal used by the bus. Each occurrence may result in the loss of one or more cells or frames. This type of event may occur during normal operation of the module, for example switching the bus's clock source from one card to another; it may also be caused by a hardware fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap parityErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute records the number of times that the bus tap has detected a cell with invalid parity on the bus. Each occurrence may result in the loss of one or more cells or frames. This type of event may occur during normal operation of the module, for example when a card is inserted, removed, or reboots; it may also be caused by a hardware fault.<br>The attribute's value wraps around to zero when it exceeds the maximum permitted value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap frmCongestionErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of times that the bus tap was unable to receive a frame from the bus because all of its bus receive channels were in use. Each occurrence results in the loss of the frame. This type of event may occur during normal operation of the module, for example when the module is operating in single bus mode; it may also be caused by a hardware fault.<br>The attribute's value wraps around to zero when it exceeds the maximum permitted value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap frmCollisionErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of times that the bus tap was unable to receive a frame from the bus because it did not receive the last cell of the frame before the first cell of the following frame from the same source. Each occurrence results in the loss of both frames. This type of event may occur during normal operation of the module, for example when a card reboots; it may also be caused by a hardware fault.<br>The attribute's value wraps around to zero when it exceeds the maximum permitted value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap frmTimeoutErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of times that the bus tap was unable to receive a frame from the bus because the delay between two successive cells in that frame exceeded the maximum allowable duration. Each occurrence results in the loss of the frame. This type of event may occur during normal operation of the module, for example when the module changes bus mode; it may also be caused by a hardware fault.<br>The attribute's value wraps around to zero when it exceeds the maximum permitted value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap frmDeliveryErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of times that the bus tap was unable to receive a frame from the bus because it was destined for a bus transmit queue; that is, the frame would have been immediately retransmitted over a bus. Each occurrence results in the loss of the frame. This type of event should never occur during normal operation of the module and indicates the occurrence of a hardware or software fault.<br>The attribute's value wraps around to zero when it exceeds the maximum permitted value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card BusTap frmSizeErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute records the number of times that the bus tap was unable to receive a frame from the bus because it required more than 255 blocks of shared memory. Each occurrence results in the loss of the frame. This type of event should never occur during normal operation of the module and indicates improper configuration of the card or the occurrence of a hardware or software fault.<br>The attribute's value wraps around to zero when it exceeds the maximum permitted value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Shelf Card Test

| | |
|---|---|
| Groups | "GROUP Shelf Card Test OsiState (State)"<br>"GROUP Shelf Card Test Setup"<br>"GROUP Shelf Card Test Results" |
| Scope | Device |
| Description | *Shelf Card/n Test*<br>This component is used to verify the operation of a module's cards. A card test may be run when new hardware or services are commissioned, as part of a routine maintenance program, or to diagnose the cause of card- or bus-related problems. The *Test* component is created automatically for each card that is running as an active or standby LP; *Test* components cannot be added or deleted.<br><br>A card test allows the operator to stress test new or existing cards under controlled conditions. The test circulates frames over the Passport bus between the card under test and a distinct "target card", thereby exercising both cards and consuming bus bandwidth. The test frames follow the same route to their destination as normal frames. If the Passport node is in dual bus mode, each card test that is activated consumes bandwidth from both backplane buses in equal amounts; if the module is in single bus mode, only the bus in service is utilized.<br><br>The test frames generated by the card under test are grouped into two independent streams. |

1) The loading frame stream circulates a set of “loading frames” between the card under test and the target card as rapidly as possible. The intent of this stream is to verify the operation of the cards and the backplane buses under a controlled load.
2) The verification stream transmits a series of “verification frames” from the card under test to the target card; as each frame is returned, its contents are verified and the next verification frame in the series is transmitted. The intent of this stream is to verify that frames are not being corrupted during transfer from card to card.
The card test can be configured to send frames from either or both streams. The priority, size, and content of the test frames can also be controlled.

Each card in Passport can run the card test independently. The operator can run the card test on any subset of the cards simultaneously and can specify different test frame configurations for each test. It is also possible for a card to act as the target card for more than one card under test, and for a card to act as a target card while it is itself under test. The flexibility provided by the card test allows the operator to tailor a set of card tests according to the testing to be performed.

Common Verbs

Help

Display

## VERB START Shelf Card Test

Impact

Service

Description

*Start Shelf Card/n Test*
This verb initiates the card test. If the card test is already running, the command has no effect and the test continues. The *Test* component on the target card must exist before the test can be run.

### VERB STOP Shelf Card Test

| | |
|---|---|
| Impact | Service |
| Description | *STOP Shelf Card/n Test*<br>This verb terminates the card test. If the card test is not running, the command has no effect. |

### GROUP Shelf Card Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Shelf Card Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE Shelf Card Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |

### ATTRIBUTE Shelf Card Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Shelf Card Test Setup

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the attributes that govern the operation of a card test. These attributes cannot be changed while a card test is running. |

### ATTRIBUTE Shelf Card Test targetCard (card)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the slot number of the card to which frames are sent during the card test. There is no single default value for this attribute—it defaults to the slot number of the *Test* component's own card and must be changed to a different value before the test can be started. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Shelf Card Test frmTypes (types)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the types of frames that are sent during the card test. It must contain at least one of the following values.<br>***loading***: A set of "loading frames" is circulated between the *Test* component and the *Test* component on the target card as rapidly as possible. This frame type should be selected when the test is intended to verify the operation of the cards and the backplane buses under a specified load.<br>***verification***: A single "verification frame" is transmitted to the *Test* component on the target card; when the frame is returned, its contents are verified and the next verification frame in the series is transmitted. This frame type should be selected when the test is intended to verify that frames are not being corrupted as they pass from card to card. |
| Set of | loading<br>verification |
| Default | (loading, verification) |

### ATTRIBUTE Shelf Card Test frmPriorities (priorities)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the priorities of the frames that are sent during the card test. It must contain at least one of the following values.<br>***lowPriority***: Low priority frames are sent.<br>***highPriority***: High priority frames are sent. |
| Set of | lowPriority<br>highPriority |
| Default | (lowPriority) |

### ATTRIBUTE Shelf Card Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the bit sequence to fill the frames used in the card test. It must contain one of the following values.<br>***ccitt32kBitPattern***: a pseudo-random sequence of 32 Kbit is used<br>***ccitt8MBitPattern***: a pseudo-random sequence of 8 Mbit is used<br>***customizedPattern***: the pattern defined by the *customizedPattern* attribute is used |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Shelf Card Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a 32 bit sequence used to fill frames when the *framePatternType* attribute has a value of ***customizedPattern***. The default value gives a pattern of alternating 0 and 1 bits. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Shelf Card Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum length of time that the card test is allowed to run. The value is expressed in minutes. The maximum allowed value permits the card test to be run for up to 30 days. |
| Values | Decimal (1..43200) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE Shelf Card Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies for each priority level the number of data bytes in each frame sent during the card test. (The value specified does not include the 4-byte header that is automatically added to a frame when it is transmitted over the backplane.) |
| Vector of | Decimal (16..16000) |
| Units | bytes |
| Index | lowPriority<br>highPriority |
| Default | (lowPriority: 1024, highPriority: 56) |

### GROUP Shelf Card Test Results

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the results of the card test that is currently running; if no test is running, the attribute group contains the results of the most recently completed card test. The attributes of the *Results* group are reset to their initial values whenever a card test is started or any attribute of the *Setup* group is set. |

### ATTRIBUTE Shelf Card Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the length of time that the card test has been running. |
| Values | Decimal (0..43200) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Shelf Card Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the maximum length of time that the card test will continue to run before stopping. |
| Values | Decimal (0..43200) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Shelf Card Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the reason the card test ended. It contains one of the following values:<br>***neverStarted***: the card test has not been started.<br>***testRunning***: the card test is currently running.<br>***testTimeExpired***: the card test ran for the specified duration.<br>***stoppedByOperator***: a *Stop* command was issued.<br>***targetFailed***: the target card became non-operational.<br>***becameActive***: the source card became the active card for some LP. |
| Values | neverStarted<br>testRunning<br>testTimeExpired<br>stoppedByOperator<br>targetFailed<br>becameActive |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf Card Test loadingFrmData

| | |
|---|---|
| Access | Read only |
| Description | This attribute records information about the loading frames that have been transmitted to the *Test* component on the target card. The following data is shown for each priority level:<br>— the number of frames that have been transmitted,<br>— the number of frames that were not returned successfully.<br>The attribute's value wraps to zero when they exceed the maximum permitted value.<br><br>Note: A loading frame is considered to have been successfully returned even if it contains bit errors. Frame error statistics are recorded in the *verificationFrmData* attribute. |
| Array of | Decimal (0..4294967295) |
| Row | results [framesSent framesLost] |
| Column | priority [low high] |
| Default | No default |

### ATTRIBUTE Shelf Card Test verificationFrmData

| | |
|---|---|
| Access | Read only |
| Description | This attribute records information about the verification frames that have been transmitted to the *Test* component on the target card. The following data is shown for each priority level:<br>— the number of frames that have been tested,<br>— the number of frames that had incorrect bits when returned.<br>The attribute's values wrap around to zero when they exceed the maximum permitted value.<br><br>Note: Verification frames that are not returned at all, or are returned too late, are considered "lost" and are not counted in either of the above values. Frame loss statistics are recorded in the *loadingFrmData* attribute. |

| | | |
|---|---|---|
| Array of | Decimal (0..4294967295) | |
| Row | results [framesTested framesBad] | |
| Column | priority [low high] | |
| Default | No default | |

## COMPONENT Shelf Card Diagnostics (Diag)

| | |
|---|---|
| Scope | Device |
| Description | Shelf Card/n Diagnostics<br>This component manages all diagnostic information for a specific Card. The diagnostic information under this component are intended to be used by Nortel technical support. |
| Subcomponents | "COMPONENT Shelf Card Diag TrapData"<br>"COMPONENT Shelf Card Diag RecoverableError (RecErr)" |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Shelf Card Diag TrapData

| | |
|---|---|
| Scope | Device |
| Description | Shelf Card/n Diag TrapData<br>On Passport control and function processors, hardware or software detected critical faults are preserved on the card until the power is lost. These critical faults lead to the reboot of the card and the captured trap data survives the rebooting of the card. This component manages trap data stored in the persistent |

memory on the card. The trap data can be retrieved from the card to determine the cause of the fault.

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Shelf Card Diag TrapData Line" |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Shelf Card Diag TrapData Line

| | |
|---|---|
| Instance | Decimal (1..500) |
| Groups | "GROUP Shelf Card Diag TrapData Line Operational (Oper)" |
| Scope | Device |
| Description | *Shelf Card/m Diag TrapData Line/n*<br>This component represents one line of trap data report. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Shelf Card Diag TrapData Line Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains operational attributes for one line of trap data or recoverable error report. |

### ATTRIBUTE Shelf Card Diag TrapData Line data

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains one line of trap data or recoverable error report. |
| Values | String (0..512, Extended ASCII) |
| Default | No default |

### COMPONENT Shelf Card Diag RecoverableError (RecErr)

| | |
|---|---|
| Scope | Device |

| | |
|---|---|
| Description | Shelf Card/n Diag RecoverableError<br>This component manages recoverable errors stored in the persistent memory which are preserved on the card until the power is lost.<br>Recoverable errors do not cause the reboot of a card. Information about the errors can be retrieved from the card to determine the cause of the fault. |
| Dyn. Subcomp. | "COMPONENT Shelf Card Diag RecErr Line" |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Shelf Card Diag RecErr Line

| | |
|---|---|
| Instance | Decimal (1..500) |
| Groups | "GROUP Shelf Card Diag RecErr Line Operational (Oper)" |
| Scope | Device |
| Description | *Shelf Card/m Diag RecErr Line/n*<br>This component represents one line of recoverable error report. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Shelf Card Diag RecErr Line Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains operational attributes for one line of trap data or recoverable error report. |

## ATTRIBUTE Shelf Card Diag RecErr Line data

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains one line of trap data or recoverable error report. |
| Values | String (0..512, Extended ASCII) |

| | |
|---|---|
| Default | No default |

## COMPONENT Shelf Card FabricPort

| | |
|---|---|
| Instance | x<br>y |
| Groups | "GROUP Shelf Card FabricPort OsiState (State)"<br>"GROUP Shelf Card FabricPort Operational (Oper)"<br>"GROUP Shelf Card FabricPort Errors" |
| Scope | Device |
| Description | *Shelf Card/n FabricPort/f*<br>This component represents a physical fabric port on a card. A fabric port is a card's interface to a fabric card; it provides a pathway for the card to send cells over the fabric card to the other cards in the module, and to receive cells sent to it over the fabric card by the other cards in the module.<br><br>A card's *FabricPort* components are created automatically whenever the card begins acting as an active or standby LP. They remain in existence as long as the card remains operational. *FabricPort* components cannot be added or deleted. |
| Dyn. Subcomp. | "COMPONENT Shelf Card FabricPort Test" |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## GROUP Shelf Card FabricPort OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific |

information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Shelf Card FabricPort adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Shelf Card FabricPort operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Shelf Card FabricPort usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Shelf Card FabricPort availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Shelf Card FabricPort proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Shelf Card FabricPort controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Shelf Card FabricPort alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms

may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Shelf Card FabricPort standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Shelf Card FabricPort unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Shelf Card FabricPort Operational (Oper)

Properties
Operational

Description
This attribute group contains operational attributes of a fabric port. This information outlines what the fabric port is doing and why it is doing it. It is primarily intended for use in diagnosing the cause of a fabric-related problem reported by the module.

### ATTRIBUTE Shelf Card FabricPort failuresInEffect

Access
Read only

Description
This attribute indicates the failures that prevent the fabric port from using the associated fabric. It may contain any combination of the following values:

***selfTest***: The port has failed its self-test.
***hardwareError***: An unrecoverable critical error has occurred on the hardware of the processor card which exchanges cells with fabric card.
***portProtocolError:*** Errors have occurred which violate the protocol between components of the fabric port in datapath.
***switchClockError***: The fabric card clock is no longer detected by the processor card.
***livelinessError***: A non-fatal hardware error has occurred on the component which exchanges cells with the fabric card. Excessive numbers of these errors on the fabric port may be indicating a serious hardware problem.
***dataCorruptionError:*** Cell payloads or headers are detected as being corrupted at the fabric port level.
***linkLivelinessError:*** The link between the fabric port and the fabric card is not indicating liveliness.

**Operator action**: Run the fabric test to clear these errors.

Set of

selfTest
hardwareError
portProtocolError
switchClockError
livelinessError
dataCorruptionError
linkLivelinessError

Default

No default

## ATTRIBUTE Shelf Card FabricPort dependenciesInEffect

Access

Read only

Description

This attribute indicates the non-hardware problems that prevent the fabric port from using the associated fabric. It may be a combination of the following values:
***fabricLocked***: The fabric card is locked.
***fabricDisabled***: The fabric card is disabled.
***portDisabled***: The corresponding card port on the fabric is disabled.

| | |
|---|---|
| Set of | fabricLocked<br>fabricDisabled<br>portDisabled |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort cardsAvailable

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the slot numbers of the cards that the fabric port considers available through the fabric; that is, the cards that have an operational port connected to the fabric. The value of this attribute is determined automatically by the fabric port by monitoring signals generated by each fabric port connected to the fabric card. Normally, every card in the module signals its availability on both fabrics. If a card does not signal its availability on a fabric, then the card is not present or its fabric port has failed. By examining this attribute for both of a card's *FabricPort* components, it is possible to determine which cards are present in the module and which fabric each can use.<br><br>Note: If *failuresInEffect* has a value of ***selfTest***, ***signalLoss***, ***synchronizationLoss***, or ***protocolError***, the fabric port is unable to monitor the availability of the fabric ports on the fabric. In such cases, *cardsAvailable* indicates that no fabric port is available on the fabric. |
| Set of | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort cardsTxTo

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the slot number of the cards to which the fabric port is currently configured to transmit cells. This configuration is managed automatically, and cannot be changed by the operator. By examining this attribute for both of a card's *FabricPort* components, it is possible to determine which fabric |

(if any) the card uses when it needs to transmits cells to a specific card in the module.

Set of: Decimal (0..15)

Default: No default

### GROUP Shelf Card FabricPort Errors

Properties: Operational

Description: This attribute group indicates errors that the fabric port has detected since the card was last rebooted. This information is intended for use in detecting and diagnosing fabric-related problems within a module.

### ATTRIBUTE Shelf Card FabricPort selfTestErrorCode

Access: Read only

Description: This attribute indicates the error code generated by the most recent self-test of the port. Zero indicates that the self-test was successful. A non-zero value indicates that the self-test failed. This information is used by the service technician when a defective card is returned for repair.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Shelf Card FabricPort livelinessErrors

Access: Read only

Description: This attribute counts the liveliness errors detected on the port. Liveliness errors are failures to receive yellow cells within a certain period of time. The value wraps to zero when it exceeds the maximum value.

*Note*: **Yellow cells** are special types of packets which are generated by the fabric port and detected by the fabric card and the fabric port in order to check the link liveness with the fabric card.

Values: Decimal (0..4294967295)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort switchClockErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the clock errors which have occurred on this port. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort portHardwareErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the errors which have occurred on the hardware which exchanges cells with the fabric card. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort portProtocolErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of errors which affect the protocol between components of the fabric port datapath. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort dataCorruptionErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the errors which have occurred on the corrupted cell payloads or headers at fabric port level. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort linkLivelinessErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the errors which occurred on the link between the fabric port and the fabric card. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Shelf Card FabricPort Test

| | |
|---|---|
| Groups | "GROUP Shelf Card FabricPort Test OsiState (State)"<br>"GROUP Shelf Card FabricPort Test Setup"<br>"GROUP Shelf Card FabricPort Test Results" |
| Scope | Device |
| Description | *Shelf Card/n Fabric/f Test*<br>This component is used to verify the operation of a fabric port. A fabric port test may be run as part of a regular maintenance program or to diagnose the cause of a *FabricPort*-related problem. The *Test* component is created automatically, and cannot be added or deleted.<br><br>The fabric port test ensures that the fabric port on a specific card is functioning properly at minimal utilization rates. The fabric port to be tested must be locked while testing is in progress. The test only involves the fabric port on the specified card. The results of the test can help to determine which portions of the fabric port system are faulty, if any.<br><br>A fabric port test comprises several different tests. The tests are performed in the following order:<br><br>**port test:** The fabric port selfTest<br><br>**broadcast test:** The fabric port ensures that it can receive a broadcast frame over the fabric card from every operational card (including itself). |

**ping test:** The fabric port ensures that it can receive a low priority non-broadcast frame over the backplane from every operational card (including itself).

Once all of the tests have been performed, the ping test is repeated continuously until the fabric port test is terminated; this repetition helps to detect transient fabric card and fabric port faults. The fabric port test stops automatically after a specified time interval, or if it detects a port test failure, or a broadcast test failure.

Common Verbs

Help
List
Display

### VERB START Shelf Card FabricPort Test

Impact: Service

Description: *Start Shelf Card/n Fabric/f Test*
This verb initiates the fabric port test. If the fabric port test is already running, the command has no effect and the test continues. The fabric port must be locked before the test can be run.

### VERB STOP Shelf Card FabricPort Test

Impact: Service

Description: *Stop Shelf Card/n Fabric/f Test*
This verb terminates the fabric port test. If the fabric port test is not running, the command has no effect.

### GROUP Shelf Card FabricPort Test OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Shelf Card FabricPort Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Shelf Card FabricPort Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Shelf Card FabricPort Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Shelf Card FabricPort Test Setup

Properties
Operational

Description
This attribute group contains the attributes that govern the operation of a fabric card or fabric port test. These attributes cannot be changed while the fabric card or fabric port test is running.

### ATTRIBUTE Shelf Card FabricPort Test duration

Access
Read and write

Description
This attribute specifies the maximum length of time that the fabric card test is allowed to run. The maximum allowed value permits the fabric card test to be run for up to 30 days.

| | |
|---|---|
| Values | Decimal (1..43200) |
| Units | minutes |
| Default | 2 |

### ATTRIBUTE Shelf Card FabricPort Test type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of the test to be run.<br><br>When this attribute is set to ***main***, a subsequent fabric card test verifies that the fabric ports on this card and the corresponding cards ports are functioning properly.<br><br>When this attribute is set to ***scbPoll***, a subsequent fabric card test exercises all the secondary control bus (SCB) bus taps in the system corresponding to the fabric card under test. |
| Values | main<br>scbPoll |
| Default | main |

### GROUP Shelf Card FabricPort Test Results

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the results of the fabric port test that is currently running; if no fabric port test is running, the attribute group contains the results of the most recently completed fabric port test. The attributes of the *Results* group are reset to their initial values, whenever a fabric card test is started or any attribute in the *Setup* group is set |

### ATTRIBUTE Shelf Card FabricPort Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time that the fabric port test has been running. |
| Values | Decimal (0..43200) |
| Units | minutes |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum length of time that the fabric port test runs before stopping. |
| Values | Decimal (0..43200) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason the fabric port test ended. It contains one of the following values:<br>***neverStarted***: The fabric port test has not been started.<br>***testRunning***: The fabric port test is currently running.<br>***testTimeExpired***: The fabric port test ran for the specified duration.<br>***stoppedByOperator*:** A *Stop* command was issued.<br>***portTestFailure***: A failure was detected during the port test.<br>***fabricSelfTestFailure*:** A failure was detected during the fabric self test.<br>***broadcastFailure***: A failure was detected during the broadcast test. |
| Values | neverStarted<br>testRunning<br>testTimeExpired<br>stoppedByOperator<br>portTestFailure<br>fabricSelfTestFailure<br>broadcastFailure |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort Test testsDone

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the tests that have been performed during the fabric port test. It contains zero or more of the following values:<br>***portTest***: The port test has been performed.<br>***broadcastTest***: The broadcast test has been performed.<br>***pingTest***: At least one ping test has been performed. |
| Set of | portTest<br>broadcastTest<br>pingTest |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort Test portTestResults

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the results of the fabric port tested. The entry contains one of the following values.<br>**+**: the port passed its test<br>***X***: the port failed its test<br>**.**: the port was not tested<br>The fabric port test terminates automatically if a failure is detected. |
| Values | + (pass)<br>X (fail)<br>. (noTest) |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort Test broadcastPortTestResults

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the results of the broadcast test of this fabric port. This test verifies that the fabric port can send a broadcast message to other operational cards in the shelf. The entry contains one of the following values.<br>**+**: a broadcast message was successfully sent from the transmitting fabric port to the receiving fabric port<br>***X***: a broadcast message was not successfully sent from the transmitting fabric port to the receiving fabric port<br>**.**: the associated pair of fabric ports was not tested |

| | |
|---|---|
| | The fabric port test terminates automatically if a failure is detected. |
| Vector of | + (pass)<br>X (fail)<br>. (noTest) |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort Test pingTests

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ping tests performed. Each test attempts to transmit a single low-priority frame from this fabric port to the fabric ports of other operational cards in the shelf. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Shelf Card FabricPort Test pingTestFailures (pingFailures)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ping test failures detected. Each failure represents a single low-priority frame that was not successfully transmitted from the fabric port to the fabric ports of other operational cards in the shelf. The fabric port test does *not* terminate automatically if a failure is detected. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (0..15) |
| Default | No default |

### COMPONENT Shelf Card SparedServices (SpServ)

| | |
|---|---|
| Groups | "GROUP Shelf Card SpServ OsiState (State)" |
| Scope | Application |

Description

*Shelf Card/n SparedServices*
This component represents the rolled-up view of spared services which exist on the parent *Card*. The existence of this component is dependent on whether the parent *Card* has a mate *Card*, either in a single LP or multi-LP sparing configuration.

The spared services themselves may be providing service or they may be operating in a standby mode. For an FP, the standby mode (cold or hot) is dependent on the applications present on the *Lp* component linked to the parent *Card* component. For an CP, the standby mode (cold or hot) is dependent on the provisioning of the *cpEquipmentProtection* attribute in the *Shelf* component. If *cpEquipmentProtection* is provisioned as ***hot/cold***, then the standby mode of the spared services for the standby CP is hot/cold respectively.

The *SparedServices* component itself reflects the overall sparing status via its OSI *operationalState*, *availabilityStatus*, and *standbyStatus* attributes.

An *operationalState* of ***enabled*** on a card with active service instances, indicates that the spared services are configured and running. On a card with standby service instances, ***enabled*** indicates that they are able to take over from the active instances if the corresponding card fails.

An *operationalState* of ***disabled*** indicates that spared services are configured but are not yet running on this card. Also, on the card with standby instances of spared services, this state is entered while an activation is in progress for any components (spared service instances or any other components, for that matter) on the card. For the standby CP, this state can also be entered if the *journaling* attribute in the *ProvisioningSystem* component becomes operationally ***disabled***. If Switchover occurs in this ***disabled*** state, then the *standby card* will reset before taking over for the *active card*. If *CP Switchover* occurs in this ***disabled*** state when the *standbyStatus* is ***hotStandby***, then the whole shelf will be reset.

An empty value for the *availabilityStatus* indicates that all instances of spared services are either providing service or are

ready to take over with their normal level of switchover support, as indicated by the *standbyStatus* attribute.

An *availabilityStatus* of ***degraded*** indicates that at least one standby service instance is not ready to take over with its normal level of switchover support. This value is valid only when the *standbyStatus* attribute has a value of ***hotStandby***. Refer to alarms from the *Shelf Card SparedServices* component to determine specific applications and their problems. For the standby CP, the value of *availailityStatus* attribute can be ***degraded*** when the file systems are out of synchronization, or when the *Provisioning* system has not finished synchronizing the active CP's configuration data. Note that ***degraded*** can appear even when the value of the *operationalState* attribute is ***disabled*** due to an activation.

A *standbyStatus* of ***providingService*** indicates that all spared service instances are active.

A *standbyStatus* of ***coldStandby*** indicates that all spared service instances are standby, and the normal or expected level of switchover support for the current combination of services on this card is cold. That is, there can be extended service outage on a switchover.

A *standbyStatus* of ***hotStandby*** indicates that all spared service instances are standby, and the normal or expected level of switchover support on an FP is either warm or hot, depending on the applications involved. That is, there is no service outage on switchover for the applications that are hot, and minimal service outage for the applications which are warm. The normal or expected level of switchover support on an CP is application dependent. Some applications can have warm or hot switchover support, other applications can have cold switchover support.

## GROUP Shelf Card SpServ OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Shelf Card SpServ adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Shelf Card SpServ operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Shelf Card SpServ usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Shelf Card SpServ availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

### ATTRIBUTE Shelf Card SpServ proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Shelf Card SpServ alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Shelf Card SpServ standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Shelf Card SpServ unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### COMPONENT Shelf Card DaughterCard (Dcard)

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Shelf Bus alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Shelf Bus standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Shelf Bus unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Shelf Bus Operational (Oper)

Properties
Operational

Description
This attribute group contains operational attributes of a bus.

### ATTRIBUTE Shelf Bus clockSource

Access
Read only

| | |
|---|---|
| Description | This attribute records the source of the fundamental clock signal and end-of-cell synchronization signal used by the bus. It contains one of the following values.<br>***activeCP***: the card which is the active control processor (CP) is providing clock signals<br>***alternate***: the card at the opposite end of the module from the active CP is providing clock signals |
| Values | activeCP<br>alternate |
| Default | No default |

### ATTRIBUTE Shelf Bus utilization

| | |
|---|---|
| Access | Read only |
| Description | This attribute records how much of the available bus bandwidth was actually used during the most recently sampled 1 second interval. The value is expressed as a percentage. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Shelf Bus busTapStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the operability of each bus tap on the bus, as reported by the associated *BusTap* component; the entries are indexed by slot number of the card. Each entry contains one of the following values.<br>***ok***: the bus tap is operational<br>***failed***: the bus tap has failed<br>***none***: the bus tap status is not available—the associated *BusTap* component does not currently exist |
| Vector of | ok<br>failed<br>none |
| Index | Decimal (0..15) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf Bus clockSourceStatus

| | |
|---|---|
| Access | Read only |
| Description | This vector attribute, indexed with ***activeCP*** or ***alternate***, represents the state of the bus clock sources. It can be set to one of the following values:<br>***ok***: all operational cards can receive signals from the clock source.<br>***failed***: at least one operational card is unable to receive signals from the clock source.<br>***unknown***: status of a clock source is unknown. To determine the status of the clock source, a test must be run.<br>***testInProgress***: the clock source is currently being tested.<br>***notApplicable***: the LP state of the clock source's card is down or not provisioned. |
| Vector of | ok<br>failed<br>unknown<br>testInProgress<br>notApplicable |
| Index | activeCP<br>alternate |
| Default | No default |

### COMPONENT Shelf Bus Test

| | |
|---|---|
| Groups | "GROUP Shelf Bus Test OsiState (State)"<br>"GROUP Shelf Bus Test Setup"<br>"GROUP Shelf Bus Test Results" |
| Scope | Device |
| Description | *Shelf Bus/b Test*<br>The *Test* component is used to verify the operation of a bus. A bus test may be run as part of a regular maintenance program, or to diagnose the cause of a bus-related problem. The *Test* component is created automatically, and cannot be added or deleted. |

The bus test ensures that the bus taps on a specific bus are functioning properly at minimal utilization rates. The bus to be tested must be locked while testing is in progress. The test only involves bus taps on operational cards (active and standby LPs). If an operational card becomes non-operational or fails to respond during the test, it is dropped from the test and is not allowed to rejoin; however, the results of any tests on its bus tap up to that point are preserved. The results of the test can help to determine which portions of the bus system are faulty, if any.

A bus test is composed of several different tests. The tests are performed in the following order.
1) Bus tap self-test: Each bus tap executes its self-test.
2) Clock source test: Each bus tap ensures that it can receive clock signals from the active control processor clock source and the alternate clock source (if present).
3) Broadcast test: Each bus tap ensures that it can receive a broadcast frame over the backplane from every operational card (including itself).
4) Ping test: Each bus tap ensures that it can receive a low priority non-broadcast frame over the backplane from every operational card (including itself).
Once all of the tests have been performed, the ping test is repeated continuously until the bus test is terminated; this repetition helps to detect transient bus faults. The bus test stops automatically after a specified time interval, or if it detects a bus tap self-test failure, an active control processor clock source test failure, or a broadcast test failure.

Common Verbs

Help
List
Display

### VERB START Shelf Bus Test

| | |
|---|---|
| Impact | Service |
| Description | *START Shelf Bus/b Test*<br>This verb initiates the bus test. If the bus test is already running, the command has no effect and the test continues. The bus must be locked before the test can be run. |

### VERB STOP Shelf Bus Test

| | |
|---|---|
| Impact | Service |
| Description | *STOP Shelf Bus/b Test*<br>This verb terminates the bus test. If the bus test is not running, the command has no effect. |

### GROUP Shelf Bus Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Shelf Bus Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Shelf Bus Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Shelf Bus Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Shelf Bus Test Setup

Properties
Operational

Description
This attribute group contains the attributes that govern the operation of a bus test. These attributes cannot be changed while the bus test is running.

### ATTRIBUTE Shelf Bus Test duration

Access
Read and write

Description
This attribute specifies the maximum length of time that the bus test is allowed to run. The value is expressed in minutes. The maximum allowed value permits the bus test to be run for up to 30 days.

Values
Decimal (1..43200)

Units
minutes

Default
1

### GROUP Shelf Bus Test Results

Properties
Operational

Description
This attribute group contains the results of the bus test that is currently running; if no bus test is running, the attribute group contains the results of the most recently completed bus test. The attributes of the *Results* group are reset to their initial values whenever a bus test is started or any attribute in the *Setup* group is set.

### ATTRIBUTE Shelf Bus Test elapsedTime

Access
Read only

| | |
|---|---|
| Description | This attribute records the length of time (in minutes) that the bus test has been running. |
| Values | Decimal (0..43200) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Shelf Bus Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the maximum length of time (in minutes) that the bus test will continue to run before stopping. |
| Values | Decimal (0..43200) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Shelf Bus Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the reason the bus test ended. It contains one of the following values.<br>***neverStarted***: the bus test has not been started<br>***testRunning***: the bus test is currently running<br>***testTimeExpired***: the bus test ran for the specified duration<br>***stoppedByOperator***: a *STOP* command was issued<br>***selfTestFailure***: a failure was detected during the bus tap self-test<br>***clockSourceFailure***: a failure was detected during the test of the active control processor (CP) clock source<br>***broadcastFailure***: a failure was detected during the broadcast test |
| Values | neverStarted<br>testRunning<br>testTimeExpired<br>stoppedByOperator<br>selfTestFailure<br>clockSourceFailure<br>broadcastFailure |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf Bus Test testsDone

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the tests that have been performed during the bus test. It may contain zero or more of the following values.<br>***selfTest***: the bus tap self-test has been performed<br>***clockSourceTest***: the clock source test has been performed<br>***broadcastTest***: the broadcast test has been performed<br>***pingTest***: at least one ping test has been performed |
| Set of | selfTest<br>clockSourceTest<br>broadcastTest<br>pingTest |
| Default | No default |

### ATTRIBUTE Shelf Bus Test selfTestResults

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the results of the bus tap self-test, indexed by the slot number of the card containing the bus tap tested. Each entry contains one of the following values.<br>+: the bus tap passed its self-test<br>X: the bus tap failed its self-test<br>.: the bus tap was not tested<br>The bus test terminates automatically if a failure is detected. |
| Vector of | + (pass)<br>X (fail)<br>. (noTest) |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Shelf Bus Test clockSourceTestResults

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute records the results of the clock source test, indexed by the clock source and the slot number of the card containing the bus tap tested. Each entry contains one of the following values.<br>+: the bus tap was able to receive clock signals from the clock source<br>X: the bus tap was unable to receive clock signals from the clock source<br>.: the bus tap was not tested against the clock source<br>The bus test terminates automatically if a failure is detected involving the active control processor (CP) clock source. |
| Array of | + (pass)<br>X (fail)<br>. (noTest) |
| Row | source [activeCP alternate] |
| Column | card [Decimal (0..15)] |
| Default | No default |

### ATTRIBUTE Shelf Bus Test broadcastTestResults

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the results of the broadcast test, indexed by the slot numbers of the cards containing the bus taps tested. Each entry contains one of the following values.<br>+: a broadcast message was successfully sent from the transmitting bus tap to the receiving bus tap<br>X: a broadcast message was not successfully sent from the transmitting bus tap to the receiving bus tap<br>.: the associated pair of bus taps was not tested<br>The bus test terminates automatically if a failure is detected. |
| Array of | + (pass)<br>X (fail)<br>. (noTest) |
| Row | txCard [Decimal (0..15)] |
| Column | rxCard [Decimal (0..15)] |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf Bus Test pingTests

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of ping tests performed, indexed by the slot numbers of the cards containing the bus taps involved. Each test attempts to transmit a single low-priority frame from the transmitting bus tap to the receiving bus tap. |
| Array of | Decimal (0..4294967295) |
| Row | txCard [Decimal (0..15)] |
| Column | rxCard [Decimal (0..15)] |
| Default | No default |

### ATTRIBUTE Shelf Bus Test pingTestFailures (pingFailures)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of ping test failures detected, indexed by the slot numbers of the cards containing the bus taps involved. Each failure represents a single low-priority frame that was not successfully transmitted from the transmitting bus tap to the receiving bus tap. The bus test does *not* terminate automatically if a failure is detected. |
| Array of | Decimal (0..4294967295) |
| Row | txCard [Decimal (0..15)] |
| Column | rxCard [Decimal (0..15)] |
| Default | No default |

### COMPONENT Shelf Test

| | |
|---|---|
| Groups | "GROUP Shelf Test Provisioned (Prov)"<br>"GROUP Shelf Test Setup"<br>"GROUP Shelf Test Results" |
| Scope | Device |

| | |
|---|---|
| Description | *PcsTest*<br>The *PcsTest* component allows automated tests of the *Shelf* to be controlled for regular execution. |
| Common Verbs | Help<br>List<br>Display |

### VERB RUN Shelf Test

| | |
|---|---|
| Impact | Service |
| Description | *RUN Shelf Test*<br>This verb initiates the shelf test. It executes the test specified by *type* attribute. |

### GROUP Shelf Test Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes of the *Test* component. |

### ATTRIBUTE Shelf Test automaticBusClockTest (clockTest)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not a bus clock source test is automatically executed after a clock source's LP state changes, and after failure or recovery of the active CP bus clock source. Since tests of an alternate bus clock source may cause a minor loss of traffic, the attribute is set to ***disabled*** by default.<br>If set to ***enabled,*** a bus clock source test is automatically executed. If the status of the corresponding *Shelf Bus clockSourceStatus* is changed after the test, an alarm is issued if the status is one of the following: ***ok, failed***, or ***unknown***.<br>If set to ***disabled***, no bus clock source test is automatically executed. However, a test can be executed by the *RUN* command. If the status is changed after the test, an alarm is issued if the status is one of the following: ***ok***, or ***failed***. |
| Values | enabled<br>disabled |

| | |
|---|---|
| Default | disabled |

### GROUP Shelf Test Setup

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the attributes that govern the operation of a shelf test. |

### ATTRIBUTE Shelf Test type

| | |
|---|---|
| Access | Read and write |
| Description | type<br>The attribute determines the test to be executed when the *RUN* command is applied to the component. Note that running a ***busClock*** test may cause a minor loss of traffic. |
| Values | busClock |
| Default | busClock |

### GROUP Shelf Test Results

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the results of the *Shelf Test* that is currently running; if no test is running, the attribute group contains the results of the most recently completed *Shelf Test*. The attributes of the *Results* group are reset to their initial values whenever a corresponding *Shelf Test* is run or the corresponding attribute of the *Setup* group is set. |

### ATTRIBUTE Shelf Test busClockTestResult (busClock)

| | |
|---|---|
| Access | Read only |
| Description | busClockTestResult<br>This attribute records the result of the bus clock manual test. The result can be one of the following values.<br>***pass*** : the test passed<br>***fail*** : the test failed<br>***noTest*** : the test was not executed when *RUN* command is issued, because the shelf was in single bus mode. |

| | |
|---|---|
| Values | pass<br>fail<br>noTest |
| Default | No default |

## COMPONENT Shelf FabricCard

| | |
|---|---|
| Instance | x<br>y |
| Groups | "GROUP Shelf FabricCard OsiState (State)"<br>"GROUP Shelf FabricCard Property (Prop)"<br>"GROUP Shelf FabricCard Operational (Oper)"<br>"GROUP Shelf FabricCard Errors"<br>"GROUP Shelf FabricCard Banks" |
| Scope | Device |
| Description | *Shelf FabricCard/f*<br>This component represents a hardware resource within a module that cards can use to communicate with each other. Data to be transferred between cards is broken up into one or more cells by the sending card, and reassembled by the receiving card.<br><br>A module's *FabricCard* components are created automatically, and cannot be added or deleted. |
| Dyn. Subcomp. | "COMPONENT Shelf FabricCard Test"<br>"COMPONENT Shelf FabricCard CardPort" |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## VERB INSTALL Shelf FabricCard

Impact: Service

Description: *Install* -file(***s***) *Shelf FabricCard*/***n***

This verb initiates loading new software in to the writable bank of the fabric card. If the fabric card is already loading, the command has no effect and the loading continues. The fabric card must be locked and the fixed bank must be active before the loading of the writable bank can be started. Loading should only take a few seconds.

The software to be loaded must first be downloaded from the SDS site using *Sw Dld*.

Software loading of the fabric card is rare and does not need to be done on every upgrade. All software running on Passport will be compatible with any software running in the fabric card. However later releases of the fabric card software contain enhancements, robustness features, and new functionality. An alarm is raised whenever a newer version of the fabric card software is available than that which is active in the fabric card. The alarm indicates which software should be loaded onto the fabric card. Again, it is not necessary to upgrade the software on the fabric card, but the switch will run more efficiently if it is.

Any failures in loading the software either indicates corrupt software, bad hardware on the fabric card, or a malfunctioning secondary control bus (SCB). On failure repeat the *Install* and look for errors and alarms indicating faulty hardware. As a general rule, it is best to perform fabric card software loading when the switch is most idle.

Both fabric cards should always be running the same software. If one fabric card is loaded with new software then the other fabric card should also be loaded with this new software. An alarm is raised when there is a mismatch in the software running on the two fabric cards.

## GROUP Shelf FabricCard OsiState (State)

Properties: Operational

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Shelf FabricCard adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Shelf FabricCard operationalState (osiOper)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Shelf FabricCard usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Shelf FabricCard availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Shelf FabricCard proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Shelf FabricCard controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE Shelf FabricCard alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

### ATTRIBUTE Shelf FabricCard standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Shelf FabricCard unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Shelf FabricCard Property (Prop)

Properties
Operational

Description
This attribute group indicates property attributes of a fabric card.

### ATTRIBUTE Shelf FabricCard productCode

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the product code (that is the PEC and revision codes) of the fabric card. |
| Values | String (0..12, ASCII) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard serialNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the serial number of the fabric card. |
| Values | String (0..16, ASCII) |
| Default | No default |

### GROUP Shelf FabricCard Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains operational attributes of a *FabricCard* component. |

### ATTRIBUTE Shelf FabricCard failureCause

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates why the fabric card has failed. This attribute is meaningful when the OSI *availabilityStatus* attribute is set to ***failed***. Possible values are:<br>***queueFull***: The fabric card buffers are full.<br>***notInserted***: The fabric card is not inserted.<br>***failedSelfTest***: The fabric card has failed its self test.<br>***internalFailure***: The fabric card has internal ASIC failure.<br>***notResponding***: The fabric card is not responding.<br>***highTemperature***: The fabric card is running at high temperature.<br>***powerProblem***: The fabric card has a power problem.<br>***fabricStateUnknown***: The fabric card is inserted, but it is in an unknown state. |

| | |
|---|---|
| Set of | queueFull<br>notInserted<br>failedSelfTest<br>internalFailure<br>notResponding<br>highTemperature<br>powerProblem<br>fabricStateUnknown |
| Default | No default |

### ATTRIBUTE Shelf FabricCard utilization

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates an approximation of the current fabric utilization. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Shelf FabricCard operatingTemperature

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current fabric operating temperature. When the temperature reaches the value specified by the *temperatureThreshold* attribute, the fabric card generates an alarm. |
| Values | Decimal (0.1..64.0)<br>zeroOrLessDegreeC |
| Units | degreeC |
| Default | No default |

### ATTRIBUTE Shelf FabricCard secondaryControlBusStatus

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the state of the fabric's secondary control bus (SCB). It may contain any combination of the following values:<br>***operational*** - The SCB is operational.<br>***locked*** - The SCB is being manually prevented from operating.<br>***noBus*** - The bus is down.<br>***failed*** - The SCB is disabled due to fault.<br>***bestEffort*** - The SCB is ignoring faults to allow a single channel to be operational.<br>***hardwareFailure*** - The bus failed due to an HSCX hardware error.<br>***parityOrCrcError*** - The bus failed due to a CRC error or a parity error.<br>***timeOutError*** - The bus failed due to an SSC message time-out.<br>***txOrRxError*** - The bus failed due to Tx or Rx problems.<br>***pollError*** - The bus failed an SCB poll.<br>***testMessageError*** - The bus failed a fabric card test. |
| Set of | operational<br>locked<br>noBus<br>failed<br>bestEffort<br>hardwareFailure<br>parityOrCrcError<br>timeOutError<br>txOrRxError<br>pollError<br>testMessageError |
| Default | No default |

### ATTRIBUTE Shelf FabricCard selfTestResults

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the result of the most recent execution of the fabric card's self-tests, performed either when it initially came up, or during operation. A value of 0 indicates success, and a non-zero value indicates a failure or and absent fabric card. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf FabricCard dependencyInEffect

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates why the fabric card has failed. This attribute is meaningful when the OSI *availabilityStatus* attribute is set to ***depend***. Possible values are:<br>***portDisabled***: Card port or fabric port is disabled.<br>***fabricCardLocked***: The fabric card is locked. |
| Set of | portDisabled<br>fabricCardLocked |
| Default | No default |

### ATTRIBUTE Shelf FabricCard voltageAFeedDetected

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the fabric card is detecting current on power feed A. If it is not, check that the breaker is not turned off. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Shelf FabricCard voltageBFeedDetected

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the fabric card is detecting current on power feed B. If it is not, check that the breaker is not turned off. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Shelf FabricCard temperatureThreshold

| | |
|---|---|
| Access | Read only |
| Description | This attributes indicates at which temperature the fabric card generates a temperature alarm. |

| | |
|---|---|
| Values | Decimal (0.1..100.0) |
| Units | degreeC |
| Default | No default |

### ATTRIBUTE Shelf FabricCard secondaryControlBusCardBustaps

| | |
|---|---|
| Access | Read only |
| Description | Each processor card has a bus tap on both of the system's secondary control buses. This indicates the state of each processor card's bus tap onto the secondary control bus for which clocking is supplied by this fabric card. Possible values are:<br>***ok*** - The SCB is operational.<br>***hardwareFailure*** - The bus failed due to an HSCX hardware error.<br>***parityOrCrcErrors*** - The bus failed due to a CRC error or a parity error.<br>***timeOutError*** - The bus failed due to an SSC message time-out.<br>***txOrRxError*** - The bus failed due to Tx or Rx problems.<br>***pollError*** - The bus failed an SCB poll.<br>***none*** - The processor card is not available. |
| Vector of | ok<br>hardwareFailure<br>parityOrCrcErrors<br>timeOutError<br>txOrRxError<br>pollError<br>none |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard secondaryControlBusFabricBustaps

| | |
|---|---|
| Access | Read only |
| Description | Each fabric card has a bus tap on both of the system's secondary control buses. This indicates the state of each fabric card's bus tap onto the secondary control bus for which clocking is supplied by this fabric card. The enumerated values describe the state of the |

each bus tap.
Possible values are:
***ok*** - The SCB is operational.
***txOrRxError*** - The bus failed due to Tx or Rx problems.
***pollError*** - The bus failed an SCB poll.
***testMessageError*** - The bus failed a fabric card test.
***none*** - The processor card is not available.
***unknown*** - The state cannot be determined due to faulty bustap on CP.

Vector of

### GROUP Shelf FabricCard Errors

Properties
Operational

Description
This attribute group indicates errors that the fabric card has detected since the card was last rebooted. This information is intended for use in detecting and diagnosing the fabric-related problems within a module.

### ATTRIBUTE Shelf FabricCard voltageErrors

Access
Read only

Description
This attribute counts the voltage errors detected on the fabric. The value wraps to zero when it exceeds the maximum value.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Shelf FabricCard temperatureErrors

Access
Read only

| | |
|---|---|
| Description | This attribute counts the temperature errors encountered on the fabric card. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard fabricInternalErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the internal errors encountered on the fabric card. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard fabricInterfaceCrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the CRC errors detected by the fabric card when receiving data from other cards. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Shelf FabricCard Banks

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes that govern the operation of a fabric card banks. These attributes cannot be changed while the fabric card writable bank is loading. |

### ATTRIBUTE Shelf FabricCard fixedBankVersion

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates what the fabric card software version in the fixed bank is. It is zero during start-up. After start-up it is queried from the fabric card. |

| | |
|---|---|
| Values | Decimal (0.0..99.9) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard writableBankVersion

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the software version that is loaded on the writable bank. It is zero if there is no version loaded. |
| Values | Decimal (0.0..99.9) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard recommendedVersionToInstall

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the recommended fabric application version to install using the *Install* command. If the current active software is up-to-date, it indicates no version is needed to install. |
| Values | String (0..49, ASCII) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard activeBank

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates which bank is the currently running. The writable bank can only be made active if it has been installed using the *Install* command at least once.<br><br>***writable***: Indicates the writable bank is the active bank.<br>***fixed***: Indicates the fixed bank is the active bank.<br>***unknown***: The software has not yet determined which is the active bank. This normally takes a few seconds when the software is first activated. |
| Values | fixed<br>writable<br>unknown |
| Default | No default |

### ATTRIBUTE Shelf FabricCard bankOnShelfRestart

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates which bank will be running when the shelf is reset or powered-down and then powered-up.<br><br>***writable***: Indicates the writable bank will be the bank on the next power up or reset.<br>***fixed***: Indicates the fixed bank will be the bank on the next power up or reset.<br>***unknown***: The software has not yet determined which is the bank on shelf restart. This normally takes a few seconds when the software is first activated. |
| Values | fixed<br>writable<br>unknown |
| Default | No default |

### ATTRIBUTE Shelf FabricCard writableBankStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the current status of the writable bank. It is set to ***unknown*** until the status is determined by the software. It takes a few seconds at software activation time to determine the status of the writable bank.<br><br>***unknown***: The switch has not yet determined the state of the writable bank. This happens only within the first few seconds the software is activated.<br>***empty***: No (valid) software is loaded in the writable bank.<br>***loading***: Software is currently loading into the writable bank.<br>***loaded***: The software has successfully loaded.<br><br>An example of a transition sequence for the writable bank status is:<br>***unknown*** -> ***empty***-> ***loading*** -> ***loaded***-> ***loading***.<br><br>On a failure, the status reverts to the previous status that was |

successful. For example if the ***loading*** fails, the status returns to ***empty***.

Values
unknown
empty
loading
loaded

Default
No default

### ATTRIBUTE Shelf FabricCard downloadProgressPercent

Access
Read only

Description
This attribute indicates relative progress of a fabric software download as a percentage. When ***writableBankStatus*** is loading the value is between 0 and 100 inclusive. When ***writableBankStatus*** is ***empty*** or ***unknown*** the value is 0. When ***writableBankStatus*** is loaded it is 100.

Values
Decimal (0..100)

Units
%

Default
No default

### COMPONENT Shelf FabricCard Test

Groups
"GROUP Shelf FabricCard Test OsiState (State)"
"GROUP Shelf FabricCard Test Setup"
"GROUP Shelf FabricCard Test Results"

Scope
Device

Description
*Shelf FabricCard/b Test*
This component is used to verify the operation of a fabric card. A fabric card test may be run as part of a regular maintenance program, or to diagnose the cause of a fabric-related problem. The *Test* component is created automatically, and cannot be added or deleted.

When the *type* attribute is set to ***main***, the fabric card test ensures that the fabric ports on a specific fabric card are functioning properly at minimal utilization rates. The fabric card to be tested

must be locked while testing is in progress. The test only involves fabric ports on operational cards (active and standby LPs). If an operational card becomes non-operational or fails to respond during the test, it is dropped from the test and is not allowed to rejoin; however, the results of any tests on its fabric port up to that point are preserved. The results of the test can help to determine which portions of the fabric card system are faulty, if any.

A ***main*** type of fabric card test comprises several different tests. The tests are performed in the following order:
**self test**: The fabric card performs its self-test.
**port test**: The fabric port
**broadcast test**: Each fabric port ensures that it can receive a broadcast frame over the fabric card from every operational card (including itself).
**ping test**: Each fabric port ensures that it can receive a low priority non-broadcast frame over the backplane from every operational card (including itself).

Once all of the tests have been performed, the ping test is repeated continuously until the fabric card test is terminated; this repetition helps to detect transient fabric faults.

When the *type* attribute is set to ***scbPoll,*** the fabric card test ensures that the X and Y fabric bus taps and the function processor bus taps on a corresponding secondary control bus (SCB) are functioning properly. The test can be run without locking the fabric card. This test only involves SCB bus taps on operational cards (active and standby LPs) and the SCB bus taps on the fabric cards. If an operational card becomes non-operational or fails to respond during the test, it is removed from the test. The results of the test can help to determine which portions of the SCB are faulty, if any.

A ***scbPoll*** type of fabric card test comprises several SCB poll queries which run continuously for the duration of the test. At the reception of a poll query, each SCB bus tap ensures that it can receive a frame over the SCB from every operational card, including itself and the fabrics.

The fabric test stops automatically after a specified time interval, or if it detects a self-test failure, a port test failure, or a broadcast test failure.

Common Verbs

Help
List
Display

### VERB START Shelf FabricCard Test

Impact: Service

Description: *start Shelf FabricCard/f Test*
This verb initiates the fabric card test. If the fabric card test is already running, the command has no effect and the test continues. The fabric card must be locked before the test can be run.

### VERB STOP Shelf FabricCard Test

Impact: Service

Description: *stop Shelf FabricCard/b Test*
This verb terminates the fabric card test. If the fabric card test is not running, the command has no effect.

### GROUP Shelf FabricCard Test OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Shelf FabricCard Test adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Shelf FabricCard Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Shelf FabricCard Test usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Shelf FabricCard Test Setup

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the attributes that govern the operation of a fabric card or fabric port test. These attributes cannot be changed while the fabric card or fabric port test is running. |

### ATTRIBUTE Shelf FabricCard Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum length of time that the fabric card test is allowed to run. The maximum allowed value permits the fabric card test to be run for up to 30 days. |
| Values | Decimal (1..43200) |
| Units | minutes |
| Default | 2 |

### ATTRIBUTE Shelf FabricCard Test type

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the type of the test to be run.<br><br>When this attribute is set to ***main***, a subsequent fabric card test verifies that the fabric ports on this card and the corresponding cards ports are functioning properly.<br><br>When this attribute is set to ***scbPoll***, a subsequent fabric card test exercises all the secondary control bus (SCB) bus taps in the system corresponding to the fabric card under test. |
| Values | main<br>scbPoll |
| Default | main |

### GROUP Shelf FabricCard Test Results

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the results of the fabric card test that is currently running; if no fabric card test is running, the attribute group contains the results of the most recently completed fabric card test. The attributes of the *Results* group are reset to their initial values whenever a fabric card test is started or any attribute in the *Setup* group is set. |

### ATTRIBUTE Shelf FabricCard Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time that the fabric card test has been running. |
| Values | Decimal (0..43200) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum length of time that the fabric card test runs before stopping. |

| | |
|---|---|
| Values | Decimal (0..43200) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason the fabric card test ended. It contains one of the following values:<br>***neverStarted***: The fabric card test has not been started.<br>***testRunning***: The fabric card test is currently running.<br>***testTimeExpired***: The fabric card test ran for the specified duration.<br>***stoppedByOperator***: A stop command was issued.<br>***portTestFailure***: A failure was detected during the port test.<br>***fabricSelfTestFailure***: A failure was detected during the fabric card self-test.<br>***broadcastFailure***: A failure was detected during the broadcast test. |
| Values | neverStarted<br>testRunning<br>testTimeExpired<br>stoppedByOperator<br>portTestFailure<br>fabricSelfTestFailure<br>broadcastFailure |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test testsDone

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the tests that have been performed during the fabric card test. It contains zero or more of the following values:<br>***selfTest***: The fabric card self-test has been performed.<br>***portTest***: The port test has been performed.<br>***broadcastTest***: The broadcast test has been performed.<br>***pingTest***: At least one ping test has been performed. |

| | |
|---|---|
| | This attribute is displayed only when the *type* attribute is set to ***main*** |
| Set of | selfTest<br>portTest<br>broadcastTest<br>pingTest |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test fabricSelfTestResults

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the results of the fabric's self test. The fabric test terminates automatically if a failure is detected.<br>***ok***: The fabric self test is passed.<br>***failed***: The fabric self test is failed.<br>***noTest***: The default value indicates no self test is performed.<br><br>This attribute is displayed only when the *type* attribute is set to ***main*** |
| Values | ok<br>failed<br>noTest |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test numberOfScbPolls

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of times the secondary control bus bus taps are polled since the start of the fabric card test.<br><br>This attribute is displayed only when the *type* attribute is set to ***scbPoll*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test portTestResults

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the results of the fabric port, indexed by the slot number of the card containing the fabric port tested. Each entry contains one of the following values.<br>**+**: the port passed its test<br>***X***: the port failed its test<br>**.**: the port was not tested<br>The fabric card test terminates automatically if a failure is detected.<br><br>This attribute is displayed only when the *type* attribute is set to ***main*** |
| Vector of | + (pass)<br>X (fail)<br>. (noTest) |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test broadcastTestResults

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the results of the broadcast test, indexed by the slot numbers of the cards containing the fabric port tested. Each entry contains one of the following values.<br>**+**: a broadcast message was successfully sent from the transmitting fabric port to the receiving fabric port<br>***X***: a broadcast message was not successfully sent from the transmitting fabric port to the receiving fabric port<br>**.**: the associated pair of fabric ports was not tested<br>The fabric card test terminates automatically if a failure is detected.<br><br>This attribute is displayed only when the *type* attribute is set to ***main*** |

| | |
|---|---|
| Array of | + (pass)<br>X (fail)<br>. (noTest) |
| Row | txCard [Decimal (0..15)] |
| Column | rxCard [Decimal (0..15)] |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test pingTests

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ping tests performed, indexed by the slot numbers of the cards containing the fabric ports involved. Each test attempts to transmit a single low-priority frame from the transmitting fabric port to the receiving fabric port.<br><br>This attribute is displayed only when the *type* attribute is set to ***main*** |
| Array of | Decimal (0..4294967295) |
| Row | txCard [Decimal (0..15)] |
| Column | rxCard [Decimal (0..15)] |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test pingTestFailures (pingFailures)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ping test failures detected, indexed by the slot numbers of the cards containing the fabric ports involved. Each failure represents a single low-priority frame that was not successfully transmitted from the transmitting fabric port to the receiving fabric port. The fabric card test does *not* terminate automatically if a failure is detected. |

| | |
|---|---|
| | This attribute is displayed only when the *type* attribute is set to ***main*** |
| Array of | Decimal (0..4294967295) |
| Row | txCard [Decimal (0..15)] |
| Column | rxCard [Decimal (0..15)] |
| Default | No default |

### ATTRIBUTE Shelf FabricCard Test scbCardBustapsFailures (scbFailures)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of secondary control bus (SCB) card bus tap failures, indexed by the slot numbers of the cards containing the bus tap involved. The SCB test does not terminate automatically if a failure is detected.<br><br>This attribute is displayed only when the *type* attribute is set to ***scbPoll*** |
| Vector of | Decimal (0..4294967295) |
| Index | 0<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15 |
| Default | No default |

## ATTRIBUTE Shelf FabricCard Test scbFabricBustapsFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of times the secondary control bus (SCB) fabric bus tap failures of the corresponding fabric card. The SCB test does not terminate automatically if a failure is detected<br><br>This attribute is displayed only when the *type* attribute is set to ***scbPoll*** |
| Vector of | Decimal (0..4294967295) |
| Index | x<br>y |
| Default | No default |

## COMPONENT Shelf FabricCard CardPort

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Shelf FabricCard CardPort OsiState (State)"<br>"GROUP Shelf FabricCard CardPort Operational (Oper)"<br>"GROUP Shelf FabricCard CardPort CardPortErrors" |
| Scope | Device |
| Description | *Shelf FabricCard/f cardPort/n*<br>This component represents a physical port on a fabric card. A card port is the interface to the cards; it provides a pathway for the fabric card to send cells to the processor cards in the module and to receive cells sent to it from the processor cards.<br><br>A fabric card's *CardPort* components are created automatically, can not be added or deleted. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Shelf FabricCard CardPort OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Shelf FabricCard CardPort adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Shelf FabricCard CardPort operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Shelf FabricCard CardPort usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Shelf FabricCard CardPort availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)

migrating

Default

No default

### ATTRIBUTE Shelf FabricCard CardPort proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Shelf FabricCard CardPort controlStatus (osiCntrl)

Access

Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard CardPort alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Shelf FabricCard CardPort standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Shelf FabricCard CardPort unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

## GROUP Shelf FabricCard CardPort Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains operational attributes of a card port. This information outlines what the card port is doing and why it is doing it and is primarily intended for use in diagnosing the cause of a port-related problem reported by the module. |

## ATTRIBUTE Shelf FabricCard CardPort failuresInEffect

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the hardware problems that prevent the *CardPort* from using the fabric. It may contain any combination of the following values.<br>***selfTest***: The port has failed its self-test.<br>***crcError***: The port has detected too many CRC errors.<br>***signalLoss***: The serial link receiver is not receiving a signal. That is, the electrical connection to the far end transmitter is not valid.<br>***flowControlViolation***: An unacceptable number of flow control violation errors have occurred.<br>***synchronizationLoss***: The serial link's phase or alignment is lost. Therefore, the port's synchronization is lost.<br>***queueFull***: The output queue is full.<br>***syncLoss***: The card port has lost synchronization with the fabric port. |
| Set of | selfTest<br>crcError<br>signalLoss<br>flowControlViolation<br>synchronizationLoss<br>queueFull<br>syncLoss |
| Default | No default |

## ATTRIBUTE Shelf FabricCard CardPort dependenciesInEffect

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the non-hardware problems that prevent the port from using the associated fabric. It may contain the following values:<br>***fabricLocked*** - The fabric card is locked.<br>***fabricDisabled*** - The fabric card is disabled.<br>***portDisabled*** - The corresponding fabric port is disabled.<br>***cardNotInserted*** - The corresponding processor card is not inserted. |
| Set of | fabricLocked<br>fabricDisabled<br>portDisabled<br>cardNotInserted |
| Default | No default |

### GROUP Shelf FabricCard CardPort CardPortErrors

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group indicates errors that the card port has detected since the fabric card was last rebooted. This information is intended for use in detecting and diagnosing port-related problems within a module. |

### ATTRIBUTE Shelf FabricCard CardPort selfTestErrorCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the error code generated by the most recent self-test of the port. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard CardPort dataOrAddressCrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the packet data or address CRC errors encountered on the port. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Shelf FabricCard CardPort flowControlViolationErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the flow control violations (that is “threshold exceeded errors”) detected on the port. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard CardPort livelinessErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the liveliness errors detected on the card port. Liveliness errors are failures to receive yellow cells within a certain period of time. The value wraps to zero when it exceeds the maximum value.<br><br>*Note*: **Yellow cells** are special types of packets which are generated<br>by the fabric port and detected by the fabric card and the fabric port<br>in order to check the link liveness with the fabric card. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Shelf FabricCard CardPort lossOfSignalOrSyncErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the loss of signal or loss of synchronization errors on the port that caused the port to fail. The value wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## GROUP SigChan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE SigChan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. |

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP SigChan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE SigChan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE SigChan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |

| | |
|---|---|
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP SigChan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE SigChan snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP SigChan OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE SigChan adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively |

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE SigChan operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SigChan usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP SigChan Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents the provisionable attributes of a *SigChan*. |

### ATTRIBUTE SigChan commentText

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | Use of this attribute is at the discretion of the system administrator. Typically, this attribute specifies the name of the customer that is using this *SigChan*. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE SigChan octothorpeEod (eod)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether the octothorpe should be used as an end of dialling indication. When this character is received, |

only the digits that have been received to that point will be used for address resolution. All subsequent digits will be forwarded to the far-end, but they will not be used.
The octothorpe will not be sent to the far-end.

Values
yes
no

Default
no

### ATTRIBUTE SigChan forceNpiTon (fnt)

Access
Read: All
Write: All

Description
This attribute, together with the *defaultNpiTon* attribute, controls Numbering Plan Identifier (NPI) and Type Of Number (TON) values to be used by the *SigChan* component for egress calls (if applicable).
If set to ***yes***, NPI and TON values defined by the *defaultNpiTon* attribute unconditionally overwrite values received in the call setup message from the subnet.

Values
yes
no

Default
no

### ATTRIBUTE SigChan defaultNpiTon (dnt)

Access
Read: All
Write: All

Description
This attribute, together with the *forceNpiTon* attribute, controls Numbering Plan Identifier (NPI) and Type Of Number (TON) values to be used by the *SigChan* component for egress calls (if applicable).
The combination of NPI and TON values defined by the *defaultNpiTon* attribute is used for an egress call whenever:
- the call setup message received from subnet indicates that NPI or TON information is not supplied or doesn't make sense, or
- attribute *forceNpiTon* is set to ***yes***
Mapping between values of the *defaultNpiTon* attribute and associated combinations of NPI and TON values follows:

***casUnknown***: NPI=unknown (0) TON=unknown (0)
***unknown***: NPI=E.164 (1) TON=unknown (0)
***international***: NPI=E.164 (1) TON=international (1)
***national***: NPI=E.164 (1) TON=national (2)
***subscriber***: NPI=E.164 (1) TON=subscriber (4)
***p0***: NPI=private(9) TON=0
***p1***: NPI=private(9) TON=1
***p2***: NPI=private(9) TON=2
***p3***: NPI=private(9) TON=3
***p4***: NPI=private(9) TON=4
***p5***: NPI=private(9) TON=5

### ATTRIBUTE SigChan E1Cas faultRx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the fault signal when received. When received, the channel status for the timeslot goes to a lockout state. This signal must be different from the *idleRx* signal. |
| Values | 0<br>1<br>00<br>01<br>10<br>11<br>0000<br>0001<br>0010<br>0011<br>0100<br>0101<br>0110<br>0111<br>1000<br>1001<br>1010<br>1011<br>1100<br>1101<br>1110<br>1111 |
| Default | 1101 |

## ATTRIBUTE SigChan E1Cas seizeTx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the seize signal when transmitted. There is no Voice or Data call distinction unless it is provided by a leading *Discrimination* digit. This signal can not be defined if the *seizeVoiceTx* or *seizeVoiceRx* or *seizeDataTx* or *seizeDataRx* signals are defined. The *seizeRx* must also be defined along with this signal. If defined, the signal must be different from the *idleTx* signal. |
| Values | 0<br>1<br>00<br>01<br>10<br>11<br>0000<br>0001<br>0010<br>0011<br>0100<br>0101<br>0110<br>0111<br>1000<br>1001<br>1010<br>1011<br>1100<br>1101<br>1110<br>1111<br>unused |

### GROUP SigChan E1Cas TimerProv

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the various timers used by *Ds1Cas* component to handle a particular timing events. |

### ATTRIBUTE SigChan E1Cas guardTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time needed after a channel is idled before it is made available for the next outgoing call to the link. |
| Values | Decimal (50..30000) |
| Units | msec |
| Default | 1000 |

### ATTRIBUTE SigChan E1Cas winkTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the length of time that a *winkTx* signal is transmitted. This attribute is only referenced if the *winkTx* signal is defined |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 220 |

### ATTRIBUTE SigChan E1Cas winkMinTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the minimum time that a *winkRx* signal, when received, must persist before being considered as a valid wink. Anything less is ignored. This value must be less than *winkMaxTime*. This attribute is only referenced if the *winkRx* Signal is defined |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 130 |

### ATTRIBUTE SigChan E1Cas winkMaxTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum time that a *winkRx* signal, when received, may persist before it is interpreted as a GLARE condition. This value must be larger than the *winkMinTime*. This attribute is only referenced if the *winkRx* Signal is defined |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 300 |

### ATTRIBUTE SigChan E1Cas seizeAckDelayTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the delay, after receiving any particular seize signal, before responding with a *seizeAckTx* or *winkTx* signal |
| Values | Decimal (30..3000) |
| Units | msec |
| Default | 180 |

### ATTRIBUTE SigChan E1Cas seizeAckSupvTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time, on an outgoing call to the link, the network will wait to receive a *seizeAckRx* or a *winkRx* signal. Should this timer time-out, the call is considered as a seize failure. This timer is not started unless either the *seizeAckRx* or a *winkRx* signals are defined. |
| Values | Decimal (1000..15000) |
| Units | msec |
| Default | 4000 |

### ATTRIBUTE SigChan E1Cas outpulseDelayTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of delay, after transmitting any seize signal, before digit transmission begins.<br>If the *seizeAckRx* or *winkRx* signal is defined, the timer is started upon complete reception of the signal.<br>If the *seizeAckRx* or *winkRx* signal are not defined, the timer is started immediately after sending any particular seize signal. |
| Values | Decimal (100..30000) |
| Units | msec |

| | |
|---|---|
| Default | 400 |

### ATTRIBUTE SigChan E1Cas endOfDialTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time allowed between digits after which any more digits are to be ignored. |
| Values | Decimal (1000..30000) |
| Units | msec |
| Default | 9000 |

### ATTRIBUTE SigChan E1Cas disconnectTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time that a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) must persist before it is interpreted as a valid disconnect signal. |
| Values | Decimal (10..30000) |
| Units | msec |
| Default | 100 |

### ATTRIBUTE SigChan E1Cas disconnectSupvTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time allowed for the link to respond with a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) once the network has already started the disconnect sequence. |

| | |
|---|---|
| Values | Decimal (1000..60000) |
| Units | msec |
| Default | 35000 |

### GROUP SigChan E1Cas LinkCallStatistics

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics on various call events on the link. |

### ATTRIBUTE SigChan E1Cas totalCallsOutgoing

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts made to this link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan E1Cas totalCallsIncoming

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming link call attempts made to this node. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan E1Cas outgoingAnsweredCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node calls to this link that were answered by the link |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan E1Cas incomingAnsweredCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming link calls that were answered by this node. That is a connect signal was transmitted by this node out to the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan E1Cas seizeFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal. That is, no seizure acknowledgment or wink was returned from link. This attribute does not count calls that<br>encountered glare. Glare situations are counted via the glareCalls attribute. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan E1Cas releaseFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that the link failed to respond correctly during the disconnect sequence of a call. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan E1Cas activeChannels

| | |
|---|---|
| Access | Read only |
| Description | This attribute tracks the current number of active channels. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE SigChan E1Cas peakActiveChannels

| | |
|---|---|
| Access | Read only |
| Description | This attribute tracks the peak number of active channels. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan E1Cas glareCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts to the link that encountered glare. Glare occurs when an outgoing node call attempt and an incoming link call attempt occur on the same channel simultaneously. Priority is given to the incoming call and the outgoing call is reattempted on another channel. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COLLECTED STATS SignallingChannel E1Cas

| | |
|---|---|
| Description | The statistics record generated by the SignallingChannel E1Cas component. |

### ATTRIBUTE SigChan E1Cas totalCallsOutgoing

| | |
|---|---|
| Description | This spooled statistic counts the number of outgoing node call attempts made to this link in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan E1Cas totalCallsIncoming

| | |
|---|---|
| Description | This attribute counts the number of incoming link call attempts made to this node in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan E1Cas seizeFailures

Description This spooled statistic counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal in the last statistics collection interval. That is no seizure acknowledgment or wink was returned from link.

Values Decimal (0..65535)

### ATTRIBUTE SigChan E1Cas releaseFailures

Description This spooled statistic counts the number of times that the link failed to respond correctly during the disconnect sequence of a call in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan E1Cas outgoingAnsweredCalls

Description This spooled statistic counts the number of outgoing node calls to this link that were answered by the link in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan E1Cas incomingAnsweredCalls

Description This spooled statistic counts the number of incoming link calls that were answered by this node, connect signals transmitted by this node out to the link in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan E1Cas peakActiveChannels

Description This spooled statistic counts the maximum number of channels that have been simultaneously active on this signalling channel during the last statistics collection interval.

Values Decimal (0..30)

### COMPONENT SigChan E1Cas Framer (Framer)

Groups "GROUP SigChan E1Cas Framer Provisioned (Prov)"
"GROUP SigChan E1Cas Framer OsiState (State)"

| | |
|---|---|
| Scope | Application |
| Description | *SigChan/n Ds1Cas Framer*<br>*SigChan/n E1Cas Framer*<br>*SigChan/n J2Cas Framer*<br>The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.<br><br>The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.<br><br>The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts). |
| Common Verbs | Help<br>List<br>Display |

### GROUP SigChan E1Cas Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE SigChan E1Cas Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This |

| | |
|---|---|
| | defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP SigChan E1Cas Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE SigChan E1Cas Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE SigChan E1Cas Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE SigChan E1Cas Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## COMPONENT SigChan E1Cas Dtmf

| | |
|---|---|
| Groups | "GROUP SigChan E1Cas Dtmf Provisioned (Prov)" |
| Scope | Application |
| Description | *SigChan/n Ds1Cas Dtmf*<br>*SigChan/n E1Cas Dtmf*<br>*SigChan/n J2Cas Dtmf*<br>This component defines attributes that defines what settings are need to recognize and transmit DTMF tones. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP SigChan E1Cas Dtmf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes that defines what settings are needed to transmit and recognize DTMF tones. |

## ATTRIBUTE SigChan E1Cas Dtmf burstTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the length of time a tone persists for digit transmission.<br>When a 50 msecs burst is selected, the interdigit time is 50 msecs.<br>When a 60 msecs burst is selected, the interdigit time is 90 msecs.<br>When a 70 msecs burst is selected , the interdigit time is 80 msecs.<br>When a 100 msecs burst is selected , the interdigit time is 100 msecs. |
| Values | Decimal (50; 60; 70; 100) |

| | |
|---|---|
| Units | msec |
| Default | 100 |

### COMPONENT SigChan E1Cas TimeSlotStatus (Tslot)

| | |
|---|---|
| Instance | Decimal (1..31) |
| Groups | "GROUP SigChan E1Cas Tslot Channels" |
| Scope | Application |
| Description | *SigChan/n Ds1Cas Tslot/n*<br>*SigChan/n E1Cas Tslot/n*<br>*SigChan/n J2Cas Tslot/n*<br>This component contains replicated attribute which displays operational attributes of individual timeslots. \ |
| Common Verbs | Help<br>List<br>Display |

### GROUP SigChan E1Cas Tslot Channels

| | |
|---|---|
| Properties | Operational |
| Description | This group contains various operational attributes of every channel which is serviced by a CAS Signalling Channel. |

### ATTRIBUTE SigChan E1Cas Tslot maintenanceStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies what the internal current channel status is.<br>The attribute “Status” may have the following values:<br>UnDefined, timeslot has not yet been configured<br>Locked, timeslot has been locked by the operator<br>LockOut, timeslot is busied out due to some protocol failure<br>Incoming, timeslot is currently being used for a call incoming to the Passport<br>Outgoing, timeslot is currently being used for a call outgoing from the network<br>Idle, timeslot is currently available for use. |

| | |

| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the length of time that a *winkTx* signal is transmitted. This attribute is only referenced if the *winkTx* signal is defined |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 220 |

### ATTRIBUTE SigChan Ds1Cas winkMinTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the minimum time that a *winkRx* signal, when received, must persist before being considered as a valid wink. Anything less is ignored. This value must be less than *winkMaxTime*. This attribute is only referenced if the *winkRx* Signal is defined |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 130 |

### ATTRIBUTE SigChan Ds1Cas winkMaxTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum time that a *winkRx* signal, when received, may persist before it is interpreted as a GLARE condition. This value must be larger than the *winkMinTime*. This attribute is only referenced if the *winkRx* Signal is defined |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 300 |

### ATTRIBUTE SigChan Ds1Cas seizeAckDelayTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the delay, after receiving any particular seize signal, before responding with a *seizeAckTx* or *winkTx* signal |
| Values | Decimal (30..3000) |
| Units | msec |
| Default | 1000 |

### ATTRIBUTE SigChan Ds1Cas seizeAckSupvTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time, on an outgoing call to the link, the network will wait to receive a *seizeAckRx* or a *winkRx* signal. Should this timer time-out, the call is considered as a seize failure. This timer is not started unless either the *seizeAckRx* or a *winkRx* signals are defined. |
| Values | Decimal (1000..15000) |
| Units | msec |
| Default | 4000 |

### ATTRIBUTE SigChan Ds1Cas outpulseDelayTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of delay, after transmitting any seize signal, before digit transmission begins.<br>If the *seizeAckRx* or *winkRx* signal is defined, the timer is started upon complete reception of the signal.<br>If the *seizeAckRx* or *winkRx* signal are not defined, the timer is started immediately after sending any particular seize signal. |
| Values | Decimal (100..30000) |
| Units | msec |

| | |
|---|---|
| Default | 400 |

### ATTRIBUTE SigChan Ds1Cas endOfDialTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time allowed between digits after which any more digits are to be ignored. |
| Values | Decimal (1000..30000) |
| Units | msec |
| Default | 9000 |

### ATTRIBUTE SigChan Ds1Cas disconnectTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time that a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) must persist before it is interpreted as a valid disconnect signal. |
| Values | Decimal (10..30000) |
| Units | msec |
| Default | 100 |

### ATTRIBUTE SigChan Ds1Cas disconnectSupvTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time allowed for the link to respond with a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) once the network has already started the disconnect sequence. |

| | |
|---|---|
| Values | Decimal (1000..60000) |
| Units | msec |
| Default | 35000 |

### GROUP SigChan Ds1Cas LinkCallStatistics

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics on various call events on the link. |

### ATTRIBUTE SigChan Ds1Cas totalCallsOutgoing

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts made to this link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Ds1Cas totalCallsIncoming

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming link call attempts made to this node. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Ds1Cas outgoingAnsweredCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node calls to this link that were answered by the link |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Ds1Cas incomingAnsweredCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming link calls that were answered by this node. That is a connect signal was transmitted by this node out to the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Ds1Cas seizeFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal. That is, no seizure acknowledgment or wink was returned from link. This attribute does not count calls that<br>encountered glare. Glare situations are counted via the glareCalls attribute. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Ds1Cas releaseFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that the link failed to respond correctly during the disconnect sequence of a call. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Ds1Cas activeChannels

| | |
|---|---|
| Access | Read only |
| Description | This attribute tracks the current number of active channels. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE SigChan Ds1Cas peakActiveChannels

| | |
|---|---|
| Access | Read only |
| Description | This attribute tracks the peak number of active channels. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Ds1Cas glareCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts to the link that encountered glare. Glare occurs when an outgoing node call attempt and an incoming link call attempt occur on the same channel simultaneously. Priority is given to the incoming call and the outgoing call is reattempted on another channel. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP SigChan Ds1Cas Discrimination (Discr)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group provides the attributes necessary to implement voice and data call discrimination via the first received or transmitted digit of a call. |

### ATTRIBUTE SigChan Ds1Cas voiceDataDiscr

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether or not voice and data calls are to be identified via the *voiceCallDigit* or *dataCallDigit*. |
| Values | off<br>on |

| | |
|---|---|
| Default | off |

### ATTRIBUTE SigChan Ds1Cas voiceCallDigit

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the digit that will identify a call to be a voice call via the first digit. This value must be different than *dataCallDigit*. |
| Values | Decimal (0..9) |
| Default | 1 |

### ATTRIBUTE SigChan Ds1Cas dataCallDigit

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute contains the digit that will identify a call to be a data call via the first digit. This value must be different than *voiceCallDigit*. |
| Values | Decimal (0..9) |
| Default | 2 |

## COLLECTED STATS SignallingChannel Ds1Cas

| | |
|---|---|
| Description | The statistics record generated by the SignallingChannel Ds1Cas component. |

### ATTRIBUTE SigChan Ds1Cas totalCallsOutgoing

| | |
|---|---|
| Description | This spooled statistic counts the number of outgoing node call attempts made to this link in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan Ds1Cas totalCallsIncoming

Description: This attribute counts the number of incoming link call attempts made to this node in the last statistics collection interval.

Values: Decimal (0..65535)

### ATTRIBUTE SigChan Ds1Cas seizeFailures

Description: This spooled statistic counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal in the last statistics collection interval. That is no seizure acknowledgment or wink was returned from link.

Values: Decimal (0..65535)

### ATTRIBUTE SigChan Ds1Cas releaseFailures

Description: This spooled statistic counts the number of times that the link failed to respond correctly during the disconnect sequence of a call in the last statistics collection interval.

Values: Decimal (0..65535)

### ATTRIBUTE SigChan Ds1Cas outgoingAnsweredCalls

Description: This spooled statistic counts the number of outgoing node calls to this link that were answered by the link in the last statistics collection interval.

Values: Decimal (0..65535)

### ATTRIBUTE SigChan Ds1Cas incomingAnsweredCalls

Description: This spooled statistic counts the number of incoming link calls that were answered by this node, connect signals transmitted by this node out to the link in the last statistics collection interval.

Values: Decimal (0..65535)

### ATTRIBUTE SigChan Ds1Cas peakActiveChannels

Description: This spooled statistic counts the maximum number of channels that have been simultaneously active on this signalling channel during the last statistics collection interval.

| | |
|---|---|
| Values | Decimal (0..30) |

## COMPONENT SigChan Ds1Cas Framer (Framer)

| | |
|---|---|
| Groups | "GROUP SigChan Ds1Cas Framer Provisioned (Prov)"<br>"GROUP SigChan Ds1Cas Framer OsiState (State)" |
| Scope | Application |
| Description | *SigChan/n Ds1Cas Framer*<br>*SigChan/n E1Cas Framer*<br>*SigChan/n J2Cas Framer*<br>The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.<br><br>The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.<br><br>The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts). |
| Common Verbs | Help<br>List<br>Display |

## GROUP SigChan Ds1Cas Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE SigChan Ds1Cas Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP SigChan Ds1Cas Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE SigChan Ds1Cas Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE SigChan Ds1Cas Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SigChan Ds1Cas Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## COMPONENT SigChan Ds1Cas Dtmf

Groups
"GROUP SigChan Ds1Cas Dtmf Provisioned (Prov)"

Scope
Application

Description
*SigChan/n Ds1Cas Dtmf*
*SigChan/n E1Cas Dtmf*
*SigChan/n J2Cas Dtmf*
This component defines attributes that defines what settings are need to recognize and transmit DTMF tones.

Common Verbs
Help
List
Display
Add
DELete

## GROUP SigChan Ds1Cas Dtmf Provisioned (Prov)

Properties
Provisioned

Description
This group contains attributes that defines what settings are needed to transmit and recognize DTMF tones.

## ATTRIBUTE SigChan Ds1Cas Dtmf burstTime

Access
Read: All
Write: All

Criticality
Process

Description
This attribute specifies the length of time a tone persists for digit transmission.
When a 50 msecs burst is selected, the interdigit time is 50

msecs.
When a 60 msecs burst is selected, the interdigit time is 90 msecs.
When a 70 msecs burst is selected , the interdigit time is 80 msecs.
When a 100 msecs burst is selected , the interdigit time is 100 msecs.

Values: Decimal (50; 60; 70; 100)

Units: msec

Default: 100

## COMPONENT SigChan Ds1Cas TimeSlotStatus (Tslot)

Instance: Decimal (1..24)

Groups: "GROUP SigChan Ds1Cas Tslot Channels"

Scope: Application

Description: *SigChan/n Ds1Cas Tslot/n*
*SigChan/n E1Cas Tslot/n*
*SigChan/n J2Cas Tslot/n*
This component contains replicated attribute which displays operational attributes of individual timeslots. \

Common Verbs:
Help
List
Display

## GROUP SigChan Ds1Cas Tslot Channels

Properties: Operational

Description: This group contains various operational attributes of every channel which is serviced by a CAS Signalling Channel.

## ATTRIBUTE SigChan Ds1Cas Tslot maintenanceStatus

Access: Read only

Description: This attribute specifies what the internal current channel status is. The attribute “Status” may have the following values:

UnDefined, timeslot has not yet been configured
Locked, timeslot has been locked by the operator
LockOut, timeslot is busied out due to some protocol failure
Incoming, timeslot is currently being used for a call incoming to the Passport
Outgoing, timeslot is currently being used for a call outgoing from the network
Idle, timeslot is currently available for use.

Values

IDLE
BUSY
LCKO
MBUSY
DSBL
UNEQ
UNKNOWN
INVALID

Default

No default

### ATTRIBUTE SigChan Ds1Cas Tslot receivedBits

Access

Read only

Description

This attribute specifies what are the raw A, AB or ABCD bits being received.

Values

0

## GROUP SigChan J2 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group conatins attirbutes that defines various settings that do not fall under any other group. |

## ATTRIBUTE SigChan J2 toneTableSelection

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies which tone table to select when a call is to receive a given tone.<br>0 for North America<br>1 for Japan |

| | |
|---|---|
| | 2 for United Kingdom<br>3 for Germany<br>4 for France<br>5 for Central America (Brazil, Mexico)<br>6 for Chile<br>7 for Autralia |
| Values | Decimal (0..7) |
| Default | 1 |

### GROUP SigChan J2 AbcdProv

| | |
|---|---|
| Properties | Provisioned |
| Description | This group specifies the attributes that define what the A bit pattern for a particular signal should be. The input is a 1 bit (0 or 1) format. |

### ATTRIBUTE SigChan J2 signallingBits

| | |
|---|---|
| Access | Read only |
| Criticality | Process |
| Description | This attribute specifies which bits are to be used for interpretation.<br>(A,AB or ABCD). |
| Values | A<br>AB<br>ABCD |
| Default | A |

### ATTRIBUTE SigChan J2 idleTx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in A bit terms, of the idle signal is when transmitted. This signal must be different from the *connectTx* signal. |

| | |
|---|---|
| Values | 0<br>1 |
| Default | 1 |

### ATTRIBUTE SigChan J2 idleRx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in A bit terms, of the idle signal when received. This signal must be different from the *connectRx* signal. |
| Values | 0<br>1 |
| Default | 1 |

### ATTRIBUTE SigChan J2 faultTx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the fault signal when transmitted. It is transmitted when the timeslot is undefined or locked. This signal must be different from the *idleTx* signal. |
| Values | 0<br>1 |
| Default | 0 |

### ATTRIBUTE SigChan J2 faultRx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies what the value is, in ABCD terms, of the fault signal when received. When received, the channel status for the timeslot goes to a lockout state. This signal must be different from the *idleRx* signal. |
| Values | 0<br>1 |
| Default | 0 |

### ATTRIBUTE SigChan J2 seizeTx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in A bit terms, of the seize signal when transmitted. This signal must be different from the *idleTx* signal. |
| Values | 0<br>1 |
| Default | 0 |

### ATTRIBUTE SigChan J2 seizeRx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in A bit terms, of the seize signal when received. This signal must be different from the *idleRx* signal. |
| Values | 0<br>1 |
| Default | 0 |

### ATTRIBUTE SigChan J2 seizeVoiceTx

| | |
|---|---|
| Access | Read only |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the seize Voice signal when transmitted. This signal when transmitted identifies the call as a voice call. This signal can not be defined if the *seizeTx* or *seizeRx* are defined. The *seizeVoiceRx*, *seizeDataRx* and *seizeDataTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeDataTx* and *idleTx* signals. |
| Values | unused |
| Default | unused |

### ATTRIBUTE SigChan J2 seizeVoiceRx

| | |
|---|---|
| Access | Read only |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the seize Voice signal when received. This signal when received identifies the call as a voice call. This signal can not be defined if the *seizeTx* or *seizeRx* are defined. The *seizeVoiceTx*, *seizeDataRx* and *seizeDataTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeDataRx* and *idleRx* signals. |
| Values | unused |
| Default | unused |

### ATTRIBUTE SigChan J2 seizeDataTx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the seize Data signal when transmitted. This signal when transmitted identifies the call as a data call. This signal can not be |

| | |
|---|---|
| | defined if the *seizeTx* or *seizeRx* are defined. The *seizeDataRx*, *seizeVoiceRx* and *seizeVoiceTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeVoiceTx* and *idleTx* signals. |
| Values | unused |
| Default | unused |

### ATTRIBUTE SigChan J2 seizeDataRx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the seize Data signal when received. This signal when received identifies the call as a data call. This signal can not be defined if the *seizeTx* or *seizeRx* are defined. The *seizeDataTx*, *seizeVoiceRx* and *seizeVoiceTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeVoiceRx* and *idleRx* signals. |
| Values | unused |
| Default | unused |

### ATTRIBUTE SigChan J2 seizeAckTx

| | |
|---|---|
| Access | Read only |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the seizure acknowledgment signal when transmitted. If defined, the value of the signal must be different from the *idleTx* and the *connectTx* signals. |
| Values | unused |
| Default | unused |

### ATTRIBUTE SigChan J2 seizeAckRx

| | |
|---|---|
| Access | Read only |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the seizure acknowledgment when received. If defined, the value of the signal must be different from the *idleRx* and the *connectRx* signals. |
| Values | unused |
| Default | unused |

### ATTRIBUTE SigChan J2 winkTx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in A bit terms, of the wink signal when transmitted. This is a pulsed signal of *winkTime* duration. Where ***P*** specifies which bit is toggled. A pulse signal returns to the original A bit pattern before the start of transmission. |
| Values | P<br>unused |
| Default | P |

### ATTRIBUTE SigChan J2 winkRx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in A bit terms, of the wink signal when received. This pulsed signal must be within the *winkMinTime* and *winkMaxTime* before it is considered as valid. Where ***P*** specifies which bit is toggled. A pulse signal returns to the original A bit pattern before the start of reception. |

| | |
|---|---|
| Values | P<br>unused |
| Default | P |

### ATTRIBUTE SigChan J2 connectTx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the connect or answer signal when transmitted. The value of the signal must be different from the *idleTx* signal. |
| Values | 0<br>1 |
| Default | 0 |

### ATTRIBUTE SigChan J2 connectRx

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the connect or answer signal when received. The value of the signal must be different from the *idleRx* signal. |
| Values | 0<br>1 |
| Default | 0 |

### ATTRIBUTE SigChan J2 clearBackTx

| | |
|---|---|
| Access | Read only |
| Criticality | Process |
| Description | This attribute specifies what the value is, in ABCD terms, of the clear back signal when transmitted. This signal is sent, if defined, on an incoming call from the link when the network side |

first initiates the disconnect sequence. This value, if used, must be different from the *idleTx* and *connectTx* signals.

Values unused

Default unused

### ATTRIBUTE SigChan J2 clearBackRx

Access Read only

Criticality Process

Description This attribute specifies what the value is, in ABCD terms, of the clear back signal when received. This signal is received, if defined, on an outgoing call to the link when the link side first initiates the disconnect sequence. This value, if used, must be different from the *idleRx* and *connectRx* signal.

Values unused

Default unused

### ATTRIBUTE SigChan J2 clearFwdTx

Access Read only

Criticality Process

Description This attribute specifies what the value is, in ABCD terms, of the clear forward signal when transmitted. This signal is sent, if defined, on an outgoing call to the link when the network side first initiates the disconnect sequence. This value, if used, must be different from the *idleTx* signal and any transmitted seize signal defined.

Values unused

Default unused

### ATTRIBUTE SigChan J2 clearFwdRx

Access Read only

Criticality Process

This value, if used, must be different from *idleRx* signal and any transmitted seize signal defined. |
| Values | unused |
| Default | unused |

### GROUP SigChan J2 TimerProv

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the various timers used by *Ds1Cas* component to handle a particular timing events. |

### ATTRIBUTE SigChan J2 guardTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time needed after a channel is idled before it is made available for the next outgoing call to the link. |
| Values | Decimal (0..30000) |
| Units | msec |
| Default | 1000 |

### ATTRIBUTE SigChan J2 winkTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the length of time that a *winkTx* signal is transmitted. This attribute is only referenced if the *winkTx* signal is defined |

| | |
|---|---|
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 220 |

### ATTRIBUTE SigChan J2 winkMinTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the minimum time that a *winkRx* signal, when received, must persist before being considered as a valid wink. Anything less is ignored. This value must be less than *winkMaxTime*. This attribute is only referenced if the *winkRx* Signal is defined |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 130 |

### ATTRIBUTE SigChan J2 winkMaxTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum time that a *winkRx* signal, when received, may persist before it is interpreted as a GLARE condition. This value must be larger than the *winkMinTime*. This attribute is only referenced if the *winkRx* Signal is defined |
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 300 |

### ATTRIBUTE SigChan J2 seizeAckDelayTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the delay, after receiving any particular seize signal, before responding with a *seizeAckTx* or *winkTx* signal |
| Values | Decimal (30..30000) |
| Units | msec |
| Default | 180 |

### ATTRIBUTE SigChan J2 seizeAckSupvTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time, on an outgoing call to the link, the network will wait to receive a *seizeAckRx* or a *winkRx* signal. Should this timer time-out, the call is considered as a seize failure. This timer is not started unless either the *seizeAckRx* or a *winkRx* signals are defined. |
| Values | Decimal (1000..15000) |
| Units | msec |
| Default | 4000 |

### ATTRIBUTE SigChan J2 outpulseDelayTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of delay, after transmitting any seize signal, before digit transmission begins.<br>If the *seizeAckRx* or *winkRx* signal is defined, the timer is started |

| | |
|---|---|
| | upon complete reception of the signal.<br>If the *seizeAckRx* or *winkRx* signal are not defined, the timer is started immediately after sending any particular seize signal. |
| Values | Decimal (100..30000) |
| Units | msec |
| Default | 1000 |

### ATTRIBUTE SigChan J2 endOfDialTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time allowed between digits after which any more digits are to be ignored. |
| Values | Decimal (1000..30000) |
| Units | msec |
| Default | 9000 |

### ATTRIBUTE SigChan J2 disconnectTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time that a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) must persist before it is interpreted as a valid disconnect signal. |
| Values | Decimal (10..30000) |
| Units | msec |
| Default | 100 |

### ATTRIBUTE SigChan J2 disconnectSupvTime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the amount of time allowed for the link to respond with a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) once the network has already started the disconnect sequence. |
| Values | Decimal (1000..60000) |
| Units | msec |
| Default | 35000 |

### GROUP SigChan J2 LinkCallStatistics

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics on various call events on the link. |

### ATTRIBUTE SigChan J2 totalCallsOutgoing

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts made to this link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan J2 totalCallsIncoming

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming link call attempts made to this node. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan J2 outgoingAnsweredCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node calls to this link that were answered by the link |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan J2 incomingAnsweredCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming link calls that were answered by this node. That is a connect signal was transmitted by this node out to the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan J2 seizeFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal. That is, no seizure acknowledgment or wink was returned from link. This attribute does not count calls that<br>encountered glare. Glare situations are counted via the glareCalls attribute. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan J2 releaseFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that the link failed to respond correctly during the disconnect sequence of a call. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE SigChan J2 activeChannels

| | |
|---|---|
| Access | Read only |
| Description | This attribute tracks the current number of active channels. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan J2 peakActiveChannels

| | |
|---|---|
| Access | Read only |
| Description | This attribute tracks the peak number of active channels. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan J2 glareCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of outgoing node call attempts to the link that encountered glare. Glare occurs when an outgoing node call attempt and an incoming link call attempt occur on the same channel simultaneously. Priority is given to the incoming call and the outgoing call is reattempted on another channel. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COLLECTED STATS SignallingChannel J2Cas

| | |
|---|---|
| Description | The statistics record generated by the SignallingChannel J2Cas component. |

### ATTRIBUTE SigChan J2 totalCallsOutgoing

| | |
|---|---|
| Description | This spooled statistic counts the number of outgoing node call attempts made to this link in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan J2 totalCallsIncoming

| | |
|---|---|
| Description | This attribute counts the number of incoming link call attempts made to this node in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan J2 seizeFailures

| | |
|---|---|
| Description | This spooled statistic counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal in the last statistics collection interval. That is no seizure acknowledgment or wink was returned from link. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan J2 releaseFailures

| | |
|---|---|
| Description | This spooled statistic counts the number of times that the link failed to respond correctly during the disconnect sequence of a call in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan J2 outgoingAnsweredCalls

| | |
|---|---|
| Description | This spooled statistic counts the number of outgoing node calls to this link that were answered by the link in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan J2 incomingAnsweredCalls

| | |
|---|---|
| Description | This spooled statistic counts the number of incoming link calls that were answered by this node, connect signals transmitted by this node out to the link in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan J2 peakActiveChannels

| | |
|---|---|
| Description | This spooled statistic counts the maximum number of channels that have been simultaneously active on this signalling channel during the last statistics collection interval. |

Values Decimal (0..30)

## COMPONENT SigChan J2 Framer (Framer)

Groups "GROUP SigChan J2 Framer Provisioned (Prov)"
"GROUP SigChan J2 Framer OsiState (State)"

Scope Application

Description *SigChan/n Ds1Cas Framer*
*SigChan/n E1Cas Framer*
*SigChan/n J2Cas Framer*
The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Common Verbs
Help
List
Display

## GROUP SigChan J2 Framer Provisioned (Prov)

Properties Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

### ATTRIBUTE SigChan J2 Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP SigChan J2 Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE SigChan J2 Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE SigChan J2 Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SigChan J2 Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## COMPONENT SigChan J2 Dtmf

| Values | Decimal (1..8) |
| Default | 3 |

### ATTRIBUTE SigChan EQsig t203

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum time for which layer 2 frames may be absent. Expiry triggers a check on whether the far end is alive. |

| | |
|---|---|
| Values | Decimal (2..40) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE SigChan EQsig circuitSwitchedK

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of sequentially numbered I frames (that is, window size (k)) that may be unacknowledged at any given time for a SAP supporting primary rate (64kbit/sec) signalling. |
| Values | Decimal (1..127) |
| Default | 7 |

### GROUP SigChan EQsig Layer3Options (L3)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents the provisionable Layer 3 timer attributes of the ETSI Qsig protocol. |

### ATTRIBUTE SigChan EQsig t309

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the data link failure timer; used to ride out temporary failures. |
| Values | Decimal (15..120) |
| Units | seconds |
| Default | 90 |

### ATTRIBUTE SigChan EQsig t310

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the call proceeding state timer. |
| Values | Decimal (10..120) |
| Units | seconds |
| Default | 30 |

### GROUP SigChan EQsig Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the general options of the D-channel signalling link. |

### ATTRIBUTE SigChan EQsig side

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether the interface is the network or user side of the connection. The parameter applies to both the layer 2 and layer 3 of the interface. If this attribute is set to ***network***, then the interface is master during channel negotiation. If this attribute is set to ***user***, then the interface is slave during channel negotiation. |
| Values | network<br>user |
| Default | network |

### ATTRIBUTE SigChan EQsig maxNonCallConcurrent (nonCall)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the maximum number of simultaneous active non-call messages that are allowed. |
| Values | Decimal (1..30) |
| Default | 30 |

### ATTRIBUTE SigChan EQsig overlapSendingEnabled (ose)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether overlap sending to the PBX is enabled. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE SigChan EQsig overlapReceivingEnabled (ore)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether overlap receiving from the PBX is enabled. |
| Values | enabled<br>disabled |
| Default | enabled |

### GROUP SigChan EQsig OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE SigChan EQsig adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE SigChan EQsig operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SigChan EQsig usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP SigChan EQsig Statistics (Stats)

Properties
Operational

Description
This group provides the operational components for the *EtsiQsig* component.

### ATTRIBUTE SigChan EQsig totalCallsToIf

Access
Read: All
Write: Illegal

Description
This attribute counts the total number of calls that have been made to the interface. The value wraps when it reaches its maximum.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig totalCallsFromIf

| Description | This attribute indicates the number of currently active channels. This includes data and voice channels. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig activeVoiceChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of channels that are currently carrying voice. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig activeDataChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of channels that are currently carrying data. This does not include modem data. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig peakActiveChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of channels that have been active on this signalling channel during the last polling period. |

| | |
|---|---|
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig peakActiveVoiceChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of voice channels that have been active on this signalling channel during the last polling period. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig peakActiveDataChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of data channels that have been active on this signalling channel during the last polling period. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig dChanStatus (dCh)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of the D-channel.<br>***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX.<br>***establishing*** means that the signalling channel is attempting to stage the layer 2.<br>***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX.<br>***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state |

then it is waiting for a restart acknowledgement from the PBX.
***inService*** means that the resources for processing calls are available.
***restarting*** means that the resources for call processing are being rei-initialized.

Values
outOfService
establishing
established
enabling
inService
restarting

Default
No default

## GROUP SigChan EQsig Tools

Properties
Operational

Description
This contains a series of operational attributes which turn on and off several kinds of tracing.

## ATTRIBUTE SigChan EQsig tracing

Access
Read: All
Write: All

Description
This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in *Col/debug* must be greater than 0 and a Telnet NMIS session must list the debug stream in in its data streams (ex. *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously.
Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically reenabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages.

Types of tracing include:

***protocolErrors*** - get details of any protocol errors which are occuring. Protocol errors are also reported in summary form as alarms.
***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).
***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.
***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.
***portHex*** - Messages in hex format being sent and received on the link.

| | |
|---|---|
| Set of | protocolErrors<br>q931Summary<br>q931Hex<br>q931Symbolic<br>portHex |
| Default | No default |

## GROUP SigChan EQsig EQsigSpecificProv

| | |
|---|---|
| Properties | Provisioned |
| Description | This group provides EtsiQsig protocol specific provisioning. |

## ATTRIBUTE SigChan EQsig msgSegmentation

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute allows users to enable/disable the EtsiQsig message segmentation service. |
| Values | enabled<br>disabled |
| Default | disabled |

## ATTRIBUTE SigChan EQsig e1ChannelNumbers

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute is applicable to E1 interfaces only. It specifies the mapping scheme between channel numbers (identified in Layer 3 messages) and timeslot numbers on the E1 link.<br>When the attribute value is ***skip16***, channel numbers map directly to actual E1 timeslots; therefore only channel numbers 1 - 15 and 17 - 31 are expected.<br>When the value is ***contiguous***, channel numbers from 1 - 30 are expected, and the following mapping is used: channels 1 - 15 are mapped to timeslots 1 - 15, and channels 16 - 30 are mapped to timeslots 17 - 31.<br>On T1 interfaces, channel numbers are always expected in the range 1 - 23. |
| Values | skip16<br>contiguous |
| Default | skip16 |

## GROUP SigChan EQsig EQsigSpecificOp

| | |
|---|---|
| Properties | Operational |
| Description | This group provides specific operational attributes for the Etsi Qsig protocol. |

## ATTRIBUTE SigChan EQsig segmentationAccepted

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times a long Etsi Qsig message has been received from a PBX and forwarded to a Passport subnet. The value wraps when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig segmentationFailed

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times a long Etsi Qsig message has been received from a PBX and could not be forwarded as is to a Passport subnet due to end-to-end incompatibility. The value wraps when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COLLECTED STATS SignallingChannel EtsiQsig

| | |
|---|---|
| Description | The statistics record generated by the SignallingChannel EtsiQsig component. |

### ATTRIBUTE SigChan EQsig peakActiveChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan EQsig peakActiveVoiceChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of voice channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan EQsig peakActiveDataChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of data channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan EQsig totalCallsToIf

Description This collected statistic counts the total number of calls that have been made to the interface in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan EQsig totalCallsFromIf

Description This collected statistic counts the number of calls from the interface in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan EQsig nonCallAssocSessionsToIf

Description This collected statistic counts the number of non-call associated sessions to the interface in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan EQsig nonCallAssocSessionsFromIf

Description This collected statistic counts the number of non-call associated sessions from the interface in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan EQsig frmToIf

Description This collected statistic counts the number of frames transmitted to the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SigChan EQsig frmFromIf

Description

This collected statistic counts the number of frames received from the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SigChan EQsig octetFromIf

Description — The number of bytes received from the link interface by *Framer* in the last statistics collection interval.

Values — Decimal (0..4294967295)

### ATTRIBUTE SigChan EQsig octetToIf

Description — The number of bytes sent to the link interface by *Framer* in the last statistics collection interval.

Values — Decimal (0..4294967295)

### COMPONENT SigChan EQsig Framer (Framer)

Groups — "GROUP SigChan EQsig Framer Provisioned (Prov)"
"GROUP SigChan EQsig Framer OsiState (State)"
"GROUP SigChan EQsig Framer Statistics (Stats)"

Scope — Application

Description — *SigChan/n EQsig Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to data path aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface data path statistics (such as frame counts and aborts).

Common Verbs — Help
List
Display

### GROUP SigChan EQsig Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE SigChan EQsig Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP SigChan EQsig Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE SigChan EQsig Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component. |

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE SigChan EQsig Framer operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE SigChan EQsig Framer usageState (osiUsage)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP SigChan EQsig Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *Framer* component. |

### ATTRIBUTE SigChan EQsig Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted to the link interface by *Framer.*<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the link interface by *Framer.*<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by *Framer.* |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of aborts received.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with CRC errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of frames that were non octet aligned.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan EQsig Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received which were too large (longer than 500 bytes).<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT SigChan Bchannel (Bch)

| | |
|---|---|
| Instance | Decimal (1..331) |

| | |
|---|---|
| Groups | "GROUP SigChan Bch Operational (Oper)" |
| Scope | Application |
| Description | *SigChan/n Bchannel/n*<br>This component contains operational attributes of an individual B-channel serviced by the *SigChan* component. The *Bchannel* component instance value reflects the external (protocol specific) channel number. In nB+D configurations, channel number also reflects the related interface:<br>*Bchannel/1-xx* - primary interface,<br>*Bchannel/101-1xx* - secondary interface,<br>*Bchannel/201-2xx* - tertiary interface,<br>*Bchannel/301-3xx* - quaternary interface |
| Common Verbs | Help<br>List<br>Display |

## GROUP SigChan Bch Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains various operational attributes of a B-channel serviced by a Signalling Channel. |

## ATTRIBUTE SigChan Bch status

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates what is current internal B-channel state. The attribute may have the following values for any supported access signalling protocol on Passport:<br>***unknown***, the B-channel has not registered yet for *SigChan* services<br>***maintB***, the B-channel is undergoing a maintenance action<br>***idle***, the B-channel is available for ingress/egress calls<br>***busy***, the B-channel is currently being used for an ingress or egress call<br>***ingress***, the B-channel is currently being used for an ingress call (from the external network to the subnet)<br>***egress***, the B-channel is currently being used for an egress call (from the subnet to the external network) |

In addition, CCS protocols supporting SERVICE messaging may also use the following values:
***idleMaintenance***, the B-channel received a SERVICE message placing the channel in maintenance, and no calls are active on the channel
***ingressMaintenance***, the B-channel received a SERVICE message placing the channel in maintenance, and an incoming call is active on the channel
***egressMaintenance***, the B-channel received a SERVICE message placing the channel in maintenance, and an outgoing call is active on the channel
***outOfService***, a SERVICE message to or from the PBX has placed the channel out of service

Values
unknown
maintB
idle
busy
ingress
egress
idleMaintenance
ingressMaintenance
egressMaintenance
outOfService

Default
unknown

### ATTRIBUTE SigChan Bch timeSlot

Access
Read only

Description
This attribute indicates which timeslot the B-channel uses.

Values
Decimal (0..100)

Default
0

### ATTRIBUTE SigChan Bch vsrInstance

Access
Read only

Description
This attribute indicates the component instance of the *VoiceSubroute* to which the B-channel belongs.

| | |
|---|---|
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE SigChan Bch calledDirectoryNumber (calledDn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the dialled number for the currently active call on this B-channel. |
| Values | BCD (1..32) |
| Default | No default |

### COMPONENT SigChan NisSig (Nis)

| | |
|---|---|
| Groups | "GROUP SigChan Nis Layer2Options (L2)"<br>"GROUP SigChan Nis Layer3Options (L3)"<br>"GROUP SigChan Nis Provisioned (Prov)"<br>"GROUP SigChan Nis OsiState (State)"<br>"GROUP SigChan Nis Statistics (Stats)"<br>"GROUP SigChan Nis Operational (Oper)"<br>"GROUP SigChan Nis Tools"<br>"GROUP SigChan Nis NisSpecificProv" |

"COLLECTED STATS SignallingChannel NisSig"

| | |
|---|---|
| Scope | Device |
| Description | *SigChan/n NisSig*<br>The *NisSig* component defines the operational characteristics of the signalling channel's connection to the external equipment. |
| Subcomponents | "COMPONENT SigChan Nis Framer (Framer)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP SigChan Nis Layer2Options (L2)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group specifies the provisionable layer 2 attributes of the Q.931 ITU-T protocol. |

## ATTRIBUTE SigChan Nis t23

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the layer 2 enable request timer. |
| Values | Decimal (1..15) |
| Units | seconds |
| Default | 10 |

## ATTRIBUTE SigChan Nis t200

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum time between a layer 2 frame and its acknowledgment. |
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 1 |

## ATTRIBUTE SigChan Nis n200

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of re-transmissions of a layer 2 frame. |

| | |
|---|---|
| Values | Decimal (1..8) |
| Default | 3 |

### ATTRIBUTE SigChan Nis t203

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum time for which layer 2 frames may be absent. Expiry triggers a check on whether the far end is alive. |
| Values | Decimal (2..40) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE SigChan Nis circuitSwitchedK

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of sequentially numbered I frames (that is, window size (k)) that may be unacknowledged at any given time for a SAP supporting primary rate (64kbit/sec) signalling. |
| Values | Decimal (1..127) |
| Default | 7 |

### GROUP SigChan Nis Layer3Options (L3)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents the provisionable Layer 3 timer attributes of a the Nis signalling protocol. |

### ATTRIBUTE SigChan Nis t309

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the data link failure timer; used to ride out temporary failures. |
| Values | Decimal (15..120) |
| Units | seconds |
| Default | 90 |

### ATTRIBUTE SigChan Nis t310

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the call proceeding state timer. |
| Values | Decimal (10..120) |
| Units | seconds |
| Default | 10 |

### GROUP SigChan Nis Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the general options of the D-channel signalling link. |

### ATTRIBUTE SigChan Nis side

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether the interface is the network or user side of the connection. The parameter applies to both the |

layer 2 and layer 3 of the interface. If this attribute is set to ***network***, then the interface is master during channel negotiation. If this attribute is set to ***user***, then the interface is slave during channel negotiation.

Values: network
user

Default: network

### ATTRIBUTE SigChan Nis maxNonCallConcurrent (nonCall)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies the maximum number of simultaneous active non-call messages that are allowed.

Values: Decimal (1..30)

Default: 30

### GROUP SigChan Nis OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE SigChan Nis adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component.

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE SigChan Nis operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SigChan Nis usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP SigChan Nis Statistics (Stats)

Properties
Operational

Description
This group provides the operational components for the *NisSig* component.

## ATTRIBUTE SigChan Nis totalCallsToIf

Access
Read: All
Write: Illegal

Description
This attribute counts the total number of calls that have been made to the interface. The value wraps when it reaches its maximum.

Values
Decimal (0..4294967295)

Default
0

## ATTRIBUTE SigChan Nis totalCallsFromIf

Access
Read: All
Write: Illegal

Description
This attribute counts the total number of calls from the interface. The value wraps when it reaches its maximum.

Values
Decimal (0..4294967295)

Default
0

### ATTRIBUTE SigChan Nis nonCallAssocSessionsToIf

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of non-call associated sessions to the interface. The value wraps when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Nis nonCallAssocSessionsFromIf

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of data channels that have been active on this signalling channel during the last polling period. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan Nis dChanStatus (dCh)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of the D-channel.<br>***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX.<br>***establishing*** means that the signalling channel is attempting to stage the layer 2.<br>***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX.<br>***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state then it is waiting for a restart acknowledgement from the PBX.<br>***inService*** means that the resources for processing calls are available.<br>***restarting*** means that the resources for call processing are being rei-initialized. |
| Values | outOfService<br>establishing<br>established<br>enabling<br>inService<br>restarting |
| Default | No default |

## GROUP SigChan Nis Tools

| | |
|---|---|
| Properties | Operational |
| Description | This contains a series of operational attributes which turn on and off several kinds of tracing. |

## ATTRIBUTE SigChan Nis tracing

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in *Col/debug* must be greater than 0 and a Telnet NMIS session must list the debug stream in in its data streams (ex. *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously.<br>Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically reenabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages.<br><br>Types of tracing include:<br>***protocolErrors*** - get details of any protocol errors which are occuring. Protocol errors are also reported in summary form as alarms.<br>***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).<br>***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.<br>***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link. |

***portHex*** - Messages in hex format being sent and received on the link.

## GROUP SigChan Nis NisSpecificProv

Properties
Provisioned

Description
This group provides NIS protocol specific provisioning.

## ATTRIBUTE SigChan Nis chanMaintenanceHandling (cmh)

Access
Read: All
Write: All

Criticality
Process

Description
This attribute specifies how channel maintenance events should be handled upon startup. Channel maintenance events include locking and unlocking a channel or channel registration. The decision is either to send individual channel RESTART messages, SERVICE messages, or nothing. Note that channel registration only occurs after the global interface restart at startup.

Setting this attribute to enable SERVICE messages ensures that SERVICE messages occur at startup and whenever a channel goes into or out of service. If this attribute is not set to enable SERVICE messaging, a RESTART is always sent on unlocking a channel.

***globalOnStartup*** provides the minimum required functionality at startup, without any individual channel confirmation. Note that when this is set, channel RESTART is still used for channel unlock. ***globalOnStartup*** applies to *SigChan* startup only.

***serviceMessage*** enables sending and receiving SERVICE messages. If this attribute is set to ***serviceMessage***, SERVICE

messages are used for channel maintenance on channel lock, channel unlock, and startup.

***restartMessage*** specifies that individual channel RESTARTs when the SigChan starts up. If this attribute is set to ***restartMessage***, a RESTART message is used to send at startup and channel unlock.

Values: globalOnStartup (gbl)
serviceMessage (svc)
restartMessage (rest)

Default: restartMessage

## COLLECTED STATS SignallingChannel NisSig

Description: The statistics record generated by the SignallingChannel NisSig component.

### ATTRIBUTE SigChan Nis peakActiveChannels

Description: This collected statistic counts the maximum number of channels that have been active on this signalling channel in the last statistics collection interval.

Values: Decimal (0..30)

### ATTRIBUTE SigChan Nis peakActiveVoiceChannels

Description: This collected statistic counts the maximum number of voice channels that have been active on this signalling channel in the last statistics collection interval.

Values: Decimal (0..30)

### ATTRIBUTE SigChan Nis peakActiveDataChannels

Description: This collected statistic counts the maximum number of data channels that have been active on this signalling channel in the last statistics collection interval.

Values: Decimal (0..30)

### ATTRIBUTE SigChan Nis totalCallsToIf

Description This collected statistic counts the total number of calls that have been made to the interface in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan Nis totalCallsFromIf

Description This collected statistic counts the number of calls from the interface in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan Nis nonCallAssocSessionsToIf

Description This collected statistic counts the number of non-call associated sessions to the interface in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan Nis nonCallAssocSessionsFromIf

Description This collected statistic counts the number of non-call associated sessions from the interface in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE SigChan Nis frmToIf

Description This collected statistic counts the number of frames transmitted to the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SigChan Nis frmFromIf

Description

This collected statistic counts the number of frames received from the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE SigChan Nis octetFromIf

Description — The number of bytes received from the link interface by *Framer* in the last statistics collection interval.

Values — Decimal (0..4294967295)

### ATTRIBUTE SigChan Nis octetToIf

Description — The number of bytes sent to the link interface by *Framer* in the last statistics collection interval.

Values — Decimal (0..4294967295)

### COMPONENT SigChan Nis Framer (Framer)

Groups — "GROUP SigChan Nis Framer Provisioned (Prov)"
"GROUP SigChan Nis Framer OsiState (State)"
"GROUP SigChan Nis Framer Statistics (Stats)"

Scope — Application

Description — *SigChan/n Nis Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to data path aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface data path statistics (such as frame counts and aborts).

Common Verbs — Help
List
Display

### GROUP SigChan Nis Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE SigChan Nis Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP SigChan Nis Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE SigChan Nis Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or |

*Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE SigChan Nis Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SigChan Nis Framer usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP SigChan Nis Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *Framer* component. |

### ATTRIBUTE SigChan Nis Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted to the link interface by *Framer.*<br>This count wraps to zero after reaching its maximum value. |

### ATTRIBUTE SigChan Nis Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of aborts received.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Nis Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with CRC errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Nis Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Nis Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of frames that were non octet aligned.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Nis Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Nis Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Nis Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received which were too large (longer than 500 bytes).<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

| Default | 10 |

### ATTRIBUTE SigChan Elsdn t200

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum elapsed time between a layer 2 frame and its acknowledgment. |
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 1 |

### ATTRIBUTE SigChan Elsdn n200

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of re-transmissions of a layer 2 frame. |
| Values | Decimal (1..8) |
| Default | 3 |

### ATTRIBUTE SigChan Elsdn t203

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the maximum time during which layer 2 frames may be absent. Expiry triggers a check on whether the far end is alive. |
| Values | Decimal (2..40) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE SigChan Elsdn circuitSwitchedK

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of sequentially numbered I frames (that is, window size (k)) that may be unacknowledged at any given time for a SAP supporting primary rate (64kbit/sec) signalling. |
| Values | Decimal (1..127) |
| Default | 7 |

### GROUP SigChan Elsdn Layer3Options (L3)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents the provisionable Layer 3 timer attributes of a the Euro ISDN (ETSI-T) protocol. |

### ATTRIBUTE SigChan Elsdn t310

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies duration of the call proceeding state timer. |
| Values | Decimal (10..120) |
| Units | seconds |
| Default | 30 |

## GROUP SigChan Elsdn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the general options of the D-channel signalling link. |

## ATTRIBUTE SigChan Elsdn side

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether the interface is the network or user side of the connection. The parameter applies to both the layer 2 and layer 3 of the interface. In addition, if this attribute is set to ***network***, then the interface is master during channel negotiation. If this attribute is set to ***user***, then the interface is slave during channel negotiation. |
| Values | network<br>user |
| Default | network |

## ATTRIBUTE SigChan Elsdn maxNonCallConcurrent (nonCall)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of simultaneous active non call-associated sessions that are allowed. Reduction of the value does not impact NCAS sessions already in progress. |
| Values | Decimal (0..30) |
| Default | 30 |

## ATTRIBUTE SigChan Elsdn overlapSending (ovls)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies whether overlap sending to the PBX is enabled. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE SigChan Elsdn overlapReceiving (ovlr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether overlap receiving from the PBX is enabled. |
| Values | enabled<br>disabled |
| Default | enabled |

### GROUP SigChan Elsdn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE SigChan Elsdn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE SigChan EIsdn operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE SigChan EIsdn usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in

use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP SigChan EIsdn Statistics (Stats)

Properties
Operational

Description
This group provides the statistical attributes for the *SigChan/x EuroIsdn* component.

## ATTRIBUTE SigChan EIsdn totalCallsToIf

Access
Read: All
Write: Illegal

Description
This attribute counts the total number of calls that have been made to the interface. The value wraps to zero when it exceeds its maximum.

Values
Decimal (0..4294967295)

Default
0

## ATTRIBUTE SigChan EIsdn totalCallsFromIf

Access
Read: All
Write: Illegal

Description
This attribute counts the total number of calls that have been made from the interface. The value wraps to zero when it exceeds its maximum.

Values
Decimal (0..4294967295)

Default
0

### ATTRIBUTE SigChan EIsdn nonCallAssocSessionsToIf

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of non call-associated sessions that have been made to the interface. The value wraps to zero when it exceeds its maximum. |

|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum value of the *activeDataChannels* attribute during the last polling period. |
| Values | Decimal (0..128) |
| Default | 0 |

## ATTRIBUTE SigChan Elsdn dChanStatus (dCh)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of the D-channel.<br>***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX.<br>***establishing*** means that the signalling channel is attempting to stage the layer 2.<br>***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX.<br>***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state then it is waiting for a restart acknowledgment from the PBX.<br>***inService*** means that the resources for processing calls are available.<br>***restarting*** means that the resources for call processing are being initialized. |
| Values | outOfService<br>establishing<br>established<br>enabling<br>inService<br>restarting |
| Default | No default |

## GROUP SigChan Elsdn Tools

| | |
|---|---|
| Properties | Operational |
| Description | This contains a series of operational attributes which turn on and off several kinds of tracing. |

## ATTRIBUTE SigChan Elsdn tracing

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute defines which types of tracing are active on the signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueueSize* attribute of the *Lp/x Eng Ds/debug* component must be greater than 0 and the operator's NMIS session must have the debug stream included in its data stream list (for example: *set Nmis Telnet Session/1 dataStreams deb*). Several types of tracing can be enabled simultaneously.<br>Note that tracing consumes additional CPU resources and slows down call processing on a heavily loaded card. If there is message block exhaustion tracing is suspended for a period of time and then automatically re-enabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages.<br>Types of tracing include:<br>***protocolErrors*** - get details of any protocol errors which are occurring. Protocol errors are also reported in summary form as alarms.<br>***q931Summary*** - summary of the Q.931 messages on the signalling link.<br>***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.<br>***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link. |

| | |
|---|---|
| | ***portHex*** - Q.921 messages in hex format being sent and received on the link. |
| Set of | protocolErrors<br>q931Summary<br>q931Hex<br>q931Symbolic<br>portHex |
| Default | No default |

### GROUP SigChan Elsdn Options (Opt)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group specifies the provisionable attributes specific to the Euro ISDN (ETSI-T) protocol. |

### ATTRIBUTE SigChan Elsdn variant

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the specific variant of the Euro ISDN (ETSI-T) protocol. Supported variants are:<br>***etsiGeneric*** - provides generic ETSI-T protocol. Only proxy of the NETWORK side of the protocol is implemented,<br>***austria*** - provides ETSI-T protocol variant as per the Austrian national specification. Only the USER side of the protocol is implemented,<br>***germany*** - provides ETSI-T protocol variant as per the German national specification. Only the USER side of the protocol is implemented. |
| Values | etsiGeneric<br>austria<br>germany |
| Default | etsiGeneric |

### ATTRIBUTE SigChan Elsdn connectServiceTimer (cst)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies duration of the “await connection” supervisory timer which applies to non call-associated sessions providing bearer-independent connection-oriented transport for supplementary services. The timer is started at the ingress Passport when a REGISTER message is received from the source PBX and stopped when a virtual circuit with the egress Passport is established. If the timer expires, the non call-associated session is cleared.<br>The “await connection” timer (attribute *connectServiceTimer*) together with “await response” timer (attribute *responseServiceTimer*) provide equivalent of the T-ACTIVATE timer described in the relevant supplementary service specifications.<br>A change of the timer value does not apply to timers already running. |
| Values | Decimal (1..10) |
| Units | seconds |
| Default | 8 |

### ATTRIBUTE SigChan Elsdn responseServiceTimer (rst)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies duration of the “await response” supervisory timer which applies to non call-associated sessions providing bearer-independent connection-oriented transport for supplementary services. The timer is started at the ingress Passport when creation of a virtual circuit with the egress Passport is confirmed and stopped when the first message from the destination PBX is received. If the timer expires, the non call-associated session is cleared.<br>The “await connection” timer (attribute *connectServiceTimer*) together with “await response” timer (attribute *responseServiceTimer*) provide equivalent of the T-ACTIVATE |

| | |
|---|---|
| | timer described in the relevant supplementary service specifications.<br>A change of the timer value does not apply to timers already running. |
| Values | Decimal (1..10) |
| Units | seconds |
| Default | 8 |

### ATTRIBUTE SigChan Elsdn lifetimeServiceTimer (lst)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies duration of the service lifetime supervisory timer which applies to non call-associated sessions providing bearer-independent connection-oriented transport for supplementary services. The timer limits the duration of a virtual call. It is started at the ingress Passport at the moment the first response message from the destination PBX has been received and stopped when the non call-associated session is released. If the timer expires, the non call-associated session is cleared.<br>This timer is equivalent to the T-CCBS6 timer described in the relevant supplementary service specifications.<br>A change of the timer value does not apply to timers already running. |
| Values | Decimal (1..200) |
| Units | minutes |
| Default | 60 |

### GROUP SigChan Elsdn EuroSpecificProv

| | |
|---|---|
| Properties | Provisioned |
| Description | This group provides Euro ISDN protocol specific provisioning. |

### ATTRIBUTE SigChan EIsdn chanMaintenanceHandling (cmh)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies how channel maintenance events should be handled upon startup. Channel maintenance events include locking and unlocking a channel or channel registration. The decision is either to send individual channel RESTART message,or global interface restart at at startup.<br><br>A RESTART is always sent on unlocking a channel.<br><br>***globalOnStartup*** provides the minimum required functionality at startup, without any individual channel confirmation. Note that when this is set, channel RESTART is still used for channel unlock. ***globalOnStartup*** applies to *SigChan* startup only.<br><br>***restartMessage*** specifies that individual channel RESTARTs when the SigChan starts up. If this attribute is set to ***restartMessage***, a RESTART message is used to send at startup and channel unlock, Global Restart is implemented first for in this choice.<br><br>***restartOnlyMessage*** specifies that individual channel RESTARTs when the SigChan starts up. If this attribute is set to ***restartOnlyMessage***, a RESTART message is used to send at startup and channel unlock, Global Restart is not implemented for this choice. |
| Values | globalOnStartup (gbl)<br>restartMessage (rest)<br>restartOnlyMessage (reso) |
| Default | globalOnStartup |

## COLLECTED STATS SignallingChannel EuroIsdn

| | |
|---|---|
| Description | The statistics record generated by the SignallingChannel EuroIsdn component. |

### ATTRIBUTE SigChan Elsdn peakActiveChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan Elsdn peakActiveVoiceChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of voice channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan Elsdn peakActiveDataChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of data channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan Elsdn totalCallsToIf

| | |
|---|---|
| Description | This collected statistic counts the total number of calls that have been made to the interface in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan Elsdn totalCallsFromIf

| | |
|---|---|
| Description | This collected statistic counts the number of calls from the interface in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan Elsdn nonCallAssocSessionsToIf

| | |
|---|---|
| Description | This collected statistic counts the number of non-call associated sessions to the interface in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan EIsdn nonCallAssocSessionsFromIf

Description: This collected statistic counts the number of non-call associated sessions from the interface in the last statistics collection interval.

Values: Decimal (0..65535)

### ATTRIBUTE SigChan EIsdn frmToIf

Description: This collected statistic counts the number of frames transmitted to the link interface by *Framer* in the last statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE SigChan EIsdn frmFromIf

Description: This collected statistic counts the number of frames received from the link interface by *Framer* in the last statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE SigChan EIsdn octetFromIf

Description: The number of bytes received from the link interface by *Framer* in the last statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE SigChan EIsdn octetToIf

Description: The number of bytes sent to the link interface by *Framer* in the last statistics collection interval.

Values: Decimal (0..4294967295)

### COMPONENT SigChan EIsdn Framer (Framer)

Groups: "GROUP SigChan EIsdn Framer Provisioned (Prov)"
"GROUP SigChan EIsdn Framer OsiState (State)"
"GROUP SigChan EIsdn Framer Statistics (Stats)"

Scope: Application

Description *SigChan/n EuroIsdn Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to data path aspects of the hardware interface (such as CRC and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface data path statistics (such as frame counts and aborts).

## GROUP SigChan EIsdn Framer Provisioned (Prov)

Properties Provisioned

Description This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE SigChan EIsdn Framer interfaceName

Access Read and write

Criticality Process

Description This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values Link (Hardware, applicationFramerName)

Default — No default

### GROUP SigChan Elsdn Framer OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE SigChan Elsdn Framer adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

### ATTRIBUTE SigChan Elsdn Framer operationalState (osiOper)

Access — Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE SigChan Elsdn Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP SigChan Elsdn Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the operational statistics data for a *Framer* component.

### ATTRIBUTE SigChan Elsdn Framer frmToIf

Access: Read only

Description: This attribute counts the number of frames transmitted to the link interface by the *Framer.*
This count wraps to zero after exceeding its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE SigChan Elsdn Framer frmFromIf

Access: Read only

Description

This attribute counts the number of frames received from the link interface by the *Framer.*
This count wraps to zero after exceeding its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE SigChan Elsdn Framer octetFromIf

Access: Read only

Description: This attribute counts the number of bytes received from the link interface by the *Framer.*
This count wraps to zero after exceeding its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE SigChan Elsdn Framer aborts

Access: Read only

Description

This attribute counts the total number of aborts received.
This count wraps to zero after exceeding its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE SigChan Elsdn Framer crcErrors

Access Read only

Description

This attribute counts the total number of frames with CRC errors.
This count wraps to zero after exceeding its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE SigChan Elsdn Framer lrcErrors

Access Read only

Description

This attribute counts the total number of frames with LRC errors.
This count wraps to zero after exceeding its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE SigChan Elsdn Framer nonOctetErrors

Access Read only

Description

This attribute counts the total number of frames that were non octet aligned.
This count wraps to zero after exceeding its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE SigChan Elsdn Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred.<br>This count wraps to zero after exceeding its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Elsdn Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred.<br>This count wraps to zero after exceeding its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Elsdn Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received which were too large (longer than 500 bytes).<br>This count wraps to zero after exceeding its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT SigChan Gateway (Gw)

| | |
|---|---|
| Groups | "GROUP SigChan Gw Operational (Oper)"<br>"GROUP SigChan Gw Statistics (Stats)" |
| Scope | Application |
| Description | *SigChan/n Gateway*<br>This component contains operational attributes which describe gateway capabilities of the *SigChan* component as well as the basic statistics related to calls requiring signalling protocol conversion. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP SigChan Gw Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains an operational attribute which indicates signalling protocol conversion capabilities of the *SigChan* component. |

## ATTRIBUTE SigChan Gw gatewayCapability (gwc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *SigChan* component's capability to convert from one access signalling type to another. Access signalling protocols (protocols between a Passport and external switching equipment, for example a PBX) are grouped into protocol groups. Protocols within the same protocol group are considered completely compatible. This means that no extra processing is needed when a call originates from an ingress link using protocol A and terminates on an egress link using protocol B if protocols A and B belong to the same protocol group. The following protocol groups are defined:<br>***etsiQsigPG*** - ETSI QSIG protocol group containing ETSI QSIG protocol,<br>***mcdnFamilyPG*** - MCDN Family protocol group containing NIS, Meridian Customer Defined Network (MCDN) peer to peer, and MCDN User to Network (UNI) protocols,<br>***analogAndCasPG*** - Analog and CAS protocol group containing most of the analog and channel associated signalling protocols with steady state line signalling and DTMF register signalling,<br>***euroIsdnPG*** - EURO ISDN protocol group containing most of the European national ISDN protocols based on ETSI ISDN (ETSI-T) standard.<br><br>For every of the protocols group this attribute indicates what is |

the level of protocol conversion support available on the *SigChan* component:
***noGw*** - no protocol conversion available for the protocol group,
***singleEndedGw*** - only full protocol conversion available for the protocol group (that is the *SigChan* component on the other side of the subnet does not have to get involved in the gateway processing),
***doubleEndedGw*** - only partial protocol conversion available for the protocol group (that is both *SigChan* components, ingress and egress, have to get involved in signalling conversion),
***singleOrDoubleEndedGw*** - both, full and partial protocol conversions available for the protocol group,
***nativePG*** - the protocol group is the native protocol group for the *SigChan* component.

## GROUP SigChan Gw Statistics (Stats)

Properties
Operational

Description
This group provides signalling gateway related statistical attributes for the *SigChan* component.

## ATTRIBUTE SigChan Gw requiredConversions (rc)

Access
Read: All
Write: Illegal

Description
This attribute counts the total number of calls that have been made from the subnet to the interface (that is external equipment, for example a PBX) which needed signalling protocol conversion.

The value wraps to zero when it exceeds its maximum. The count includes both, supported and unsupported conversions.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE SigChan Gw unsupportedConversions (uc)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of calls that have been made from the subnet to the interface (that is external equipment, for example a PBX) which needed signalling protocol conversion but were rejected since the requested conversion was not supported. The value wraps to zero when it exceeds its maximum.

Values: Decimal (0..4294967295)

Default: 0

### COMPONENT SigChan NcaSession (Ncas)

Instance: Hex (H.0..H.ffff)

Groups: "GROUP SigChan Ncas Operational (Oper)"

Scope: Application

Description: *SigChan/n NcaSession/n*
This component represents a single Non Call-Associated signalling Session (NCAS) serviced by the *SigChan* component. Non call-associated signalling sessions are only supported on some Common Channel Signalling (CCS) protocols (for example ETSI QSIG, ETSI UNI ISDN). The instance value of a *NcaSession* component is an arbitrary number which does not change during an individual NCAS session.

## GROUP SigChan Mcdn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the general options of the D-channel signalling link. |

## ATTRIBUTE SigChan Mcdn side

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether the interface provides layer 2 and 3 services equivalent to the ITU-T network or user side of the connection. If this attribute is set to ***network***, then the interface is master during channel negotiation, and uses network side layer 2 command/response bits. If this attribute is set to ***user***, then the interface is slave during channel negotiation, and uses user side layer 2 command/response bits.<br>Note that although a peer to peer protocol has no true network or user side, for channel negotiation and layer 2 handling the peer to peer and UNI protocols have identical function. A true UNI may also have uni-directional messages and/or message elements; the peer to peer has all elements bidirectional. |
| Values | network<br>user |
| Default | network |

## ATTRIBUTE SigChan Mcdn maxNonCallConcurrent (nonCall)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of simultaneous active non-call transactions that are allowed. |
| Values | Decimal (1..30) |
| Default | 30 |

### ATTRIBUTE SigChan Mcdn overlapSending (ovls)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether overlap sending to the PBX is enabled. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE SigChan Mcdn overlapReceiving (ovlr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether overlap receiving from the PBX is enabled. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE SigChan Mcdn chanMaintenanceHandling (cmh)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies handling of channel maintenance events such as locking and unlocking a channel or channel registration on start-up. The decision here is whether to send individual channel RESTART messages, SERVICE messages, or nothing. Note that channel registration only occurs after the global interface restart at startup.<br><br>The attribute controls start-up handling absolutely, and channel lock and unlock conditionally. That is, setting this to enable |

SERVICE messages ensures SERVICE messages at start-up and whenever a channel goes into or out of service. However, if this is not set to enable SERVICE messaging, a RESTART is always sent on unlocking a channel.

***globalOnStartup*** provides the minimum required function at start-up, without any individual channel confirmation. Note that when this is set, channel RESTART is still used for channel unlock. ***globalOnStartup*** applies to *SigChan* start-up only.

***serviceMessage*** enables sending and receiving SERVICE messages. If enabled, SERVICE messages are always used for channel maintenance on channel lock, channel unlock and start-up.

***restartMessage*** provides individual channel RESTARTs when a *SigChan* starts up. If enabled, the RESTART is used at start-up and channel unlock. However, if both SERVICE and RESTART messages are disabled, the RESTART will still be used when a channel unlocks.

Values: globalOnStartup (gbl)
serviceMessage (svc)
restartMessage (rest)

Default: restartMessage

## GROUP SigChan Mcdn OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE SigChan Mcdn adminState (osiAdmin)

Access: Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE SigChan Mcdn operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE SigChan Mcdn usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP SigChan Mcdn Statistics (Stats)

| | |

| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of non-call associated sessions from the interface. The value wraps when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP SigChan Mcdn Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the MCDN signalling. |

### ATTRIBUTE SigChan Mcdn activeChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of currently active channels. This includes data and voice channels. |

| | |
|---|---|
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn activeVoiceChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of channels that are currently carrying voice. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn activeDataChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of channels that are currently carrying data. This does not include modem data. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn peakActiveChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of channels that have been active on this signalling channel during the last polling period. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn peakActiveVoiceChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the maximum number of voice channels that have been active on this signalling channel during the last polling period. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn peakActiveDataChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of data channels that have been active on this signalling channel during the last polling period. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn dChanStatus (dCh)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of the D-channel.<br>***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX.<br>***establishing*** means that the signalling channel is attempting to stage the layer 2.<br>***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX.<br>***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state then it is waiting for a restart acknowledgement from the PBX.<br>***inService*** means that the resources for processing calls are available.<br>***restarting*** means that the resources for call processing are being rei-initialized. |
| Values | outOfService<br>establishing |

established
enabling
inService
restarting

Default: No default

## GROUP SigChan Mcdn Tools

Properties: Operational

Description: This contains a series of operational attributes which turn on and off several kinds of tracing.

## ATTRIBUTE SigChan Mcdn tracing

Access: Read: All
Write: All

Description: This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in *Col/debug* must be greater than 0 and a Telnet NMIS session must list the debug stream in in its data streams (ex. *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously.
Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically reenabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages.

Types of tracing include:
***protocolErrors*** - get details of any protocol errors which are occuring. Protocol errors are also reported in summary form as alarms.
***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).
***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local

| | |
|---|---|
| | or remote ends.<br>***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.<br>***portHex*** - Messages in hex format being sent and received on the link. |
| Set of | protocolErrors<br>q931Summary<br>q931Hex<br>q931Symbolic<br>portHex |
| Default | No default |

### ATTRIBUTE SigChan Mcdn messageTraced (msgtrc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the type of ISDN messages that are to be traced. |
| Set of | alerting<br>callProceeding (callProc)<br>connectionlessFacility (clsFac)<br>congestionControl (contCtrl)<br>connect<br>connectAcknowledge (connectAck)<br>disconnect<br>facility (fac)<br>facilityAcknowledge (facAck)<br>facilityReject (facRej)<br>information (info)<br>notify<br>progress<br>register |

| | |
|---|---|
| | releaseComp (relComp)<br>release<br>restart<br>restartAcknowledge (restartAck)<br>service<br>serviceAcknowledge (serviceAck)<br>setup<br>setupAcknowledge (setupAck)<br>status<br>statusEnquiry<br>userInformation (userInfo)<br>all |
| Default | (alerting, callProceeding, connectionlessFacility, congestionControl, connect, connectAcknowledge, disconnect, facility, facilityAcknowledge, facilityReject, information, notify, progress, register, releaseComp, release, restart, restartAcknowledge, service, serviceAcknowledge, setup, setupAcknowledge, status, statusEnquiry, userInformation) |

### ATTRIBUTE SigChan Mcdn directionTraced (dirt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute indicates whether the incoming (from PBX), outgoing (to PBX), or both incoming and outgoing messages are traced. |
| Set of | incoming<br>outgoing |
| Default | (incoming, outgoing) |

### GROUP SigChan Mcdn ConnectionlessFeatures (Cls)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group enables and disables the support of the MCDN proprietary signalling for connectionless features on the local signalling channel. |

## ATTRIBUTE SigChan Mcdn clsFeaturesSupported (clsfsup)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the features to be supported by MCDN "TCAP" connectionless messaging. Note that some features such as Network ACD combine connectionless and connection oriented. In the NACD case, the connectionless messaging enables the source and target PBXs to establish the networked relationship, and calls sent across the network (connection oriented) will contain basic information relating the call to the feature.<br><br>Feature Definitions:<br>***networkAcd***: transfer of a call from a pool of agents to a second pool of agents across the network.<br>***networkMessageService***: message waiting capability (for example, lamps on sets). Also includes signalling for voice mail, but is not limited to voice mail.<br>***networkVoiceMail***: a specific subset of Network Message Service, separated functionally as it always terminates on an interactive voice response mailbox application.<br>***networkRingAgain***: ring again to remote sets.<br>***electronicLock***: change of set capabilities by a remote user dialling the applicable code and password.<br>***remoteCallForward***: call forwarding a phone via applicable code and password.<br>***callPickupNetworkWide*** (call pickup world wide): scan for a ringing call on another node, to enable the scanning set to pick up the call.<br>***networkPackage1***: a collection of other features including but not limited to network clock synchronization. Note that on the Meridian 1, this is a general purpose group used for very small features not requiring a new ISDN Facility feature type.<br>***isdnApplicationInterface***: network wide support of a number of Meridian 1 Application Module Link features.<br>***mobilityMultisiteNetworking***: the capability to use a wireless phone in multiple sites, by having the phone register on arrival at the new site, and having the PBX at the new site negotiate the set |

| | |
|---|---|
| | "relocation" with the base PBX.<br>***miscellaneous***: Any feature that is not listed above. |
| Set of | networkAcd (nacd)<br>networkMessageService (nms)<br>networkRingAgain (nrag)<br>networkVoiceMail (nvm)<br>electronicLock (elck)<br>remoteCallForward (rcf)<br>callPickupWorldWide (cpww)<br>networkPackage1 (net1)<br>isdnApplicationInterface (isdnapi)<br>mobilityMultisiteNetworking (mmn)<br>miscellaneous (misc) |
| Default | (networkAcd, networkMessageService, networkRingAgain, networkVoiceMail, electronicLock, remoteCallForward, callPickupWorldWide, networkPackage1, isdnApplicationInterface, mobilityMultisiteNetworking, miscellaneous) |

### GROUP SigChan Mcdn ConnectionOrientedFeatures (Co)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group enables and disables the support of the MCDN proprietary signalling for the listed features on the local signalling channel. |

### ATTRIBUTE SigChan Mcdn dropBackCongestion (dbb)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies if the Meridian 1 Drop Back Congestion Handling for trunks is enabled, and what type is being supported. |
| Values | noDropBackAllowed (ndbb)<br>dropBackToOriginator (dborig)<br>dropBackToPriorNode (dbnode) |
| Default | dropBackToOriginator |

### ATTRIBUTE SigChan Mcdn networkNameDisplay (name)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies what Name Display is supported.<br><br>***nd1*** corresponds to the Meridian 1 RCAP (Remote CAPability) ***nd1***. This translates as caller provides name info in SETUP, ringing party name in ALERTING, redirection name in NOTIFY, and answering party name in CONNECT (as applicable, and if the name changes).<br><br>***nd2*** corresponds to the Meridian 1 RCAP (Remote CAPability) ***nd2***. This translates as caller provides name info in SETUP, answering party provides name in NOTIFY on answer.<br><br>***nd3*** corresponds to the Meridian 1 RCAP (Remote CAPability) ***nd3***, which is ***nd1*** plus name information in call clearing messages (busy user, etc.) where a specific user was found but either could not answer or cleared the call. This corresponds to the QSIG name display. |
| Set of | nameDisplay1 (nd1)<br>nameDisplay2 (nd2)<br>nameDisplay3 (nd3) |
| Default | No default |

### ATTRIBUTE SigChan Mcdn multisiteBusinessGroup (mbg)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies whether to enable transport for the Meridian 1 Multisite Business Group IE. The Meridian 1 allows multiple "Tenants" to exist on a single PBX. These Tenants have limited access to each other and to system resources. That is, users associated with “Tenant group one” cannot use trunks, attendants, and features from another group, and so forth. The |

Multi-Site Business Group is a single Tenant existing on more than one PBX. As an example, “tenant one” on a PBX may "own" resources belonging to “tenant one” on another PBX. The Multi-Site Business Group IE as used in the Meridian 1 Network Tenant Services feature enables linking the two tenants together.

Values
transport
discard

Default
transport

### ATTRIBUTE SigChan Mcdn conOrFeaturesSupported (confsup)

Access
Read: All
Write: All

Criticality
Process

Description
This attribute indicates the features to be supported by MCDN “ROSE” connection oriented messaging.

Feature Definitions:
***networkAttendantService***: network wide support of Attendant (“operator”) services.
***classOfServiceTransport***: this is not a ROSE feature. Class of Service transport takes place in the called party number when provisioned on the Meridian 1 to use an ESN signalling type.
***trunkRouteOptimization***: dropping of redundant links in a call, when a set call forwards a call prior to answer.
***remoteVirtualQueuing***: queuing at a remote node without requiring a B channel to be kept up.
***offHookQueuing***: Queuing by maintaining the speech path to the queuing node.
***networkCallTrace***: call progress tracing across a network (that is, call reached node a, node b, terminated at c,...).
***networkIntercom***: network wide access to an intercom system onm a Meridian 1.
***callPickupNetworkWide***: connection oriented messages associated with the TCAP call pickup scan operation. The messages that actually pick up the ringing call.
***radioPaging***: access to a radio paging system network wide, allowing single radio paging facilities in a relatively dense local PBX network.

***networkAccess***: information to enable access to PBX features from outside the network. Additional data is provided to identify access capabilities for a spoecific call. (Similar to transmittiong authorization code capabilities network wide.)
***antiTromboning***: actually includes two capabilities - NAS (Network Attendant Setvice) and Trunk Anti-Tromboning. Calls that exit the subnet to a PBX and are transferred back to a network number via the same D channel can be optimized. If PBX A (Passport A) calls across the subnet to Passport B, D channel Z, to PBX B, and PBX B transfers across D channel Z to Passport B and therefore to PBX C/Passport C, this allows tha call to simplify to PBX/Passport A to PBX/Passport C.
***miscellaneous***: Any feature that is not listed above.

Set of

networkAttendantService (nas)
classOfServiceTransport (cos)
trunkRouteOptimization (tro)
remoteVirtualQueuing (rvq)
networkCallId (nci)
offHookQueuing (ohq)
networkCallTrace (nctrc)
networkIntercom (nint)
callPickupNetworkWide (cpnw)
radioPaging (radpag)
networkAccess (netacc)
antiTromboning (at)
miscellaneous (misc)

Default

(networkAttendantService, classOfServiceTransport, trunkRouteOptimization, remoteVirtualQueuing, networkCallId, offHookQueuing, networkCallTrace, networkIntercom, callPickupNetworkWide, radioPaging, networkAccess, antiTromboning, miscellaneous)

## COLLECTED STATS SignallingChannel McdnSig

Description

The statistics record generated by the SignallingChannel McdnSig component.

### ATTRIBUTE SigChan Mcdn peakActiveChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan Mcdn peakActiveVoiceChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of voice channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan Mcdn peakActiveDataChannels

| | |
|---|---|
| Description | This collected statistic counts the maximum number of data channels that have been active on this signalling channel in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE SigChan Mcdn totalCallsToIf

| | |
|---|---|
| Description | This collected statistic counts the total number of calls that have been made to the interface in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan Mcdn totalCallsFromIf

| | |
|---|---|
| Description | This collected statistic counts the number of calls from the interface in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan Mcdn nonCallAssocSessionsToIf

| | |
|---|---|
| Description | This collected statistic counts the number of non-call associated sessions to the interface in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE SigChan Mcdn nonCallAssocSessionsFromIf

Description: This collected statistic counts the number of non-call associated sessions from the interface in the last statistics collection interval.

Values: Decimal (0..65535)

### ATTRIBUTE SigChan Mcdn frmToIf

Description: This collected statistic counts the number of frames transmitted to the link interface by *Framer* in the last statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE SigChan Mcdn frmFromIf

Description: This collected statistic counts the number of frames received from the link interface by *Framer* in the last statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE SigChan Mcdn octetFromIf

Description: The number of bytes received from the link interface by *Framer* in the last statistics collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE SigChan Mcdn octetToIf

Description: The number of bytes sent to the link interface by *Framer* in the last statistics collection interval.

Values: Decimal (0..4294967295)

### COMPONENT SigChan Mcdn Framer (Framer)

Groups: "GROUP SigChan Mcdn Framer Provisioned (Prov)"
"GROUP SigChan Mcdn Framer OsiState (State)"
"GROUP SigChan Mcdn Framer Statistics (Stats)"

Scope: Application

Description *SigChan/n Mcdn Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to data path aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface data path statistics (such as frame counts and aborts).

Common Verbs
Help
List
Display

## GROUP SigChan Mcdn Framer Provisioned (Prov)

Properties Provisioned

Description This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE SigChan Mcdn Framer interfaceName

Access Read and write

Criticality Process

Description This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values Link (Hardware, applicationFramerName)

Default No default

### GROUP SigChan Mcdn Framer OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE SigChan Mcdn Framer adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

### ATTRIBUTE SigChan Mcdn Framer operationalState (osiOper)

Access Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE SigChan Mcdn Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP SigChan Mcdn Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *Framer* component. |

### ATTRIBUTE SigChan Mcdn Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted to the link interface by *Framer.*<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the link interface by *Framer.*<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the link interface by *Framer.* This count wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of aborts received.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with CRC errors. This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors. This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames that were non octet aligned.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE SigChan Mcdn Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received which were too large (longer than 500 bytes).<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT SigChan InternalCauseMap (ICmap)

| | |
|---|---|
| Groups | "GROUP SigChan ICmap InternalCauseCode (IntCause)" |
| Scope | Application |
| Description | *SigChan/n VnetInternalCauseManipulation*<br>This component represents the provisionable attributes for the internal, Passport and subnet generated cause codes of an establishing call. This component can be added for most of the ISDN (common channel signalling) protocols (*EtsiQsig*, *NisSig*, *EuroIsdn*) and cannot be added for a channel associated signalling protocol. This component is useful in a network where the originating PBX has restricted conditions to initiating alternate rerouting (rerouting on just one, specific, clearing cause code). |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP SigChan ICmap InternalCauseCode (IntCause)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable, Passport generated clearing reasons of an establishing call. |

### ATTRIBUTE SigChan ICmap egressLinkOutOfServCause

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the cause code sent to the originating PBX when the data link to the remote PBX is down or when remote channels are in maintenance.<br>If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 27. |
| Values | Decimal (0..127)<br>autoConfigure (auto) |
| Default | autoConfigure |

### ATTRIBUTE SigChan ICmap chanOrCircNotAvailCause

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the cause code sent to the originating PBX if no timeslot is available for an incoming call.<br>If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent |

to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 34.

Values
Decimal (0..127)
autoConfigure (auto)

Default
autoConfigure

### ATTRIBUTE SigChan ICmap tempFailureCause

Access
Read: All
Write: All

Description
This attribute specifies the cause code sent to the originating PBX when PORS fails to establish a call due to congestion or a disabled trunk. It is also generated when the calling side fails to decode payload capabilities sent by the called side.
If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 41.

Values
Decimal (0..127)
autoConfigure (auto)

Default
autoConfigure

### ATTRIBUTE SigChan ICmap switchCongestCause

Access
Read: All
Write: All

Description
This attribute specifies the cause code sent to the originating PBX when the allocation of internal resources for an incoming call fails. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, typical cause code values sent back to the originating PBX are 42 for NIS and 41 for ETSI.

Values
Decimal (0..127)
autoConfigure (auto)

Default autoConfigure

### ATTRIBUTE SigChan ICmap reqChanOrCircNotAvailCause

Access Read: All
Write: All

Description This attribute specifies the cause code sent to the originating PBX when an exclusively requested channel is not in service or a channel request is unsuccessful.
If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 44.

Values Decimal (0..127)
autoConfigure (auto)

Default autoConfigure

### ATTRIBUTE SigChan ICmap resourceUnavailCause

Access Read: All
Write: All

Description This attribute specifies the cause code sent to the originating PBX when the path establishing timer expires, when the switched voice service associated to a call is locked by CAS or when an H-channel is requested.
If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, typical cause code values sent back to the originating PBX are 47 for NIS and 44 for ETSI.

Values Decimal (0..127)
autoConfigure (auto)

Default autoConfigure

### ATTRIBUTE SigChan ICmap servNotAllowedCause

Access Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies the cause code sent to the originating PBX when the requested call type (voice or data) is not compatible with *Vroute typeOfRoute* at the calling side.<br>If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 63. |
| Values | Decimal (0..127)<br>autoConfigure (auto) |
| Default | autoConfigure |

### ATTRIBUTE SigChan ICmap noSuchChannelCause

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the cause code sent to the originating PBX when a requested channel does not exist.<br>If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 82. |
| Values | Decimal (0..127)<br>autoConfigure (auto) |
| Default | autoConfigure |

### ATTRIBUTE SigChan ICmap incompatDestCause

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the cause code sent to the originating PBX when the calling and called side capabilities do not match.<br>If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 88. |

## GROUP SrvTrace Rcvr X25 Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes common to all *Dna*s. This group is composed of two attributes that define a DNA. These attributes are used to interpret the format of the address digits. |

## ATTRIBUTE SrvTrace Rcvr X25 Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the DNA that is entered. The address may belong to an E.164 or X.121 plan. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE SrvTrace Rcvr X25 Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Description | The attribute contains digits which form a unique identifier for the calling end of the trace connection. DNA digits are selected and assigned by network operators. The maximum DNA length is 15 digits. |
| Values | BCD (1..15) |
| Default | No default |

## GROUP SrvTrace Rcvr X25 Dna OutgoingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines call options for outgoing calls. |

## ATTRIBUTE SrvTrace Rcvr X25 Dna outCalls (ouc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE.<br><br>This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature. At least one of *outCalls* and *incCalls* must be set to a value of ***allowed*** for this Dna to be usable. |
| Values | disallowed<br>allowed |
| Default | allowed |

## ATTRIBUTE SrvTrace Rcvr X25 Dna outDefaultPriority (odf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to a value of ***normal***, indicates that the default priority for outgoing calls (from the DTE to the network) using this particular *Dna* is normal priority - if the priority is not specified in the call. If this attribute is set to a value of ***high*** then the default priority for outgoing calls using this particular *Dna* is high priority. |
| Values | normal<br>high |
| Default | high |

## ATTRIBUTE SrvTrace Rcvr X25 Dna outIntl (oic)

| | |
|---|---|
| Access | Read only |

Description

This attribute, if set to a value of ***allowed***, indicates that outgoing international calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE.

This attribute also currently controls access to the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls are allowed.

This attribute is ignored if the corresponding attribute *outCalls* is set to a value of ***disallowed***.

Values

disallowed
allowed

Default

allowed

### ATTRIBUTE SrvTrace Rcvr X25 Dna outDefaultPathReliability (opr)

Access

Read only

Description

This attribute specifies the default reliability class of routing for all calls (from the DTE to the network) using this particular *Dna*. The chosen default reliability class of routing normally applies to all packets (including the call packets) travelling into the network. If the *outPathReliabilityOverRide* attribute is subscribed to, the default reliability class of routing is chosen by the calling party.

This attribute, if set to a value of ***normal***, indicates that the default class of routing is normal reliability routing. If set to a value of ***high***, then the default class of routing is high reliability routing.
High reliability is the standard choice for most DPN and Passport services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the VC handles the duplication and disordering to ensure that packets are delivered to the DTE properly.

| | |
|---|---|
| Values | normal<br>high |
| Default | high |

### ATTRIBUTE SrvTrace Rcvr X25 Dna outPathReliabilityOverRide (oro)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***no***, specifies that the called end of the connection will not use the calling end provisioning data for reliability class of routing to override the provisioning data at the called end. |
| Values | yes<br>no |
| Default | no |

### ATTRIBUTE SrvTrace Rcvr X25 Dna outPathReliabilitySignal (ores)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***disallowed***, specifies that reliability routing signaling is not used. |
| Values | allowed<br>disallowed |
| Default | disallowed |

### ATTRIBUTE SrvTrace Rcvr X25 Dna outAccess (oua)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is an extension of the Closed User Group (CUG) facility, as follows:<br>This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE to the network) to the open (non-CUG) part of the network are permitted. It also permits outgoing calls to DTEs that have Incoming Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE.<br><br>This attribute corresponds to the ITU-T 'Closed User Group with Outgoing Access' feature. |

| | |
|---|---|
| Values | disallowed<br>allowed |
| Default | disallowed |

### GROUP SrvTrace Rcvr X25 Dna IncomingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the call options for incoming calls. |

### ATTRIBUTE SrvTrace Rcvr X25 Dna incCalls (inc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed***, indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.<br><br>This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for DNAs in that incoming calls are barred if this attribute is set to a value of ***disallowed***.<br><br>Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### GROUP SrvTrace Rcvr X25 Dna CallOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines additional options for calls which are not specific to the direction of the call. |

### ATTRIBUTE SrvTrace Rcvr X25 Dna packetSizes (pks)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the allowable packet sizes supported for call setup using this DNA. ITU-T recommends that packet size 128 be always supported. |

The bit placement for the packet sizes is as follows:
Bit 0 - Packet Size 16
Bit 1 - Packet Size 32
Bit 2 - Packet Size 64
Bit 3 - Packet Size 128
Bit 4 - Packet Size 256
Bit 5 - Packet Size 512
Bit 6 - Packet Size 1024
Bit 7 - Packet Size 2048
Bit 8 - Packet Size 4096

This list of allowable packet sizes must always include the default packet sizes: *defaultRecvFrmNetworkPacketSize* and *defaultSendToNetworkPacketSize*.

Set of
16
32
64
128
256
512
1024
2048
4096

Default (2048)

### ATTRIBUTE SrvTrace Rcvr X25 Dna defaultRecvFrmNetworkPacketSize (rps)

Access Read only

Description This attribute specifies the default local receive packet size from network to DTE for calls using this particular *Dna*. The *packetSizes* attribute must be set with corresponding value.

Values
16
32
64
128
256
512
1024

| | |
|---|---|
| | 2048<br>4096 |
| Default | 2048 |

### ATTRIBUTE SrvTrace Rcvr X25 Dna defaultSendToNetworkPacketSize (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the default local send packet size from DTE to network for all calls using this particular *Dna*. The *packetSizes* attribute must be set with corresponding value. |
| Values | 16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | 2048 |

### ATTRIBUTE SrvTrace Rcvr X25 Dna defaultRecvFrmNetworkThruputClass (drt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default receive throughput class, (towards the interface) for all calls using this particular *Dna*. |
| Values | Decimal (0..15) |
| Default | 10 |

### ATTRIBUTE SrvTrace Rcvr X25 Dna defaultSendToNetworkThruputClass (dst)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default send throughput class (towards the network) for all calls using this particular *Dna*. |
| Values | Decimal (0..15) |
| Default | 10 |

### ATTRIBUTE SrvTrace Rcvr X25 Dna defaultRecvFrmNetworkWindowSize (rws)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the default number of data packets that can be received by the DTE from the DCE before more packets can be received. This view is oriented with respect to the DTE. |
| Values | Decimal (1..7) |
| Default | 1 |

### ATTRIBUTE SrvTrace Rcvr X25 Dna defaultSendToNetworkWindowSize (sws)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the default number of data packets that can be transmitted from the DTE to the DCE and must be acknowledged before more packets can be transmitted. |
| Values | Decimal (1..7) |
| Default | 1 |

### ATTRIBUTE SrvTrace Rcvr X25 Dna packetSizeNegotiation (psn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***local***, indicates that packet sizes can be negotiated locally at the interface irrespective of the setting at the remote interface. If set to ***endtoEnd***, then the packet size negotiation is between the local and remote interface (i.e. packet sizes are the same on both interfaces). |
| Values | endToEnd<br>local |
| Default | local |

### ATTRIBUTE SrvTrace Rcvr X25 Dna cugFormat (cft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies which CUG format is used when DTE signals CUG indices, ***basic*** or ***extended***. A ***basic*** CUG index format is two digits long. An ***extended*** CUG index format is four digits long. |

This attribute, if set to ***extended***, indicates that the DTE signals and receives CUG indices in extended CUG format. If set to a value of ***basic***, then the DTE signals and receives CUG indices in the basic CUG format.

Values
basic
extended

Default
basic

## COMPONENT SrvTrace Rcvr X25 Dna ClosedUserGroup (Cug)

Instance
Decimal (1..1)

Groups
"GROUP SrvTrace Rcvr X25 Dna Cug CugOptions"

Scope
Application

Description
*SrvTrace Rcvr/<string> X25 Dna ClosedUserGroup*
The component defines options associated with a national or international CUG (Closed User Group) identifier. Other DNAs in the network can have CUGs defined which groups these DNAs by their *Cug interlockCode* attribute value. If DNAs are defined with CUGs, calls from DNAs which do not have the same *interlockCode* attribute value defined are refused. Attributes *incAccess* and *outAccess* can override this rule.

If this component is present, the X.25 interface which connects to the X.25 trace receiver must be provisioned with the same *Cug interlockCode* attribute value.

Common Verbs
Help
List
Display
Add
DELete

## GROUP SrvTrace Rcvr X25 Dna Cug CugOptions

Properties
Provisioned

Description
Attributes in this group define the *ClosedUserGroup* component options associated with the *interlockCode* attribute. DNAs with

the same CUG (*interlockCode*) can make calls within this group. Various combinations of attributes are defined under this option which permit or prevent calls in the same CUG group.

### ATTRIBUTE SrvTrace Rcvr X25 Dna Cug type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an intermediary X.75 Gateway, whereas national closed user groups are usually established between DTEs for which there is no intermediary X.75 Gateway. (National CUGs cannot normally traverse an X.75 Gateway).<br><br>If this attribute is set to ***national***, then the CUG is a national CUG, in which case, the *dnic* attribute should be left at its default value since it is not part of a national CUG. If this attribute is set to ***international***, then the CUG is an international CUG, in which case, the *dnic* attribute should be set appropriately as part of the *Cug interlockCode* attribute value. |
| Values | national<br>international |
| Default | national |

### ATTRIBUTE SrvTrace Rcvr X25 Dna Cug dnic

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the DNIC (Data Network ID Code) of the *Cug* by which packet networks are identified. This attribute is not applicable if the CUG is a national CUG, as specified by the *Cug type* attribute. There are usually 1 or 2 DNICs assigned per country, for public networks. The U.S. is an exception where each BOC has a DNIC. Also, a group of private networks can have its own DNIC.<br><br>DNIC value is not an arbitrary number. It is assigned by international agreement and controlled by ITU-T. |
| Values | BCD (4) |

| | |
|---|---|
| Default | 0000 |

### ATTRIBUTE SrvTrace Rcvr X25 Dna Cug interlockCode (ilc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the CUG identifier of a national or international CUG call. It is an arbitrary number and it can also be called CUG in some descriptions. Interfaces (*Dna*s) defined with this number can only make calls to *Dna*s defined with the same *interlockCode* attribute value. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE SrvTrace Rcvr X25 Dna Cug preferential (pre)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***yes***, indicates that this *Cug* is the preferential CUG, in which case it will be used during the call establishment phase if the DTE has not explicitly specified a CUG index in the call request packet. If set to a value of ***no***, then this *Cug* is not the preferential CUG.<br><br>Only one of the *Cug* components associated with a particular DNA can be the preferential CUG - only one *Cug* component can have this attribute set to ***yes***. |
| Values | no<br>yes |
| Default | yes |

### ATTRIBUTE SrvTrace Rcvr X25 Dna Cug outCalls (ouc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE into the network) can be made using this particular *Cug*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.<br><br>This attribute corresponds to the ITU-T 'Outgoing Calls Barred' |

feature for CUG*s* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***.

Values
disallowed
allowed

Default
allowed

### ATTRIBUTE SrvTrace Rcvr X25 Dna Cug incCalls (inc)

Access
Read only

Description
This attribute, if set to a value of ***allowed***, indicates that incoming calls (from the network to the DTE) can be made using this particular *Cug*. If set to a value of ***disallowed***, then incoming calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.

This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for CUG*s* in that incoming calls are barred if this attribute is set to a value of ***disallowed***.

Values
disallowed
allowed

Default
disallowed

### ATTRIBUTE SrvTrace Rcvr X25 Dna Cug privileged (pri)

Access
Read and write

Description
This attribute, if set to a value of ***yes***, indicates that this *Cug* is a privileged CUG. In DPN, at least one side of a call setup within a CUG must have the CUG as a privileged CUG. If set to a value of ***no***, then the *Cug* is not privileged.

If both the local DTE and the remote DTE subscribe to the CUG, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTE’s in which case the other DTE’s cannot call one another, but can call the host. In this example, the host would have the privileged CUG, and the other DTE’s would belong to the same CUG, but it would not be privileged.

| | |
|---|---|
| Values | no<br>yes |
| Default | yes |

### COMPONENT SrvTrace Rcvr X25 DirectCall (Dc)

| | |
|---|---|
| Groups | "GROUP SrvTrace Rcvr X25 Dc Options" |
| Scope | Application |
| Description | *SrvTrace Rcvr/<string> X25 DirectCall*<br>This component defines direct call options for the call to the X.25 trace receiver. The connection is initiated on receipt of a *Start FrUni/n SrvTrace* command. |
| Common Verbs | Help<br>List<br>Display |

### GROUP SrvTrace Rcvr X25 Dc Options

| | |
|---|---|
| Properties | Provisioned |
| Description | The *Options* group defines attributes associated with the SVC direct call. |

### ATTRIBUTE SrvTrace Rcvr X25 Dc remoteNpi (rnpi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the numbering plan used for the *remoteDna*. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE SrvTrace Rcvr X25 Dc remoteDna (rdna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Data Network Address (DNA) of the remote end of the connection. This is the DNA of the X.25 trace receiver that receives the trace data. |

| | |
|---|---|
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE SrvTrace Rcvr X25 Dc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the type of call as ***switched***. For a ***switched*** call, no information is defined at the remote end about the local end of the connection. |
| Values | switched (svc)<br>permanentMaster (master)<br>permanentSlave (slave)<br>permanentBackupSlave (backSl) |
| Default | switched |

### ATTRIBUTE SrvTrace Rcvr X25 Dc userData (usd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains the user data. It is a 0 to 16 byte length string which is appended to the call request packet that is presented to the called (destination) DTE. |
| Values | String (0..16, Hex) |
| Default | "" |

### COMPONENT SrvTrace Rcvr FrameRelay (Fr)

| | |
|---|---|
| Scope | Application |
| Description | *SrvTrace Rcvr/<string> FrameRelay*<br>This component identifies the access method used by the receiver of the trace data as Frame Relay. |

| | |
|---|---|
| Subcomponents | "COMPONENT SrvTrace Rcvr Fr DataNetworkAddress (Dna)"<br>"COMPONENT SrvTrace Rcvr Fr DirectCall (Dc)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

| | |
|---|---|
| Groups | "GROUP SrvTrace Rcvr Fr Dna Address"<br>"GROUP SrvTrace Rcvr Fr Dna OutgoingOptions"<br>"GROUP SrvTrace Rcvr Fr Dna IncomingOptions"<br>"GROUP SrvTrace Rcvr Fr Dna CallOptions" |
| Scope | Application |
| Description | *SrvTrace Rcvr/<string> Fr DataNetworkAddress*<br>This component defines the calling end of the trace connection. It includes the set of attributes that apply to a VC connection with a Frame Relay trace receiver. |
| Opt. Subcomp. | "COMPONENT SrvTrace Rcvr Fr Dna ClosedUserGroup (Cug)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP SrvTrace Rcvr Fr Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes common to all *Dnas*. This group is composed of two attributes that define a DNA. These attributes are used to interpret the format of the address digits. |

## ATTRIBUTE SrvTrace Rcvr Fr Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the DNA that is entered. The address may belong to either the E.164 or X.121 plan. X.121 is used in packet-switched data networks. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE SrvTrace Rcvr Fr Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies digits that form a unique identifier of the calling end of the trace connection. DNA digits are selected and assigned by network operators. |
| Values | BCD (1..15) |
| Default | No default |

### GROUP SrvTrace Rcvr Fr Dna OutgoingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the call options for outgoing calls. |

### ATTRIBUTE SrvTrace Rcvr Fr Dna outCalls (ouc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. |
| Values | disallowed<br>allowed |
| Default | allowed |

### ATTRIBUTE SrvTrace Rcvr Fr Dna outDefaultPriority (odf)

| | |
|---|---|
| Access | Read and write |

Description — This attribute, if set to a value of ***normal***, indicates that the default priority for outgoing calls (from the DTE to the network) using this particular *Dna* is normal priority - if the priority is not specified by the DTE. If this attribute is set to a value of ***high,*** then the default priority for outgoing calls using this particular *Dna* is high priority.

Values — normal
high

Default — high

### ATTRIBUTE SrvTrace Rcvr Fr Dna outIntl (oic)

Access — Read only

Description — This attribute, if set to a value of ***allowed***, indicates that outgoing international calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE.

This attribute also currently controls access to the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls are allowed.

This attribute is ignored if the corresponding attribute *outCalls* is set to a value of ***disallowed***.

Values — disallowed
allowed

Default — allowed

### ATTRIBUTE SrvTrace Rcvr Fr Dna outDefaultPathReliability (opr)

Access — Read only

Description — This attribute specifies the default class of routing for reliability routing for all outgoing calls (from the DTE to the network) using this particular *Dna*. The chosen default class of routing applies to all outgoing calls established using this *Dna*, and applies to the packets travelling in both directions on all outgoing calls (local to remote, and remote to local). For incoming calls,

the default class of routing is chosen by the calling party (as opposed to DPN, where either end of the call can choose the default routing class).

This attribute, if set to a value of ***normal***, indicates that the default class of routing is normal reliability routing. If set to a value of ***high***, then the default class of routing is high reliability routing.
High reliability is the standard choice for most DPN and Passport services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the VC handles the duplication and disordering to ensure that packets are delivered to the DTE properly.

For the Frame Relay service, duplication of packets is not desired, in which case, normal reliability may be chosen as the preferred class of routing.

Values: normal
high

Default: high

### ATTRIBUTE SrvTrace Rcvr Fr Dna outPathReliabilityOverRide (oro)

Access: Read only

Description: This attribute, if set to a value of ***no***, specifies that the called end of the connection will not use the calling end provisioning data for reliability class of routing to override the provisioning data at the called end.

Values: yes
no

Default: no

### ATTRIBUTE SrvTrace Rcvr Fr Dna outPathReliabilitySignal (ores)

Access: Read only

| | |
|---|---|
| Description | This attribute, if set to a value of ***disallowed***, specifies that reliability routing signaling is not used. |
| Values | allowed<br>disallowed |
| Default | disallowed |

### ATTRIBUTE SrvTrace Rcvr Fr Dna outAccess (oua)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is an extension of the Closed User Group (CUG) facility, as follows:<br>This attribute, if set to a value of ***allowed,*** indicates that outgoing calls (from the DTE to the network) to the open (non-CUG) part of the network are permitted. It also permits outgoing calls to DTEs that have Incoming Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE.<br><br>This attribute corresponds to the ITU-T 'Closed User Group with Outgoing Access' feature for DNAs in that outgoing access is granted if this attribute is set to a value of ***allowed***. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### GROUP SrvTrace Rcvr Fr Dna IncomingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the call options for incoming calls. |

### ATTRIBUTE SrvTrace Rcvr Fr Dna incCalls (inc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed***, indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. |

This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for DNAs in that incoming calls are barred if this attribute is set to a value of ***disallowed***.

Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.

Values: disallowed
allowed

Default: disallowed

## GROUP SrvTrace Rcvr Fr Dna CallOptions

Properties: Provisioned

Description: This group defines additional options for calls not related directly to the direction of a call.

## ATTRIBUTE SrvTrace Rcvr Fr Dna packetSizes (pks)

Access: Read only

Description: This attribute indicates the allowable packet sizes supported for calls setup using this *Dna*. To set a given packet size to be allowed on the *Dna*, the packet size is entered, and the corresponding bit in the structure is set to a value of 1. To set a given packet size to be disallowed on the *Dna*, the packet size is entered preceded with the '~' character, and the corresponding bit in the structure is set to a value of 0. ITU-T recommends that packet size 128 always be supported.

The bit placement for the packet sizes is as follows:
Bit 0 - Packet Size 16
Bit 1 - Packet Size 32
Bit 2 - Packet Size 64
Bit 3 - Packet Size 128
Bit 4 - Packet Size 256
Bit 5 - Packet Size 512
Bit 6 - Packet Size 1024
Bit 7 - Packet Size 2048
Bit 8 - Packet Size 4096

This attribute relates to the *defaultRecvFrmNetworkPacketSize* and *defaultSendToNetworkPacketSize* attributes.

Set of
16

| Values | 16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | 2048 |

### ATTRIBUTE SrvTrace Rcvr Fr Dna cugFormat (cft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies which CUG format is used when DTE signals CUG indices, ***basic*** or ***extended***. A ***basic*** CUG index format is two digits long and an ***extended*** format is four digits long.<br><br>This attribute, if set to a value of ***extended***, indicates that the DTE signals and receives CUG indices in extended CUG format. If set to a value of ***basic***, then the DTE signals and receives CUG indices in the basic CUG format. |
| Values | basic<br>extended |
| Default | basic |

### COMPONENT SrvTrace Rcvr Fr Dna ClosedUserGroup (Cug)

| | |
|---|---|
| Instance | Decimal (1..1) |
| Groups | "GROUP SrvTrace Rcvr Fr Dna Cug CugOptions" |
| Scope | Application |
| Description | *SrvTrace Rcvr/<string> Fr Dna ClosedUserGroup*<br>This component defines options associated with national or international CUG Identifier. Other DNAs in the network can have CUGs defined which groups these DNAs by their *Cug interlockCode* attribute value. If DNAs are defined with CUGs, calls from DNAs which do not have the same *interlockCode* |

attribute value defined are refused. Attributes *incAccess* and *outAccess* can override this rule.

If this component is present, the Frame Relay interface which connects to the Frame Relay trace receiver must be provisioned with the same *Cug interlockCode* attribute value.

Common Verbs

Help
List
Display
Add
DELete

## GROUP SrvTrace Rcvr Fr Dna Cug CugOptions

Properties: Provisioned

Description: Attributes in this group define the *ClosedUserGroup* component options associated with the *interlockCode* attribute. DNAs with the same CUG (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same CUG group are defined here.

## ATTRIBUTE SrvTrace Rcvr Fr Dna Cug type

Access: Read and write

Description: This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an intermediary X.75 Gateway, whereas national closed user groups are usually established between DTEs for which there is no intermediary X.75 Gateway. (National CUGs cannot normally traverse an X.75 Gateway).

This attribute, if set to a value of ***national***, then the CUG is a national CUG, in which case, the *dnic* attribute should be left at its default value since it is not part of a national CUG. If set to a value of ***international***, then the CUG is an international CUG, in which case, the *dnic* attribute should be set appropriately as part of the *Cug interlockCode* attribute.

| | |
|---|---|
| Values | national<br>international |
| Default | national |

### ATTRIBUTE SrvTrace Rcvr Fr Dna Cug dnic

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the DNIC (Data Network ID Code) of the *Cug* by which packet networks are identified. This attribute is not applicable if the CUG is a national CUG, as specified by the *Cug type* attribute. There are usually 1 or 2 DNICs assigned per country, for public networks. The U.S. is an exception where each BOC has a DNIC. Also, a group of private networks can have its own DNIC.<br><br>DNIC value is not an arbitrary number. It is assigned by international agreement and controlled by ITU-T. |
| Values | BCD (4) |
| Default | 0000 |

### ATTRIBUTE SrvTrace Rcvr Fr Dna Cug interlockCode (ilc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the CUG identifier of a national or international CUG call. It is an arbitrary number and it also can be called CUG in some descriptions. Interfaces (DNAs) defined with this number can only make calls to DNAs defined with the same *interlockCode* attribute value. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE SrvTrace Rcvr Fr Dna Cug preferential (pre)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***yes***, indicates that this *Cug* is the preferential CUG, in which case it will be used during the call establishment phase if the DTE has not explicitly specified a CUG index in the call request packet. If set to a value of ***no***, then |

this *Cug* is not the preferential CUG.

Only one of the *Cug* components associated with a particular DNA can be the preferential CUG - only one *Cug* component can have this attribute set to ***yes***.

Values
no
yes

Default
yes

### ATTRIBUTE SrvTrace Rcvr Fr Dna Cug outCalls (ouc)

Access
Read only

Description
This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE into the network) can be made using this particular *Cug*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.

This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for CUG*s* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***.

Values
disallowed
allowed

Default
allowed

### ATTRIBUTE SrvTrace Rcvr Fr Dna Cug incCalls (inc)

Access
Read only

Description
This attribute, if set to a value of ***allowed***, indicates that incoming calls (from the network to the DTE) can be made using this particular *Cug*. If set to a value of ***disallowed***, then incoming calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.

This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for CUG*s* in that incoming calls are barred if this attribute is set to a value of ***disallowed***.

Values
disallowed
allowed

Default
disallowed

### ATTRIBUTE SrvTrace Rcvr Fr Dna Cug privileged (pri)

Access
Read only

Description
This attribute, if set to a value of ***yes***, indicates that this *Cug* is a privileged CUG. In DPN, at least one side of a call setup within a CUG must have the CUG as a privileged CUG. If set to a value of ***no***, then this *Cug* is not privileged.

If both the local DTE and the remote DTE subscribe to the CUG, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTE's, in which case the other DTE's cannot call each other, but can call the host. In this example, the host would have the privileged CUG, and the other DTE's would belong to the same CUG, but it would not be privileged.

Values
no
yes

Default
yes

### COMPONENT SrvTrace Rcvr Fr DirectCall (Dc)

Groups
"GROUP SrvTrace Rcvr Fr Dc Options"

Scope
Application

Description
*SrvTrace Rcvr/<string> Fr DirectCall*
This component defines direct call options for the call to the Frame Relay trace receiver. The connection is initiated on receipt of a *Start FrUni/n SrvTrace* command.

Common Verbs
Help
List
Display

## GROUP SrvTrace Rcvr Fr Dc Options

| | |
|---|---|
| Properties | Provisioned |
| Description | The *Options* group defines attributes associated with the SVC direct call. |

## ATTRIBUTE SrvTrace Rcvr Fr Dc remoteNpi (rnpi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the numbering plan used for the *remoteDna*. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE SrvTrace Rcvr Fr Dc remoteDna (rdna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Data Network Address (DNA) of the remote end of the connection. This is the DNA of the Frame Relay trace receiver that will receive the trace data. |
| Values | BCD (1..15) |
| Default | No default |

## ATTRIBUTE SrvTrace Rcvr Fr Dc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the type of call as ***switched***. For a ***switched*** call, no information is defined at the remote end about the local end of the connection. |
| Values | switched (svc)<br>permanentMaster (master)<br>permanentSlave (slave)<br>permanentBackupSlave (backSl) |
| Default | switched |

### ATTRIBUTE SrvTrace Rcvr Fr Dc userData (usd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains the user data. It is a 0 to 16 byte length string which is appended to the call request packet that is presented to the called (destination) DTE. |
| Values | String (0..16, Hex) |
| Default | "" |

### COMPONENT SrvTrace Rcvr FrAtm

| | |
|---|---|
| Groups | "GROUP SrvTrace Rcvr FrAtm Provisioned (Prov)"<br>"GROUP SrvTrace Rcvr FrAtm TrafficManagement (Tm)" |
| Scope | Application |
| Description | *SrvTrace Rcvr/<string> FrAtm*<br>This component represents the characteristics of FrAtm service trace receiver. If this component is provisioned, the *X25*, *Fr*, or *Atm* component cannot be provisioned under the same *SrvTrace Rcvr* component. If this component is deleted, all active *SrvTrace Session*s associated with this component are not affected. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP SrvTrace Rcvr FrAtm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains general provisioned information of the FrAtm service trace receiver.<br><br>When started, service trace attempts to establish a connection to the FR-ATM service specified by *calledAddress* attribute. Every time a different DLCI ranging between *minimumDlci* and *maximumDlci* attributes is specified in call setup message, until a successful connection is established or all available DLCIs are |

tried.

To reduce the number of useless connection attempt, a consecutive set of DLCI should be provisioned in the FR-ATM service, and with the *minimumDlci* and *maximumDlci* attributes of *PtsFrAtmProv* group corresponding to the minimum and maximum instance number of *Dlci* provisioned in the FR-ATM service.

### ATTRIBUTE SrvTrace Rcvr FrAtm calledAddress (addr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the NSAP address of the FR-ATM service through which the FrAtm trace receiver is connected. Changing this attribute does not impact active *SrvTrace Session*s associated with this receiver. This change takes effect when *SrvTrace Session*s are restarted (*stop* and then *start*) |
| Values | String (6..44, AESANsapAddress) |
| Default | No default |

### ATTRIBUTE SrvTrace Rcvr FrAtm tracedLength (len)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of octets to trace per frame starting from the octet following the frame flag. If the frame length is longer than the value specified by this attribute, then the traced frame is truncated to *tracedLength*. If set to ***disabled***, the traced frame is not truncated.<br><br>Changing this attribute does not affect active *SrvTrace Session*s. The *SrvTrace Sessions* need to be restarted (*Stop* and then *Start*) for this attribute to take effect. |
| Values | Decimal (1..4000)<br>disabled |
| Units | octets |
| Default | 2000 |

### ATTRIBUTE SrvTrace Rcvr FrAtm minimumDlci (min)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum provisioned *Dlci* instance number in the FR-ATM service specified by *calledAddress*. |
| Values | Decimal (16..1007) |
| Default | 16 |

### ATTRIBUTE SrvTrace Rcvr FrAtm maximumDlci (max)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum provisioned *Dlci* instance number in the FR-ATM service specified by *calledAddress*. |
| Values | Decimal (16..1007) |
| Default | 16 |

### GROUP SrvTrace Rcvr FrAtm TrafficManagement (Tm)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains basic traffic parameters used for ATM connection setup procedure. |

### ATTRIBUTE SrvTrace Rcvr FrAtm serviceCategory (service)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the service category of the ATM connection.<br>Currently, the service trace receiver feature only supports ATM connections whose service category is UBR, RT-VBR or NRT-VBR. |
| Values | unspecifiedBitRate (ubr)<br>rtVariableBitRate (rtvbr)<br>nrtVariableBitRate (nrtvbr) |
| Default | unspecifiedBitRate |

### ATTRIBUTE SrvTrace Rcvr FrAtm peakCellRate (pcr)

| | |
|---|---|
| Access | Read and write |
| Description | The attribute specifies the peak cell rate allowed on the ATM connection. |
| Values | Decimal (1..2147483647) |
| Units | cell/s |
| Default | No default |

### COMPONENT SrvTrace Rcvr Atm

| | |
|---|---|
| Groups | "GROUP SrvTrace Rcvr Atm Provisioned (Prov)"<br>"GROUP SrvTrace Rcvr Atm TrafficManagement (Tm)" |
| Scope | Application |
| Description | *SrvTrace Rcvr/<string> Atm*<br>This component represents the characteristics of ATM service trace receiver. If this component is provisioned, the *X25*, *Fr*, or *FrAtm* component cannot be provisioned under the same *SrvTrace Rcvr* component. If this component is deleted, all active *SrvTrace Session*s associated with this component are not affected. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP SrvTrace Rcvr Atm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains general provisioned information of the ATM service trace receiver. |

### ATTRIBUTE SrvTrace Rcvr Atm calledAddress (addr)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the NSAP address of the ATM service trace receiver. Changing this attribute does not impact active *SrvTrace Session*s associated with this receiver. This change takes effect when *SrvTrace Session*s are restarted (*stop* and then *start*). |
| Values | String (6..44, AESANsapAddress) |
| Default | No default |

### ATTRIBUTE SrvTrace Rcvr Atm tracedLength (len)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of octets to trace per frame starting from the octet following the frame flag. If the frame length is longer than the value specified by this attribute, then the traced frame is truncated to *tracedLength*. If set to ***disabled***, the traced frame is not truncated.<br><br>Changing this attribute does not affect active *SrvTrace Session*s. The *SrvTrace Sessions* need to be restarted (*Stop* and then *Start*) for this attribute to take effect.<br><br>When this *SrvTrace Rcvr* is used for Frame Relay trace services, the [*FrUni* \| *FrNni]* *SrvTrace Filter tracedLength* attribute overrides this attribute. |
| Values | Decimal (1..4000)<br>disabled |
| Units | octets |
| Default | 2000 |

### GROUP SrvTrace Rcvr Atm TrafficManagement (Tm)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains basic traffic parameters used for ATM connection setup procedure. |

### ATTRIBUTE SrvTrace Rcvr Atm serviceCategory (service)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the service category of the ATM connection.<br>Currently, the service trace receiver feature only supports ATM connections whose service category is UBR, RT-VBR or NRT-VBR. |
| Values | unspecifiedBitRate (ubr)<br>rtVariableBitRate (rtvbr)<br>nrtVariableBitRate (nrtvbr) |
| Default | unspecifiedBitRate |

### ATTRIBUTE SrvTrace Rcvr Atm peakCellRate (pcr)

| | |
|---|---|
| Access | Read and write |
| Description | The attribute specifies the peak cell rate allowed on the ATM connection. |
| Values | Decimal (1..2147483647) |
| Units | cell/s |
| Default | No default |

### COMPONENT SrvTrace Session

| | |
|---|---|
| Instance | Decimal (1..50) |
| Groups | "GROUP SrvTrace Session Operational" |
| Scope | Application |
| Description | *SrvTrace Session/n*<br>The *Session* component provides information about an active trace. |
| Dyn. Subcomp. | "COMPONENT SrvTrace Session X25"<br>"COMPONENT SrvTrace Session FrameRelay (Fr)"<br>"COMPONENT SrvTrace Session FrAtm"<br>"COMPONENT SrvTrace Session Atm" |
| Common Verbs | Help<br>List<br>Display |

## GROUP SrvTrace Session Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *Session* component. It displays the service being traced and the destination for the traced data. |

## ATTRIBUTE SrvTrace Session serviceTraced (service)

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the service being traced. An example is *FrUni/5*. |
| Values | The name of the component |
| Default | No default |

## ATTRIBUTE SrvTrace Session receiver (rcvr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the trace receiver which is the destination for the traced data. |
| Values | The name of the component |
| Default | No default |

## ATTRIBUTE SrvTrace Session sessionState

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the trace session.<br>The ***active*** value is the normal state for a running trace session. The ***waitingForSession***, ***waitingForProvisioningData***, ***callingReceiver*** and ***binding*** values are all normal transient states used to establish a session with the trace receiver on receipt of a *Start* command. In the ***waitingForSession*** state, a trace session is being allocated. In the ***waitingForProvisioningData*** state, a trace session has been allocated and receiver provisioning data, used to setup the call to the receiver, is being retrieved. In the ***callingReceiver*** state, the call to the receiver is being established. In the ***binding*** state, the call to the receiver has been established and the service data path is being adjusted to include trace. |

The ***unbinding***, ***clearingCallToReceiver*** and ***releasingSession*** values are all normal transient states used to disconnect a session with the trace receiver on receipt of a *Stop* command. In the ***unbinding*** state, the service data path is being adjusted to remove trace. In the ***clearingCallToReceiver*** state, the call to the receiver is being cleared. In the ***releasingSession*** state, a trace session is being deallocated.
A value of ***abortingDueToCallFailure*** indicates that the call to the trace receiver has disconnected unexpectedly and trace is stopping. The clear cause and diagnostic for the failure is reported. Correct the fault indicated and retry the *Start* command.
Values of ***initializing*** and ***idle*** can never be seen since these states occur before a *Session* component is created and after it is destroyed.

Values

initializing
idle
waitingForSession
releasingSession
waitingForProvisioningData
callingReceiver
clearingCallToReceiver
abortingDueToCallFailure
binding
unbinding
active

Default

No default

## ATTRIBUTE SrvTrace Session callState

Access

Read only

Description

This attribute indicates the state of the trace call to the receiver.
The ***dataTransfer*** value is the normal state for the call.
The ***initializing***, ***creatingVc***, ***waitingApiUp***, ***calling***, and ***enteringDataTransfer*** values are all normal transient states used to establish a call to the trace receiver on receipt of a *Start* command. These states occur during the ***callingReceiver*** state of the *sessionState* attribute. In the ***initializing*** state, receiver provisioning data, used to setup the call to the receiver, is being retrieved. In the ***creatingVc*** state, the local VC is being created.

In the ***calling*** state, the direct call to the receiver is being connected. In the ***enteringDataTransfer*** state, the call to the receiver has been accepted and the data path is being established. The ***clearing***, ***terminatingVc*** and ***terminated*** values are all normal transient states used to disconnect a call with the trace receiver on receipt of a *Stop* command. These states occur during the ***clearingCallToReceiver*** state of the *sessionState* attribute. In the ***clearing*** state, the call to the receiver is being cleared. In the ***terminatingVc*** state, the local VC is being destroyed. In the ***terminated*** state, the call is down and all cleanup is complete.
A value of ***reseting*** indicates a data sequencing problem has occurred on the call. This value is applicable for sessions to X.25 trace receivers only and indicates an incompatibility with the receiver. Tracing continues, however some trace data may have been lost.
A value of ***terminating*** is a normal transient state which occurs if a *Stop* command is received before the local VC has been created.

Values

initializing
creatingVc
calling
clearing
enteringDataTransfer
terminatingVc
dataTransfer
reseting
terminating
terminated
waitingApiUp

Default

No default

## ATTRIBUTE SrvTrace Session queueState

Access

Read only

Description

This attribute indicates the state of the trace queue. A value of ***normal*** indicates that traced data is being queued normally. A value of ***full*** indicates that trace data is being discarded because the queue is full. A value of ***blocked*** indicates that trace data is being discarded because the trace VC is not able to transport the data.

| | |
|---|---|
| Values | normal<br>full<br>blocked |
| Default | normal |

### ATTRIBUTE SrvTrace Session framesQueued

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of traced frames that are currently queued to be sent to the VC. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SrvTrace Session framesSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of traced frames sent to the VC. The counter wraps when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SrvTrace Session framesDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discarded trace frames while the trace queue is full. Frames discarded while the queue is blocked are not counted. The counter wraps when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE SrvTrace Session framesTruncated

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of truncated frames that require truncation. Truncation is needed when the traced frame length |

exceeds the limitation specified for this service trace session.

If a *Filter* component exists under the service *SrvTrace*, the limitation is specified by *SrvTrace Filter tracedLength* attribute; otherwise the limitation is specified by the *tracedLength* attribute under component *SrvTrace Rcvr/<string> [FrAtm | Atm]*.

This counter wraps when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

## COMPONENT SrvTrace Session X25

Scope: Application

Description: *SrvTrace Session/<n> X25*
This component identifies the access method used by the receiver of the trace data as X.25.

Dyn. Subcomp.: "COMPONENT SrvTrace Session X25 Vc"

Common Verbs:

## COMPONENT SrvTrace Session X25 Vc

Groups:
"GROUP SrvTrace Session X25 Vc CallData (Cad)"
"GROUP SrvTrace Session X25 Vc IntervalData (Intd)"
"GROUP SrvTrace Session X25 Vc Statistics (Stats)"

Scope: Application

Description: ... *Vc()*
This component defines display of general Vc dynamic attributes

Common Verbs:
- Help
- List
- Display

### GROUP SrvTrace Session X25 Vc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to General *Vc*. It can be displayed only for General *Vc* which is created by application. |

### ATTRIBUTE SrvTrace Session X25 Vc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the type of call, ***pvc*** or ***svc***. *type* is provided at provisioning time. |
| Values | pvc<br>svc |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc previousState

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc callingNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc fastSelectCall

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc localRxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of send packets. |
| Values | unknown<br>16<br>32<br>64 |

| | |
|---|---|
| | 128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc localTxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of send packets. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc localTxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the send window size provided on incoming call packets or the default when a call request packet does not explicitly provide the window size. |
| Values | Decimal (0..127) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc localRxWindowSize

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the receive window size provided on incoming call packets or the default when a call request does not explicitly provide the window sizes. |
| Values | Decimal (0..127) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc segmentSize

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc subnetTxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of the data packets on this *Vc*. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc subnetTxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the current send window size of *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc subnetRxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of receive packets. |
| Values | unknown<br>16 |

| | |
|---|---|
| | 32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc subnetRxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the receive window size provided on incoming call packets and to the default when a call request does not explicitly provide the window sizes. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the maximum packet size allowed on *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc transferPriorityToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the priority in which data is transferred to the network.<br><br>The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.<br><br>Each transfer priority contains a predetermined setting for trunk |

queue (interrupting, delay or throughput), and routing metric (delay or throughput).

When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay.

When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput.

Values: normal
high

Default: No default

### ATTRIBUTE SrvTrace Session X25 Vc transferPriorityFromNetwork

Access: Read only

Description: This attribute displays the priority in which data is transferred from the network.

The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.

Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput).

When the transfer priority is set at ***high***, and the trunk queue is set to high, the routing metric is set to delay.

When the transfer priority is set at ***normal***, the trunk queue is set to normal, and the routing metric is set to throughput.

Values: normal
high

Default: No default

### GROUP SrvTrace Session X25 Vc IntervalData (Intd)

Properties: Operational

| | |
|---|---|
| Description | This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued. |

### ATTRIBUTE SrvTrace Session X25 Vc elapsedTimeTillNow

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc segmentsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc segmentsSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this |

packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.

Values: Decimal (0..16777215)

Default: No default

### ATTRIBUTE SrvTrace Session X25 Vc startTime

Access: Read only

Description: This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.

Values: Time (DHMS)

Default: No default

### ATTRIBUTE SrvTrace Session X25 Vc callReferenceNumber

Access: Read only

Description: This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.

Values: Decimal (0..4294967295)

Default: No default

### GROUP SrvTrace Session X25 Vc Statistics (Stats)

Properties: Operational

Description: ... *Statistics(Stats)*
This group defines general attributes collected by general *Vc*.
The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.
Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each

attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.

### ATTRIBUTE SrvTrace Session X25 Vc ackStackingTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of ack stacking timer expiries. It is used as an indicator of the acknowledgment behavior across the subnet when ack stacking is in effect. If it expires often, usually this means end users will experience longer delay.<br>The ack stacking timer specifies how long the *Vc* will wait before finally sending the subnet acknowledgment. if this attribute is set to a value of 0, then the *Vc* will automatically return acknowledgment packets without delay. If this attribute is set to a value other than zero, then the *Vc* will wait for this amount of time in an attempt to piggyback the acknowledgment packet on another credit or data packet. If the *Vc* cannot piggyback the acknowledgment packet within this time, then the packet is returned without piggybacking. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc outOfRangeFrmFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of subnet frames discarded due to the sequence number being out of range.<br>Two Categories apply for the General *Vc*<br>1) lost Acks (previous Range)<br>2) unexpected Packets (next Range)<br>*Vc* internally maintains its own sequence number of packet order and sequencing. Due to packet retransmission, *Vc* may receive duplicate packets that have the same *Vc* internal sequence number. Only 1 copy is accepted by the *Vc* and other copies of the same packets are detected through this count. This attribute can be used to record the frequency of packet retransmission due to *Vc* and other part of the subnet. |

| | |
|---|---|
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc duplicatesFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of subnet packets discarded due to duplication. It is used to detect software error fault or duplication caused by retransmitting. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc frmRetryTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which have retransmission time-out.<br>If packets from *Vc* into the subnet are discarded by the subnet, the source *Vc* will not receive any acknowledgment. The retransmission timer then expires and packets will be retransmitted again. Note that the *Vc* idle probe may be retransmitted and is included in this count. This statistics does not show the distribution of how many times packets are retransmitted (e.g. first retransmission results in successful packet forwarding). |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of the retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc peakOoSeqQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of the out of sequence queue.<br>This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of the sequence packet queue.<br>This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets, which by the receipt of an expected packet have been transformed to expected packets. The number of times this peak is reached is not recorded as it is traffic dependent. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc peakStackedAcksRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of wait acks.<br>This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest collective acknowledgment. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc subnetRecoveries

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of successful *Vc* recovery attempts.<br>This attribute is used as an indicator of how many times the *Vc* path is broken but can be recovered. This attribute is useful to record the number of network path failures. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc windowClosuresToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of window closures to subnet. A packet may have been sent into the subnet but its acknowledgment from the remote *Vc* has not yet been received. This is a 8 bit sequence number.This number is useful in detecting whether the *Vc* is sending any packet into the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc windowClosuresFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of window closures from subnet. This attribute is useful in detecting whether the *Vc* is receiving any packet from the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session X25 Vc wrTriggers

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of times the *Vc* stays within the W-R region. The W-R region is a value used to determined the timing of credit transmission. Should the current window size be beneath this value, the credits will be transmitted immediately. Otherwise, they will be transmitted later with actual data. The |

| | |
|---|---|
| | wrTriggers statistic is therefore used to analyze the flow control and credit mechanism. |
| Values | Decimal (0..5000) |
| Default | No default |

## COMPONENT SrvTrace Session FrameRelay (Fr)

| | |
|---|---|
| Scope | Application |
| Description | *SrvTrace Session/<n> FrameRelay*<br>This component identifies the access method used by the receiver of the trace data as Frame Relay. |
| Dyn. Subcomp. | "COMPONENT SrvTrace Session Fr Vc" |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT SrvTrace Session Fr Vc

| | |
|---|---|
| Groups | "GROUP SrvTrace Session Fr Vc CallData (Cad)"<br>"GROUP SrvTrace Session Fr Vc IntervalData (Intd)"<br>"GROUP SrvTrace Session Fr Vc FrameRelayData (Frd)" |
| Scope | Application |
| Description | This component defines attributes collected by Frame Relay *Vc*. |
| Common Verbs | Help<br>List<br>Display |

## VERB Ping SrvTrace Session Fr Vc

| | |
|---|---|
| Impact | Passive |
| Description | *Ping [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] FrUni/<n> Dlci/<n> Vc* |

*Ping* causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the *ping* query packet will be the same as that of the Frame Relay data except at the source and destination module. The *ping* packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the *roundTripDelay* option is specified, the command reports the time taken to reach the destination and back. For the *roundTripDelay* option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the *ping* packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The *ping* command supports the following options:

*-roundTripDelay (-rtd):* If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

*-sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is

less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

### GROUP SrvTrace Session Fr Vc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application. |

### ATTRIBUTE SrvTrace Session Fr Vc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***. |
| Values | pvc<br>svc<br>spvc<br>frf10spvc |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***. |

| | |
|---|---|
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc callingNpi

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc fastSelectCall

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc segmentSize

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum packet size allowed on the *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc rcosToNetwork (rcosto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the routing metric routing class of service to<br>the network. |
| Values | throughput<br>delay<br>multimedia |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc rcosFromNetwork (rcosfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the routing metric Routing Class of Service from the Network. |
| Values | throughput<br>delay<br>multimedia |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc emissionPriorityToNetwork (epto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority to the network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc emissionPriorityFromNetwork (epfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority from the network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc dataPath (dapa)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value.<br><br>If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system)<br><br>If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed.<br><br>If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed. |
| Values | String (0..32, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc dprsMcsEndPoint (dmep)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components.<br><br>If the connection is using ***dprsOnly*** data path, this attribute is empty.<br><br>If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint. |
| List of | The name of the component |
| Default | No default |

### GROUP SrvTrace Session Fr Vc IntervalData (Intd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued. |

### ATTRIBUTE SrvTrace Session Fr Vc elapsedTimeTillNow

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc segmentsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is |

updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.

| | |
|---|---|
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc segmentsSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc callReferenceNumber

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP SrvTrace Session Fr Vc FrameRelayData (Frd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines Frame Relay attributes collected by Frame Relay *Vc*.<br>The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.<br>Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.<br>Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers |

### ATTRIBUTE SrvTrace Session Fr Vc frmCongestedToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size. |

| | |
|---|---|
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc cannotForwardToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc notDataXferToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc outOfRangeFrmFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc combErrorsFromSubnet

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc* |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc duplicatesFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc notDataXferFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc frmLossTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |

| | |
|---|---|
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc ooSeqByteCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc peakOoSeqPktCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure |

| | |
|---|---|
| | expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc sendSequenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame. |
| Values | Decimal (0..1048575) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc pktRetryTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc subnetRecoveries

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of successful *Vc* recovery attempts. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc ooSeqPktCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE SrvTrace Session Fr Vc peakOoSeqByteCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak byte count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..50000) |
| Default | No default |

### COMPONENT SrvTrace Session FrAtm

| | |
|---|---|
| Groups | "GROUP SrvTrace Session FrAtm Operational" |
| Scope | Application |

| | |
|---|---|
| Description | *SrvTrace Session/<n> FrAtm*<br>This component indicates that this *SrvTrace Session* uses FR-ATM (FrameRelay-ATM Interworking) service to connect with the service trace receiver |
| Dyn. Subcomp. | "COMPONENT SrvTrace Session FrAtm AtmConnection (AtmCon)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP SrvTrace Session FrAtm Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes of the FrAtm connection used by the service trace session. |

### ATTRIBUTE SrvTrace Session FrAtm activeDlci (dlci)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the DLCI (Data Link Connection Identifier) of remote FR-ATM (FrameRelay-ATM Interworking) service associated with the service trace connection. |
| Values | Decimal (16..1007) |
| Default | No default |

### COMPONENT SrvTrace Session FrAtm AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP SrvTrace Session FrAtm AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP SrvTrace Session FrAtm AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE SrvTrace Session FrAtm AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

### COMPONENT SrvTrace Session Atm

| | |
|---|---|
| Scope | Application |
| Description | *SrvTrace Session/<n> Atm*<br>This component indicates that this *SrvTrace Session* uses ATM services to connect with the service trace receiver. |

## GROUP Ss7 Mtp3 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Mtp3* component. |

## ATTRIBUTE Ss7 Mtp3 mtpType

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the type of MTP3.<br><br>The possible values for *mtpType* are:<br>***mtp3*** - This is the standard MTP layer 3 from Q.704 that supports signalling units up to 272 octets in length.<br>***mtp3b*** - This is the MTP layer 3 broadband variant that supports signalling units up to 4096 octets in length.<br><br>For the SS7 stack on the Iu interface this attribute must be set to ***mtp3b***.<br><br>For the SS7 stack on the Call Server interface this attribute must be set to ***mtp3***. |

Changing the value of this attribute causes all the linksets associated with the MTP3 layer to be restarted.

Values
mtp3
mtp3b

Default
mtp3b

### ATTRIBUTE Ss7 Mtp3 origPointCode (opc)

Access
Read: All
Write: All

Criticality
Component

Description
This attribute specifies the point code of the node that the MTP3 layer manages.

The point code must be provisioned in one of the following formats:

basic***:*** The point code is provisioned as a decimal number in the range ***1***..***16383***. A value of ***0*** is not valid.
segmented: The point code is provisioned as three integers, separated by dots. The first integer must be in the range ***0***..***7***, the second integer must be in the range ***0***..***255***, and the third integer must be in the range ***0***..***7***. A value of ***0.0.0*** is not valid.

This attribute must not specify a point code identical to that specified by *adjPointCode*.

Changing the value of this attribute causes all the linksets associated with this MTP3 layer to be restarted.

Values
Integer Sequence

Default
No default

### ATTRIBUTE Ss7 Mtp3 changeoverHoldoffTimer (t1)

Access
Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies the value of the timer T1 defined in ITU-T recommendation Q.704. This timer value determines how long to wait for a failed link to become available when changeover is required, but there is no alternate link. It is used to avoid message mis-sequencing on changeover.<br><br>This timer is started when a link goes down and a changeover is required, but changeover messages cannot be exchanged on an alternate link.<br><br>This timer is stopped when the failed link becomes available.<br><br>Upon timer expiration, it sends all the retrieved (layer 2) and buffered (layer 3) messages down the new link and marks changeover as complete. |
| Values | Decimal (500..1200) |
| Units | msec |
| Default | 500 |

### ATTRIBUTE Ss7 Mtp3 changeoverAckTimer (t2)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the timer T2 defined in ITU-T recommendation Q.704.<br><br>This timer is started when MTP layer 3 receives a Backward Sequence Number of the next signalling unit to be Transmitted (BSNT) from a link in the changeover process.<br><br>This timer is stopped when the link becomes available, or when a changeover message is received while waiting for an ack.<br><br>Upon timer expiration, the link is released.<br><br>The number of expiries of this timer is indicated by the attribute *changeoverAckTimeouts*. |
| Values | Decimal (700..2000) |

| | |
|---|---|
| Units | msec |
| Default | 700 |

### ATTRIBUTE Ss7 Mtp3 changebackDiversionDelayTimer (t3)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value for the timer T3 defined in ITU-T recommendation Q.704. It provides time controlled diversion-delay to avoid mis-sequencing on changeback.<br><br>This timer is started when a link is in changeback and the signalling point at the remote end of newly available link is not accessible via an alternative link.<br><br>Upon timer expiry, traffic is restarted on the link. |
| Values | Decimal (500..1200) |
| Units | msec |
| Default | 500 |

### ATTRIBUTE Ss7 Mtp3 firstAttemptChangebackAckTImer (t4)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value for the timer T4 defined in ITU-T recommendation Q.704.<br><br>This timer is started when a link is in changeback and the Signalling Point (SP) at the remote end of the newly available link is accessible via an alternative link.<br><br>This timer is stopped when a link has attempted changeback for the first time and receives a changeback ack for every changeback declaration sent.<br><br>Upon timer expiration, *secondAttemptChangebackAckTimer* is started and all the unacknowledged changeback declarations are re-sent. |

| | |
|---|---|
| | The number of resends of the changeback declarations is indicated by the attribute *changebackDeclarationTimeouts*. |
| Values | Decimal (500..1200) |
| Units | msec |
| Default | 500 |

### ATTRIBUTE Ss7 Mtp3 secondAttemptChangebackAckTimer (t5)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value for the timer T5 defined in ITU-T recommendation Q.704. It creates a delay to avoid oscillation of initial alignment failure and link restart.<br><br>The timer is started when a link does not changeback in the first attempt with *firstAttemptChangeBackAckTimer*.<br><br>The timer is stopped when a link is in the second attempt of changeback and receives a changeback ack for every changeback declaration sent.<br><br>Upon timer expiration, changeback is terminated.<br><br>The number of expiries of this timer is indicated by the attribute *secondAttemptChangebackAckTimeouts*. |
| Values | Decimal (500..1200) |
| Units | msec |
| Default | 500 |

### ATTRIBUTE Ss7 Mtp3 uninhibitAckTimer (t12)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value for the timer T12 defined in ITU-T recommendation Q.704. |

The timer is started every time a link *Uninhibit* command is executed.

The timer is stopped when the link uninhibit is acknowledged by the remote end.

Upon timer expiry, the uninhibit is started again for a maximum of one more time. If it fails this time, the uninhibit is cancelled.

The number of expiries of this timer is indicated by the attribute *uninhibitAckTimeouts*.

| | |
|---|---|
| Values | Decimal (800..1500) |
| Units | msec |
| Default | 800 |

### ATTRIBUTE Ss7 Mtp3 forceUninhibitTimer (t13)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value for the timer T13 defined in ITU-T recommendation Q.704.<br><br>The timer is started when this end initiates a link force uninhibit.<br><br>The timer is stopped when the signalling link uninhibit is acknowledged.<br><br>Upon timer expiry, the uninhibit is started again one more time. If it fails this time, the uninhibit is cancelled.<br><br>The number of expiries of this timer is indicated by the attribute *forceUninhibitTimeouts*. |
| Values | Decimal (800..1500) |
| Units | msec |
| Default | 800 |

### ATTRIBUTE Ss7 Mtp3 inhibitAckTimer (t14)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the timer T14 defined in ITU-T recommendation Q.704. This timer waits for inhibition acknowledgement.<br><br>The timer is started when an *Inhibit* command is executed.<br><br>The timer is stopped when the local link inhibit is denied or successful.<br><br>Upon expiry, the local link inhibit request is cancelled. |
| Values | Decimal (2..3) |
| Units | seconds |
| Default | 2 |

### ATTRIBUTE Ss7 Mtp3 initialAlignmentDelayTimer (t17)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the timer T17 defined in ITU-T recommendation Q.704. It creates a delay to avoid oscillation of initial alignment failure and link restart.<br><br>This timer is started when a signalling link is started.<br><br>Upon timer expiry, it sends a START message to layer 2. |
| Values | Decimal (800..1500) |
| Units | msec |
| Default | 800 |

### ATTRIBUTE Ss7 Mtp3 localInhibitTestTimer (t22)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the value of the timer T22 (Local inhibit test timer) defined in ITU-T recommendation Q.704.<br><br>This timer is started when a link becomes locally inhibited. Upon timer expiry, if the link is still unavailable and locally inhibited, the timer is restarted, and a local inhibit test message is sent to the remote end. |
| Values | Decimal (180..360) |
| Units | seconds |
| Default | 180 |

### ATTRIBUTE Ss7 Mtp3 remoteInhibitTestTimer (t23)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the timer T23 (Remote inhibit test timer) defined in ITU-T recommendation Q.704.<br><br>This timer is started when a link becomes remote inhibited. Upon timer expiry, if the link is still unavailable and remotely inhibited, the timer is restarted, and a remote inhibit test message is sent to the remote end |
| Values | Decimal (180..360) |
| Units | seconds |
| Default | 180 |

### ATTRIBUTE Ss7 Mtp3 sltAckTimer (tQ707T1)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the Supervision timer to wait for a signalling link test acknowledgement message.<br><br>This timer is started every time a Signalling Link Test Controller (SLTC) sends out a test message.<br><br>The timer is stopped when the SLTC receives an acknowledge |

| | |
|---|---|
| | message from the peer MTP3 layer.<br><br>Upon timer expiration, if this is the first attempt, this timer is restarted and a second attempt is made. If the timer expires after the second attempt, the MTP3 layer is informed of a broken link. |
| Values | Decimal (4..12) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE Ss7 Mtp3 sltIntervalTimer (tQ707T2)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the Interval timer defined in ITU-T recommendation Q.707 for sending signalling link test messages.<br><br>The timer is started when a link comes in service, and each time the timer expires if the link is still good.<br><br>The timer is stopped when the link fails, as determined by the *sltAckTimer*.<br><br>Upon timer expiry, another test message is sent to the peer and the timer is restarted. |
| Values | Decimal (30..90) |
| Units | seconds |
| Default | 30 |

### GROUP Ss7 Mtp3 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Ss7 Mtp3 adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Ss7 Mtp3 operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Ss7 Mtp3 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Ss7 Mtp3 Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes of the *Ss7MessageTransferPartLayer3* component.

### ATTRIBUTE Ss7 Mtp3 changeoverAckTimeouts (t2Tmouts)

Access
Read: All
Write: Illegal

Description
This attribute counts the timeouts of timer T2, specified by the attribute *changeoverAckTimer*.

The counter wraps to zero when its maximum value is exceeded.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Mtp3 firstAttemptChangebackAckTmouts (t4Tmouts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of timer T4, specified by the attribute *firstAttemptChangebackAckTimer*.<br><br>The counter wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Mtp3 secondAttemptChangebackAckTmouts (t5Tmouts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of timer T5, specified by the attribute *secondAttemptChangebackAckTimer*.<br><br>The counter wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Mtp3 forceUninhibitAckTimeouts (t13Tmouts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of timer T13, specified by the attribute *forceUninhibitAckTimer*.<br><br>The counter wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## GROUP Ss7 Mtp3 WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

## ATTRIBUTE Ss7 Mtp3 customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Ss7 Mtp3 customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Ss7 Mtp3 customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

## COLLECTED STATS SignallingSystem7 MessageTransferPartLayer3

Description The statistics record generated by the SignallingSystem7 MessageTransferPartLayer3 component.

### ATTRIBUTE Ss7 Mtp3 linkSetsUnavailable (lsUnavail)

Description This attribute indicates the number of linkset unavailable conditions over the collection interval.

Values Decimal (0..4294967295)

### COMPONENT Ss7 Mtp3 Linkset (Ls)

Instance Decimal (0..63)

Groups "GROUP Ss7 Mtp3 Ls Provisoned (Prov)"
"GROUP Ss7 Mtp3 Ls OsiState (State)"
"GROUP Ss7 Mtp3 Ls WlcCustomCounters (WlcCustomCntr)"

Scope Application

Description Ss7 Mtp3/n Linkset/n

This component represents an MTP3 linkset. A linkset is a grouping of signalling links that are used to transfer signalling between this node and a specific adjacent signalling point.

### GROUP Ss7 Mtp3 Ls Provisoned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes of the *Ss7LinkSet* component.

### ATTRIBUTE Ss7 Mtp3 Ls adjPointCode (apc)

Access
Read: All
Write: All

Criticality Component

Description This attribute specifies the point code of the node that this node directly connects to through this linkset.

The point code must be provisioned in one of the following formats:

basic***:*** The point code is provisioned as a decimal number in the range ***1***..***16383***. A value of ***0*** is not valid.
segmented: The point code is provisioned as three integers, separated by dots. The first integer must be in the range ***0***..***7***, the second integer must be in the range ***0***..***255***, and the third integer must be in the range ***0***..***7***. A value of ***0.0.0*** is not valid.

This attribute must not specify a point code identical to that specified by *origPointCode*.

Changing the value of this attribute causes all the linksets associated with the MTP3 layer to be restarted.

Values Integer Sequence

Default No default

### ATTRIBUTE Ss7 Mtp3 Ls networkIndicator (netInd)

Access
Read: All
Write: All

Criticality Component

Description This attribute specifies whether the network is a national network, or an international network. This attribute determines the value that is filled in the Network Indicator field of the messages sent to the remote end.This attribute must match what the peer MTP3

layer on the remote end expects in the messages. Changing the value of this attribute causes all the linksets associated with this MTP3 layer to be restarted.Each meaning of each valid value for *networkIndicator* is described in SS7 Mtp3 specification Q.704.

***international*** - MTP3 node is a member of an “International” network.
***internationalSpare*** - MTP3 node is a member of an “International Spare” network.
***national*** - MTP3 node is a member of a “National” network.
***nationalSpare*** - MTP3 node is a member of a “National Spare” network.

Values: international, internationalSpare, national, nationalSpare

Default: international

## GROUP Ss7 Mtp3 Ls OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Ss7 Mtp3 Ls adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Ss7 Mtp3 Ls operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Ss7 Mtp3 Ls usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Ss7 Mtp3 Ls WlcCustomCounters (WlcCustomCntr)

## VERB INHIBIT Ss7 Mtp3 Ls Link

Impact: Service

Description: *Inhibit Mtp3/n Linkset/n Link/n*

This command requests that the signalling link represented by the *Ss7Link* component be locally inhibited, as per the ITU-T recommendation Q.704.

The *Inhibit* will be denied locally if the requested link is the last available link in the linkset, or if an uninhibit on the requested is in progress. The *Inhibit* can also be denied by the remote end.

If the link is inhibited successfully, all the traffic carried on the linkset will be distributed among the other links in the linkset.

## VERB UNINHIBIT Ss7 Mtp3 Ls Link

Impact: Service

Description: *Uninhibit Mtp3/n Linkset/n Link/n*

This command requests that the signalling link represented by the *Ss7Link* component be uninhibited, as per the ITU-T recommendation Q.704.

The *Uninhibit* will be denied locally if the requested link has not been inhibited from this end, or if an inhibit on the link is in progress.

If the link is uninhibited successfully, the link will be made available for traffic.

### VERB LOCK Ss7 Mtp3 Ls Link

| | |
|---|---|
| Impact | Service |
| Description | *Lock [-force] Mtp3/n Linkset/n Link/n*<br><br>This verb causes the specified *Ss7Link* component to immediately enter the OSI ***locked*** administrative state. Traffic flow ceases on the newly locked *Link* and is diverted to the remaining unlocked *Links* of the *LinkSet.*<br><br>The *Lock* command fails if executed on the last ***unlocked*** *Link* of a *LinkSet*. The last ***unlocked*** *Link* of a *LinkSet* must be locked using the *force* option.<br><br>**Options:**<br>*-force*<br>If this option is specified, the *Link* is locked even if it is the only unlocked *Link* in the *LinkSet*. |

### GROUP Ss7 Mtp3 Ls Link Provisoned (Prov)

| | |

Instance Decimal (3; 12)

Groups "GROUP Ss7 Mtp3 ServInd Provisioned (Prov)"
"GROUP Ss7 Mtp3 ServInd WlcCustomCounters (WlcCustomCntr)"

Scope Application

Description *Ss7 Mtp3/n ServiceIndicator/<service indicator>*

This component represents an MTP layer 3 service indicator. A service indicator is a logical identifier that represents a particular user of MTP layer 3 services.

The SS7 specifications define which users are required to use a

given service indicator.

Only one application can use a particular MTP layer 3 service indicator.

Access: Read: All
Write: All

Description: This attribute specifies the value of the TConnEst timer defined in the ITU-T spec Q.714. This is the period of time to wait for a CONNECTION CONFIRM message from the remote user of SCCP.

This timer is started when a CONNECT REQUEST message is sent to the remote SCCP layer.

This timer is stopped when either a CONNECT CONFIRM, RELEASED, or CONNECT REFUSED message is received, or when a routing failure happens.

Upon timer expiration, the resources associated with the connection are released and a disconnect message is sent to the local user(s).

The number of timeouts of this timer is indicated by the attribute *connEstTmouts*.

Values: Decimal (60..120)

Units: seconds

Default 60

### ATTRIBUTE Ss7 Sccp timerInactivitySend (tIas)

Access
Read: All
Write: All

Description
This attribute specifies the value of the Tias timer defined in Q.714. This is the period of time to wait before sending an INACTIVITY TEST message for a connection when there are no messages to send.

The timer is started when a CONNECT CONFIRM or CONNECT RESPONSE message is received.

The timer is restarted if a DATA FORM 1 message is transmitted.

This timer is stopped when a DISCONNECT, RELEASE COMPLETE or ERROR message is received, or when a routing failure occurs.

If the timer expires on an open connection, an INACTIVITY TEST message is sent.

It is recommended that the timer be set to a value that is half as long as the *tIarTimer.*

Values
Decimal (300..600)

Units
seconds

Default
300

### ATTRIBUTE Ss7 Sccp timerInactivityReceive (tIar)

Access
Read: All
Write: All

Description
This attribute specifies the value of the inactivity receive timer defined in Q.714. This is the period of time to wait on receiving a message for a connection, before releasing the connection.

This timer is started when a CONNECT CONFIRM or CONNECT RESPONSE message is received.

This timer is restarted if a DATA FORM 1 or INACTIVITY TEST message is received.

This timer is stopped when a DISCONNECT, RELEASED, or ERROR message is received, or when a routing failure occurs.

If this timer expires on an open connection, a DISCONNECT message is sent and the resources are released.

It is recommended that the timer be set to a value that is twice as long as *tIasTimer*.

The number of timeouts of this timer is indicated by the attribute *inactivityReceiveTimeouts*.

Values: Decimal (660..1260)

Units: seconds

Default: 660

### ATTRIBUTE Ss7 Sccp timerRel (tRel)

Access: Read: All
Write: All

Description: This attribute specifies the value of the release timer defined in Q.714. This is the period of time to wait for a RELEASE COMPLETE message in response to the initial release attempt.

This timer is started when a RELEASED message is sent.

This timer is stopped when a RELEASE COMPLETE or ERROR message is received, or on a routing failure.

Upon timer expiration, a RELEASE message is sent and the *tRepeatRelTimer* is started.

The number of timeouts of this timer is indicated by the attribute *tRelTimeouts*.

Values: Decimal (10..20)

| | |
|---|---|
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Ss7 Sccp timerRepeatRel (tRepeatRel)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the repeat release timer. This is the period of time to wait for a RELEASE COMPLETE message after *tRelTimer* has expired. This timer determines the interval between successive release retries.<br><br>This timer is started when *tRelTimer* expires.<br><br>This timer is stopped when a RELEASE COMPLETE or an ERROR message is received, or when a routing failure occurs.<br><br>Upon timer expiration, the timer is restarted for a maximum of ten times. Upon the tenth timer expiration, the resources are released.<br><br>The number of timeouts of this timer is indicated by the attribute *tRepeatRelTimeouts.* |
| Values | Decimal (10..20) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Ss7 Sccp classOfService (classOfServ)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the type of service provided by the SCCP layer.<br>The different service classes are:<br>***0*** - This class represents basic connectionless service.<br>***2***- This class represents basic connection-oriented service. |

| | |
|---|---|
| | Any combination of these classes can be provisioned by the user, but at least one class must be specified. |
| Set of | 0<br>2 |
| Default | (0, 2) |

### GROUP Ss7 Sccp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Ss7 Sccp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE Ss7 Sccp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Ss7 Sccp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Ss7 Sccp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Ss7SignallingConnControlPart* component. |

## ATTRIBUTE Ss7 Sccp timerConnEstTimeouts (tConnEstTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of the *tConnEstTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Ss7 Sccp timerInactivityReceiveTimeouts (tIarTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of the timer specified by the attribute *timerInactivityReceive*.<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Ss7 Sccp timerRelTimeouts (tRelTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of the timer specified by the attribute *tRelTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Ss7 Sccp timerRepeatRelTimeouts (repRelTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timeouts of the timer specified by the attribute *tRepeatRelTimer.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp activeConnections (actConn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current open signalling connections for the *Ss7SignallingConnControlPart* component. The maximum number of open signalling connections is set by the attribute *maxConnections.* |
| Values | Decimal (0..1000000) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp rejectedConnections (rejConn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a signalling connection establishment request by the application was refused. The reasons include the subsystem being down, the number of open connections exceeding the limit specified by the attribute *maxConnections* and so on. This includes the number of rejected connections indicated by the attribute *maxConnExhausted*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Ss7 Sccp maxConnectionsExhausted (maxConnEx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a signalling connection establishment request by the application was refused because the number of open connections reached the limit specified by the attribute *maxConnection.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp lostConnections (lostConn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the open signalling connections lost due to unavailability of the SCCP Subsystem.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp unsupportedMessages (unsuppMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of unsupported (class1, class3) messages received.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp gttRequests (gttRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of messages received that require Global Title Translation.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp segmentationRequests (segRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of messages received that require segmentation.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp reassemblyRequests (reassemblyRqsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of messages received that require reassembly.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp localRoutingFailures (localRoutFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of the routing failures to the local subsystem. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp remoteRoutingFailures (remRoutFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the routing failures to the remote subsystem. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp messagesTx (msgsTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the messages sent to layer 3. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp payloadMessagesTx (plMsgsTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of payload messages transmitted. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp messagesRx (msgsRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the messages received from layer 3. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp payloadMessagesRx (plMsgsRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of payload messages received from layer 3. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp invalidMessages (invMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of invalid (syntax error or undecodable) messages received.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp attemptedConnections (attCon)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of signalling connections that this *Ss7SignallingConnControlPart* component has attempted to establish. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Ss7 Sccp WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Ss7 Sccp customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 Sccp customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS SignallingSystem7 SignallingConnControlPart

| | |
|---|---|
| Description | The statistics record generated by the SignallingSystem7 SignallingConnControlPart component. |

### ATTRIBUTE Ss7 Sccp activeConnections

| | |
|---|---|
| Description | This attribute indicates the number of the current open signalling connections for the *Ss7SignallingConnControlPart* component at the end of the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Ss7 Sccp rejectedConnections

| | |
|---|---|
| Description | This attribute indicates the number of rejected signalling connections for the *Ss7SignallingConnControlPart* component over the collection interval. The reasons include the subsystem being down, the number of open connections exceeding the limit specified by the attribute *maxConnections* and so on, at the end of the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Ss7 Sccp maxConnectionsExhausted

| | |
|---|---|
| Description | This attribute indicates the number of times a signalling connection establishment request by the application was refused because the number of open connections reached the limit |

specified by the attribute *maxConnections*, over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp lostConnections

Description This attribute indicates the number of the open signalling connections lost due to unavailability of the SCCP Subsystem over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp invalidMessages

Description This attribute indicates the number of invalid (syntax error or undecodable) messages received over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp messagesTx

Description This attribute indicates the number of the messages sent to layer 3 over the collection interval. This includes maintenance messages.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp payloadMessagesTx

Description This attribute indicates the number of payload messages transmitted over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp messagesRx

Description This attribute indicates the number of the messages received from layer 3 over the collection interval. This includes maintenance messages.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp payloadMessagesRx

Description This attribute indicates the number of payload messages received over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp localRoutingFailures

Description This attribute indicates the number of the routing failures to the local subsystem over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp remoteRoutingFailures

Description This attribute indicates the number of the routing failures to the remote subsystem over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Ss7 Sccp attemptedConnections (attCon)

Description This attribute indicates the number of signalling connections that this *Ss7SignallingConnControlPart* component has attempted to establish during the collection interval.

Values Decimal (0..4294967295)

### COMPONENT Ss7 Sccp LocalSubsystem (Loc)

Instance Decimal (0..255)

Groups "GROUP Ss7 Sccp Loc Provisioned (Prov)"

## ATTRIBUTE Ss7 Sccp Loc subsystemNumber (ssn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies the subsystem number of the local subsystem represented by the *Ss7LocalSubsystem* component. |
| Values | ranap<br>rnsap |
| Default | ranap |

## GROUP Ss7 Sccp Loc OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Ss7 Sccp Loc adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Ss7 Sccp Loc operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Ss7 Sccp Loc usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP Ss7 SaalNni Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *SS7SaalNni* component. |

## ATTRIBUTE Ss7 SaalNni linkToLinkInLinkset (link)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a linkage between an *Ss7 Mtp3/n LinkSet/n Link/n* component and an *Ss7 SaalNni/n* component. |
| Values | Link (Service, linkToSaalNni) |

| | |
|---|---|
| Default | No default |

### GROUP Ss7 SaalNni SscopProv (Sscop)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes needed by the SSCOP sub-layer of SAAL-NNI. |

### ATTRIBUTE Ss7 SaalNni maxPdusBetweenPolls (maxPdus)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of Signalling Data PDUs that can be sent without sending a POLL PDU, as defined in ITU-T recommendation Q.2110. |
| Values | Decimal (1..1000) |
| Default | 500 |

### ATTRIBUTE Ss7 SaalNni ccTimer (cc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time between transmissions of ‘BGN’, ‘END’, ‘RS’ and ‘ER’ PDUs, as defined in ITU-T recommendation Q.2110.<br><br>The timer is started when any one of these PDUs is transmitted.<br><br>The timer is stopped when a proper acknowledgement is received (e.g. BGNAK, ENDAK, RSACK, or ERACK).<br><br>Upon timer expiry the PDU will be retransmitted. The PDU is transmitted a maximum of *maxCc* times.<br><br>If the timer expires *maxCc* times, the link will be released, and the and the number of times this happens will be indicated by the attribute *maxCcReached.*<br><br>Layer 3 will attempt to bring the link back up. |

| | |
|---|---|
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 200 |

### ATTRIBUTE Ss7 SaalNni maxCc

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of allowed unacknowledged transmissions of ‘BGN’, ‘END’, ‘ER’ or ‘RS’ Protocol Data Units (PDUs) as defined in ITU-T recommendation Q.2110.<br><br>If the number of unacknowledged transmissions exceeds this value, the link will be released, and the number of times this happens will be indicated by the attribute *maxCcReached*. |
| Values | Decimal (1..1000) |
| Default | 4 |

### ATTRIBUTE Ss7 SaalNni keepAliveTimer (tKeepAl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time between sending of POLL PDUs when there is no activity on the link, as defined in ITU-T recommendation Q.2110.<br><br>The timer is started when either the *pollTimer* or the *keepAliveTimer* expires and there are no PDUs queued for sending.<br><br>The timer is stopped when a data request (SD PDU) is ready to be sent.<br><br>Upon expiry this timer sends a POLL PDU.<br><br>The value of *keepAliveTimer* should be set to a value greater that *pollTimer* and greater than the round-trip delay of a PDU. |

| | |
|---|---|
| Values | Decimal (100..1000) |
| Units | msec |
| Default | 100 |

### ATTRIBUTE Ss7 SaalNni noResponseTimer (noResp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time interval during which at least one STAT PDU should be received.<br><br>The timer is started when a POLL PDU is sent.<br><br>The timer is stopped when a STAT PDU is received.<br><br>Upon timer expiry, the link is released, that is, brought out of service. Layer 3 will then attempt to bring it back to service.<br><br>The value of the *noResponseTimer* must not be less than the sum of the *keepAliveTimer* and one round-trip delay of a Protocol Data Unit (PDU).<br><br>The number of expiries of this timer is indicated by the attribute *noResponseTimeouts*. |
| Values | Decimal (500..2000) |
| Units | msec |
| Default | 1500 |

### ATTRIBUTE Ss7 SaalNni pollTimer

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time between sending of POLL PDUs when the link has traffic, as defined in ITU-T recommendation Q.2110.<br><br>The timer is started when the link enters the Data Transfer Ready |

State.

The timer is stopped when the link is released.

Upon expiry, a POLL PDU is sent and *pollTimer* is restarted if the link has traffic.

Values: Decimal (100..1000)

Units: msec

Default: 100

### ATTRIBUTE Ss7 SaalNni idleTimer

Access: Read: All
Write: All

Description: This attribute specifies the idle time after receipt of a STAT PDU, as defined in ITU-T recommendation Q.2110.

The timer is started when a STAT PDU is received.

The timer is stopped when data is sent or received on the link.

Upon expiry, a POLL PDU is sent and the *noResponseTimer* is started.

The value of the *idleTimer* must be greater that the sum of the *pollTimer* and the maximum round trip delay of a PDU.

Values: Decimal (100..1000)

Units: msec

Default: 100

### GROUP Ss7 SaalNni SscfProv (Sscf)

Properties: Provisioned

Description: This group contains provisionable attributes needed by the SSCF sub layer of SAAL-NNI.

## ATTRIBUTE Ss7 SaalNni provingMode

Access
Read: All
Write: All

Description
This attribute allows the operator to place the link into one of the link proving modes defined in ITU-T recommendation Q.2140.

***normal*** - This mode corresponds to the MAAL-FORCE_PROVING-request. It forces the SAAL-NNI layer to utilize proving when bringing up the link.

***neutral*** - This mode corresponds to the MAAL-CLEAR_FORCE_MODES-request.It specifies that the layer using SAAL-NNI will select the proving mode.

***emergency*** - This mode corresponds to the MAAL-FORCE_EMERGENCY-request. It causes proving to be skipped.

When this attribute is set to ***neutral,*** the layer that uses SAAL_NNI (MTP3) selects the proving mode, but when the attribute is set to ***normal*** or ***emergency***, instructions from the entity which uses SAAL-NNI are ignored.

Values
normal
neutral
emergency

Default
neutral

## ATTRIBUTE Ss7 SaalNni linkReEstablishTimer (t1)

Access
Read: All
Write: All

Description
This attributes specifies the time between the link release action and the next link re-establish action during alignment, as defined in ITU-T recommendation Q.2140.

This timer is started when a release indication or confirmation is received while the link is in the Alignment or InService state.

This timer is stopped in one of two cases:

If the SAAL-NNI layer successfully receives an establish request or establish confirm from the peer SAAL-NNI layer.
If the SAAL_NNI layer receives a stop indication or release request from the layer 3 user or layer management respectively.

Upon timer expiration, link alignment and proving is re-started.

Values: Decimal (0..30)

Units: seconds

Default: 5

### ATTRIBUTE Ss7 SaalNni alignmentAcceptTimer (t2)

Access: Read: All
Write: All

Description: This attributes specifies the total time to attempt alignment and is defined in ITU-T recommendation Q.2140.

This timer is started when a start request is received. If the link is put in service before the expiry of this timer, no action is performed.

This timer is stopped in one of two cases.
If the SAAL-NNI layer successfully passes from the link proving state to the InService state.

If the SAAL-NNI layer receives a stop indication from the layer 3, or a release request from layer management.

Upon timer expiration, link establishment is cancelled and link is taken out of service. Layer 3 will attempt to bring the link back in service.

The value of this timer can be adjusted if link proving fails due to an inability to send the target number proving PDUs indicated by the attribute *targetProvingPdus.* The current number of proving PDUs sent successfully is indicated by the attribute *currentProvingPdus*.

| | |
|---|---|
| Values | Decimal (5..150) |
| Units | seconds |
| Default | 30 |

### GROUP Ss7 SaalNni OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Ss7 SaalNni adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Ss7 SaalNni operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Ss7 SaalNni usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Ss7 SaalNni Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *SS7SaalNni* component. |

## ATTRIBUTE Ss7 SaalNni state (provSt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the proving state of the link. The different states are:<br>***notStarted*** - Proving has not started.<br>***incomplete*** - Proving is in progress, but not completed yet.<br>***completeSuccess*** - Proving has been completed successfully.<br>***completeFailed*** - This proving attempt failed. |
| Values | notStarted<br>inComplete<br>completeSuccess<br>completeFailed |
| Default | No default |

## ATTRIBUTE Ss7 SaalNni targetProvingPdus (n1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the target number of proving PDUs to be sent across the link during the proving period.<br><br>The current number of proving PDUs that have been sent is indicated by the attribute *currentProvingPdus*. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Ss7 SaalNni currentProvingPdus (c1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the number of proving PDUs that have been sent across the link during this proving period.<br><br>The target number of proving PDUs that must be sent is indicated by the attribute *targetProvingPdus* |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni inSrvDuration (inSrvDur)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the time that the signalling link has remained in the in-service state since it was most recently brought in service. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni maxCcReached (maxCcR)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the signalling link has been released because the number of unacknowledeged transmissions of ‘BGN’, ‘END’, ‘ER’ or ‘RS’ Protocol Data Units (PDUs) has exceeded the value provisioned in the attribute *maxCc*.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni noResponseTimeouts (noRespTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the expiries of the No Response timer, specified by the attribute *noResponseTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni pdusTx (pduTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the protocol data units transmitted.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni pdusRx (pduRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the protocol data units received.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni pduOctetsTx (pduOctTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload PDU octets transmitted.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Ss7 SaalNni pduOctetsRx (pduOctRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload PDU octets received over the collection interval. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni insvFailures (insvFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the in-service link outages. It does not include failures which occur during the alignment process.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Ss7 SaalNni WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Ss7 SaalNni customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Ss7 SaalNni customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS SignallingSystem7 SaalNni

| | |
|---|---|
| Description | The statistics record generated by the SignallingSystem7 SaalNni component. |

### ATTRIBUTE Ss7 SaalNni insvFailures

| | |
|---|---|
| Description | This attribute indicates the number of in-service link outages over the collection interval. It does not include failures which occur during the alignment process. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Ss7 SaalNni pdusTx

| | |
|---|---|
| Description | This attribute indicates the number of protocol data units transmitted over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Ss7 SaalNni pdusRx

| | |
|---|---|
| Description | This attribute indicates the number of protocol data units received over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Ss7 SaalNni pduOctetsTx

| | |
|---|---|
| Description | This attribute indicates the number of payload PDU octets transmitted over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Ss7 SaalNni pduOctetsRx

| | |
|---|---|
| Description | This attribute indicates the number of payload PDU octets received over the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Ss7 SaalNni NailedupAdaptationPoint (Nap)

| | |
|---|---|
| Groups | "GROUP Ss7 SaalNni Nap Provisioned (Prov)"<br>"GROUP Ss7 SaalNni Nap WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Ss7 SaalNni/n NailedupAdaptationPoint*<br><br>This component is used to provide access to a nailed-up ATM connection (an *Atmif/n Vcc/n Nep*). |
| Common Verbs | Help<br>List<br>Display |

### GROUP Ss7 SaalNni Nap Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Ss7NailedupAdaptationPoint* component. |

### ATTRIBUTE Ss7 SaalNni Nap atmConnection (atmConn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Component |
| Description | This attribute specifies a link to an *AtmIf Vcc Nep* component that provides access to an ATM network. |
| Values | Link (Service, applicationName) |
| Default | No default |

### GROUP Ss7 SaalNni Nap WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Ss7 SaalNni Nap customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni Nap customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ss7 SaalNni Nap customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

| Impact | Configuration |
| Description | *Tidy Sw*<br>This verb is used to remove all unreferenced *AV* operational subcomponents along with all their associated software files from the disk. This means that an *AV* can be removed only if all of the following conditions are met:<br>1) The *AV* is not specified in the AVL in the Current view (that is, the one currently activated).<br>2) The *AV* is not specified in the AVL of the Edit view if it has been semantically checked.<br>3) The *AV* is not specified in any AVL which would become active if an existing semantically-checked provisioning file is loaded and activated.<br>4) The *AV* is not specified in any *AVL* in the journaling files.<br>5) The *AV* is not the parent *AV* of a patched *AV* that is ineligible for *Tidy*ing because it doesn't meet one or more of the above criteria.<br>The *Tidy* command is mutually exclusive with *Check Prov*, *Download* and *Remove* commands. It will fail, not removing any *AVs*, if either a *Check Prov*, a download, a *Remove* or *a Tidy* command is still in progress, or the file system is locked or otherwise unavailable. |

## GROUP Sw Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the Provisionable attributes for the *SW* component. |

## ATTRIBUTE Sw avList (avl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies, for each application, which version of its *Features* and the associated software will be loaded when any of its *Features* are selected in an *LPT*.<br>A version of the "base" application must be specified.<br>All names specified by the user must actually be *AV* names. |

| | |
|---|---|
| | All *AVs* specified must be compatible with each other.<br>No more than one version of a single application can be specified |
| List of | String (1..30, ASCII) |
| Default | No default |

### ATTRIBUTE Sw patchList (patl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which patches are to be loaded and enabled.<br>Only patches for *Av*'s that appear in the *AvList* may be specified.<br>Only patches appearing as instances of *Sw Av Patch* may be specified.<br>Patch names are case insensitive. Except for case, patch names must be typed as they appear as instances of *Sw Av Patch*.<br>All patches specified must be compatible with one another.<br>Any prerequisite patches for specified patches, must themselves be specified.<br>A patch must be specified only once in the list. |
| List of | String (1..30, ASCII) |
| Default | No default |

### GROUP Sw Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contain the operational attributes for the *SW* component. |

### ATTRIBUTE Sw tidyStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the tidy or remove status. If the value is ***inactive***, no tidy or remove is in progress. If the value is ***inProgress*** or ***querying***, the tidy or remove process has begun and therefore no further *Tidy Sw or Remove sw/<avName>* command is allowed until status returns to inactive. |

| | |
|---|---|
| Values | inactive<br>inProgress<br>querying |
| Default | No default |

### ATTRIBUTE Sw avBeingTidied

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the name of the AV currently being tidied or removed. An empty string indicates there is no AV being tidied. |
| Values | String (1..30, ASCII) |
| Default | No default |

### ATTRIBUTE Sw avListToTidy

| | |
|---|---|
| Access | Read only |
| Description | This attribute holds the list of names of AVs to be tidied or removed. As AVs are successfully cleaned, they are removed from this list and added to *avListTidied*. |
| List of | String (1..30, ASCII) |
| Default | No default |

### ATTRIBUTE Sw avListTidied

| | |
|---|---|
| Access | Read only |
| Description | This attribute holds the list of names of AVs which have been successfully tidied or removed as a result of the last *Tidy Sw or Remove Sw av/<avName>* command. It is cleared each time a new *Tidy Sw or Remove Sw av/<avName>* command is issued. |
| List of | String (1..30, ASCII) |
| Default | No default |

### COMPONENT Sw Download (Dld)

| | |
|---|---|
| Groups | "GROUP Sw Dld Operational (Oper)" |

| | |
|---|---|
| Scope | Device |
| Description | *Sw Dld*<br>The *Download* component manages the retrieval of software from the Software Distribution Site (SDS). The module initiates the connection to the SDS and retrieves the files it wants according to the *AVs* specified by the user in *avListToDownload*. |
| Common Verbs | Help<br>List<br>Display |

### VERB Start Sw Dld

| | |
|---|---|
| Impact | Configuration |
| Description | *Start -u(<userid>) -p(<password>) -h(<host>) Sw Dld*<br>This command is used to start a download. Before starting the download, the *avListToDownload* should be set up, specifying what to download. The *Start* will fail if a *Remove*, a *Tidy*, or a *Check Prov* are in progress. |

### VERB Stop Sw Dld

| | |
|---|---|
| Impact | Configuration |
| Description | *Stop Sw Dld*<br>This command is used to stop a download. Note that it may not be possible to start another download immediately since it may take some time to tear down the IP connection (that is, the entity handling the connection may be suspended and not be able to even detect that a stoppage was requested). |

### GROUP Sw Dld Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Download* component. |

### ATTRIBUTE Sw Dld avBeingDownloaded

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the name of the AV currently being downloaded. If the download is ***inProgress***, this attribute will indicate the same as the first AV in the list of AV's to be downloaded. If there is no AV being downloaded, this attribute will indicate an empty string. |
| Values | String (0..30, ASCII) |
| Default | No default |

### ATTRIBUTE Sw Dld status

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the download status.<br>If the value is ***inactive***, no download is in progress. This is the value required in order to issue a *Start* command.<br>If the value is ***inProgress***, the download procedure has begun. This process starts from the time a Software Distribution Site (SDS) login is attempted and continues through the time during which files are actually being transferred.<br>If the value is ***stopping***, a user has requested a stoppage but the connections have not yet been completely torn down. |
| Values | inactive<br>inProgress<br>stopping |
| Default | No default |

### ATTRIBUTE Sw Dld filesToTransfer

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of files which are still left to transfer for the *AV* currently being downloaded. It is cleared each time a new *AV* is processed from the *avListToDownload*. Note that for each *AV*, the value of this attribute will be 0 until the actual number of files to transfer has been computed. |
| Values | Decimal (0..1000) |
| Default | No default |

### ATTRIBUTE Sw Dld processorTargets

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the processor based object file to download on switch. After a CP restart or software migration, this attribute is initialized to the processor targets present on the CP disk for the current provisioned Application Versions ( *AVs*). This attribute can have the following values:<br><br>***i960*** - Object files for cards with an i960 processor are to be downloaded.<br>***ppc*** - Object files for cards with a PowerPC processor are to be downloaded. |
| Set of | i960<br>ppc |
| Default | No default |

### ATTRIBUTE Sw Dld avListToDownload (dldList)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the list of names of *AVs* to be downloaded. If a download is in progress, the first one in the list is the one currently being downloaded. As *AVs* are successfully downloaded, they are removed from this list and added to the *downloadedAvList*.<br>The user cannot specify an *AV* which already exists on disk. It must first be removed before re-downloading it (see the *Tidy* and *Remove* commands). |
| List of | String (1..30, ASCII) |
| Default | No default |

### ATTRIBUTE Sw Dld downloadedAvList

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute holds the list of names of *AVs* which have been successfully downloaded as a result of the last *Start* command. It is cleared each time the *Start* command is issued. |
| List of | String (1..30, ASCII) |
| Default | No default |

### COMPONENT Sw ApplicationVersion (Av)

| | |
|---|---|
| Instance | String (1..30, ASCII) |
| Groups | "GROUP Sw Av Operational (Oper)" |
| Scope | Device |
| Description | *Sw Av/<name>*<br>This component represents a particular version of an application that is available to use in the *AVL*. They can only be created by downloading and can only be deleted by using the *Tidy* or *Remove* commands.<br>An *AV* has one or more *Feature* subcomponents which belong to it. |
| Dyn. Subcomp. | "COMPONENT Sw Av Feature (Feat)"<br>"COMPONENT Sw Av Patch (Patch)" |
| Common Verbs | Help<br>List<br>Display |

### VERB Remove Sw Av

| | |
|---|---|
| Impact | Configuration |
| Description | *Remove Sw Av/<name>*<br>This command is used to remove an *AV* component and the associated software files from the disk as long as it is unreferenced. This means that an *AV* can be removed only if all of the following conditions are met:<br>1) The *AV* is not specified in the *AVL* in the Current view (that is, the one currently activated).<br>2) The *AV* is not specified in the *AVL* in the Edit view if it has been semantically checked.<br>3) The *AV* is not specified in any *AVL* which would become active if an existing semantically-checked provisioning file is loaded and activated.<br>4) The *AV* is not specified in any *AVL* in the journaling files.<br>5) The AV is not a parent *AV* to a patched *AV*. To remove an *AV* that has patched *AV*s based upon it, first remove the patched *AV*s.<br>To clean up unused provisioning files, see the "*Tidy Prov*" command. To clean up journaling files, see the "*Commit Prov*" command.<br>The *Remove* command is mutual exclusive with *Check Prov*, *Download* and *Tidy* command. It will fail, not removing this *AV*, if either a *Check Prov*, a *Download*, a *Tidy* or a *Remove* command is still in progress, or if the file system is locked or otherwise unavailable. |

### GROUP Sw Av Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for an *AV* component. |

### ATTRIBUTE Sw Av processorTargets

| | |
|---|---|
| Access | Read only |
| Description | This is a list of the processor based object file types which exist on disk for a given AV. Semantic check will validate that the |

| | |
|---|---|
| | object files needed for a provisioned card type are present as part of an application. |
| Set of | i960<br>ppc |
| Default | No default |

### ATTRIBUTE Sw Av description (descr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the functionality of the *AV*. If the *AV* is a patched *AV*, this attribute describes the new behavior delivered by the patched *AV*. |
| Values | String (0..512, ASCII) |
| Default | No default |

### ATTRIBUTE Sw Av compatibleAvList

| | |
|---|---|
| Access | Read only |
| Description | This is a list of the *AV* names which specify the minimum version of all other applications that can be used in conjunction with this *AV* in an *AVL*. Semantic checks will validate that *AVs* within the *AVL* are indeed compatible. |
| List of | String (1..30, ASCII) |
| Default | No default |

### COMPONENT Sw Av Feature (Feat)

| | |
|---|---|
| Instance | String (1..30, ASCII) |
| Scope | Device |
| Description | *Sw Av/<name> Feat/<name>*<br>There is one of these components for each provisionable feature of the parent AV component. Each feature's name can be used in an Lpt's feature list attribute. A feature component does not have any attributes of its own. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Sw Av Patch (Patch)

| | |
|---|---|
| Instance | String (1..30, ASCII) |
| Groups | "GROUP Sw Av Patch Operational (Oper)" |
| Scope | Device |
| Description | Sw Av/<name> Patch/<name><br>There is one of these components for each patch of the parent AV component that has been downloaded to the switch. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Sw Av Patch Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Patch* component. |

### ATTRIBUTE Sw Av Patch description (descr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the new behavior that the patch provides. The availability of this description is dependent on the disk being available. |
| Values | String (0..512, ASCII) |
| Default | No default |

### ATTRIBUTE Sw Av Patch patchType (type)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the patch type. This attribute can have a value of ***tap*** (transparent application), ***cpReset***, or ***fpReset***. TAP patches do not require a card reset in order for the patch to become active, whereas Reset patches involve the full replacement of an executable file and therefore necessitate the reloading of the cards on which that file is active. Because the *patchType* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependant on the disk being available. |
| Set of | tap<br>cpReset<br>fpReset |
| Default | No default |

### ATTRIBUTE Sw Av Patch mutuallyExclusive (mutEx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates patches that are mutually exclusive to the patch being displayed. Because the *mutuallyExclusive* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependant on the disk being available. |
| List of | String (1..30, ASCII) |
| Default | No default |

### ATTRIBUTE Sw Av Patch prerequisites (prereq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates patches that are prerequisites to the patch being displayed. Prerequisite patches must appear in the *Sw patchList* along with the patch in question. Because the *prerequisites* attribute is not stored in memory and must be |

| | |
|---|---|
| | retrieved from the CP disk, the availability of this attribute is dependant on the disk being available. |
| List of | String (1..30, ASCII) |
| Default | No default |

### ATTRIBUTE Sw Av Patch activateAfter (actAft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the patch or patches that are activated prior to the patch currently being displayed, when all patches are provisioned (that is, the patch being displayed is activated following the activation of the patches listed in this attribute). For example, if patch A is the patch listed in patch B's *activateAfter* attribute, patch A is activated before patch B, when both patch A and B are present in the *Sw patchList* attribute. Since the *activateAfter* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available. |
| List of | String (1..30, ASCII) |
| Default | No default |

### COMPONENT Sw LogicalProcessorType (Lpt)

| | |
|---|---|
| Instance | String (1..25, ASCII) |
| Groups | "GROUP Sw Lpt Provisioned (Prov)" |
| Scope | Device |
| Description | *Sw Lpt/<name>*<br>This component is the Logical Processor Type, specifying characteristics of the software to be loaded on a card. Minimally, *LPT/CP* is required to exist. If it is deleted, semantic checks will fail. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Sw Lpt Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *LPT* component. |

### ATTRIBUTE Sw Lpt commentText (text)

| | |
|---|---|
| Access | Read and write |
| Description | An arbitrary string used to enter a comment about an *LPT*. |
| Values | String (0..80, ASCII) |
| Default | No default |

### ATTRIBUTE Sw Lpt systemConfig (systemConfig)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which set of preconfigured system parameters to use for the set of *Features* selected in *featureList*. |
| Values | default |
| Default | default |

### ATTRIBUTE Sw Lpt featureList (fl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a list of names of *Features* that define a particular configuration of application functionality that the user wants to load on a single processor.<br>The combination of *Features* selected must be compatible (for |

| | |
|---|---|
| | example, none can be mutually exclusive with another in the list).<br>All *Features* must belong to an *AV* specified in the *AVL*.<br>All *Features* must be able to be loaded on any of the *Cards* which are linked to *LPs* which are linked to this *LPT*.<br>All prerequisite *Features* of the ones in this list will also be loaded. |
| List of | String (1..30, ASCII) |
| Default | No default |

### ATTRIBUTE Sw Lpt logicalProcessors

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows which *LPs* are configured to load the *Feature* files associated with this *LPT*. It is the opposite side of the *LP* component's *logicalProcessorType* link attribute. |
| List of | Link (Service, logicalProcessorType) |
| List Size | 16 |
| Default | No default |

# COMPONENT TcapStack (Tcap)

| | |
|---|---|
| Instance | Decimal (1..15) |
| Groups | "GROUP Tcap Provisioned (Prov)"<br>"GROUP Tcap SccpUserInfoProv (SccpProv)"<br>"GROUP Tcap OsiState (State)"<br>"GROUP Tcap Operational (Oper)"<br>"GROUP Tcap SigRegistrationOp"<br>"GROUP Tcap WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS TcapStack"

| | |
|---|---|
| Scope | Application |
| Description | *Tcap/n*<br><br>This component represents Transaction Capability Application Part (TCAP) Stack functionality.<br><br>The TCAP Stack provides transaction services to applications such as Mobile Application Part(MAP) and Camel Application Part(CAP) on the UMTS and GPRS Serving GPRS Support Node (SGSN and USGSN). |

| | |
|---|---|
| | At most one *Tcap* component can be linked to given *Lp* at a time. |
| Subcomponents | "COMPONENT Tcap MemoryPoolManager (Mpm)"<br>"COMPONENT Tcap Ss7IpInterface (Ss7IpIf)" |
| Opt. Subcomp. | "COMPONENT Tcap MapStack (Map)" |
| Dyn. Subcomp. | "COMPONENT Tcap RemoteApplicationConnection (RaConn)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Tcap Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *Tcap* component. |

## ATTRIBUTE Tcap linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor on which the *Tcap* component process will be created. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

## ATTRIBUTE Tcap maxTransactionsPerSubsystem (maxTransPerSs)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of concurrent TCAP Transactions that are supported by the TCAP stack for each subsystem receiving service. |

The value specified for each subsystem must be less than that specified by the *maxInvokesPerSubsystem* attribute for the same subsystem. Furthermore, the total number of transactions specified over all subsystems must not be greater than 4000.

If the value of the maxTransactionsPerSubsystem attribute is zero, the maxInvokesPerSubsystem attribute must also be zero.

The ratio of the maxTransactionsPerSubsystem attribute value to the maxInvokesPerSubsystem attribute value should be provisioned based on a low or high resource level. For a high resource level, a ratio of 1:1.5 is recommended as a large number of transactions and invokes is provisioned. For a low resource level, a ratio of 1:2 is recommended as a small to average number of transactions and invokes is provisioned.

The current number of TCAP transactions active for each subsystem is indicated by the *currentTransactionsPerSubsystem* operational attribute. If the current number of active transactions for a given subsystem reaches the maximum, new requests for service from that subsystem are ignored.

A Critical alarm is set when the current number of transactions for a subsystem reaches 95% of the value specified for that subsystem by this attribute.

Altering the value specified by this attribute after initial activation will result in an interruption of service for all clients while the TCAP stack is restarted. Transactions in progress are lost and new transactions cannot be serviced.

| | |
|---|---|
| Vector of | Decimal (0..4000) |
| Index | sgsnSubsystem (sgsn)<br>capSubsystem (cap)<br>mscEmulationSubsystem (mscE) |
| Default | (sgsnSubsystem: 500, capSubsystem: 500, mscEmulationSubsystem: 500) |

## ATTRIBUTE Tcap maxInvokesPerSubsystem (maxInvokePerSs)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of concurrent TCAP invokes that are supported by the TCAP Stack for each subsystem receiving service.<br><br>The value specified for each subsystem must be greater than that specified by the *maxTransactionsPerSubsystem* attribute for the same subsystem. Furthermore, the total number of invokes specified over all subsystems must not be greater than 6000.<br><br>If the value of the maxTransactionsPerSubsystem attribute is zero, the maxInvokesPerSubsystem attribute must also be zero.<br><br>The ratio of the maxTransactionsPerSubsystem attribute value to the maxInvokesPerSubsystem attribute value should be provisioned based on a low or high resource level. For a high resource level, a ratio of 1:1.5 is recommended as a large number of transactions and invokes is provisioned. For a low resource level, a ratio of 1:2 is recommended as a small to average number of transactions and invokes is provisioned.<br><br>The current number of TCAP invokes active for each subsystem is indicated by the *currentInvokesPerSubsystem* operational attribute. If the current number of active invokes for a given subsystem reaches the maximum, new requests for service from that subsystem are ignored.<br><br>A Minor alarm is set when the current number of transactions reaches 90% of the value specified by this attribute. A Critical alarm is set at 95%.<br><br>Altering the value specified by this attribute after initial activation will result in an interruption of service for all clients while the |

| | |
|---|---|
| | TCAP stack is restarted. Transactions in progress are lost and new transactions cannot be serviced. |
| Vector of | Decimal (0..6000) |
| Index | sgsnSubsystem (sgsn)<br>capSubsystem (cap)<br>mscEmulationSubsystem (mscE) |

### ATTRIBUTE Tcap linkToTcapStackUsers (users)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies components that utilize the services of this *TcapStack* component. |
| List of | Link (Service, linkToTcapStack) |
| Default | No default |

### GROUP Tcap SccpUserInfoProv (SccpProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes that specify SCCP User Information for the *Tcap* component. |

### ATTRIBUTE Tcap sccpVariant

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SCCP variant used by the TCAP Stack.<br><br>***itu*** - use ITU SCCP Standards<br>***ansi*** - use ANSI SCCP Standards<br>***ituChinese*** - use ITU Chinese SCCP Standard |
| Values | itu<br>ansi<br>ituChinese |

Default itu

### ATTRIBUTE Tcap natureOfAddress (noa)

Access
Read: All
Write: All

Description
This attribute specifies the Nature of Address for Global Titles in the Calling Party Address (CGPA) and the Called Party Address (CDPA) in the SCCP header. This attribute directly maps to the Nature of Address parameter of the SCCP CgPA/CdPA described in SCCP specifications. It is used to qualify the type (nature) of global title address digits. The Nature of Address must match the corresponding global title translation tables on the SS7/Ip Gateway (SIG) or Universal Signalling Point (USP).

Possible values are:
***subNum*** **-** Subscriber number
***resNationalUse*** **-** Reserved National Use
***natSpecNum*** - National Specific number
***intlNum*** - International number

Values
subNum
resNationalUse
natSpecNum
intlNum

Default intlNum

### ATTRIBUTE Tcap sccpClassOfOperation (sccpCOP)

Access
Read: All
Write: All

Description
This attribute specifies the class of operation used in the SCCP layer for TCAP messaging. It must match SS7/IP Gateway (SIG) or Universal Signalling Point (USP) settings.
Possible values are:

***nonSequenced(nonSeq)***: non-sequenced message delivery
***sequenced(seq):*** sequenced message delivery.

Values
nonSequenced (nonSeq)
sequenced (seq)

| | |
|---|---|
| Default | sequenced |

### ATTRIBUTE Tcap e164TransType (e164tt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Global Title Translation type used for E.164 Numbering Plan global titles. This value is used for all message types except Mobile Originated Forward Short Message.<br><br>For the Mobile Originated Forward Short Message, the attribute *e164MofsmTransType* is used.<br><br>When set to ***autoConfig***, the value used is based on the *sccpVariant* attribute. If the value specified by *sccpVariant* is ***itu*** or ***ituChinese***, a value of 0 is used for the E164 Translation Type. If the *sccpVariant* specifies ***ansi***, a value of 10 is used. |
| Values | Decimal (0..255)<br>autoConfig |
| Default | autoConfig |

### ATTRIBUTE Tcap e164MofsmTransType (e164Mtt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Global Title Translation type to be used for E.164 Numbering Plan global titles for the Mobile Originated Forward Short Message only.<br><br>When set to ***autoConfig***, the value used is based on the *sccpVariant* attribute. If the value specified by *sccpVariant* is ***itu*** or ***ituChinese***, a value of 0 is used for the E164 Translation Type. If the *sccpVariant* specifies ***ansi***, a value of 10 is used. |
| Values | Decimal (0..255)<br>autoConfig |
| Default | autoConfig |

### ATTRIBUTE Tcap e212TransType

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Global Title Translation type to be used for E.212 Numbering Plan global titles.<br><br>When set to ***autoConfig***, the value used is based on the *sccpVariant* attribute. If the value specified by *sccpVariant* is ***itu*** or ***ituChinese***, a value of 0 is used for the E164 Translation Type. If the *sccpVariant* specifies ***ansi***, a value of 9 is used. |
| Values | Decimal (0..255)<br>autoConfig |
| Default | autoConfig |

### ATTRIBUTE Tcap e214TransType

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Global Title Translation Type to be used for E.214 Numbering Plan global titles.<br><br>When set to ***autoConfig***, the value used is based on the *sccpVariant* attribute. If the value specified by *sccpVariant* is ***itu*** or ***ituChinese***, a value of 0 is used for the E164 Translation Type. If the *sccpVariant* specifies ***ansi***, a value of 10 is used. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE Tcap sccpReturnOption

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SCCP return option used by the TCAP Stack.<br><br>***noReturn*** - undeliverable messages are discarded.<br>***return*** - undeliverable messages are returned. |

| | |
|---|---|
| Values | noreturn<br>return |
| Default | return |

### ATTRIBUTE Tcap hopCounter

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of hops before a message is discarded.<br><br>It is used for circular route prevention. Each SS7 node will decrement the hop counter by one and will discard the message if the counter equals zero. |
| Values | Decimal (1..15) |
| Default | 15 |

### ATTRIBUTE Tcap xudtOption

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether or not XUDT (extended unitdata) messages can be used. The specified value is used to determine the type of message the SS7 IP Gateway uses for transmission of SCCP connectionless data.<br><br>***off*** **-** an SCCP XUDT (extended unitdata) message is transmitted only when the data size is such that segmentation is required, otherwise an SCCP UDT (unitdata) message is transmitted.<br><br>***on*** **-** an XUDT message is transmitted for all connectionless data regardless of data size**.**<br><br>Usually, this attribute should specify ***off*** so that XUDT is only used when needed. An operator may desire to set this value to ***on*** so that this SS7 node can use XUDT messages to indicate to other nodes that it supports Whitebook (ITU-T 96/ANSI-96) SCCP. |

| | |
|---|---|
| Values | off<br>on |
| Default | off |

### GROUP Tcap OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Tcap adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Tcap operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Tcap usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Tcap Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data of the *Tcap*. |

## ATTRIBUTE Tcap currentTransactions (currTrans)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of TCAP Transactions that are currently active. The provisionable attribute, *maxTransactionsPerSubsystem*, specifies the maximum number of transactions supported for each subsystem. This attribute will never be greater than the sum of the maximum transactions for each subsystem. |
| Values | Decimal (0..12000) |
| Default | No default |

## ATTRIBUTE Tcap currentInvokes (currInvokes)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of TCAP Invokes that are currently active. The provisionable attribute, *maxInvokesPerSubsystem*, specifies the maximum number of invokes supported for each subsystem. This attribute will never be greater than the sum of the maximum transactions for each subsystem. |
| Values | Decimal (0..15000) |
| Default | No default |

## ATTRIBUTE Tcap beginSent (txBegin)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Begin messages sent to all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap beginReceived (rxBegin)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Begin messages received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap continueSent (txContinue)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Continue messages sent to all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap continueReceived (rxContinue)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Continue messages received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap endSent (txEnd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of TCAP End messages sent to all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap endReceived (rxEnd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP End messages received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap uabortSent (txUabort)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP User Abort messages sent to all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap uabortReceived (rxUabort)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP User Abort messages received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap pabortReceived (rxPabort)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Provider Abort messages received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap noticeReceived (rxNotice)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Notice messages received from all peer nodes. Notices are received when messages cannot be delivered to a remote node. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap invokeSent (txInvoke)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Invoke Components sent to all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap invokeReceived (rxInvoke)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of TCAP Invoke Components received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap resultLastSent (txResultLast)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Result Last Components sent to all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap resultLastReceived (rxResultLast)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Result Last Components received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap returnErrorSent (txReturnError)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Return Error Components sent to all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap returnErrorReceived (rxReturnError)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Return Error Components received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap rejectsSent (txRejects)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Reject Components sent to all peer nodes. A Reject Component is sent when an invalid TCAP message is received from a peer node. The *rejectReason* attribute indicates the reason for the most recent reject. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap rejectsReceived (rxRejects)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCAP Reject Components received from all peer nodes. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap rejectReason

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description

This attribute indicates the reason for the most recent Reject message sent to a peer node.

***none*** - no rejects have been received.

***duplicateInvokeId*** - a duplicate Invoke Id was received from the peer.

***unrecognizedComponent*** - an unrecognized component was received from the peer.

***mistypedParameter*** - a mistyped parameter was received from the peer.

***badlyStructuredComponent*** - a badly structured component was received from the peer.

***unrecognizedOperation*** - an unrecognized operation was received from the peer.

***unexpectedLinkedOperation*** - an unexpected linked operation was received from the peer.

***resourceLimitation*** - a resource limitation forced a reject to be sent.

***initRelease*** - the corresponding dialogue has been released.

***unrecognizedLinkedId*** - an unrecognized linked Id was received from the peer.

***linkedResponseUnexpected*** - an unexpected linked response was received from the peer.

***unrecognizedInvokeId*** - an unrecognized invoke Id was received from the peer.

***returnResultUnexpected*** - an unexpected return result was received from the peer.

***returnErrorUnexpected*** - an unexpected return error was

received from the peer.

***unrecognizedError*** - an unrecognized error was received from the peer.

***unexpectedError*** - an unexpected error message was received from the peer.

Values

duplicateInvokeId
unrecognizedComponent
mistypedParameter
badlyStructuredComponent
unrecognizedOperation
unexpectedLinkedOperation
resourceLimitation
initRelease
unrecognizedLinkedId
linkedResponseUnexpected
unrecognizedInvokeId
returnResultUnexpected
returnErrorUnxepected
unrecognizedError
unexpectedError
none

Default

No default

### ATTRIBUTE Tcap currentTransactionsBySubsystem (currTransBySs)

Access

Read: All
Write: Illegal

Description

This attribute indicates the number of TCAP Transactions that are currently active for each subsystem.

***sgsn*** - the SGSN subsystem
***cap*** - the CAP subsystem
***mscE*** - the MSC Emulation subsystem.

| | |
|---|---|
| Vector of | Decimal (0..4000) |
| Index | sgsn<br>cap<br>mscEmulationSubsystem (mscE) |
| Default | No default |

### ATTRIBUTE Tcap currentInvokesBySubsystem (currInvokesBySs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of TCAP Invokes that are currently active for each subsystem.<br><br>***sgsn*** - the SGSN subsystem<br>***cap*** - the CAP subsystem<br>***mscE***- the MSC Emulation subsystem. |
| Vector of | Decimal (0..6000) |
| Index | sgsn<br>cap<br>mscEmulationSubsystem (mscE) |
| Default | No default |

### GROUP Tcap SigRegistrationOp

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for any component that monitors SS7 IP Gateway (SIG) registration statistics. |

### ATTRIBUTE Tcap sigRegisterAttempts (regAttempts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of SCIP registrations attempted with the SIG. The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap sigRegisterSuccessAcks (regAcks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of successful registration responses received from the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap sigRegisterFailures (regFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of unsuccessful registration responses received from the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap sigDeregisterAttempts (deregAttempts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of SCIP deregistrations attempted with the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap sigDeregisterSuccessAcks (deregAcks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of successful deregistration responses received from the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap sigDeregisterFailures (deregFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of unsuccessful deregistration responses received from the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap sigSccpNoticeIndications (sccpNotice)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of SCCP Notice Indications that have been received from the SIG. SCCP Notice Indications are received from the SIG when there are errors in the messages being sent to it. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Tcap WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Tcap customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS TcapStack

| | |
|---|---|
| Description | The statistics record generated by the TcapStack component. |

### ATTRIBUTE Tcap registerAttempts (regAttempts)

Description This attribute indicates the number of SCIP registrations attempted with the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Tcap registerSuccessAcks (regAcks)

Description This attribute indicates the number of successful registration responses received from the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Tcap registerFailures (regFail)

Description This attribute indicates the number of unsuccessful registration responses received from the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Tcap deregisterAttempts (deregAttempts)

Description This attribute indicates the number of SCIP deregistrations attempted with the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Tcap deregisterSuccessAcks (deregAcks)

Description This attribute indicates the number of successful deregistration responses received from the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Tcap deregisterFailures (deregFail)

Description This attribute indicates the number of unsuccessful deregistration responses received from the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Tcap sigSccpNoticeIndications (sccpNotice)

Description This attribute indicates the number of SCCP Notice Indications that have been received from the SIG during the collection

interval. SCCP Notice Indications are received from the SIG when there are errors in the messages being sent to it.

Values — Decimal (0..4294967295)

### ATTRIBUTE Tcap concurrentTransactionsLowBySs (transLowBySs)

Description — This attribute indicates the lowest number of simultaneous TCAP Transactions active during the collection interval for each subsystem.

***sgsn*** - the SGSN subsystem
***cap*** - the CAP subsystem
***mscE***- the MSC Emulation subsystem.

Vector of — Decimal (0..4000)

Index — sgsn
cap
mscEmulationSubsystem (mscE)

### ATTRIBUTE Tcap concurrentTransactionsAvgBySs (transAvgBySs)

Description — This attribute indicates the average number of simultaneous Tcap Transactions active over the collection interval for each subsystem.

The average for each subsystem is computed based on the cumulative total of the values of the *currentTransactionsBySubsystem* attribute for that subsystem at each event that causes the attribute to change, divided by the total number of such events during the collection interval.

***sgsn*** - the SGSN subsystem
***cap*** - the CAP subsystem
***mscE***- the MSC Emulation subsystem.

Vector of — Decimal (0..4000)

Index — sgsn
cap
mscEmulationSubsystem (mscE)

### ATTRIBUTE Tcap concurrentTransactionsHighBySs (transHighBySs)

| | |
|---|---|
| Description | This attribute indicates the highest number of simultaneous TCAP Transactions active during the collection interval for each subsystem.<br><br>***sgsn*** - the SGSN subsystem<br>***cap*** - the CAP subsystem<br>***mscE***- the MSC Emulation subsystem. |
| Vector of | Decimal (0..4000) |
| Index | sgsn<br>cap<br>mscEmulationSubsystem (mscE) |

### ATTRIBUTE Tcap concurrentInvokesLowBySs (invksLowBySs)

| | |
|---|---|
| Description | This attribute indicates the lowest number of simultaneous Tcap Invokes active during the collection interval for each subsystem.<br><br>***sgsn*** - the SGSN subsystem<br>***cap*** - the CAP subsystem<br>***mscE***- the MSC Emulation subsystem. |
| Vector of | Decimal (0..6000) |
| Index | sgsn<br>cap<br>mscEmulationSubsystem (mscE) |

### ATTRIBUTE Tcap concurrentInvokesAvgBySs (invksAvgBySs)

| | |
|---|---|
| Description | This attribute indicates the average number of simultaneous Tcap Invokes active during the collection interval.<br><br>The average is computed for each subsystem based on the cumulative total of the values of the *currentInvokesBySubsystem* attribute for that subsystem at each event that causes the attribute to change, divided by the total number of such events during the collection interval.<br><br>***sgsn*** - the SGSN subsystem |

***cap*** - the CAP subsystem
***mscE***- the MSC Emulation subsystem

Vector of: Decimal (0..6000)

Index: sgsn
cap
mscEmulationSubsystem (mscE)

### ATTRIBUTE Tcap concurrentInvokesHighBySs (invksHighBySs)

Description: This attribute indicates the highest number of simultaneous Tcap Invokes active during the collection interval for each subsystem.

***sgsn*** - the SGSN subsystem
***cap*** - the CAP subsystem
***mscE***- the MSC Emulation subsystem

Vector of: Decimal (0..6000)

Index: sgsn
cap
mscEmulationSubsystem (mscE)

### ATTRIBUTE Tcap beginSent (txBegin)

Description: This attribute counts the number of TCAP Begin messages sent to all peer nodes during the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Tcap beginReceived (rxBegin)

Description: This attribute counts the number of TCAP Begin messages received from all peer nodes during the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Tcap continueSent (txContinue)

Description: This attribute counts the number of TCAP Continue messages sent to all peer nodes during the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Tcap continueReceived (rxContinue)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Continue messages received from all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap endSent (txEnd)

| | |
|---|---|
| Description | This attribute counts the number of TCAP End messages sent to all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap endReceived (rxEnd)

| | |
|---|---|
| Description | This attribute counts the number of TCAP End messages received from all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap uabortSent (txUabort)

| | |
|---|---|
| Description | This attribute counts the number of TCAP User Abort messages sent to all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap uabortReceived (rxUabort)

| | |
|---|---|
| Description | This attribute counts the number of TCAP User Abort messages received from all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap pabortReceived (rxPabort)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Provider Abort messages received from all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap noticeReceived (rxNotice)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Notice messages received from all peer nodes during the collection interval. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap invokeSent (txInvoke)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Invoke Components sent to all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap invokeReceived (rxInvoke)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Invoke Components received from all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap resultLastSent (txResultLast)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Result Last Components sent to all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap resultLastReceived (rxResultLast)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Result Last Components received from all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap returnErrorSent (txReturnError)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Return Error Components sent to all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap returnErrorReceived (rxReturnError)

| | |
|---|---|
| Description | This attribute counts the number of TCAP Return Error Components received from all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap rejectsSent (rejsent)

| | |
|---|---|
| Description | This attribute counts the number of TCAP REJECT Components sent to all peer nodes during the collection interval. A Peer is an application on a different node using data from the same protocol layer. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap rejectsReceived (rejRcvd)

| | |
|---|---|
| Description | This attribute counts the number of TCAP REJECT Components received from all peer nodes during the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Tcap MemoryPoolManager (Mpm)

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n MemoryPoolManager*<br>*Gsd/n MemoryPoolManager*<br>*Gtl/n MemoryPoolManager*<br>*DnsAgent/<vr>,n MemoryPoolManager*<br><br>This component represents the memory resources of a given GPRS application that are managed as pools of objects. |
| Dyn. Subcomp. | "COMPONENT Tcap Mpm MemoryPoolClient (Mpc)" |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Tcap Mpm MemoryPoolClient (Mpc)

| | |
|---|---|
| Instance | String (1..30, ASCII) |
| Scope | Application |
| Description | *Gsc/n Mpm MemoryPoolClient/<name>*<br>*Gsd/n Mpm MemoryPoolClient/<name>*<br>*SgGtl/n Mpm MemoryPoolClient/<name>*<br>*DnsAgent/<vr>,n Mpm MemoryPoolClient/<name>* |

This component represents a pool of objects of a particular class that a GPRS application currently owns as well as all the objects that could be owned by that application. All the objects in the pool are of the same class. The instance value of this component is a string which is the class name of the objects in the pool.

Groups

"GROUP Tcap Ss7IpIf Provisioned (Prov)"
"GROUP Tcap Ss7IpIf OsiState (State)"
"GROUP Tcap Ss7IpIf WlcCustomCounters (WlcCustomCntr)"

Scope

Application

Description

*Tcap/n Ss7IpIf/n*
*Gsc/n Bssap Ss7IpIf/n*

This component represents an interface to the HP or USP SS7-IP Gateway (SIG). The HP SIG and Universal Signalling Point (USP) SIG are referred to generically as the SIG.

The SIG is a “stateless” message routing gateway used by many wireless components to communicate with other SS7 nodes in the wireless network such as the Home Location Register (HLR) and Visitor Location Register (VLR).

A single instance of the *Ss7IpIf* provides connectivity to the SIG, but an additional instance can be added for redundancy.

### GROUP Tcap Ss7Iplf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *Ss7IpIf* component. |

### ATTRIBUTE Tcap Ss7Iplf linkToPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to a *Gips/n Ip/address Tcp Port/n* component. This determines the IP Address and port used by this component for communication with the SIG. |
| Values | Link (Service, linkToApplication) |
| Default | No default |

### ATTRIBUTE Tcap Ss7Iplf ss7IpGatewayAddress (sigIpAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SS7-IP Gateway (SIG) IP address.<br><br>The value must match the IP address specified on the SIG and must not be set to 0.0.0.0.<br><br>Changing this value causes the *Ss7IpIf* to redirect data using the new IP address. Current transactions being processed using this interface may be affected. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Tcap Ss7Iplf ss7IpGatewayTcpPort (sigTcpPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SS7-IP Gateway (SIG) TCP port number. |

The value must match the TCP port number specified on the SIG.

Changing this value causes the *Ss7IpIf* to redirect data using the new TCP Port number. Current transactions being processed using this interface may be affected.

Values: Decimal (0..65535)

Default: No default

### ATTRIBUTE Tcap Ss7IpIf heartbeatTimer (heartBTmr)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time between heartbeat messages sent to the SIG by the *Ss7IpIf*. Specifying ***disabled*** indicates that the heartbeat timer is disabled, that is, heartbeat messages are not sent to the SIG.

The value specified by this attribute should be less than the keep-alive timer specified on the SIG. It is recommended that this attribute specify a value that is one-third the value of that specified by the keep-alive timer on the SIG.

Values: Decimal (1..100)
disabled

Units: seconds

Default: 20

### ATTRIBUTE Tcap Ss7IpIf keepAliveTimer (keepAliveTmr)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time the *Ss7IpIf* waits to receive heartbeat messages from the USP SIG before timing out. If the *Ss7IpIf* does not receive a heartbeat message from the SIG within the amount of time specified, it transitions into the OSI ***disabled*** operational state until connectivity with the SIG can be reestablished.

If the *Ss7IpIf* is provisioned to connect to an HP SIG, this attribute should be set to ***disabled***. Setting this attribute to ***disabled*** indicates that the *Ss7IpIf* will not monitor heartbeat messages from the SIG.

This attribute should specify a value greater than that specified by the heartbeat timer on the SIG. It is recommended that this attribute specify a value that is three times the value specified by the heartbeat timer on the SIG.

Values: Decimal (1..300)
disabled

Units: seconds

Default: 60

### GROUP Tcap Ss7IpIf OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Tcap Ss7IpIf adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Tcap Ss7Iplf operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Tcap Ss7Iplf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Tcap Ss7Iplf WlcCustomCounters (WlcCustomCntr)

Properties
Operational

Description
This group contains the spare counters that can be dynamically patched.

### ATTRIBUTE Tcap Ss7Iplf customCounter1 (customCntr1)

Access
Read: All
Write: Illegal

Description
This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Tcap Ss7Iplf customCounter2 (customCntr2)

Access
Read: All
Write: Illegal

Description
This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values
Decimal (0..4294967295)

Default
No default

## ATTRIBUTE Tcap Ss7Iplf customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Tcap MapStack (Map)

| | |
|---|---|
| Groups | "GROUP Tcap Map Timers"<br>"GROUP Tcap Map Operational (Oper)"<br>"GROUP Tcap Map OsiState (State)"<br>"GROUP Tcap Map WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS TcapStack MapStack"

| | |
|---|---|
| Scope | Application |
| Description | *Tcap/n MapStack*<br><br>This component represents the Mobile Application Part (MAP) Stack functionality.<br><br>Mobile Application Part (MAP) Stack provides MAP Protocol services for the MAP client on the (UMTS) Serving GPRS Support Node (SGSN and USGSN). |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Tcap Map Timers

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains general provisioning data for the *MapStack* component. |

### ATTRIBUTE Tcap Map uglSanityTimer (ugltim)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Stack waits for the UPDATE GPRS LOCATION RESPONSE from the HLR.<br><br>The timer is started when the UPDATE GPRS LOCATION message is sent to the HLR.<br><br>The number of timeouts of this timer is indicated by the attribute *uglTimeouts*.<br><br>The number of retries is specified by the attribute *uglRetries* in the *MapClient* component that is associated with this MAP Stack. |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 25 |

### ATTRIBUTE Tcap Map saiSanityTimer (saitim)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Stack waits for the SEND AUTHENTICATION INFORMATION RESPONSE from the HLR.<br><br>The timer is started when the SEND AUTHENTICATION INFORMATION message is sent to the HLR.<br><br>The number of timeouts of this timer is indicated by the attribute *saiTimeouts*.<br><br>The number of retries is specified by the attribute *saiRetries* in the *MapClient* component that is associated with this MAP Stack |

| | |
|---|---|
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 25 |

### ATTRIBUTE Tcap Map clSanityTimer (cltim)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Stack waits for the CANCEL LOCATION RESPONSE from the MAP Client.<br><br>The timer is started when the CANCEL LOCATION message is received from the HLR.<br><br>The number of timeouts of this timer is indicated by the attribute *clTimeouts*.<br><br>The number of retries is specified by the HLR provisioning which is external to the SGSN. |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 25 |

### ATTRIBUTE Tcap Map dsdSanityTimer (dsdtim)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Stack waits for the DELETE SUBSCRIBER DATA RESPONSE from the MAP Client.<br><br>The timer is started when the DELETE SUBSCRIBER DATA message is received from the HLR.<br><br>The number of timeouts of this timer is indicated by the attribute *dsdTimeouts*. |

| | |
|---|---|
| | The number of retries is specified by the attribute *dsdRetries* in the *MapClient* component that is associated with this MAP Stack |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 25 |

### ATTRIBUTE Tcap Map isdSanityTimer (isdtim)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Stack waits for the INSERT SUBSCRIBER DATA RESPONSE from the MAP Client.<br><br>The timer is started when the INSERT SUBSCRIBER DATA message is received from the HLR.<br><br>The number of timeouts of this timer is indicated by the attribute *isdTimeouts*.<br><br>The number of retries is specified by HLR provisioning which is external to the SGSN. |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 25 |

### ATTRIBUTE Tcap Map mtfsmSanityTimer (mtfsmtim)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Stack waits for the MOBILE TERMINATED FORWARD SHORT MESSAGE RESPONSE from the MAP Client.<br><br>The timer is started when the MOBILE TERMINATED FORWARD SHORT MESSAGE message is received from the |

Short Message Service Center (SMSC).

The number of timeouts of this timer is indicated by the attribute *mtfsmTimeouts*.

The number of retries is specified by SMSC provisioning which is external to the SGSN.

Values: Decimal (1..600)

Units: seconds

Default: 60

### ATTRIBUTE Tcap Map mofsmSanityTimer (mofsmtim)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time the MAP Stack waits for the MOBILE ORIGINATED FORWARD SHORT MESSAGE RESPONSE from the SMSC.

The timer is started when the MOBILE ORGINATED FORWARD SHORT MESSAGE message is sent to the SMSC.

The number of timeouts of this timer is indicated by the attribute *mofsmTimeouts*.

There are no retries associated with this message.

Values: Decimal (1..600)

Units: seconds

Default: 60

### ATTRIBUTE Tcap Map fsmSanityTimer (fsmtim)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time the MAP Stack waits for the FORWARD SHORT MESSAGE RESPONSE from the MAP Client.

The timer is started when the FORWARD SHORT MESSAGE message is received from the Short Message Service Center (SMSC).

The number of timeouts of this timer is indicated by the attribute *fsmTimeouts*.

The number of retries is specified by SMSC provisioning which is external to the SGSN.

Values: Decimal (1..600)

Units: seconds

Default: 60

### ATTRIBUTE Tcap Map rfsmSanityTimer (rfsmtim)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time the MAP Stack waits for the READY FOR FORWARD SHORT MESSAGE RESPONSE from the HLR.

The timer is started when the READY FOR FORWARD SHORT MESSAGE message is sent to the HLR.

The number of timeouts of this timer is indicated by the attribute *rfsmTimeouts*.

There are no retries associated with this message.

Values: Decimal (1..30)

Units: seconds

Default: 25

### ATTRIBUTE Tcap Map afrSanityTimer (afrtim)

Access: Read: All
Write: All
