| Description | This attribute specifies the amount of time the MAP Stack waits for the AUTHENTICATION FAILURE REPORT RESPONSE from the HLR.<br><br>The timer is started when the AUTHENTICATION FAILURE REPORT message is sent to the HLR.<br><br>The number of timeouts of this timer is indicated by the attribute *afrTimeouts*.<br><br>The number of retries is specified by the attribute *afrRetries* in the *MapClient* component that is associated with this MAP Stack. |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 25 |

### ATTRIBUTE Tcap Map pmsSanityTimer (pmstim)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Stack waits for the MOBILE SUBSCRIBER PURGE RESPONSE from the HLR. The timer is started when the MOBILE SUBSCRIBER PURGE REQUEST message is sent to the HLR. The number of timeouts of this timer is indicated by the attribute pmsTimeouts. |
| Values | Decimal (1..60) |
| Units | seconds |
| Default | 50 |

### ATTRIBUTE Tcap Map pslSanityTimer (pslTimer)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Stack waits for the PROVIDE SUBSCRIBER LOCATION RESPONSE message from the MAP Client. |

The timer is started when the PROVIDE SUBSCRIBER LOCATION message is received from the Gateway Mobile Location Center (GMLC).

The number of timeouts of this timer is indicated by the *pslTimeouts* attribute.

In the GPRS network, this attribute value must be greater than the value of the *pagingTimer* attribute.

In the UMTS network, this attribute value must be greater than the sum of the *pagingTimer* attribute and either the *locationReportTimer* attribute or the *locationNotifyTimer* attribute, depending on which of the two has the higher value.

| | |
|---|---|
| Values | Decimal (1..600) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE Tcap Map linkToMapStackUsers (users)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies components that utilize the services of this *MapStack* component. |
| List of | Link (Service, linkToMapStack) |
| Default | No default |

### GROUP Tcap Map Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data of the *MapStack.* |

### ATTRIBUTE Tcap Map uglTimeouts (uglTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the expiries of the timer specified by he attribute *uglSanityTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map saiTimeouts (saiTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *saiSanityTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map clTimeouts (clTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *clSanityTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map isdTimeouts (isdTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *isdSanityTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Tcap Map dsdTimeouts (dsdTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *dsdSanityTimer.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map mtfsmTimeouts (mtfsmTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *mtfsmSanityTimer.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map mofsmTimeouts (mofsmTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *mofsmSanityTimer.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map fsmTimeouts (fsmTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the expiries of the *fsmSanityTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map rfsmTimeouts (rfsmTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *rfsmSanityTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map afrTimeouts (afrTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *afrSanityTimer*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map pmsTimeouts (pmsTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the expiries of the *pmsSanityTimer* attribute.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map pslTimeouts (pslTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts theexpiries of the *pslSanityTimer* attribute.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Tcap Map OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Tcap Map adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Tcap Map operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Tcap Map usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Tcap Map WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Tcap Map customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap Map customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS TcapStack MapStack

| | |
|---|---|
| Description | The statistics record generated by the TcapStack MapStack component. |

### ATTRIBUTE Tcap Map uglTimeouts (uglTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *uglSanityTimer* over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map saiTimeouts (saiTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *saiSanityTimer* over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map clTimeouts (clTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *clSanityTimer* over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map isdTimeouts (isdTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *isdSanityTimer* in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map dsdTimeouts (dsdTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *dsdSanityTimer* in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map mtfsmTimeouts (mtfsmTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *mtfsmSanityTimer* in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map mofsmTimeouts (mofsmTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *mofsmSanityTimer* in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map fsmTimeouts (fsmTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *fsmSanityTimer* in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map rfsmTimeouts (rfsmTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *rfsmSanityTimer* in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map afrTimeouts (afrTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the timer specified by the attribute *afrSanityTimer* in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map pmsTimeouts (pmsTo)

| | |
|---|---|
| Description | This attribute indicates the number of expiries of the *pmsSanityTimer* attribute in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Tcap Map pslTimeouts (pslTo)

| | |
|---|---|
| Description | This attribute counts the expiries of the timer specified by the *pslSanityTimer* attribute in the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Tcap RemoteApplicationConnection (RaConn)

| | |
|---|---|
| Instance | appType [String (1..8, ASCII)]<br>shelfId [Decimal (0..15)]<br>n [Decimal (1..15)] |
| Groups | "GROUP Tcap RaConn OsiState (State)"<br>"GROUP Tcap RaConn WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *... RemoteApplicationConnection/<appType, shelfId, n>*<br><br>This component represents the Remote Application Connection information of an application that talks to applications on other shelves. For each application that it can communicate with, one of these connection components is created and is instantiated with the name of the remote application, the Id of the shelf on which the application runs, and the instance number of the application. ShelfId ***0*** represents the Master shelf. |
| Dyn. Subcomp. | "COMPONENT Tcap RaConn AtmConnection (AtmCon)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Tcap RaConn OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Tcap RaConn adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Tcap RaConn operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Tcap RaConn usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Tcap RaConn WlcCustomCounters (WlcCustomCntr)

Properties
Operational

Description
This group contains the spare counters that can be dynamically patched.

### ATTRIBUTE Tcap RaConn customCounter1 (customCntr1)

Access
Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap RaConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Tcap RaConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Tcap RaConn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Tcap RaConn AtmCon Operational (Oper)" |
| Scope | Device |

| | |
|---|---|
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Tcap RaConn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

## ATTRIBUTE Tcap RaConn AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

## GROUP TdmaBc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes concerning the operation of this particular *TdmaIwfBearerChannel* for the current or most recent call. |

## ATTRIBUTE TdmaBc state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the MSC/IWF Interface Protocol (MIP) Message Router (MMR) for an IWF element. This attribute has one of the following values:<br>***idle***: Startup state of IWF element.<br>***setup***: This call half is being set up.<br>***active***: This call half has been connected by both the MTX and IWF and is active.<br>***releas***e: This call half is being released. |

Values
idle
setup
active
release

Default
No default

## ATTRIBUTE TdmaBc callType

Access
Read: All
Write: Illegal

Description
This attribute indicates the current call type. This attribute has one of the following values:
***analogSpeech***: Analog speech calls.
***digitalSpeech***: Digital speech calls.
***analogPrefSpeech***: Analog preferred speech calls.
***digitalPrefSpeech***: Digital preferred speech calls.
***asyncData***: Asynchronous data service calls.
***g3Fax***: Group 3 fax calls.
***rejected***: Rejected calls.
***stuIII***: STU III calls.
***notUsedYet***: Bearer Channel has not been used in a call yet.
***directAsyncData***: FastConnect or Direct Async Data Service (DADS) calls.

Values
analogSpeech
digitalSpeech
analogPrefSpeech
digitalPrefSpeech
asyncData
g3Fax
rejected
stuIII
notUsedYet
directAsyncData

Default
No default

## ATTRIBUTE TdmaBc lastResponseCode (respCode)

Access

Read: All
Write: Illegal

Description

This attribute indicates the MSC/IWF Interface Protocol (MIP) Message Router (MMR) response code returned for the last call which was active on this particular *TdmaIwfBearerChannel*. This attribute has one of the following values:
***noCause***: No cause available.
***unassignedNumber***: Unallocated or unassigned number.
***noRouteToDest***: No route to destination.
***normalClearing***: The call was terminated normally.
***userBusy***: User busy.
***noResponse***: No carrier.
***userNoAnswer***: No answer from user.
***invalidNumberFormat***: Translation or routing problem.
***unspecNormal***: Normal, unspecified.
***temporaryFailure***: Temporary failure.
***channelUnavailable***: Channel unavailable.
***resourceUnavailable***: Resources unavailable to handle call.
***qosUnavailabled***: Specified rate of call unavailable.
***serviceUnavailable***: Service not implemented.
***unimplementedOption***: Option not implemented.
***invalidCallRefValue***: Invalid call reference value.
***invalidChannel***: Identified channel does not exist.
***unspecInvalidMessage***: Invalid message, unspecified.
***missingMandatoryIe***: Missing mandatory information element.
***invalidMessageType***: Message type not implemented.
***incompatibleMessage***: Message not compatible with call state.
***timerRecovery***: Recovery on timer expiration.
***protocolError***: Protocol error, unspecified.

Values

noCause
unassignedNumber
noRouteToDest
normalClearing
userBusy
noResponse
userNoAnswer
invalidNumberFormat

unspecNormal
temporaryFailure
channelUnavailable
resourceUnavailable
qosUnavailable
serviceUnavailable
unimplementedOption
invalidCallRefValue
invalidChannel
unspecInvalidMessage
missingMandatoryIe
invalidMessageType
incompatibleMessage
timerRecovery
unspecProtocolError

Default: No default

### ATTRIBUTE TdmaBc mateBearerChannel (mateBc)

Access: Read: All
Write: Illegal

Description: This attribute contains the name of the mate *TdmaIwfBearerChannel* that this *TdmaIwfBearerChannel* is involved with in the currently active call. In the case of a FastConnect call, this mate is a *TdmaIwfFcBearerChannel*.

Values: The name of the component

Default: No default

### GROUP TdmaBc CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE TdmaBc customerIdentifier (cid)

Access: Read and write

Description

This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values

Decimal (0; 1..8191)

Default

0

## GROUP TdmaBc OsiState (State)

Properties

Operational

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE TdmaBc adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component.

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE TdmaBc operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE TdmaBc usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## COMPONENT TdmaBc Framer

Groups
"GROUP TdmaBc Framer Provisioned (Prov)"
"GROUP TdmaBc Framer Statistics (Stats)"
"GROUP TdmaBc Framer LinkOptions (Link)"
"GROUP TdmaBc Framer OsiState (State)"

Scope
Device

Description
*TdmaBc/<csIndex>,<bcIndex> Framer*
The *TdmaIwfFramer* component controls link layer framing for application components sending and receiving data on a link interface. The *TdmaIwfFramer* component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes which are associated with hardware components. The *TdmaIwfFramer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

## GROUP TdmaBc Framer Provisioned (Prov)

Properties
Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

### ATTRIBUTE TdmaBc Framer interfaceName

Access: Read and write

Criticality: Process

Description

This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values: Link (Hardware, applicationFramerName)

Default: No default

### GROUP TdmaBc Framer Statistics (Stats)

Properties: Operational

Description: This group contains the operational statistics data for a *TdmaIwfFramer* component.

### ATTRIBUTE TdmaBc Framer txFrames

Access: Read only

Description: This attribute counts the number of frames transmitted to the link interface by *TdmaIwfFramer*.
The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE TdmaBc Framer rxFrames

Access: Read only

| | |
|---|---|
| Description | This attribute counts the number of frames received from the link interface by *TdmaIwfFramer*.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc Framer rxBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the link interface by *TdmaIwfFramer*.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP TdmaBc Framer LinkOptions (Link)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *TdmaIwfFramer*<br>which controls link layer framing for application components sending and receiving data on a link interface for this particular *TdmaIwfBearerChannel*. |

### ATTRIBUTE TdmaBc Framer framingType

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Criticality | Process |
| Description | This attribute indicates the type of framing for the link layer data received and transmitted on this channel. This attribute has one of the following values:<br>***btdsFraming***: Bit transparent framing for the *TdmaIwfBearerChannel* components on MVP cards.<br>***mtxFraming***: DMS-MTX InterSystem Link Protocol (ISLP) framing required for the *TdmaIwfBearerChannel* components on DS1C/E1C cards. |

| | |
|---|---|
| Values | btdsFraming<br>mtxFraming |
| Default | No default |

### GROUP TdmaBc Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE TdmaBc Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE TdmaBc Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE TdmaBc Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## COMPONENT TdmaBc Modem

| | |
|---|---|
| Groups | "GROUP TdmaBc Modem Operational (Oper)"<br>"GROUP TdmaBc Modem Statistics (Stats)" |
| Scope | Application |
| Description | *TdmaBc/<csIndex>,<bcIndex> Modem*<br>This component represents the group of measurements for the modem protocol established for a DMS-MTX IWF call (on the IWF to PSTN modem link) on this particular *TdmaIwfBearerChannel.*<br>Note that this component is present only if the current or most recent call involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP TdmaBc Modem Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure performance of the *modem* component for this particular *TdmaIwfBearerChannel*. |

## ATTRIBUTE TdmaBc Modem voiceLaw

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the active voice law associated with the *modem* component. This attribute has one of the following values: ***aLaw*** and ***muLaw***. Both protocols are utilized for encoding voice-band audio. For additional information on each, refer to ITU-T G.711 “Pulse Code Modulation (PCM) of Voice Frequencies”. |
| Values | aLaw<br>muLaw |
| Default | No default |

## ATTRIBUTE TdmaBc Modem rate

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the transmission rate of the current modem in use. All rates are the same in both the transmit and receive directions. |
| Values | 50<br>300<br>600<br>1200<br>2400<br>4800<br>7200<br>9600<br>12000<br>14400<br>16800<br>19200<br>21600<br>24000<br>26400<br>28800<br>31200<br>32000<br>33600<br>38400<br>43200<br>48000<br>56000<br>57600<br>64000 |
| Units | bit/s |
| Default | No default |

## ATTRIBUTE TdmaBc Modem modemAlgorithmInUse (algorithm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description

This attribute indicates the current modem algorithm(s) active for the channel. This attribute has one of the following values:
***t30***: T.30 is active. T.30 is the Group 3 fax protocol.
***v17***: V.17 is active.V.17 is an ITU-T 14400bit/s modem standard.
***v21***: V.21 is active. V.21 is an ITU-4 300bit/s modem standard.
***v22***: V.22 ia active. V.22 is an ITU-T modem standard that operates at 1200bit/s and 600 baud.
***v22bis***: V.22bis is active. V.22bis is an ITU-T modem standard that operates at 2400bit/s and 600 baud.
***v27ter***: V.27ter is active. V.27ter is an ITU-T 7200bit/s modem standard.
***v29***: V.29 is active. V.29 is an ITU-T 9600bit/s modem standard.
***v32***: V.32 is active. V.32 is an ITU-T modem standard that operates at 9600bit/s and 2400 baud.
***v32bis***: V.32bis is an ITU-T modem standard that operates at a speed of 14.4kbit/s.

## ATTRIBUTE TdmaBc Modem protocolState (state)

Access

Read: All
Write: Illegal

Description

This attribute indicates the active protocol state of the modem in use.This attribute has one of the following values:
***idle***: Modem is in an inactive state and has no current connection established.
***training***: Modem is attempting to establish a connection with the far end modem via handshaking.
***connected***: Modem has establish a connection with the far end

modem.
***releasing***: Modem has begun tearing down the connection.

Values
idle
training
connected
releasing

Default
No default

### ATTRIBUTE TdmaBc Modem mobileSideFlowControlState (mobileFlow)

Access
Read: All
Write: Illegal

Description
This attribute indicates the state of flow control based on whether flow control was requested by the mobile side of the connection and an indication was sent to an upper layer protocol. This attribute has one of the following values:
***on***: Flow control is active towards the mobile side of the call.
***off***: Flow control is not active towards the mobile side of the call.

Values
on
off

Default
No default

### ATTRIBUTE TdmaBc Modem pstnSideFlowControlState (pstnFlow)

Access
Read: All
Write: Illegal

Description
This attribute indicates the state of flow control based on whether flow control was requested by the PSTN side of the connection and an indication was sent to the Digital Signal Processor. This attribute has one of the following values:
***on***: Flow control is active towards the DSP (PSTN side of the call).
***off***: Flow control is not active towards the DSP (PSTN side of the call).

Values
on
off

Default
No default

### ATTRIBUTE TdmaBc Modem asyncMode (async)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether conversion between synchronous and asynchronous data format (specifically, the stripping or insertion of start and stop bits) is being performed. The value is ***on*** unless the V.42 layer is active or it is a fax call. This attribute has one of the following values:<br>***on***: Conversion between synchronous and asynchronous data is being performed.<br>***off***: Conversion between synchronous and asynchronous data is not being performed. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE TdmaBc Modem outbandFlowControl (outbandFlow)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether outband flow control conversions are being performed. If outband flow control is on, then when the Modem Application Layer (MAL) receives an xon or xoff from the PSTN, the MAL converts the instruction into a primitive and sends it to the Data Service Control (DSC). In the opposite direction with outband flow control on, when the MAL receives a primitive from the DSC, the MAL converts the primitive into an xon or xoff and forwards it to the PSTN. If outband flow control is off, then all flow control is handled inband. The modem performs either inband or outband flow control unless V.42 layer is active, it is a fax call, or no flow control was specified by the DMS-MTX. This attribute has one of the following values:<br>***on***: Conversion to and from out-of-band signaling is enabled.<br>***off***: Conversion to and from out-of-band signaling is disabled. |
| Values | on<br>off |
| Default | No default |

## ATTRIBUTE TdmaBc Modem outbandBreak (outbandBrk)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether inband or outband break control conversions are being performed. If outband break control is on, when the modem detects a break condition coming from the PSTN, the Modem Application Layer (MAL) converts the instruction into a primitive and forwards it to the Data Service Control (DSC). In the opposite direction with outband break control on, when the MAL receives a primitive from the DSC, the MAL converts the primitive into a break and forwards it to the PSTN. When a break condition is discovered all subsequent incoming data is discarded until a start bit is received. |
| Values | on<br>off |
| Default | No default |

## ATTRIBUTE TdmaBc Modem autobaud

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether autobaud is active.<br>The modem is instructed at call setup time by the DMS-MTX on the following:<br>(1) the initial modem data rate value, and<br>(2) whether a modem is allowed to perform autobauding (***on***) or not (***off***).<br>With autobauding on, the modem is allowed to connect using a valid modem data rate less than or equal to the initial rate specified to the modem by the DMS-MTX. If a modem cannot perform autobauding and the carrier cannot be established at the initial data rate, the modem is disabled. |
| Values | on<br>off |
| Default | No default |

## GROUP TdmaBc Modem Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure performance of the modem component for this particular *TdmaIwfBearerChannel*. |

## ATTRIBUTE TdmaBc Modem txBytes

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of payload bytes transmitted. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE TdmaBc Modem rxBytes

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of payload bytes received. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE TdmaBc Modem framingErrors (frmErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of framing errors detected by the hardware. This is the absence of a stop bit after a start bit and eight bits of data. All incoming data is discarded until the next start bit is received.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT TdmaBc Fax

| | |
|---|---|
| Groups | "GROUP TdmaBc Fax Operational (Oper)"<br>"GROUP TdmaBc Fax Statistics (Stats)" |
| Scope | Application |
| Description | *TdmaBc/<csIndex>,<bcIndex> Fax*<br>This component represents the group of measurements for the fax protocol established for a DMS-MTX IWF call (on the mobile station to IWF link or the IWF to PSTN fax modem/machine link) on this particular *TdmaIwfBearerChannel.*<br>Note that this component is present only if the current or most recent call involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP TdmaBc Fax Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes which measure the performance of the fax protocol. |

## ATTRIBUTE TdmaBc Fax activeMode (mode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the mode of the fax T.30 protocol, determined during Exchange Identification (XID) negotiations. The following modes are supported:<br>***normal***: Normal T.30 protocol, Error Correction Mode (ECM) not used.<br>***ecm***: Error Correction Mode used. Fax error correction is done using a half-duplex page selective repeat technique. |
| Values | normal<br>ecm |
| Default | No default |

## ATTRIBUTE TdmaBc Fax protocolState (state)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the protocol state of the fax adaptor. This attribute has one of the following values:<br>***setup***: Call setup state.<br>***idle***: Idle state only transmitting Synchronize (SYNC) frames.<br>***bcsRx***: Receiving Binary Coded Signal (BCS) packet from modem.<br>***bcsTx***: Transmitting BCS packet to modem.<br>***msgRx***: Receiving fax message from modem.<br>***msgTx***: Transmitting fax message to modem. |
| Values | setup<br>idle<br>bcsRx<br>bcsTx<br>msgRx<br>msgTx |
| Default | No default |

## ATTRIBUTE TdmaBc Fax messageRate (msgRate)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the fax message rate used for sending fax documents. |
| Values | Decimal (0..65000) |
| Units | bit/s |
| Default | No default |

## GROUP TdmaBc Fax Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes which measure the performance of the fax protocol. |

## ATTRIBUTE TdmaBc Fax txPagesToMobile (txPages)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | The attribute counts the number of fax pages transmitted to the mobile.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE TdmaBc Fax rxPagesFromMobile (rxPages)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of fax pages received from the mobile.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT TdmaBc DataServiceControl (Dsc)

| | |
|---|---|
| Groups | "GROUP TdmaBc Dsc Operational (Oper)"<br>"GROUP TdmaBc Dsc Statistics (Stats)" |
| Scope | Application |
| Description | *TdmaBc/<csIndex>,<bcIndex> Dsc*<br>This component represents the group of measurements for the DMS-MTX DSC Protocol established for a DMS-MTX IWF call (on the mobile station to the IWF link) on this particular *TdmaIwfBearerChannel*.<br>Note that this component is present only if the current or most recent call involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP TdmaBc Dsc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of the DSC asynchronous data service. |

## ATTRIBUTE TdmaBc Dsc p0CompressionDirection (p0)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the direction of compression requested from logical link 0 (LL0). This attribute has one of the following values:<br>***noCpmpression***: No data compression.<br>***compInitrResp***: Compression initiator to responder.<br>***compRespInitr***: compression responder to initiator.<br>***compBoth***: compression in both directions. |
| Values | noCompression<br>compInitrResp<br>compRespInitr<br>compBoth |
| Default | No default |

## ATTRIBUTE TdmaBc Dsc p1CompressionMaximumCodewords (p1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of codewords to be requested from logical link 0 (LL0) for compression. A codeword is a binary number that represents a string of characters. |
| Values | Decimal (512..65535) |
| Default | No default |

## ATTRIBUTE TdmaBc Dsc p2CompressionMaximumCharacters (p2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the maximum number of characters that can be represented by a single codeword to be requested from logical link 0 (LL0) for compression. |
| Values | Decimal (6..250) |
| Default | No default |

### GROUP TdmaBc Dsc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes that measure the performance of the DSC asynchronous data service. |

### ATTRIBUTE TdmaBc Dsc txBytes

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of data bytes relayed by DSC in the transmit direction (towards the mobile).<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc Dsc rxBytes

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of data bytes relayed by DSC in the receive direction (from the mobile).<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT TdmaBc RadioLinkProtocol1 (Rlp1)

| | |
|---|---|
| Groups | "GROUP TdmaBc Rlp1 Operational (Oper)"<br>"GROUP TdmaBc Rlp1 Statistics (Stats)" |
| Scope | Application |

Description — *TdmaBc/<csIndex>,<bcIndex> Rlp1*
This component represents the group of measurements for the Radio Link Protocol 1 (RLP1) established for a DMS-MTX IWF call (on the mobile station to IWF link) on this particular *TdmaIwfBearerChannel.*
Note that this component is present only if the current or most recent call involved this protocol.

## GROUP TdmaBc Rlp1 Operational (Oper)

Properties — Operational

Description — This group contains operational attributes that measure performance of the *TdmaIwfBearerChannel*.

## ATTRIBUTE TdmaBc Rlp1 layer3L0ReqWinSize (l3ReqW0)

Access — Read: All
Write: Illegal

Description — This attribute indicates the window size for Service Access Point (SAP) 0 requested by layer 3. The window size is the maximum number of sequentially numbered Information (I) frames that may be unacknowledged at any given time.

Values — Decimal (1..64)

Default — No default

## ATTRIBUTE TdmaBc Rlp1 layer3L1ReqWinSize (l3ReqW1)

Access — Read: All
Write: Illegal

Description — This attribute indicates the window size for Service Access Point (SAP) 1 requested by layer 3. The window size is the maximum number of sequentially numbered Information (I) frames that may be unacknowledged at any given time.

Values — Decimal (1..64)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE TdmaBc Rlp1 t1ResponseTimer (t1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current T1 timer for Service Access Points (SAP) 0 and 1 negotiated by the Radio Link Protocol 1 (RLP1), during Exchange Information (XID). This attribute specifies the time the receiving RLP1 entity shall wait for a response from the peer TIA-136-310 (formerly IS-130) application. The value used for XID negotiations can be provisioned in the *TdmaCs/* Rlp1 t1ResponseTimer* attribute. |
| Values | Decimal (5..20) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE TdmaBc Rlp1 t2LinkActivityTimer (t2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current T2 timer for Service Access Points (SAP) 0 and 1 negotiated by the Radio Link Protocol 1 (RLP1), during Exchange Information (XID). This attribute specifies the maximum time the receiving RLP1 entity shall wait for link activity. The value used for XID negotiations can be provisioned in the *TdmaCs/* Rlp1 t2LinkActivityTimer* attribute. |
| Values | Decimal (10..120) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE TdmaBc Rlp1 t3PeerAckTimer (t3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current T3 timer for Service Access Points (SAP) 0 and 1 negotiated by the Radio Link Protocol 1 |

| | |
|---|---|
| | (RLP1), during Exchange Information (XID). The attribute specifies the maximum time the receiving RLP1 entity shall wait for the peer to ACK or NAK data. The value used for XID negotiations can be provisioned in the *TdmaCs/* Rlp1 t3PeerAckTimer* attribute. |
| Values | Decimal (5..20) |
| Units | seconds |
| Default | No default |

### GROUP TdmaBc Rlp1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure performance of the *TdmaIwfBearerChannel*. |

### ATTRIBUTE TdmaBc Rlp1 txFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of valid frames transmitted to the mobile.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc Rlp1 rxFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attributes counts the number of valid frames received from the mobile.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE TdmaBc Rlp1 badRxFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute count the total number of bad RLP1 frames received from the mobile.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT TdmaBc V42

| | |
|---|---|
| Groups | "GROUP TdmaBc V42 Operational (Oper)"<br>"GROUP TdmaBc V42 Statistics (Stats)" |
| Scope | Application |
| Description | *TdmaBc/<csIndex>,<bcIndex> V42*<br>This component represents the group of measurements for the ITU-T V.42 error correcting protocol established for a DMS-MTX IWF call (on the IWF to PSTN modem link) on this particular *TdmaIwfBearerChannel.*<br>Note that this component is present only if the current or most recent call involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP TdmaBc V42 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes which measure V.42 error detection and correction performance. |

## ATTRIBUTE TdmaBc V42 protocolState (state)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the state of V.42. Valid states are:<br><br>***notActive***: The V.42 link connection with the PSTN modem is not established. None of the V.42 functions including the error detection, error correction, and flow control is provided to the data call. This is the initial state of V.42.<br>***disconnected***: This means that the V42 link is disconnected.<br>***linkSetup***: The V.42 operation enters this state from the disconnected state after the V.42 sends to the PSTN modem a Set Asynchronous Balanced Mode Extended (SABME) frame in an attempt to establish the error control connection with the PSTN modem.<br>***frameReject***: The V.42 operation enters into this state after it identifies an invalid frame sent by the peer and it sends back a frame reject (FRMR) frame to the peer.<br>***disconnectRequest***: The V.42 operation enters into this state after it sends to the peer a disconnect (DISC) frame with the attempt to disconnect the V.42 error control link.<br>***informationTransfer***: The V.42 enters into this state after it receives a UA (unnumbered acknowledgment) frame which the peer sent upon receipt of the SAMBE frame from IWF V.42. Once in this state, the V.42 can exchange data and supervisory information with its peer.<br>***waitingAck***: The V.42 enters this state after it sends polling enquiry to its peer. The V.42 sends the polling enquiry when it receives a reject frame (REJ) from its peer or either its acknowledgment timer or inactivity timer timed out on the information frames sent out. |
| Values | notActive<br>disconnected (disc)<br>linkSetup<br>frameReject (frmRej)<br>disconnectRequest (discReq)<br>informationTransfer (infoXfer)<br>waitingAck (waitAck) |
| Default | No default |

### ATTRIBUTE TdmaBc V42 txN401FrameSize (txN401)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current value of parameter N401 for V.42 which is negotiated during Exchange Information (XID). This is the maximum number of octets that can be carried in the information field of an information frame that the IWF V.42 transmits to the PSTN modem. The IWF V.42 puts this or even smaller size of data into the outgoing information frame. The value used for XID negotiations can be provisioned via *TdmaCs/* V42*. |
| Values | Decimal (0..65355) |
| Units | octets |
| Default | No default |

### ATTRIBUTE TdmaBc V42 rxN401FrameSize (rxN401)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current value of N401, that is negotiated during Exchange Identification (XID). This is the maximum number of octets that can be carried in the information field of an information frame received from the PSTN modem. An incoming information frame carrying data octets more than this size shall be rejected by the IWF V.42. The value used for XID negotiations can be provisioned via *TdmaCs/* V42*. |
| Values | Decimal (1..255) |
| Units | octets |
| Default | No default |

### ATTRIBUTE TdmaBc V42 txKWindowSize (txK)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the current value of k, that is negotiated during Exchange Identification (XID). This is the size of flow control sliding window used for the information frames that the V.42 transmits to the PSTN modem. This size governs the maximum number of information frames that the IWF V.42 error-correcting entity can have outstanding (that is, unacknowledged). The value used for XID negotiations can be provisioned via *TdmaCs/* V42*. |
| Values | Decimal (0..127) |
| Default | No default |

### ATTRIBUTE TdmaBc V42 rxKWindowSize (rxK)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current value of k that is negotiated during Exchange Identification (XID). This is the size of flow control sliding window used for information frames transmitted from the PSTN modem. This size governs the maximum number of information frames that the peer of the IWF V.42 error-correcting entity can have outstanding (that is, unacknowledged). The value used for XID negotiations can be provisioned via *TdmaCs/* V42*. |
| Values | Decimal (1..127) |
| Default | No default |

### ATTRIBUTE TdmaBc V42 v42ActiveInCall

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether V42 is really being used in this data call. |
| Values | notActiveInCall<br>activeInCall |
| Default | notActiveInCall |

### ATTRIBUTE TdmaBc V42 v42BisActiveInCall

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether V42bis is really being used in this data call. |
| Values | notActiveInCall<br>activeInCall |
| Default | notActiveInCall |

### GROUP TdmaBc V42 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes that measure the V.42 error detection and correction performance. |

### ATTRIBUTE TdmaBc V42 rxIBytes

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of bytes that the V.42 actually received from the PSTN modem in a data call.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Units | octets |
| Default | 0 |

### ATTRIBUTE TdmaBc V42 txIBytes

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of bytes that the V.42 transmitted to the PSTN modem in a data call.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Units | octets |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE TdmaBc V42 rxIFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of Information (I) frames that the V.42 received from the PSTN modem in a data call.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc V42 txIFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of information frames that the V.42 transmitted to the PSTN modem in a data call.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc V42 retransmittedFrames (retransFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of frames retransmitted by the IWF V.42 entity in a data call. The V.42 retransmits the same frame when the associated T401 acknowledgment timer timeouts or when a Reject (REJ) supervisory frame has been received from the PSTN modem.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc V42 t1AckTimeouts (t1Timeout)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times that the T401 timer has timed out within a data call. If this timer times-out frequently, the operator may need to adjust the provisioned parameter T401 acknowledgment timer to a larger time amount, since every time that V.42 sends out a frame it sets the T401 timer to wait for the peer's acknowledgment of the frame. When the timer times-out and no acknowledgment has been received, the V.42 sends the same frame to its peer.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc V42 remoteBusyIndications (remoteBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times the PSTN modem enters a busy state (the IWF has received a Receive Not Ready message) and asks the IWF V.42 not to send Information (I) frames to it until it is ready to receive information frames again (indicated by receipt of a Receive Ready message or a data message).<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc V42 localBusyIndications (localBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times the IWF V.42 enters in a busy condition and asks the peer to stop sending information frames until it has cleared up from the busy condition. The V.42 enters busy condition when its data buffer is |

about to be overflowed by the incoming Information (I) frames. The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE TdmaBc V42 badFramesRx (badFrmRx)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of bad frames the IWF V.42 has received from the PSTN remote modem within the data call. In this instance, “bad frames” refer to the V.42 protocol error frames other than the check sequence error frames.
The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE TdmaBc V42 crcErrorsRx (crcErrRx)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of frames received from the remote PSTN modem that contain incorrect frame check sequence. A high value signifies the condition of the physical medium is poor.
The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: 0

### COMPONENT TdmaBc V42Bis

Groups: "GROUP TdmaBc V42Bis Operational (Oper)"
"GROUP TdmaBc V42Bis Statistics (Stats)"

Scope: Application

Description: *TdmaBc/<csIndex>,<bcIndex> V42bis*
This component represents the group of measurements for the

ITU-T V.42bis data compression protocol established for an IWF call (on the mobile station to the IWF link or the IWF to PSTN fax modem link) on this particular *TdmaIwfBearerChannel*. Note that this component is present only if the current or most recent call involved this protocol.

## GROUP TdmaBc V42Bis Operational (Oper)

Properties: Operational

Description: This group contains operational attributes that measure the performance of *IwfV42bis*.

## ATTRIBUTE TdmaBc V42Bis protocolModeEncoder (modeEncoder)

Access: Read: All
Write: Illegal

Description: This attribute indicates the current mode of the *IwfV42bis* encoder. This mode can be either:
***transparent***: A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences may be inserted into the data stream.
***compressed***: A mode of operation in which data is transmitted in codewords.
The encoder switches between the two modes depending on whether the data coming from the Date Terminal Equipment (DTE) is suitable for compression. The data compression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.

Values: transparent
compressed

Default: No default

### ATTRIBUTE TdmaBc V42Bis protocolModeDecoder (modeDecoder)

Access
Read: All
Write: Illegal

Description
This attribute indicates the current mode of the V.42bis decoder. This mode can be either:
***transparent***: A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences may be inserted into the data stream.
***compressed***: A mode of operation in which data is transmitted in codewords.
The encoder (at the mobile or PSTN) switches between the two modes depending on whether the data coming from the Date Terminal Equipment (DTE) is suitable for compression. The data compression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.

Values
transparent
compressed

Default
No default

### ATTRIBUTE TdmaBc V42Bis p0CompressionDirection (p0)

Access
Read: All
Write: Illegal

Description
This attribute indicates the direction in which V.42bis is active, negotiated at link setup by the data link protocol through Exchange Identification (XID) negotiation of parameter P0 (compression direction). The value used for XID negotiations can be provisioned via *TdmaCs/* V42bis*. This attribute has one of the following values:
***noCompression***: No data compression.
***compInitrResp***: The data sent by the IWF to the other entity is compressed.
***compRespInitr***: The data received by the IWF from the other entity is compressed.
***compBoth***: compression in both directions.

| | |
|---|---|
| Values | noCompression<br>compInitrResp<br>compRespInitr<br>compBoth |
| Default | No default |

### ATTRIBUTE TdmaBc V42Bis p1MaximumCodewords (p1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of codewords in the dictionary negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P1 (number of codewords). The value used for XID negotiations can be provisioned via *TdmaCs/* V42bis*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE TdmaBc V42Bis p2MaximumStringSize (p2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of characters allowed in a string represented by a codeword negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P2 (maximum string size). The value used for XID negotiations can be provisioned via *TdmaCs/* V42bis.* |
| Values | Decimal (6..250) |
| Default | No default |

### ATTRIBUTE TdmaBc V42Bis lastDecodeError (lastDecodeErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates last error found by the decoder. This attribute has one of the following values: |

***none***: No errors found.
***badStepup***: Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size).
***codewordEqC1***: Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry).
***emptyCodeword***: Receipt of a codeword representing an empty dictionary entry.
***reservedCommand***: Receipt of a reserved command code.
***generalError***: Receipt of any other error.
The action taken by V.42bis on detecting an error is provisioned via *TdmaCs/* V42bis*.

Values
none
badStepup
codewordEqC1
emptyCodeword
rsvdCommand
generalError

Default
none

## ATTRIBUTE TdmaBc V42Bis compRatioEncoder

Access
Read: All
Write: Illegal

Description
This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the compression ratio achieved by the V.42bis encoder running on the Passport. This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes.

Values
Decimal (0.00..300.00)

Default
No default

## ATTRIBUTE TdmaBc V42Bis compRatioDecoder

Access
Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the compression ratio achieved by the V.42bis encoder at the mobile or PSTN. This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes. |
| Values | Decimal (0.00..300.00) |
| Default | No default |

### GROUP TdmaBc V42Bis Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes that measure the performance of *IwfV42bis*. |

### ATTRIBUTE TdmaBc V42Bis modeChangesEncode (modeChgEncode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of mode changes (from transparent to compressed or from compressed to transparent) by the encoder.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc V42Bis modeChangesDecode (modeChgDecode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of mode changes (from transparent to compressed or from compressed to transparent) by the decoder. The mode changes are determined by the encoder at the mobile or the PSTN.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE TdmaBc V42Bis resetsEncode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of resets sent by the encoder. A reset is a command code sent by the encoder to force dictionary reinitialization.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc V42Bis resetsDecode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of resets received by the decoder. A reset is a command code sent by the encoder to force dictionary reinitialization. The resets of the decoder are determined by the encoder at the mobile or PSTN.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc V42Bis reinitializations (reInit)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times V.42bis is reinitialized because of a destructive break (a destructive break is a break that causes data to be discarded) occurring on the error-corrected connection initiated by either the mobile or PSTN.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE TdmaBc V42Bis errorsInDecode (errDecode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of errors found by the decoder. The errors could be any of the following:<br>1.Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size).<br>2. Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry).<br>3. Receipt of a codeword representing an empty dictionary entry.<br>4. Receipt of a reserved command code.<br>5. Receipt of any other error.<br>The counter wraps when it exceeds the maximum value.<br>The action taken by V.42bis on detecting any of these errors is provisioned via *TdmaCs/* V42bis.* |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT TdmaBc UpperRelay (Ur)

| | |
|---|---|
| Groups | "GROUP TdmaBc Ur Operational (Oper)"<br>"GROUP TdmaBc Ur Statistics (Stats)" |
| Scope | Application |
| Description | *TdmaBc/<csIndex>,<bcIndex> UpperRelay*<br>This component represents the group of measurements for the Upper Relay function established for each half of a DMS-MTX IWF asynchronous data or fax call (internally between the two *TdmaIwfBearerChannel*s involved in a call) from this particular *TdmaIwfBearerChannel* perspective. |
| Common Verbs | Help<br>List<br>Display |

## GROUP TdmaBc Ur Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of the *UpperRelay.* |

## ATTRIBUTE TdmaBc Ur rxBufferSize

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the size of the receive flow control buffer. This attribute may be viewed via *TdmaBc/*,*,*,* UpperRelay*. |
| Values | Decimal (0..65535) |
| Default | No default |

## ATTRIBUTE TdmaBc Ur txFlowControlState (txFlowControl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the transmit flow control is active or not. This attribute has one of the following values:<br>***active***: The transmit flow control is active.<br>***inactive***: The transmit flow control is inactive.<br>This attribute may be viewed via *TdmaBc/*,*,*,* UpperRelay*. |
| Values | active<br>inactive |
| Default | No default |

## ATTRIBUTE TdmaBc Ur rxFlowControlState (rxFlowControl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the receive flow control is active or not. This attribute has one of the following values:<br>***active***: The receive flow control is active.<br>***inactive***: The receive flow control is inactive.<br>This attribute may be viewed via *TdmaBc/*,*,*,* UpperRelay*. |

| | |
|---|---|
| Values | active<br>inactive |
| Default | No default |

### GROUP TdmaBc Ur Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of the *UpperRelay*. |

### ATTRIBUTE TdmaBc Ur txFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames that are sent in the transmit direction. The counter wraps when it exceeds the maximum value.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc Ur rxFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames that are sent in the receive direction.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc Ur unacknowledgedFrames (unackFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the current number of frames sent that have not been acknowledged for this instance of the UpperRelay. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE TdmaBc Ur cumUnacknowledgedFrames (cUnackFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute is the total number of unacknowledged frames for this instance of the UpperRelay. It is not reset when a new call starts. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## GROUP TdmaCs ServiceProvisioned (ServProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the necessary timers for call setup and call clearing scenarios on the IWF. |

## ATTRIBUTE TdmaCs tIwf1

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This is an internal timer to the call server of the IWF and is used during call setup for ensuring the MIT protocol stack and the NIT modem for a new call have been allocated and initialized. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE TdmaCs tIwf2

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This is an internal timer to the call server of the IWF and is used during call clearing for ensuring the MIT protocol stack and NIT modem for a call have been deallocated correctly. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE TdmaCs t303

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This timer is a call setup timer and is used for ensuring a CallProceeding message is received for a Setup message that has been sent by the IWF to the MTX. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE TdmaCs t305

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This timer is a call clearing timer and is used for ensuring a Release message is received for a Disconnect message the IWF has sent to the MTX. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 30 |

## ATTRIBUTE TdmaCs t308

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This timer is a call clearing timer and is used for ensuring a ReleaseComplete message is received for the Release message the IWF has sent to the MTX. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 4 |

## ATTRIBUTE TdmaCs t313

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This is a call setup timer and is used for ensuring a ConnectAck message is received in response for the Connect message the IWF has sent to the MTX. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 4 |

## ATTRIBUTE TdmaCs t999

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This timer is used during a mobile termination call setup and is used for ensuring the Setup message is received from the MTX. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 300 |

### ATTRIBUTE TdmaCs supportedTechnology

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This attribute specifies the wireless technology that is supported for data calls on this IWF. |
| Values | tdmaOnly<br>cdmaOnly<br>tdmaAndCdma |
| Default | tdmaOnly |

### ATTRIBUTE TdmaCs supportedService

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This attribute specifies the type(s) of data calls this IWF supports. |
| Values | asyncDataOnly<br>g3FaxOnly<br>analogFaxOnly<br>packetOnly<br>asyncDataAndG3Fax<br>asyncDataAndAnalogFax<br>asyncDataAndPacket<br>asyncDataG3FaxAndPacket<br>asyncDataAFaxAndPacket |
| Default | asyncDataOnly |

### GROUP TdmaCs MiscProvisioned (MiscProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains general provisioning data for the *TdmaIwfCallServer* that does not fit within other provisioning groups. |

### ATTRIBUTE TdmaCs commentText

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | Use of this attribute is at the discretion of the system administrator. Typically, this attribute is used to specify the name of the DMS-MTX configured for this *TdmaIwfCallServer* plus any other commentary information. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE TdmaCs mtxIpAddress (ipAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This attribute specifies the Internet Protocol (IP) Address of the Mobile Telephone Exchange (MTX) that is permitted to set up MTX InterWorking Function (IWF) data calls using this *TdmaIwfCallServer*. This address must be specified in order for this *TdmaIwfCallServer* to provide service.<br>If call setups are attempted from an MSC which does not have this address, those calls are rejected. The *callsRequested* statistic of this *TdmaIwfCallServer* is incremented and appropriate call failure logs are generated at the MSC. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE TdmaCs virtualRouterName (vr)

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Criticality | Component |
| Description | This attribute specifies the virtual router that this *TdmaIwfCallServer* uses for transmitting and receiving signaling messages to and from the DMS-MTX. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE TdmaCs voiceLaw (encoding)

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This attribute specifies the voice law to be established for the IWF to PSTN modem link for calls established by this *TdmaIwfCallServer*. This attribute has one of the following values:<br>***aLaw***: A protocol for encoding voice-band audio, Pulse Code Modulation (PCM).<br>***muLaw***: A protocol for encoding voice-band audio, PCM. Note that this value must match the voice law used at the DMS-MTX connected to this *TdmaIwfCallServer*. |
| Values | aLaw<br>muLaw |
| Default | No default |

### GROUP TdmaCs CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE TdmaCs customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. |

An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP TdmaCs OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE TdmaCs adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE TdmaCs operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE TdmaCs usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP TdmaCs Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance used for the calls set up by this particular *TdmaIwfCallServer.* |

### ATTRIBUTE TdmaCs currentCalls (currCall)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of active calls currently serviced by this particular *TdmaIwfCallServer.* |
| Values | Decimal (0..2047) |
| Default | 0 |

### ATTRIBUTE TdmaCs callsRequested (callsReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IWF call setup requests received at this particular *TdmaIwfCallServer* from the DMS-MTX. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE TdmaCs callsSetup (callsSet)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IWF calls successfully setup by this particular *TdmaIwfCallServer.* A call is considered setup |

| | |
|---|---|
| | when the IWF-Setup-Request message is received, indicating a request for a data communications service, and the IWF has successfully allocated the necessary resources to fulfill the request. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE TdmaCs callsReleasedNormal (callsRlsdNor)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IWF calls that have completed successfully on this particular *TdmaIwfCallServer.* The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE TdmaCs callsReleasedAbnormal (callsRlsdAbnor)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IWF calls that have been released due to error conditions at this particular *TdmaIwfCallServer* or one if its *TdmaIwfBearerChannel*(s). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE TdmaCs erroredLFrames (errLFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of CM/IWF Control Interface (CCI) messages received from the DMS-MTX that have an incorrect format. The counter wraps when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT TdmaCs Modem

| | |
|---|---|
| Scope | Application |
| Description | *TdmaCs/<csIndex> Modem/<modem-type>*<br>This component represents an instance of a particular modem type that enables support of the various modem protocols on the DMS-MTX IWF. |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT TdmaCs Fax

| | |
|---|---|
| Scope | Application |
| Description | *TdmaCs/<csIndex> Fax*<br>This component represents an instance of fax attributes. These specify various default settings for aspects of the fax protocol, which may be used for a DMS-MTX IWF call. |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT TdmaCs DataCircuitTerminatingEquipment (Dce)

| | |
|---|---|
| Scope | Application |
| Description | TdmaCs/<csIndex> Dce<br>This component represents an instance of the Data Circuit-Terminating Equipment (DCE). The DCE represents a layer of the protocol stack for the network-side connection to the Public Switched Telephone Network. It is responsible for call control, AT-command handling, user-data transport, online-command signaling, break signaling, circuit/signal lead transport, and |

compression negotiation. The DCE is based on the BMI (BSC, MSC, IWF) portion of the IS-135 standard.

## GROUP TdmaCs Dsc Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes for Data Service Control Asynchronous Data Service portion of the wireless protocol stack used for the calls set up by this particular *TdmaIwfCallServer.*

## ATTRIBUTE TdmaCs Dsc k0LI0WindowSize (k0)

Access Read: All
Write: Service

Description This attribute specifies the maximum size of the DSC logical link 0 window.

| | |
|---|---|
| Values | Decimal (1..64) |
| Default | 64 |

### ATTRIBUTE TdmaCs Dsc k1Ll1WindowSize (k1)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum size of the DSC logical link 1 window. |
| Values | Decimal (1..64) |
| Default | 64 |

### COMPONENT TdmaCs RadioLinkProtocol1 (Rlp1)

| | |
|---|---|
| Instance | halfRate (half)<br>fullRate (full)<br>doubleRate (double)<br>tripleRate (triple) |
| Groups | "GROUP TdmaCs Rlp1 Provisioned (Prov)" |
| Scope | Application |
| Description | *TdmaCs/<csIndex> Rlp1/<radio-channel-type>*<br>This component represents an instance of Radio Link Protocol 1 (RLP1), indexed by radio channel type. Valid radio channel types are:<br><br>***halfRate***, Half rate channel.<br>***fullRate***, Full rate channel.<br>***doubleRate***, Double rate channel.<br>***tripleRate***, Triple rate channel.<br><br>Many RLP1 attributes are dependent on the frame rate and frame size, that is dictated by the radio channel type. When a *TdmaIwfCallServer* is added, a *RadioLinkProtocol1* instance is added automatically for each possible instance value. The attributes are set to default values, dependent on the radio channel type of the component instance. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add |

## GROUP TdmaCs Rlp1 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the Radio Link Protocol 1 (RLP1) parameters used for the calls set up by this particular *TdmaIwfCallServer*. Changes to these attributes do not affect existing calls. |

## ATTRIBUTE TdmaCs Rlp1 t1ResponseTimer (t1)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the time the receiving Radio Link Protocol (RLP1) entity shall wait for a response from the peer TIA-136-310 (formerly IS-130) application.<br>During the Exchange Information (XID) negotiation, both RLP1 entities (mobile station and IWF) can agree to use a specific value for this timer (T1). The IWF attempts to negotiate to the value specified by this attribute.<br>Changes to this attribute do not affect existing calls. |
| Values | Decimal (5..20) |
| Units | seconds |
| Default | 5 |

## ATTRIBUTE TdmaCs Rlp1 t2LinkActivityTimer (t2)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum time the receiving Radio Link Protocol (RLP1) entity shall wait for link activity. |

| | |
|---|---|
| | During the Exchange Information (XID) negotiation, both RLP1 entities (mobile station and IWF) can agree to use a specific value for this timer (T2). The IWF attempts to negotiate to the value specified by this attribute.<br>Changes to this attribute do not affect existing calls. |
| Values | Decimal (10..120) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE TdmaCs Rlp1 t3PeerAckTimer (t3)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum time the receiving Radio Link Protocol (RLP1) entity shall wait for the peer to ACK or NAK data.<br>During the Exchange Information (XID) negotiation, both RLP1 entities (mobile station and IWF) can agree to use a specific value for this timer (T3). The IWF attempts to negotiate to the value specified by this attribute.<br>Changes to this attribute do not affect existing calls. |
| Values | Decimal (5..20) |
| Units | seconds |
| Default | 5 |

### COMPONENT TdmaCs V42

| | |
|---|---|
| Groups | "GROUP TdmaCs V42 Provisioned (Prov)" |
| Scope | Application |
| Description | *TdmaCs/<csIndex> V42*<br>This component represents an instance of ITU-T V.42 error correcting data link protocol. Its attributes specify various default settings for aspects of the V.42 protocol, that may be used for an IWF call for the IWF to PSTN modem link. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP TdmaCs V42 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the V.42 protocol used for the calls set up by this particular *IwfCallServer*. Changes to these attributes do not affect existing calls. |

## ATTRIBUTE TdmaCs V42 t400DetectTimer (t400)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum amount of time that the IWF waits for an Originator Detection Pattern (ODP) or Answerer Detection Pattern (ADP). ODP/ADP is a series of special bit patterns used during the call setup procedures.<br>If the IWF is the originator of the call, it starts sending ODP patterns and waits for an ADP for the duration of T400 from the answerer at call setup time.<br>If the IWF is the answerer of the call, it waits for an ODP for T400 seconds from the originator and if it receives during that time it sends an ADP pattern to the originator at the call setup time. Since both sides operate with different values of T400 timer, a higher value increases the chance of a successful call setup.<br>Changes to this attribute do not affect existing calls. |
| Values | Decimal (0.75..2.54) |
| Units | seconds |
| Default | 0.75 |

## ATTRIBUTE TdmaCs V42 t401AckTimer (t401)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum amount of time that the IWF waits for an acknowledgment before retransmitting a frame. Since information about the T401 timer is not carried in the Exchange Identification (XID) negotiations at call setup time, both sides operate with different timer values. The value for T401 depends on many factors, such as propagation delay or frame processing time. A frame is retransmitted up to N400 times if the timer T401 expires before an acknowledgment for a frame is actually received. The performance of the data link layer can be impacted by the value of this timer as retransmissions of frames occur on expiry of timer T401.<br>Changes to this attribute do not affect existing calls. |
| Values | Decimal (0.50..9.00) |
| Units | seconds |
| Default | 4.00 |

## ATTRIBUTE TdmaCs V42 t402AckDelayTimer (t402)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum amount of time that the IWF may wait following the receipt of any frame requiring a reply before it initiates transmission of an appropriate reply in order to ensure that the reply frame is received by the remote error-correcting entity prior to expiration of the T401 timer of the remote error-correcting entity. Since information about the T402 timer is not carried in the Exchange Identification (XID) negotiations at call setup, both sides operate with different timer values. If this timer expires, then the reply that would have been returned prior to its expiration is not sent. The performance of the data link layer can be impacted by the value of this timer as retransmissions of frames occur on expiry of timer T401. For better performance, a value of *t402AckDelayTimer* (T402) equal |

to half the value of *t401AckTimer* (T401) is recommended. Changes to this attribute do not affect existing calls.

Values: Decimal (0.25..4.50)

Units: seconds

Default: 2.00

### ATTRIBUTE TdmaCs V42 t403IdleProbeTimer (t403)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum amount of time that the IWF allows to elapse without frames being exchanged. The link is permitted to remain idle with no frames being exchanged on the data link. Upon expiry of this timer, the IWF polls its peer for status. Since information about the T403 timer is not carried in the Exchange Identification (XID) negotiations at call setup time, both sides operate with different timer values.
Changes to this attribute do not affect existing calls.

Values: Decimal (30..90)

Units: seconds

Default: 60

### ATTRIBUTE TdmaCs V42 txN401FrameSize (txN401)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum number of octets that can be carried in the information field of an Information (I) frame, Exchange Identification (XID) frame, and a Unnumbered Information (UI) frame from the IWF to the remote entity. The default value is 128 octets, and no XID negotiations required for *txN401FrameSize*. If the value for *txN401FrameSize* value is set to other than 128 octets, then XID frames are exchanged to negotiate a value. The value provided for *txN401FrameSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 128 is specified, then the IWF negotiates or

attempts to negotiate a value between the 128 (as a minimum) and the given value (as a maximum). If a value less than 128 is specified, then the IWF attempts to negotiate a value between the given value (as a minimum) and 128 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to 128 is recommended. Changes to this attribute do not affect existing calls.

Values: Decimal (1..255)

Units: octets

Default: 128

### ATTRIBUTE TdmaCs V42 rxN401FrameSize (rxN401)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum number of octets that can be carried in the information field of an Information (I) frame, Exchange Identification (XID) frame, and a Unnumbered Information (UI) frame from the remote entity to the IWF. The default value is 128 octets, and no XID negotiations are required for *rxN401FrameSize*. If the value set for *rxN401FrameSize* is other than 128, XID frames are exchanged to negotiate a value. The value provided for *rxN401FrameSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 128 is specified, then the IWF attempts to negotiate for a value between 128 (as a minimum) and the given value (as a maximum). If a value less than 128 value is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 128 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to the default is recommended.
Changes to this attribute do not affect existing calls.

Values: Decimal (1..255)

Units: octets

Default: 128

### ATTRIBUTE TdmaCs V42 txKWindowSize (txK)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the IWF to the remote entity. The default value is 15 frames, and if this value is used then no Exchange Identification (XID) negotiations are required for *txKWindowSize*. If the value set for *txKWindowSize* is other than 15, then XID frames are exchanged to negotiate a value. The value provided for *txKWindowSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 15 is specified, then the IWF attempts to negotiate a value between 15 (as a minimum) and the given value (as a maximum). If a value less than 15 is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 15 (as a maximum). Any value can be specified as long at it is within the provisionable limits. However, a value equal to or close to the default is recommended.<br>Changes to this attribute do not affect existing calls. |
| Values | Decimal (1..255) |
| Default | 15 |

### ATTRIBUTE TdmaCs V42 rxKWindowSize (rxK)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the remote entity to the IWF. The default value is 15 frames, and if this value is used then no Exchange Identification (XID) negotiations are required for *rxKWindowSize*. If the value set for rxKWindowSize is other than 15, then XID frames are exchanged to negotiate a value. The value provided for *rxKWindowSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 15 is specified, then the IWF attempts to negotiate a value between 15 (as a minimum) and the given value |

(as a maximum). If a value less than 15 is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 15 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to the default is recommended.
Changes to this attribute do not affect existing calls.

Values: Decimal (1..255)

Default: 15

### ATTRIBUTE TdmaCs V42 n400RetransLimit (n400)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum number of times the IWF retransmits a frame upon expiry of *t401AckTimer* before appropriate recovery action is taken. Information about N400 (Retransmission Limit) is not carried in the Exchange Identification (XID) negotiation at call setup time so both sides operate with different N400 values.
Changes to this attribute do not affect existing calls.

Values: Decimal (0..255)

Default: 1

### ATTRIBUTE TdmaCs V42 fcsLength

Access: Read: All
Write: Service

Description: This attribute specifies whether a 16 bit or a 32 bit Frame Check Sequence (FCS) will be used for the link between the IWF and the far end DCE. This attribute has one of the following values:
***fcs16***: Use only a 16 bit FCS.
***fcs32Or16***: 32 bit FCS is preferred; Use a 16 bit FCS if needed.
***fcs32Only***: Use only a 32 it FCS; If unavailable, drop the connection.

Values: fcs16
fcs32Or16
fcs32

| | |
|---|---|
| Default | fcs32Or16 |

## COMPONENT TdmaCs V42Bis

| | |
|---|---|
| Groups | "GROUP TdmaCs V42Bis Provisioned (Prov)" |
| Scope | Application |
| Description | *TdmaCs/<csIndex> V42bis*<br>This component represents an instance of ITU-T V.42bis data compression protocol. Its attributes specify various default settings for aspects of the V.42bis protocol, which may be used in an IWF call on the mobile station to IWF link or the IWF to PSTN modem link or both. |
| Common Verbs | Help<br>List<br>Display |

## GROUP TdmaCs V42Bis Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the V.42bis data compression protocol parameters used for the calls set up by this particular CallServer. Changes to these attributes do not affect existing calls. |

## ATTRIBUTE TdmaCs V42Bis p0CompressionDirection (p0)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the V.42bis data compression direction to be supported. The value for compression direction is negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P0 (compression direction).<br>During XID negotiation of parameter P0, both sides (IWF and mobile or IWF and PSTN) agree on the compression direction. This attribute has one of the following values:<br>***noCompression***: No compression is present.<br>***compInitrResp***: The data sent by the IWF to the other entity is |

compressed.
***compRespInitr***: The data received by the IWF from the other entity is compressed.
***compBoth***: The data sent and received by the IWF is compressed.
Changes to this attribute do not affect existing calls.

Values
noCompression
compInitrResp
compRespInitr
compBoth

Default
compBoth

### ATTRIBUTE TdmaCs V42Bis p1MaximumCodewords (p1)

Access
Read: All
Write: Service

Description
This attribute specifies the maximum number of V.42bis codewords the IWF supports. A codeword is a binary number that represents a string of characters in compressed form. V.42bis keeps a dictionary of codewords for each compression direction. Changes to this attribute impact the compression ratio for the encoder (component *TdmaBc V42Bis* attribute *compRatioEncoder*). Changes also impact the amount of memory used (more memory is used when increasing the attribute). The gain in performance obtained from the selection of a larger dictionary may be offset by the larger codeword size needed, and for certain types of data, better performance may be obtained by using a smaller dictionary.
Changes to this attribute do not affect existing calls.

Values
Decimal (512..4096)

Default
512

### ATTRIBUTE TdmaCs V42Bis p2MaximumStringSize (p2)

Access
Read: All
Write: Service

Description
This attribute specifies the maximum number of characters allowed in a string represented by a codeword that the IWF supports. Each codeword in a V.42bis dictionary represents a

string of characters. Changes to this attribute impact the compression ratio for the encoder.
Changes to this attribute do not affect existing calls.

Values: Decimal (6..250)

Default: 6

### ATTRIBUTE TdmaCs V42Bis actionOnError (actOnErr)

Access: Read: All
Write: Service

Description: This attribute specifies whether or not V.42bis takes down the call or resets the link when any of the following errors occur:
1.Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size).
2. Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry).
3. Receipt of a codeword representing an empty dictionary entry.
4. Receipt of a reserved command code.
5. Receipt of any other error.
If the value is ***resetLink***, the error corrected connection and V.42bis dictionaries are reset. Some data is lost but the call continues. If the value is ***takeDownCall***, the call is taken down.
Changes to this attribute do not affect existing calls.

Values: resetLink
takeDownCall

Default: resetLink

### COMPONENT TdmaCs LogicalProcessor (Lp)

Instance: Decimal (0..15)

Groups: "GROUP TdmaCs Lp Operational (Oper)"

Scope: Application

Description: *TdmaCs/<csIndex> Lp/n*
The *TdmaIwfLogicalProcessor* component represents an instance of a *TdmaIwfLogicalProcessor* that may be linked to this *TdmaIwfCallServer*. A *TdmaIwfBearerChannel* is indirectly

linked to this *TdmaIwfLogicalProcessor* by way of the *TdmaIwfFramer* component. This component must be added to the *TdmaIwfCallServer* (and the change activated) prior to adding the *TdmaIwfBearerChannel*(s). This component can only be provisioned for one *TdmaIwfCallServer.*

## GROUP TdmaCs Lp Operational (Oper)

Properties: Operational

Description: This group contains operational attributes pertaining to information about *TdmaIwfBearerChannels* and *TdmaIwfLogicalProcessor* associated with a *TdmaIwfCallServer* from a high-level view.

## ATTRIBUTE TdmaCs Lp configuredBearerChannels (configBc)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of *TdmaIwfBearerChannel* components provisioned for the *TdmaIwfLogicalProcessor* represented by this component.

Values: Decimal (0..124)

Default: No default

## ATTRIBUTE TdmaCs Lp activeCalls (actCalls)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of calls currently active on this *LogicalProcessor*.

Values: Decimal (0..124)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE TdmaCs Lp modemsSupported (modemSup)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates if modems are supported with this *TdmaIwfLogicalProcessor*. This attribute has one of the following values:<br>***yes***: Modems are supported with this *TdmaIwfLogicalProcessor*.<br>***no***: Modems are not supported with this *TdmaIwfLogicalProcessor*. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE TdmaCs Lp fastConnectSupported (fcSup)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates if the FastConnect functionality is supported with this *TdmaIwfLogicalProcessor*. This attribute has one of the following values:<br>***yes***: FastConnect is supported with this *TdmaIwfLogicalProcessor*.<br>***no***: FastConnect is not supported with this *TdmaIwfLogicalProcessor*. |
| Values | yes<br>no |
| Default | No default |

### COMPONENT TdmaCs FastConnect (Fc)

| | |
|---|---|
| Groups | "GROUP TdmaCs Fc FcStatistics (FcStats)"<br>"GROUP TdmaCs Fc FcProvisioning (FcProv)" |
| Scope | Application |

| | |
|---|---|
| Description | *TdmaCs/<csIndex> FastConnect*<br>This component represents the TDMA IWF FastConnect functionality for this particular *TdmaIwfCallServer*. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP TdmaCs Fc FcStatistics (FcStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure data about FastConnect calls set up by this particular *TdmaIwfCallServer.* |

## ATTRIBUTE TdmaCs Fc currentCalls (currCall)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the active FastConnect calls currently serviced by this particular *TdmaIwfCallServer.* |
| Values | Decimal (0..2047) |
| Default | 0 |

## ATTRIBUTE TdmaCs Fc callsRequested (callsReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IWF FastConnect call setup requests received at this particular *TdmaIwfCallServer* from the DMS-MTX. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE TdmaCs Fc callsSetUp (callsSet)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IWF FastConnect calls successfully set up by this particular *TdmaIwfCallServer*. A call is considered set up when the IWF-Setup-Request message is received, indicating a request for a data communications service, and the IWF has successfully allocated the necessary resources to fulfill the request. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE TdmaCs Fc callsReleasedNormal (callsRlsdNor)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IWF FastConnect calls that have completed successfully on this particular *TdmaIwfCallServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE TdmaCs Fc callsReleasedAbnormal (callsRlsdAbnor)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IWF FastConnect calls that have been released due to error conditions at this particular *TdmaIwfCallServer* or one if its *TdmaIwfBearerChannel*s. The MTX logs can indicate reasons for abnormal call releases. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## GROUP TdmaCs Fc FcProvisioning (FcProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the TDMA IWF FastConnect feature. |

## ATTRIBUTE TdmaCs Fc fastConnectAccessCode (fcAc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the digits that must be dialed at the mobile for this call to be identified as a FastConnect call. The dialed digits are used to identify a FastConnect call if the mobile does not support the Direct Async Data Service (DADS) service code. Up to ten access codes can be provisioned. |
| List of | BCD (1..15) |
| List Size | 10 |
| Default | No default |

## GROUP TdmaFcBc Provision (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *TdmaIwfFcBearerChannel* component. |

## ATTRIBUTE TdmaFcBc linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the link to the Logical Processor that this *TdmaIwfFcBearerChannel* is to use. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

## GROUP TdmaFcBc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes concerning the operation of this particular *TdmaIwfBearerChannel* for the current or most recent call. |

## ATTRIBUTE TdmaFcBc state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description

This attribute indicates the current state of the MSC/IWF Interface Protocol (MIP) Message Router (MMR) for an IWF element. This attribute has one of the following values:
***idle***: Startup state of IWF element.
***setup***: This call half is being set up.
***active***: This call half has been connected by both the MTX and IWF and is active.
***releas***e: This call half is being released.

Values

idle
setup
active
release

Default

No default

## ATTRIBUTE TdmaFcBc callType

Access

Read: All
Write: Illegal

Description

This attribute indicates the current call type. This attribute has one of the following values:
***analogSpeech***: Analog speech calls.
***digitalSpeech***: Digital speech calls.
***analogPrefSpeech***: Analog preferred speech calls.
***digitalPrefSpeech***: Digital preferred speech calls.
***asyncData***: Asynchronous data service calls.
***g3Fax***: Group 3 fax calls.
***rejected***: Rejected calls.
***stuIII***: STU III calls.
***notUsedYet***: Bearer Channel has not been used in a call yet.
***directAsyncData***: FastConnect or Direct Async Data Service (DADS) calls.

Values

analogSpeech
digitalSpeech
analogPrefSpeech
digitalPrefSpeech
asyncData
g3Fax
rejected

stuIII
notUsedYet
directAsyncData

Default: No default

## ATTRIBUTE TdmaFcBc lastResponseCode (respCode)

Access: Read: All
Write: Illegal

Description: This attribute indicates the MSC/IWF Interface Protocol (MIP) Message Router (MMR) response code returned for the last call which was active on this particular *TdmaIwfBearerChannel*. This attribute has one of the following values:
***noCause***: No cause available.
***unassignedNumber***: Unallocated or unassigned number.
***noRouteToDest***: No route to destination.
***normalClearing***: The call was terminated normally.
***userBusy***: User busy.
***noResponse***: No carrier.
***userNoAnswer***: No answer from user.
***invalidNumberFormat***: Translation or routing problem.
***unspecNormal***: Normal, unspecified.
***temporaryFailure***: Temporary failure.
***channelUnavailable***: Channel unavailable.
***resourceUnavailable***: Resources unavailable to handle call.
***qosUnavailabled***: Specified rate of call unavailable.
***serviceUnavailable***: Service not implemented.
***unimplementedOption***: Option not implemented.
***invalidCallRefValue***: Invalid call reference value.
***invalidChannel***: Identified channel does not exist.
***unspecInvalidMessage***: Invalid message, unspecified.
***missingMandatoryIe***: Missing mandatory information element.
***invalidMessageType***: Message type not implemented.
***incompatibleMessage***: Message not compatible with call state.
***timerRecovery***: Recovery on timer expiration.
***protocolError***: Protocol error, unspecified.

Values: noCause
unassignedNumber

noRouteToDest
normalClearing
userBusy
noResponse
userNoAnswer
invalidNumberFormat
unspecNormal
temporaryFailure
channelUnavailable
resourceUnavailable
qosUnavailable
serviceUnavailable
unimplementedOption
invalidCallRefValue
invalidChannel
unspecInvalidMessage
missingMandatoryIe
invalidMessageType
incompatibleMessage
timerRecovery
unspecProtocolError

Default: No default

### ATTRIBUTE TdmaFcBc mateBearerChannel (mateBc)

Access: Read: All
Write: Illegal

Description: This attribute contains the name of the mate *TdmaIwfBearerChannel* that this *TdmaIwfBearerChannel* is involved with in the currently active call. In the case of a FastConnect call, this mate is a *TdmaIwfFcBearerChannel*.

Values: The name of the component

Default: No default

### GROUP TdmaFcBc CustomerIdentifierData (CidData)

Properties: Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE TdmaFcBc customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values Decimal (0; 1..8191)

Default 0

### GROUP TdmaFcBc OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE TdmaFcBc adminState (osiAdmin)

Access Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE TdmaFcBc operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

## ATTRIBUTE TdmaFcBc usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## COMPONENT TdmaFcBc UpperRelay (Ur)

| | |
|---|---|
| Groups | "GROUP TdmaFcBc Ur Operational (Oper)"<br>"GROUP TdmaFcBc Ur Statistics (Stats)" |
| Scope | Application |
| Description | *TdmaBc/<csIndex>,<bcIndex> UpperRelay*<br>This component represents the group of measurements for the Upper Relay function established for each half of a DMS-MTX IWF asynchronous data or fax call (internally between the two *TdmaIwfBearerChannel*s involved in a call) from this particular *TdmaIwfBearerChannel* perspective. |
| Common Verbs | Help<br>List<br>Display |

## GROUP TdmaFcBc Ur Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains operational attributes that measure the performance of the *UpperRelay*. |

### ATTRIBUTE TdmaFcBc Ur rxBufferSize

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the size of the receive flow control buffer. This attribute may be viewed via *TdmaBc/*,*,*,* UpperRelay*. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE TdmaFcBc Ur txFlowControlState (txFlowControl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the transmit flow control is active or not. This attribute has one of the following values:<br>***active***: The transmit flow control is active.<br>***inactive***: The transmit flow control is inactive.<br>This attribute may be viewed via *TdmaBc/*,*,*,* UpperRelay*. |
| Values | active<br>inactive |
| Default | No default |

### ATTRIBUTE TdmaFcBc Ur rxFlowControlState (rxFlowControl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the receive flow control is active or not. This attribute has one of the following values:<br>***active***: The receive flow control is active.<br>***inactive***: The receive flow control is inactive.<br>This attribute may be viewed via *TdmaBc/*,*,*,* UpperRelay*. |
| Values | active<br>inactive |
| Default | No default |

## GROUP TdmaFcBc Ur Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of the *UpperRelay*. |

## ATTRIBUTE TdmaFcBc Ur txFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames that are sent in the transmit direction. The counter wraps when it exceeds the maximum value.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE TdmaFcBc Ur rxFrames

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames that are sent in the receive direction.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE TdmaFcBc Ur unacknowledgedFrames (unackFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current number of frames sent that have not been acknowledged for this instance of the UpperRelay.<br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE TdmaFcBc Ur cumUnacknowledgedFrames (cUnackFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute is the total number of unacknowledged frames for this instance of the UpperRelay. It is not reset when a new call starts. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

# COMPONENT Time (Time)

| | |
|---|---|
| Groups | "GROUP Time Operational (Oper)" |
| Scope | Device |
| Description | *Time*<br>The *Time* component provides access to time and date information on this module. It has operational attributes and optional provisionable *Server* subcomponents. |
| Opt. Subcomp. | "COMPONENT Time Server" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Time Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Time* component. |

## ATTRIBUTE Time syncStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the XNTP (Network Time Protocol) synchronization status of this module. If the value is ***synchronized*** or ***synchronizing***, the *syncSource* attribute indicates the IP address of the main network time server.<br>The values have the following meanings:<br>***synchronized*** -- The module is synchronized with the network time server. |

***unsynchronized*** -- There is no network time server selected as XNTP server for the module to synchronize its time with.
***synchronizing*** -- The module is trying to synchronize with the network time server.
***unknown*** -- The synchronization status of the module is unknown.

Values
synchronized
unsynchronized
synchronizing
unspecified

Default
No default

### ATTRIBUTE Time moduleTime

Access
Read and write

Description
This attribute indicates the current date and time on this module. The *moduleTime* is obtained by adding an offset to the reference time, which is the Universal Time Coordinated (UTC). When the *moduleTime* is set, it keeps the value even if the card boots. It is the time used for time stamps, such as in alarms and accounting data. The operator resets the current date and time by setting this attribute when *syncStatus* is ***unsynchronized***. Setting this attribute is not allowed if *syncStatus* is ***synchronized*** or ***synchronizing***.

Values
Time (DHMS)

Default
No default

### ATTRIBUTE Time mainServer

Access
Read only

Description
This attribute indicates the IP address of the main network time server that this module synchronizes with. If *syncStatus* is ***unsynchronized,*** then *mainServer* is 0.0.0.0.

Values
IP address

Default
No default

### ATTRIBUTE Time xntpVersion

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current protocol version of XNTP running on this module. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Time offset

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of minutes to be added to the reference time, which is Universal Coordinated Time (UTC), to obtain the *moduleTime*. It keeps its value even if the card reboots. However, if the node is powered-off for an extended period of time, it may reset to the default value. |
| Values | Signed (-720..900) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Time syncSources

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP addresses of the network time servers that this module synchronizes with. XNTP uses the clock values of the network time servers to set its *moduleTime*. |
| List of | IP address |
| Default | No default |

### COMPONENT Time Server

| | |
|---|---|
| Instance | Decimal (1..10) |
| Groups | "GROUP Time Server Provisioned (Prov)"<br>"GROUP Time Server OsiState (State)"<br>"GROUP Time Server Operational (Oper)" |

| | |
|---|---|
| Scope | Device |
| Description | *Time Server/n*<br>The *Server* component represents a single network time server that this module can use for network time synchronization. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Time Server Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Server* component. |

## ATTRIBUTE Time Server ipAddress (ipAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP address of a network time server that the module will attempt to synchronize with. The value of *ipAddress* must be unique across all *Server* components. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Time Server ipStack

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP stack that XNTP uses to communicate with the network time server. If ***ipiFrIpiVc*** is selected, then an *IpiFr* or *IpiVc* component must be provisioned on this module. |

If ***vrIp*** is selected, then *Ip* must be provisioned under the management *Vr* on this module.

Values
ipiFrIpiVc
vrIp

Default
ipiFrIpiVc

## GROUP Time Server OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Time Server adminState (osiAdmin)

Access
Read only

Description
This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE Time Server operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Time Server usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Time Server Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Server* component. |

## ATTRIBUTE Time Server xntpVersion

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the version of XNTP currently in use by the network time server. |
| Values | Decimal (0..15) |
| Default | No default |

## ATTRIBUTE Time Server stratum

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stratum level of the clock on the network time server. |
| Values | Decimal (0..16) |
| Default | No default |

## ATTRIBUTE Time Server poll

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time interval for the Passport module to poll the network time server for time synchronization. |
| Values | Decimal (0..15) |
| Default | No default |

## ATTRIBUTE Time Server pktSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets sent to the network time server. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Time Server pktRecv

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets received from the network time server, including the invalid packets. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Time Server pktValid

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the valid packets received from the network time server. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Time Server status

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the network time server.<br>***main*** -- This network time server is working properly, and is the system servers (synchronization sources) of the module.<br>***primary*** -- This network time server is working properly, and is the primary servers (one of the synchronization sources) of the module<br>***secondary*** -- This network time server is working properly, but its offset and dispersion is not stable or too high so that it can not be selected as one of the primary time synchronization sources. But if the primary synchronization sources are not available, it can take over the responsibility and become the time synchronization source of the module.<br>***unused*** -- This network time server is not used as a server (synchronization source) of the module.<br>***noResponse*** -- This network time server is not responding to the module's time synchronization request. This could be caused by network error or protocol error, or network time server |

configuration error.
***stratumTooHigh*** -- This network time server has the bad stratum (higher than 16), or its stratum is higher than the module's stratum.
***leapUnsync*** -- This network time server's leap value indicates that this network time server is not synchronized.
***clockUnsync*** -- This network time server's clock values indicates that this network time server is not synchronized.
***rootTooNoisy*** -- This network time server's root dispersion is too high, so that its time stamp is not used.
***peerTooNoisy*** -- The modules dispersion relative to this network time server is too high, so this network time server's time stamp is not used.
***faultStick*** -- This offset of the module relative to this network time server is out of the range or too high, so that it can not be selected as one of the primary time synchronization source.

Set of

# COMPONENT Trunk (Trk)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Trk IfEntryProv (IfEntry)"<br>"GROUP Trk Provisioned (Prov)"<br>"GROUP Trk Overrides"<br>"GROUP Trk OsiState (State)"<br>"GROUP Trk OperationalStatus (OperStatus)"<br>"GROUP Trk Operational (Oper)"<br>"GROUP Trk Transport"<br>"GROUP Trk Statistics (Stats)"<br>"GROUP Trk SpeedReporting" |

"COLLECTED STATS Trunk"

| | |
|---|---|
| Scope | Network |
| Description | *Trunk/n*<br>The *Trunk* component provides a Passport to Passport connection. It controls a protocol stack associated with a logical port on a function processor that provides an interconnection to another Passport with a *Trunk* component.<br>It requires the existence of the *Routing* component. Note that ***dpnRouting*** also needs to be included in the *featureList* of CP's *LogicalProcessorType* component.<br>Either an *AtmAccess*, *MplsAccess*, or *Unacknowledged* subcomponent must be added to provide the underlying link protocol and associated hardware that the *Trunk* will use. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Trk UnAcked (UnAcked)"<br>"COMPONENT Trk AtmAccess (Atm)"<br>"COMPONENT Trk PathAdmin (Pa)"<br>"COMPONENT Trk Address (Addr)" |
| Dyn. Subcomp. | "COMPONENT Trk LogicalChannel (LCh)"<br>"COMPONENT Trk PorsStatistics (PorsStats)"<br>"COMPONENT Trk ForwardingStatistics (FwdStats)"<br>"COMPONENT Trk DprsStatistics (DprsStats)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>Unlock |

## VERB LOCK Trk

| | |
|---|---|
| Impact | Service |
| Description | *Lock [-force][-forever] <component name>*<br>This verb causes the specified component to enter the OSI ***shuttingDown*** administrative state. While shutting down, the component continues to provide service to existing clients but rejects any new requests for service. In some cases, locking a component causes all its subcomponents to shut down also.<br><br>When the component is no longer providing service, it enters the OSI ***locked*** administrative state.<br><br>**Options:**<br>*-force*<br>If this option is present, service to current clients is terminated and the ***locked*** state is entered immediately (that is, without first going through the ***shuttingDown*** state). Without this option, *Lock* behaves as described above.<br>*-forever*<br>If this option is present, then after service to current clients is terminated and the ***locked*** state is entered, an unlock command is required to get the service into the ***unlocked*** state. Without this option, the service automatically returns to the ***unlocked*** state after five minutes. |

## GROUP Trk IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

## ATTRIBUTE Trk ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Trk ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Trk Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes provides the parameters used by the layer 3 *Trunk* to *Trunk* staging protocol. |

### ATTRIBUTE Trk expectedRemoteNodeName (expectedRemote)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected node name of the module to which this *Trunk* is connected. Once entered, the node name must correspond to the *Mod nodeName* attribute of the remote node. The *Trunk* end points exchange their node name through the *Trunk* staging protocol. The staged value is validated and the *remoteValidationAction* will be executed for those values not matching the value supplied for this attribute.<br>If this attribute is an empty string, then the comparison is always successful. |
| Values | String (0..12, ASCII) |
| Default | No default |

### ATTRIBUTE Trk remoteValidationAction (validation)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the action to be taken if there is a mismatch between the *expectedRemoteNodeName* attribute and the value received from the remote end. The *remoteValidationAction* determines the action when a value is supplied to the *expectedRemoteNodeName* attribute. If this attribute is provisioned to ***continue*** then upon an unsuccessful validation staging continues, otherwise, if ***disable*** is set then the *Trunk* does not continue to stage but, attempts to stage again after a one minute time out.<br>All unsuccessful validation when the *expectedRemoteNodeName* has been set result in the generation of an alarm. |
| Values | continue<br>disable |
| Default | continue |

### ATTRIBUTE Trk maximumExpectedRoundTripDelay (maxRtd)

| | |
|---|---|
| Access | Read and write |
| Description | This is the maximum round trip delay value used by the Trunk staging protocol, in conjunction with *measuredSpeedToIf*, to determine if it has taken too long to successfully stage with a remote Trunk. The value specified must be larger than the *measuredRoundTripDelay* or the Trunk may not successfully stage. |
| Values | Decimal (1..1500) |
| Units | msec |
| Default | 1500 |

### ATTRIBUTE Trk idleTimeOut

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Trunk protocol idle time out duration in units of seconds. If the local Trunk does not receive any packets from the link for the period specified by this attribute, the |

| | |
|---|---|
| | Trunk enters Are You There (AYT) mode for up to two seconds. If the Trunk does not receive any packets from the remote during the AYT mode it will restage; otherwise, it exits AYT mode and continues to provide service. |
| Values | Decimal (2..30) |
| Units | seconds |
| Default | 4 |

### GROUP Trk Overrides

| | |
|---|---|
| Properties | Provisioned |
| Description | Theses attribute comprise the set of provisionable override parameters supported by both the *Trunk* and *DpnGateway* components. The attributes are used when reporting operational attributes (used for metric calculations) to the routing system. |

### ATTRIBUTE Trk overrideTransmitSpeed (ots)

| | |
|---|---|
| Access | Read and write |
| Description | This is the overridden value of link speed (bit/s) that, if staged successfully with the remote, is reported to the routing system for metric calculations. A zero indicates that an override value has not been provided and that only the measured value will be reported to the routing system.<br>If this value is changed on a *Trunk* or *DpnGateway* that is enabled, the LOCK and UNLOCK commands must be issued to the component to restage the override with the remote. |
| Values | Decimal (0; 1000..4294967295) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE Trk overrideRoundTripDelay (ortd)

| | |
|---|---|
| Access | Read and write |
| Description | This is the overridden value of link delay (ms) that, if staged successfully with the remote, is reported to the routing system for metric calculations. A zero indicates that an override value has |

not been provided and that only the measured value will be reported to the routing system.
If this value is changed on a *Trunk* or *DpnGateway* that is enabled, the LOCK and UNLOCK commands must be issued to the component to restage the override with the remote.

| | |
|---|---|
| Values | Decimal (0.0..1500.0) |
| Units | msec |
| Default | 0.0 |

### GROUP Trk OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Trk adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Trk operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Trk usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Trk availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Trk proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |

| | |
|---|---|
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

### ATTRIBUTE Trk controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Trk alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component. |
| Set of | underRepair (repair)<br>critical (crit)<br>major<br>minor<br>alarmOutstanding (outst) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Trk standbyStatus (osiStby)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Standby status of the component.<br><br>The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.<br><br>The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.<br><br>The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.<br><br>The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource. |
| Values | hotStandby (hot)<br>coldStandby (cold)<br>providingService (serv)<br>notSet (nSet) |
| Default | notSet |

### ATTRIBUTE Trk unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component. |

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Trk OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Trk snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Trk Operational (Oper)

Properties
Operational

Description
This is the group of operational attributes supported by the *Trunk*.

### ATTRIBUTE Trk remoteComponentName (remote)

Access
Read only

Description
This is the component name of the remote end which it has supplied through the *Trunk* staging protocol.

| | |
|---|---|
| Values | String (1..27, ASCII) |
| Default | No default |

### GROUP Trk Transport

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes contains the set of operational parameters measured and maintained by both the *Trunk* and *DpnGateway* components. |

### ATTRIBUTE Trk measuredSpeedToIf (spd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current “transmittable” bandwidth of the underlying facility.<br>For a *Trunk* with a *Unack* subcomponent, and a *DpnGateway* with a *Utp* subcomponent, if a serial port is used, the value is the measured transmit speed of the port; if a channelized port (E1/DS1) is used, the value is the measured transmit speed of the *Channel*.<br>For a *Trunk* with an *AtmAccess* subcomponent, the value is calculated by converting the VCC transmit cell rate to an equivalent bit rate. The VCC transmit cell rate is determined based on the *vccReportingBw* attribute of the *Trunk AtmAccess* component. If *vccReportingBw* has a value of ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***no***, the peak cell rate (PCR) of the VCC, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, is used. If *vccReportingBw* has a value of ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***yes***, the minimum of the PCR, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, and the current cell rate (CCR) of the VCC is used. If *vccReportingBw* has a value of ***acr***, the best measurement of the actual cell rate (ACR) of the VCC is used, which is the minimum of the PCR, the CCR and the actual shaping rate (ASR).<br>For a *Trunk* with an *MplsAccess* subcomponent, the value is the transmit bandwidth reserved on the MPLS transport *Lsp*.<br>For a *DpnGateway* with a *FrAccess* subcomponent, the value indicates the *committedInformationRate* of *FrAccess FrMuxSetup*. |

| | |
|---|---|
| | A value of zero is displayed when the underlying facility is disabled or the current “transmittable” bandwidth is unknown. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE Trk maxTxUnit (mtu)

| | |
|---|---|
| Access | Read only |
| Description | This is the maximum transmission unit (byte size) that is supported by the *Trunk* or *DpnGateway* component. This size includes the data and routing headers. A value of zero indicates the MTU has not yet been determined. |
| Values | Decimal (0..65535) |
| Units | bytes |
| Default | 0 |

### ATTRIBUTE Trk measuredRoundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the measured Round Trip Delay (msec) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. The value includes emission, propagation, and queuing delays. A 512 byte data packet is used to perform the measurement. A value of zero is displayed when the link is disabled or the measured Round Trip Delay is unknown. |
| Values | Decimal (0.0..1500.0) |
| Units | msec |
| Default | 0.0 |

### GROUP Trk Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | These attributes comprise the statistics collected by the *Trunk* component. |

### ATTRIBUTE Trk areYouThereModeEntries (ayt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that the component has entered Are You There mode. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk pktFromIf (pkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote module. It does not include the packets received from the interrupting queue. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Trk trunkPktFromIf (trk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal trunk protocol packets (including those from the interrupting queue) received from the remote module. These packets are forwarded to the *Trunk* component. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk trunkPktToIf (trkti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal trunk protocol packets (including those through the interrupting queue) |

| | |
|---|---|
| | transmitted to the remote module. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk discardUnforward (disc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote module that have been discarded. It does not include the packets received from the interrupting queue that have been discarded. This counter wraps around to zero when the maximum value is exceeded. Two main reasons that cause this counter to increase are:<br>(1) the remote protocol is not compatible with the local protocol stack or,<br>(2) the packet cannot be forwarded due to a recent loss of connectivity or due to congestion. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Trk discardTrunkPktFromIf (discTrk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal trunk protocol packets (including those on the interrupting queue) received from the remote module that have been discarded. This counter wraps around to zero when the maximum value is exceeded. The three main reasons that cause this counter to increase are:<br>(1) the two Trunks are not synchronized,<br>(2) the remote trunk protocol is not the same version as the local protocol, and<br>(3) the remote trunk has restaged. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk intPktFromIf (intPkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received on the interrupting queue from the remote module. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Trk discardIntUnforward (discInt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received on the interrupting queue from the remote module that have been discarded. This counter wraps around to zero when the maximum value is exceeded. Two main reasons that cause this counter to increment are:<br>(1) the remote protocol is not compatible to the local protocol stack and,<br>(2) the packet cannot be forwarded due to either a recent loss of connectivity or due to congestion. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Trk stagingAttempts (statt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that the staging protocol has attempted to stage with the remote module. This counter wraps around to zero when the maximum value is exceeded. The main reason that causes this counter to increment is that the local hardware is up but, the local protocol cannot stage with the remote protocol due to a faulty connection. If the value is zero, then the local hardware has never enabled successfully. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Trk discardTrunkPktToIf (discTrkti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal trunk protocol packets (including those through the interrupting queue) that have been discarded before being transmitted to the remote module. This counter wraps around to zero when the maximum value is exceeded. The main reason that causes this counter to increment is that the trunk can not get sufficient resources to create an internal trunk protocol packet. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk utilization (util)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the average trunk utilization.<br><br>For a *Trunk/n* with an *Unack* subcomponent, the value is the link receive utilization. It is calculated every minute by comparing the number of octets received from the remote module against the value of the *Trunk/n measuredSpeedToIf*. Since the trunk application solely owns the physical link, the maximum link utilization is 100%.<br><br>For a *Trunk/n* with an *AtmAccess* subcomponent, the value is the VCC(s) transmit utilization. It is calculated every 30 seconds by comparing the number of cells transmitted by *AtmIf Vcc(s)* against the value of the *Trunk/n measuredSpeedToIf*. The VCCs include the trunk VCC indicated by *atmConnection* of *Trunk/n AtmAccess* and the PORS SPO (Short Path Oriented) multiplexing VCC if applicable. The PORS SPO multiplexing VCC only applies to a *Trunk/n* with subcomponents *Pa AtmAccess*, where the *mode* of *AtmAccess* is ***multiplexing***, and the *AtmAccess* is linked to a second VCC indicated by *atmConnection* of *Pa AtmAccess*. Since the trunk application shares a physical link with other applications, the VCCs |

utilization can exceed 100%, and the value 200% is chosen as the maximum calculated utilization.

For a *Trunk/n* with an *MplsAccess* subcomponent, the value is the receive utilization. It is calculated every 30 seconds by comparing the number of octets received from the remote module against the value of the *Trunk/n measuredSpeedToIf*. Since the trunk application shares a physical link with other applications, utilization can exceed 100%, and the value 200% is chosen as the maximum calculated utilization.

| Values | Decimal (0..200) |
| Units | % |
| Default | No default |

### ATTRIBUTE Trk pktFromIfByPrio (pktBp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received by the *Trunk*. It is a vector indexed by the emission priorities (*ep0*, *ep1*, and *ep2*) of the packets. The highest emission priority is *ep0*. These counters wrap around to zero when the maximum value is exceeded. |
| Vector of | Long Integer |
| Index | ep0<br>ep1<br>ep2 |
| Default | No default |

### ATTRIBUTE Trk discPktFromIfByPrio (discBp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote module that have been discarded. It is a vector indexed by the emission priorities (*ep0*, *ep1* and *ep2*) of the packets. The highest emission priority is *ep0*. These counters wrap around to zero when the maximum value is exceeded.<br>Two main reasons that cause this counter to increment are: |

| | |
|---|---|
| | (1) the remote protocol is not compatible to the local protocol stack and,<br>(2) the packet cannot be forwarded due to either a recent loss of connectivity or due to congestion. |
| Vector of | Long Integer |
| Index | ep0<br>ep1<br>ep2 |
| Default | No default |

### ATTRIBUTE Trk octetFromIfByPrio (octBp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets coming from the remote module which are received by the Trunk. It is a vector indexed by the emission priorities (*ep0*, *ep1* and *ep2*) of the packets. The highest emission priority is *ep0*. These counters wrap around to zero when the maximum value is exceeded. |
| Vector of | Long Integer |
| Index | ep0<br>ep1<br>ep2 |
| Default | No default |

### GROUP Trk SpeedReporting

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of provisionable attributes provides the ability to disable or enable the generation of speed change alarms by the *Trunk* component. It also provides the ability to disable or enable the Dynamic Speed Reporting mechanism. |

### ATTRIBUTE Trk speedReportingHoldOff (spdHO)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the hold off time for reporting speed increases. When the *measuredSpeedToIf* reaches a level specified |

| | |
|---|---|
| | by the *speedReportingThresholds* attribute, the value specifies the duration (in units of seconds) for which the *measuredSpeedToIf* must maintain that level before it will be reported. |
| Values | Decimal (1..1200) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Trk lowSpeedAlarmThreshold (lowAla)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the lower end of the range of normal speeds for this Trunk. If the *measuredSpeedToIf* drops below this value the *Trunk* component generates a SET alarm. When the *measuredSpeedToIf* reaches or exceeds the value of this attribute, the *Trunk* component will generate a CLEAR alarm. |
| Values | Decimal (0; 1..4294967295) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE Trk highSpeedAlarmThreshold (hiAla)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the upper end of the range of normal speeds for this Trunk. If the *measuredSpeedToIf* exceeds this value the *Trunk* component generates a SET alarm. When the *measuredSpeedToIf* returns to or falls below the value of this attribute, the *Trunk* component will generate a CLEAR alarm. |
| Values | Decimal (1..4294967295) |
| Units | bit/s |
| Default | 4294967295 |

### ATTRIBUTE Trk speedReportingThresholds (spdTh)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute controls the behavior of the Dynamic Speed Reporting mechanism. If its value is empty then the mechanism is disabled and neither increases nor decreases are reported. Otherwise, the attribute may contain up to seven threshold levels which are used to control the reporting of speed increases. Speed decreases are always reported immediately. If the *measuredSpeedToIf* increases such that it reaches one of the threshold levels which is greater than the last reported speed, the Trunk starts the *speedReportingHoldOff* timer. If the speed remains above this threshold until the timer expires, the *Trunk* component then reports the *measuredSpeedToIf*; otherwise the increase is not reported. |
| List of | Decimal (0..4294967295) |
| Units | bit/s |
| List Size | 7 |
| Default | No default |

# COLLECTED STATS Trunk

| | |
|---|---|
| Description | The statistics record generated by the Trunk component. |

### ATTRIBUTE Trk remoteComponentName (remote)

| | |
|---|---|
| Description | This attribute is the component name of the remote end which it has supplied through the *Trunk* staging protocol. |
| Values | String (1..26, ASCII) |

### ATTRIBUTE Trk measuredSpeedToIfMax

| | |
|---|---|
| Description | This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Trk measuredSpeedToIfMin

| | |
|---|---|
| Description | This is the minimum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for any part of the interval or the measured speed is unknown. |

Values Decimal (0..4294967295)

### ATTRIBUTE Trk measuredSpeedToIfCurrent

Description This is the current measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled or the measured speed is unknown.

Values Decimal (0..4294967295)

### ATTRIBUTE Trk measuredRoundTripDelayMax

Description This is the maximum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled for the whole interval or the delay is unknown.

Values Decimal (0..1500)

### ATTRIBUTE Trk measuredRoundTripDelayMin

Description This is the minimum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled for any part of the interval or the delay is unknown.

Values Decimal (0..1500)

### ATTRIBUTE Trk measuredRoundTripDelayCurrent

Description This is the measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled or the delay is unknown.

Values Decimal (0..1500)

### ATTRIBUTE Trk porsNormPktFromIf (normPkt)

Description This attribute counts the number of normal priority packets received on the PORS *Trunk* normal priority queue in the last statistics collection interval.

Values Long Integer

### ATTRIBUTE Trk porsNormDiscUnforwardFromIf (normDisc)

| | |
|---|---|
| Description | This attribute counts the number of normal priority packets discarded from the PORS *Trunk* normal priority queue in the last statistics collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk porsNormOctetFromIf (normOctet)

| | |
|---|---|
| Description | This attribute counts the number of normal priority bytes received on the PORS *Trunk* normal priority queue in the last statistics collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk porsIntPktFromIf (intPkt)

| | |
|---|---|
| Description | This attribute counts the number of interrupting priority packets received on the PORS *Trunk* interrupting priority queue in the last statistics collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk porsIntDiscUnforwardFromIf (intDisc)

| | |
|---|---|
| Description | This attribute counts the number of interrupting priority packets discarded from the PORS *Trunk* interrupting priority queue in the last statistics collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk porsIntOctetFromIf (intOctets)

| | |
|---|---|
| Description | This attribute counts the number of interrupting priority bytes received on the PORS *Trunk* interrupting priority queue in the last statistics collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk remoteComponentName (remote)

| | |
|---|---|
| Description | This attribute is the component name of the remote end which it has supplied through the *Trunk* or *DpnGateway* staging protocol. |
| Values | String (1..26, ASCII) |

### ATTRIBUTE Trk measuredSpeedToIfMax

| | |
|---|---|
| Description | This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Trk measuredSpeedToIfMin

| | |
|---|---|
| Description | This is the minimum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for any part of the interval or the measured speed is unknown. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Trk measuredSpeedToIfCurrent

| | |
|---|---|
| Description | This is the current measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled or the measured speed is unknown. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Trk measuredRoundTripDelayMax

| | |
|---|---|
| Description | This is the maximum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for the whole interval or the delay is unknown. |
| Values | Decimal (0..1500) |

### ATTRIBUTE Trk measuredRoundTripDelayMin

| | |
|---|---|
| Description | This is the minimum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for any part of the interval or the delay is unknown. |
| Values | Decimal (0..1500) |

### ATTRIBUTE Trk measuredRoundTripDelayCurrent

| | |
|---|---|
| Description | This is the measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A |

value of zero is provided when the link is disabled or the delay is unknown.

Values Decimal (0..1500)

### ATTRIBUTE Trk fwdPktFromIf (fwdPkt)

Description This attribute counts the number of forwarding packets received on the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values Long Integer

### ATTRIBUTE Trk fwdDiscUnforwardFromIf (fwdDisc)

Description This attribute counts the number of forwarding packets discarded by the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values Long Integer

### ATTRIBUTE Trk fwdOctetFromIf (fwdOctet)

Description This attribute counts the number of forwarding bytes received on the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values Long Integer

### ATTRIBUTE Trk dprsPktFromIfByPrio (dprsPktBp)

Description This attribute counts the number of DPRS packets received by the Trunk in the last statistics collection interval. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*.

Array of Long Integer

## COMPONENT Trk UnAcked (UnAcked)

| | |
|---|---|
| Groups | "GROUP Trk UnAcked Provisioned (Prov)"<br>"GROUP Trk UnAcked OsiState (State)" |
| Scope | Network |
| Description | *Trunk/n Unacknowledged*<br>The *Unacknowledged* component provides a Layer 2 protocol that adds the minimum of overhead to data on the link. A *Framer* subcomponent is automatically added providing the underlying HDLC framing and associated hardware that the *Unacknowledged* component will use. |
| Subcomponents | "COMPONENT Trk UnAcked Framer" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Trk UnAcked Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of provisionable attributes contains the parameters used by *Unacknowledged*, *Utp*, and *FrAccess* for monitoring link quality. |

### ATTRIBUTE Trk UnAcked maximumErroredInterval

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval time over which the error threshold (as specified by *receiveErrorSensitivity)* must be continuously exceeded before the *Unacknowledged*, *Utp*, or *FrAccess* component can be degraded. Once the error interval count exceeds the provisioned value, the *Unacknowledged*, *Utp*, or *FrAccess* component issues an alarm indicating that link quality has degraded, and it disables its parent component. The exception to this is a value of zero, the default, which indicates that the mechanism is completely disabled. |
| Values | Decimal (0; 1..15) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Trk UnAcked receiveErrorSensitivity

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the allowable error rate beyond which the *Unacknowledged*, *Utp*, or *FrAccess* component can be degraded if it persists for a duration longer than the *maximumErrorInterval*. The threshold is expressed as a percentage of number of errored frames in the last interval per number of frames received in the last interval. The exception to this is a value of zero, which indicates that the mechanism is completely disabled. The configurable values are:<br>0 = the mechanism is completely disabled<br>1 = 1/(2**1)<br>2 = 1/(2**2)<br>3 = 1/(2**3)<br>:<br>10 = 1/(2**10) |
| Values | Decimal (0; 1..10) |
| Default | 3 |

## GROUP Trk UnAcked OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Trk UnAcked adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Trk UnAcked operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Trk UnAcked usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Trk UnAcked availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

### ATTRIBUTE Trk UnAcked proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of
initializationRequired (initRq)
notInitialized (notInit)

### ATTRIBUTE Trk UnAcked controlStatus (osiCntrl)

Access
Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Trk UnAcked alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Trk UnAcked standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Trk UnAcked unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

## COMPONENT Trk UnAcked Framer

Groups
"GROUP Trk UnAcked Framer Provisioned (Prov)"
"GROUP Trk UnAcked Framer LinkOptions (Link)"
"GROUP Trk UnAcked Framer OsiState (State)"
"GROUP Trk UnAcked Framer Statistics (Stats)"
"GROUP Trk UnAcked Framer LinkUtilization (Util)"
"GROUP Trk UnAcked Framer LinkUtilThreshold (UtilThreshold)"

"COLLECTED STATS Trunk UnAcked Framer"

Scope
Device

Description

*Trunk/n Unack Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

## GROUP Trk UnAcked Framer Provisioned (Prov)

Properties
Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

### ATTRIBUTE Trk UnAcked Framer interfaceName

Access: Read and write

Criticality: Process

Description

This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Values: Link (Hardware, applicationFramerName)

Default: No default

### GROUP Trk UnAcked Framer LinkOptions (Link)

Properties: Provisioned

Description

This group contains attributes defining the framing of data on the link interface.

### ATTRIBUTE Trk UnAcked Framer framingType

Access: Read and write

Criticality: Process

Description

This attribute specifies the type of framing protocol that will be used for frames transmitted to the link interface and received from the link interface. If the value of this attribute is set to the default *interrupting*, then a Proprietary hdlc protocol is used which allows for voice cells to interrupt transmission of data frames, transmit the voice cell, and then continue transmitting the

data frame. If the value of this attribute is set to *hdlc*, then the standard hdlc protocol is used for the sequential transmission of individual frames.

Values
hdlc
interrupting

Default
interrupting

### ATTRIBUTE Trk UnAcked Framer dataInversion

Access
Read and write

Description
This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed.

This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density.

Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.

Values
off
on

Default
off

### ATTRIBUTE Trk UnAcked Framer frameCrcType

Access
Read and write

Description
This attribute defines the type of CRC used.

The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used.

| | |
|---|---|
| Values | crc16<br>crc32<br>noCrc |
| Default | crc16 |

### ATTRIBUTE Trk UnAcked Framer flagsBetweenFrames

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the number of flags that are inserted between frames sent to the link interface. |
| Values | Decimal (1..16) |
| Default | 1 |

### GROUP Trk UnAcked Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Trk UnAcked Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Trk UnAcked Framer operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Trk UnAcked Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

| | |
|---|---|
| | The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Trk UnAcked Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for an unacknowledged Framer component. |

### ATTRIBUTE Trk UnAcked Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with CRC errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with LRC errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer frmModeErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer outOfSequenceFrm

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of out of sequence frames in interrupting mode that have been received from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer repeatedFrm

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of repeated frames (frames with the same sequence number) in interrupting mode that have been received from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Trk UnAcked Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### GROUP Trk UnAcked Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE Trk UnAcked Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer highPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the interrupting data traffic sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with a Transfer Priority (TP) of 11 and/or Emission Priority of 1. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Trk UnAcked Framer highPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the interrupting data traffic received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with a Transfer Priority (TP) of 11 and/or Emission Priority of 1. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### GROUP Trk UnAcked Framer LinkUtilThreshold (UtilThreshold)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data required to set the link utilization alarm thresholds. All thresholds are percentages which can take on any value in the range of 0% through 100%. The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the minor alarm threshold is less than the other thresholds and that the major alarm threshold is less than the critical alarm threshold. |

## ATTRIBUTE Trk UnAcked Framer minorLinkUtilAlarmThreshold (minor)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the threshold value which defines when a minor alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.<br>The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the minor alarm threshold is less than the other thresholds. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 75 |

## ATTRIBUTE Trk UnAcked Framer majorLinkUtilAlarmThreshold (major)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the threshold value which defines when a major alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.<br>The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the major alarm threshold is greater than the minor threshold and less than the critical threshold. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 85 |

### ATTRIBUTE Trk UnAcked Framer criticalLinkUtilAlarmThreshold (critical)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the threshold value which defines when a critical alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.<br>The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the critical alarm threshold is greater than the other thresholds. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 95 |

### ATTRIBUTE Trk UnAcked Framer linkUtilAlarmStatus (status)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides control of the generation of link utilization alarms. If the value is ***disabled***, none of the alarms are generated (this is equivalent to setting all of the thresholds to 100%). If the value is ***enabled***, the individual thresholds are handled. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## COLLECTED STATS Trunk UnAcked Framer

| | |
|---|---|
| Description | The statistics record generated by the Trunk UnAcked Framer component. |

### ATTRIBUTE Trk UnAcked Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk UnAcked Framer rxFrames

Description: This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values: Long Integer

### ATTRIBUTE Trk UnAcked Framer txBytes

Description: This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values: Long Integer

### ATTRIBUTE Trk UnAcked Framer txFrames

Description: This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values: Long Integer

### ATTRIBUTE Trk UnAcked Framer rxTotalLinkUtil

Description: This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values: Decimal (0..100)

## COMPONENT Trk AtmAccess (Atm)

Groups:
"GROUP Trk Atm Provisioned (Prov)"
"GROUP Trk Atm Interface"
"GROUP Trk Atm OsiState (State)"
"GROUP Trk Atm UtilThreshold (Util)"
"GROUP Trk Atm Statistics (Stats)"

"COLLECTED STATS Trunk AtmAccess"

Scope: Network

Description — *Trunk/n AtmAccess*
The *AtmAc*cess component provides a Layer 2 protocol that adds no overhead to data on the ATM link that it accesses.

Common Verbs
- Help
- List
- Display
- Add
- DELete

## GROUP Trk Atm Provisioned (Prov)

Properties — Provisioned

Description — This group of provisionable attributes contains the parameters used by *AtmAccess* for monitoring link quality.

## ATTRIBUTE Trk Atm receiveErrorSensitivity

Access — Read and write

Description — This attribute specifies the allowable error rate beyond which the *AtmAccess* component can be degraded if the error rate persists for a duration longer than the *maximumErrorInterval*. The threshold is expressed as a percentage. It is the ratio of the number of errored cells in the last interval over the number of cells received in the last interval. For AAL5, the number of errored cells is converted from *rxFrameDiscard* of *AtmIf Vcc* using the assumption that three ATM cells are used to carry a 128 byte AAL5 frame. The number of received cells is specified by *rxCell* of *AtmIf Vcc*.

The configurable values are:
0 = the mechanism is completely disabled
1 = 1/(2**1)
2 = 1/(2**2)
3 = 1/(2**3)
:
10 = 1/(2**10)

Values — Decimal (0; 1..10)

Default — 3

### ATTRIBUTE Trk Atm maximumErroredInterval

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval time over which the error threshold (as specified by *receiveErrorSensitivity)* must be continuously exceeded before the *AtmAccess* component can be degraded. Once the error interval count exceeds the provisioned value, the *AtmAccess* component issues an alarm indicating that link quality has degraded, and it disables its parent component. The exception to this is a value of zero, the default, which indicates that the mechanism is completely disabled. |
| Values | Decimal (0.0; 0.5; 1.0; 1.5; 2.0; 2.5; 3.0; 3.5; 4.0; 4.5; 5.0; 6.0; 7.0; 8.0; 9.0; 10.0; 11.0; 12.0; 13.0; 14.0; 15.0) |
| Units | minutes |
| Default | 0.0 |

### GROUP Trk Atm Interface

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes provides the parameters used by the *AtmAccess* component for specifying access to an ATM interface. |

### ATTRIBUTE Trk Atm atmConnection (ac)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the component name of the ATM Layer 2 AAL5 interface that the *AtmAccess* component will use. |
| Values | Link (Hardware, applicationName) |
| Default | No default |

### ATTRIBUTE Trk Atm bwElastic (bwE)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies how changes in the bandwidth of the *atmConnection* are handled by the ATM software. If its value is ***no,*** the *atmConnection* will be released by the ATM software if it is incapable of providing the bandwidth specified by the peak cell rate (PCR) defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*. If the value is ***yes,*** the *atmConnection* is not released in this situation, but its bandwidth may be reduced. Also, if this value is ***yes***, the Dynamic Speed Reporting mechanism must be enabled, by provisioning at least one value in the *speedReportingThresholds* attribute of the parent *Trunk* component. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Trk Atm vccReportingBw (vccRepBw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies how the bandwidth of the VCC is reported to the parent *Trunk* component. If its value is ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***no***, the peak cell rate (PCR) of the VCC, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd,* is reported. If its value is ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***yes***, the minimum of the PCR, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, and the current cell rate (CCR) of the VCC is reported. If its value is ***acr,*** the best measurement of the actual cell rate (ACR) of the VCC is reported, which is the minimum of the PCR, the CCR and the actual shaping rate (ASR). The value of the reported bandwidth of the VCC is indicated by the *measuredSpeedToIf* attribute of the parent *Trunk* component. |
| Values | pcr<br>acr |
| Default | pcr |

### GROUP Trk Atm OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Trk Atm adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Trk Atm operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Trk Atm usageState (osiUsage)

Access

Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

## ATTRIBUTE Trk Atm availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Trk Atm proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Trk Atm controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE Trk Atm alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Trk Atm standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Trk Atm unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Trk Atm UtilThreshold (Util)

Properties
Provisioned

Description
This group contains all of the provisioning data required to set the ATM VCC utilization alarm thresholds. The ATM VCC utilization is indicated by the *lastCalculatedVccUtilization* attribute.
All thresholds are percentages which can take on any value in the

range of 0% through 200%. The value 200% is used to disable an individual threshold. For values other than 200%, the minor alarm threshold must be less than the other thresholds and the major alarm threshold must be less than the critical alarm threshold.

### ATTRIBUTE Trk Atm minorVccUtilAlarmThreshold (minor)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the threshold value at which a minor alarm will be issued based on a sustained average ATM VCC utilization as indicated by the *lastCalculatedVccUtilization* attribute. The Set alarm is issued after 3 minutes of utilization greater than the threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the threshold.<br>The value 200% is used to disable this threshold. For values other than 200%, the minor alarm threshold must be less than the other thresholds. |
| Values | Decimal (0..200) |
| Units | % |
| Default | 75 |

### ATTRIBUTE Trk Atm majorVccUtilAlarmThreshold (major)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the threshold value at which a major alarm will be issued based on a sustained average ATM VCC utilization as indicated by the *lastCalculatedVccUtilization* attribute. The Set alarm is issued after 3 minutes of utilization greater than the threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the threshold.<br>The value 200% is used to disable this threshold. For values other than 200%, the major alarm threshold must be greater than the minor threshold and less than the critical threshold. |
| Values | Decimal (0..200) |

| | |
|---|---|
| Units | % |
| Default | 85 |

### ATTRIBUTE Trk Atm criticalVccUtilAlarmThreshold (critical)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the threshold value at which a critical alarm will be issued based on a sustained average ATM VCC utilization as indicated by the *lastCalculatedVccUtilization* attribute. The Set alarm is issued after 3 minutes of utilization greater than the threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the threshold.<br>The value 200% is used to disable this threshold. For values other than 200%, the critical alarm threshold must be greater than the other thresholds. |
| Values | Decimal (0..200) |
| Units | % |
| Default | 95 |

### ATTRIBUTE Trk Atm vccUtilAlarmStatus (status)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides control of the generation of ATM VCC utilization alarms. If the value is *disabled*, none of the alarms is generated (this is equivalent to setting all of the thresholds to 200%). If the value is *enabled*, the individual thresholds are handled. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### GROUP Trk Atm Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes contains statistics collected by the *AtmAccess* component. |

### ATTRIBUTE Trk Atm lastCalculatedVccUtilization (util)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last calculated receive utilization of the ATM VCC. It is calculated every 30 seconds based on comparing the number of cells received by the *AtmIf Vcc* with the estimated available bandwidth on the *AtmIf Vcc*. |
| Values | Decimal (0..200) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Trk Atm lastCalculatedTxVccUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last calculated transmit utilization of the ATM VCC. It is calculated every 30 seconds based on comparing the number of cells transmitted by the *AtmIf Vcc* with the estimated available bandwidth on the *AtmIf Vcc*. |
| Values | Decimal (0..200) |
| Units | % |
| Default | 0 |

## COLLECTED STATS Trunk AtmAccess

| | |
|---|---|
| Description | The statistics record generated by the Trunk AtmAccess component. |

### ATTRIBUTE Trk Atm interfaceName (interface)

| | |
|---|---|
| Description | This attribute indicates the component name of the local ATM Layer 2 AAL5 interface that the *AtmAccess* component uses. |
| Values | String (1..45, ASCII) |

### ATTRIBUTE Trk Atm txCell

| | |
|---|---|
| Description | This attribute counts the number of cells that have been transmitted to the interface on the *Vcc* in the last collection interval. |
| Values | Long Integer |
| Units | cells |

### ATTRIBUTE Trk Atm txCellClp

| | |
|---|---|
| Description | This attribute counts the number of cells that have been transmitted to the interface on the *Vcc* with the CLP=1 in the last collection interval. |
| Values | Long Integer |
| Units | cells |

### ATTRIBUTE Trk Atm txDiscard

| | |
|---|---|
| Description | This attribute counts the number of cells or frames received from the bus on the *Vcc* that have been discarded (due to congestion or when the *Vcc* interface is disabled) in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk Atm txDiscardClp

| | |
|---|---|
| Description | This attribute counts the number of cells or frames received from the bus on the *Vcc* with the CLP=1 that have been discarded (due to congestion or when the *Vcc* interface is disabled) in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk Atm rxCell

| | |
|---|---|
| Description | This attribute counts the number of cells that have been received from the interface on the *Vcc* in the last collection interval. |
| Values | Long Integer |
| Units | cells |

### ATTRIBUTE Trk Atm rxCellClp

| | |
|---|---|
| Description | This attribute counts the number of cells that have been received from the interface on the *Vcc* with the CLP=1 in the last collection interval. |
| Values | Long Integer |
| Units | cells |

### ATTRIBUTE Trk Atm rxDiscard

| | |
|---|---|
| Description | This attribute counts the number of cells or frames received from the interface on the *Vcc* that have been discarded (due to congestion, non-conformance with UPC or AAL reassembly problems) in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk Atm rxDiscardClp

| | |
|---|---|
| Description | This attribute counts the number of cells or frames received from the interface on the *Vcc* with the CLP=1 that have been discarded (due to congestion, non-conformance with UPC or AAL reassembly problems) in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Trk Atm txCellRateMax

| | |
|---|---|
| Description | This attribute indicates the maximum transmit cell throughput rate of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm txCellRateMin

| | |
|---|---|
| Description | This attribute indicates the minimum transmit cell throughput rate of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm txCellRateAvg

| | |
|---|---|
| Description | This attribute indicates the average transmit cell throughput rate of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm txClpCellRateMax

| | |
|---|---|
| Description | This attribute indicates the maximum transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm txClpCellRateMin

| | |
|---|---|
| Description | This attribute indicates the minimum transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm txClpCellRateAvg

| | |
|---|---|
| Description | This attribute indicates the average transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm rxCellRateMax

| | |
|---|---|
| Description | This attribute indicates the maximum receive cell throughput rate of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm rxCellRateMin

| | |
|---|---|
| Description | This attribute indicates the minimum receive cell throughput rate of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm rxCellRateAvg

| | |
|---|---|
| Description | This attribute indicates the average receive cell throughput rate of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm rxClpCellRateMax

| | |
|---|---|
| Description | This attribute indicates the maximum receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm rxClpCellRateMin

| | |
|---|---|
| Description | This attribute indicates the minimum receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm rxClpCellRateAvg

| | |
|---|---|
| Description | This attribute indicates the average receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

### ATTRIBUTE Trk Atm rxTotalVccUtil

| | |
|---|---|
| Description | This attribute indicates the average total receive *Vcc* utilization computed based on comparing the total number of cells received on the *Vcc* with the estimated available bandwidth in the last collection interval. |
| Values | Decimal (0..200) |
| Units | % |

### ATTRIBUTE Trk Atm txTotalVccUtil

| | |
|---|---|
| Description | This attribute indicates the average total transmitted *Vcc* utilization computed based on comparing the total number of cells transmitted on the *Vcc* with the estimated available bandwidth in the last collection interval. |
| Values | Decimal (0..200) |
| Units | % |

### COMPONENT Trk PathAdmin (Pa)

| | |
|---|---|
| Groups | "GROUP Trk Pa Prov"<br>"GROUP Trk Pa Oper"<br>"GROUP Trk Pa Adaptation" |
| Scope | Application |
| Description | *Trunk/n PathAdmin*<br>This component manages all path related activities on behalf of the trunk. This component is provisioned with a maximum count of *LogicalChannels* that it is allowed to create and a maximum percent of the trunk's outgoing bandwidth that it is permitted to allocate to these *LogicalChannels.* |
| Opt. Subcomp. | "COMPONENT Trk Pa AtmAccess (Atm)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Trk Pa Prov

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all provisionable attributes relevant to path oriented traffic on a trunk. These attributes provide the maximum number of Logical Channels that are permitted under a *Trunk/n* and the maximum total bandwidth they are allowed to occupy as a percentage of the outgoing trunk bandwidth. |

## ATTRIBUTE Trk Pa maxLc (maxLc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute indicates the number of Logical Channels (*LCh/n*) supported on this trunk. This attribute is used to allocate memory on the trunk FP for the PORS forwarding tables.Unless running in mapped mode on ATM hardware, the *PathAdmin* will add 100 channels to *maxL*c to reduce the chances of allocation clashes. However, you should never see more than *maxLc* channels in use for any extended period of time. On ATM hardware in mapped mode the *PathAdmin* will only add 10 channels to *maxLc* to permit more efficient use of the available VCC space.<br><br>The *PathAdmin* may not be able to honor a request for *maxLc* channels. This will happen when the neighbor *PathAdmin* asks for less channels than this *PathAdmin*. To resolve the conflict the *PathAdmin* will always pick the minimum of the two *maxLc* values. This minimum value is called the *negotiatedMaxLc* and can be viewed as an operational parameter of the *PathAdmin*.<br><br>Note that in mapped mode on ATM hardware, the value of this attribute provides an upper bound to the number of VCCs that this *Trunk/n PathAdmin* can occupy. It is not a guarantee that *maxLc* VCCs will be available to this *PathAdmin* because the VCC space is a shared resource on the card or port. |
| Values | Decimal (0..65435) |
| Default | 512 |

### ATTRIBUTE Trk Pa maxReservedBwOut (mrbwout)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute controls the percentage of trunk bandwidth which may be reserved by outgoing path oriented traffic on the trunk. The sum of *requiredBandwidth* attributes for all paths on this trunk must not exceed this attribute. Setting this attribute to zero (0) prevents paths from being established on this trunk. The limit of reserved bandwidth for incoming path oriented traffic is set using the same attribute on the trunk component on the other end of the trunk.This attribute may be changed without the trunk being restaged. If the value is decreased, calls may be bumped as necessary to free up bandwidth. Increasing the value has no impact on existing calls and new calls are able to use the new bandwidth.<br>If this attribute is set to greater than 100%, connectionless traffic is given a minimum of 1Kbit per second for administrative traffic. A value greater than 100% overbooks the trunk bandwidth. By overbooking bandwidth, more calls are able to be established using the unused bandwidth reserved by idle *PLCs*. |
| Values | Decimal (0..200) |
| Units | % |
| Default | 50 |

### ATTRIBUTE Trk Pa trunkSecurity (tsec)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute indicates the security level of the trunk. Zero(0) represents the most secure trunk and seven(7) represents the least secure. The path's minimum security requirement is indicated by the *Plc requiredSecurity* attribute, with values identical in range and meaning to this attribute. PORS ensures that the route selected does not contain a trunk whose *PathAdmin trunkSecurity* attribute is numerically greater than the path's *requiredSecurity.* |

| | |
|---|---|
| Values | Decimal (0..7) |
| Default | 0 |

### ATTRIBUTE Trk Pa supportedTrafficTypes (sttyp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute indicates the type of traffic that can be transmitted on the trunk. There are eight(8) possible traffic types, and the trunk can transmit all of them if desired. The ***voice, data*** and ***video*** traffic types are defined, and five(5) other traffic types can be defined by the network administration. This attribute is used in the route selection process to limit the route to trunks that support the traffic type carried by the path. The *requiredTrafficType* attribute of the *PLC* indicates the type of traffic carried on the path. |
| Set of | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | (voice, data, video, trafficType1, trafficType2) |

### ATTRIBUTE Trk Pa trunkType (ttyp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute lists the type of the trunk. There can be up to eight(8) types of trunks. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six(6) remaining types that can be defined by the network administration. The set of allowed trunk types for a path is indicated in the *permittedTrunkType* attribute |

of the *PLC*. When selecting a route, PORS only chooses trunks whose P*athAdmin trunkType* are in the *permittedTrunkTypes* set of the path.

Values
terrestrial
satellite
trunkType1 (tt1)
trunkType2 (tt2)
trunkType3 (tt3)
trunkType4 (tt4)
trunkType5 (tt5)
trunkType6 (tt6)

Default
terrestrial

### ATTRIBUTE Trk Pa customerParameter (cpar)

Access
Read: All
Write: All

Criticality
Process

Description
This attribute indicates the customer defined parameter for the trunk. Its value, a number from zero(0) to seven(7), is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary *PLC* attribute, *requiredCustomerParameter*, also has a value from zero(0) to seven(7). The Route Selector does not consider trunks whose *PathAdmin customerParameter* is greater than the *requiredCustomerParameter* of the path.

Values
Decimal (0..7)

Default
0

### ATTRIBUTE Trk Pa trunkCost (tcost)

Access
Read: All
Write: All

Description
This attribute is the cost metric for the trunk. This value is assigned by the network administration to represent the network cost of using this trunk. It can be related to distance, speed, dollars, or any other factor that could be taken into consideration.

If the trunkAttributeToMinimize is set to *trunkCost*, PORS finds a route with the smallest sum of the PathAdmin *trunkCost* attribute over all trunks. The trunk cost can be increased or decreased without disrupting the service to the link. If it is increased and the PORS optimization feature is enabled calls will move off this link to lower cost links when possible. If the cost is decreased new calls will be attracted to this link.

Values: Decimal (1..255)

Default: 128

### ATTRIBUTE Trk Pa overrideTrunkDelay (ovrtd)

Access: Read: All
Write: All

Description: This attribute specifies the override value of parent trunk's half round trip delay (propagation delay), which is used by the *PathAdmin* to negotiate the value of *negotiatedTrunkDelay.* A value of zero indicates that an override value has not been provided, and that the measured propagation delay value is used for negotiation.

Values: Decimal (0..1500)

Units: msec

Default: 0

### GROUP Trk Pa Oper

Properties: Operational

Description: This group contains all operational attributes relevant to path oriented and connectionless bandwidth utilization and path activity on a trunk.

### ATTRIBUTE Trk Pa state

Access: Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute gives the operational state of the *PathAdmin* component. The *PathAdmin* may be ***up, down, goingDown, staging*** or ***downWaitingRestage***. |
| Values | String (1..80, ASCII) |
| Default | No default |

### ATTRIBUTE Trk Pa usedLc (ulc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the total number of Logical Channels currently busy on the trunk. When this number reaches *maxLc*, no more paths are allowed to instantiate through this trunk. Note that it is possible for *usedLc* to be less than *maxLc* but for there to be no currently free *LogicalChannels*. This is because a *LogicalChannel* can be in one of several intermediate states between ***free*** and ***busy***. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk Pa negotiatedMaxLc (nmlc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the actual value of *maxLc* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s *maxLc* provisionable attributes the smaller of the two is chosen on both sides. This attribute reflects the minimum of these two *maxLc*'s. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk Pa maxReservableBwOut (mrbwo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute gives the total bandwidth that this *PathAdmin* is allowed to reserve. This number is computed by multiplying the parent trunk's *measuredSpeedToIf* attribute by the *maxReservedBwOut* provisionable attribute of this *PathAdmin*. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Trk Pa overReservedBwOut (orbwo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | When bumping is required to free up enough bandwidth for a new path there exists a short period of time when both the new path and the soon to be bumped path are occupying the same bandwidth. This means that the total amount of reserved bandwidth will exceed *maxReservableBwOut*. When this happens the *unreservedBwOut* attribute will be 0 and the *overReservedBwOut* attribute will be non-zero to indicate by how much we are currently overcommitted. This value should quickly drop back to zero as the bumping starts to clear the lower *holdingPriority* calls. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Trk Pa unreservedBwOut (urbwo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the total of amount of bandwidth that is still available for reservation by new connections. When this number reaches 0 the *PathAdmin* will no longer admit new connections to the trunk. This number represents available bandwidth in the outward going direction. To determine the inward available bandwidth you must query the *PathAdmin* at the other end of this *Trunk*. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Trk Pa clashCount (clcnt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the total number of path setup requests that resulted in an *LCh/n* or *Vcc/x.y* clash. A large value for this number is an indicator of poor performance by the *PathAdmin* in its allocation of *LCh/n* or *Vcc/x.y* components. In general the channels will be allocated in opposite orders at each end of the *Trunk* but this may not always be the case. Note that as the *PathAdmin* runs out of *LCh/n* or *Vcc/x.y* components the number of clashes will increase. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk Pa negotiatedSupportedTrafficTypes (nsttyp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the actual value of *supportedTrafficTypes* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s *supportedTrafficTypes* provisionable attributes the union of the two is chosen on both sides. This attribute reflects the union of these two *supportedTrafficTypes* 's. It is this union that is advertised to all other nodes in the network and which is used for routing decisions. |

| | |
|---|---|
| Set of | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | No default |

### ATTRIBUTE Trk Pa negotiatedTrunkSecurity (ntsec)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the actual value of the *trunkSecurity* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s *trunkSecurity* provisionable attributes the larger of the two is chosen on both sides. This attribute reflects the maximum of these two *trunkSecurity*'s. |
| Values | Decimal (0..7) |
| Default | No default |

### ATTRIBUTE Trk Pa negotiatedCustomerParameter (ncpar)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the actual value of customerParameter that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s customerParameter provisionable attributes the larger of the two is chosen on both sides. This attribute reflects the maximum of these two customerParameter's. |
| Values | Decimal (0..7) |
| Default | No default |

### ATTRIBUTE Trk Pa negotiatedTrunkCost (ntcost)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the actual value of *trunkCost* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s *trunkCost* provisionable attributes the larger of the two is chosen on both sides. This attribute reflects the maximum of these two trunkCost's. |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Trk Pa negotiatedAtmMode (namode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the actual value of *PathAdmin Atm mode* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. This is only applicable to ATM cards since the mode on non ATM hardware is not specified. The ***multiplexing*** mode implies that all voice traffic will be multiplexed onto the *Atm atmConnection Vcc* and all data will be multiplexed onto the *Trunk Atm atmConnection Vcc*. The ***mapping*** mode implies that each unique logical channel will be allocated its own *Vcc*. The mode ***notApplicable*** implies either this is not ATM hardware or that no *Atm* subcomponent exists under this or the peer *PathAdmin*. |
| Values | multiplexing (mux)<br>mapping (map)<br>notApplicable (na) |
| Default | No default |

### ATTRIBUTE Trk Pa negotiatedTrunkDelay (ntdel)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute gives the actual value of parent trunk's half round trip delay (propagation delay) that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmins* the larger of the two propagation delays is chosen on both sides. This attribute reflects the maximum of these two propagation delays. |
| Values | Decimal (0..1500) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Trk Pa negotiatedTrunkType (nttyp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the actual value of *trunkType* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s *trunkType* provisionable attributes the provisioned values are used on both sides. That is, both sides maintain their provisioned value.. |
| Values | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | No default |

### ATTRIBUTE Trk Pa adaptationLevel (adpl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current PORS adaptation level of the parent trunk. The adaptation mechanism is controlled by *Adaptation* group, which is used to alleviate the high utilization |

condition on the parent trunk.
0 - adaptation is not active.
1 - new calls are prevented from being established over the parent trunk.
2 - some connections starting from the lowest *holdingPriority* attempt to reroute their paths using alternate trunks.
3 - some connections starting from the lowest *holdingPriority* are bumped away from the parent trunk.

| | |
|---|---|
| Values | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE Trk Pa reservedBwOutByHp (rbw)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the total bandwidth reserved by paths for each of five (5) holding priorities. For example the bandwidth used by *holdingPriority* 0 paths is shown in the left most value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Replication | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Trk Pa attemptCountByHp (pacnt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the total number of path instantiation attempts this trunk has processed since its creation. This number includes successful and unsuccessful attempts. This attribute provides five (5) values of this count, one for each path *holdingPriority.* |
| Values | Decimal (0..4294967295) |
| Replication | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Trk Pa failCountByHp (pfcnt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the total number of path instantiation failures that have happened since the creation of this trunk. This attribute provides five (5) values of this count, one for each path *holdingPriority.* |
| Values | Decimal (0..4294967295) |
| Replication | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Trk Pa clearCountByHp (pccnt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the total number of path clear requests this trunk has processed since its creation. This attribute provides five (5) values of this count, one for each path *holdingPriority.* |

| Replication | Decimal (0..4) |
| Default | No default |

## GROUP Trk Pa Adaptation

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of provisionable attributes controls the PORS adaptive routing mechanism. Adaptation is triggered by high trunk utilization, and is used to alleviate the high utilization condition on the parent *Trunk/n* component.<br><br>For a *Trunk/n* with *an Unack* subcomponent, the link receive utilization (indicated by *utilization* of *Trunk/n)* is used for triggering adaptation.<br><br>For a *Trunk/n* with an *AtmAccess* subcomponent, the aggregation of the transmit VCCs utilization (indicated by *utilization* of *Trunk/n)*, VP utilization, and PORT utilization (normal port or IMA port if *Ima* is used) is used for triggering adaptation. |

## ATTRIBUTE Trk Pa maxAdaptationLevel (maxadpl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum adaptation level that the parent trunk can reach. It determines the highest degree of adaptation that can be triggered by high trunk utilization.<br><br>When the first degree of adaptation is triggered, new calls are prevented from being established over the parent trunk, and the *adaptationLevel* changes to level one (1).<br><br>When the second degree of adaptation is triggered, some connections starting from the lowest *holdingPriority* attempt to reroute their paths using alternate trunks, and the *adaptationLevel* changes to level two (2).<br><br>When the third degree of adaptation is triggered, some connections starting from the lowest *holdingPriority* are bumped away from the parent trunk, and the *adaptationLevel* changes to level three (3).<br><br>The configurable values are: |

0 - The adapation mechanism is disabled.
1 - Only the first degree of adaptation can be triggered.
2 - Up to two degrees of adaptation can be triggered.
3 - Up to three degrees of adaptation can be triggered.

Regardless of its value, the operator command *CLEAR -hotSwap or CLEAR* (without an option) can always be issued on a particular *LCh/n* to cause the entire path to be rerouted if possible or bumped.

Values: Decimal (0..3)

Default: 0

### ATTRIBUTE Trk Pa adaptationBandwidth (adpbw)

Access: Read: All
Write: All

Description: This attribute specifies the amount of bandwidth to be potentially freed up by rerouting connections if possible or freed up by bumping connections on the trunk when the second or third degree of adaptation is triggered.

The *adaptationBandwidth* value is used to determine the number of connections to be rerouted or bumped starting from the lowest *holdingPriority*, such that the total of the chosen connections reserved outgoing bandwidth *requiredTxBandwidth* reaches this *adaptationBandwidth* value.

If its value is greater than the *maxReservableBwOut* of *Trunk/n Pa*, the *maxReservableBwOut* amount of bandwidth is used for rerouting or bumping.

Values: Decimal (0..4294967295)

Units: bit/s

Default: 64000

### ATTRIBUTE Trk Pa adaptationThreshold (adpth)

Access: Read: All
Write: All

Description

This attribute specifies three utilization thresholds used to trigger the three degrees of adaptation. It is a vector indexed by (*level1*, *level2*, and *level3*).

While the PORS *adaptationLevel* is zero (0),
- if the trunk utilization has exceeded the *level1* value for the period of time specified by the *set* value of *adaptationHoldOffTime*, the first degree of adaptation is triggered. Meanwhile, the *Trunk/n Pa* component generates a SET alarm indicating that the PORS adaptation mechanism is active. The PORS *adaptationLevel* increases to level one (1).

While the PORS *adaptationLevel* is one (1),
- if the trunk utilization has exceeded the *level2* value for the period of time specified by the *set* value of *adaptationHoldOffTime*, the second degree of adaptation is triggered. The PORS *adaptationLevel* increases to level two (2).
- Otherwise, if the trunk utilization has exceeded the *level1* value for an additional period of time specified by the *set* value of *adaptationHoldOffTime*, the PORS *adaptationLevel* remains unchanged.
- Otherwise, if the trunk utilization has subsequently fallen back to a level at or below the *level1* value for the period of time specified by the *clear* value of *adaptationHoldOffTime*, new calls are allowed to be established over the parent trunk. Meanwhile, the *Trunk/n Pa* component generates a CLEAR alarm indicating that the PORS adaptation mechanism is no longer active. The PORS *adaptationLevel* decreases to level zero (0).

While the PORS *adaptationLevel* is two (2),
- if the trunk utilization has exceeded the *level3* value for the period of time specified by the *set* value of *adaptationHoldOffTime*, the third degree of adaptation is triggered. The PORS *adaptationLevel* increases to level three (3).
- Otherwise, if the trunk utilization has exceeded the *level2* value for an additional period of time specified by the *set* value of *adaptationHoldOffTime*, the second degree of adaptation is triggered again, and the PORS *adaptationLevel* remains unchanged.
- Otherwise, if the trunk utilization has subsequently fallen back to a level at or below the *level2* value for the period of time

specified by the *clear* value of *adaptationHoldOffTime*, the PORS *adaptationLevel* decreases to level one (1).

While the PORS *adaptationLevel* is three (3),
- if the trunk utilization has exceeded the *level3* value for an additional period of time specified by the *set* value of *adaptationHoldOffTime*, the third degree of adaptation is triggered again, and the PORS *adaptationLevel* remains unchanged.
- Otherwise, if the trunk utilization has subsequently fallen back to a level at or below the *level3* value for the period of time specified by the *clear* value of *adaptationHoldOffTime*, the PORS *adaptationLevel* decreases to level two (2).

For a *Trunk/n* with an *Unack* subcomponent, the link receive utilization (indicated by *utilization* of *Trunk/n*) is monitored against the thresholds. Since the trunk application solely owns the physical link, the maximum link receive utilization is 100%. The restrictions on the setting of the three thresholds are:
- when *maxAdaptationLevel* is 1, the value of *(level1)* must be in the range of 0% to 100%.
- when *maxAdaptationLevel* is 2, the values of *(level1* and *level2)* must be the range of 0% to 100%, and the value of *level1* must be less than or equal to the value of *level2*.
- when *maxAdaptationLevel* is 3, the values of (*level1*, *level2*, and *level3*) must be in the range of 0% to 100%, and the value of *level1* must be less than or equal to the value of level2, which must be less than or equal to the value of level3.

For a *Trunk/n* with an *AtmAccess* subcomponent, the aggregation of transmit VCCs utilization (indicated by *utilization* of *Trunk/n*), VP utilization, and PORT utilization (normal port or IMA port if *Ima* is used) is monitored against the thresholds. Since the trunk application shares a physical link with other applications, both the VCCs and VP utilizations can exceed 100%, and the value 200% is chosen as the maximum calculated utilization for VCCs and VP, so all thresholds can take on any value in the range of 0% to 200%. The restrictions on the setting of the three thresholds are:
- when *maxAdaptationLevel* is 2, the value of *level1* must be less than or equal to the value of *level2*.

- when *maxAdaptationLevel* is 3, the value of *level1* must be less than or equal to the value of level2, which must be less than or equal to the value of level3.

| | |
|---|---|
| Vector of | Decimal (0..200) |
| Units | % |
| Index | level1<br>level2<br>level3 |
| Default | (level1: 75, level2: 85, level3: 95) |

### ATTRIBUTE Trk Pa adaptationHoldOffTime (adpho)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies two interval times. It is a vector indexed by (*set clear*). The *set* value specifies the period of time for which the trunk utilization must be above the utilization threshold specified by *adaptationThreshold* before the corresponding degree of adaptation is triggered. The *clear* value specifies the period of time for which the trunk utilization must be at or below the utilization threshold specified by *adaptationThreshold* before the PORS *adaptationLevel* is decreased by one (1). |
| Vector of | Decimal (5..60) |
| Units | minutes |
| Index | set<br>clear |
| Default | ([2] 30) |

### COMPONENT Trk Pa AtmAccess (Atm)

| | |
|---|---|
| Groups | "GROUP Trk Pa Atm Prov" |
| Scope | Network |
| Description | *Trunk/n PathAdmin AtmAccess*<br>This subcomponent is optionally added to the *PathAdmin* component on ATM hardware. |

Without this subcomponent the *PathAdmin* will transport all Path Oriented traffic as AAL5 encapsulated cells on the *Trunk AtmAccess localConnection* VCC.
With this subcomponent added under the *PathAdmin* the *PathAdmin* will operate in one of two modes. These modes are referred to as mapping and multiplexing and the selection of the mode is done by setting the *PathAdmin AtmAccess mode* attribute to either ***mapping*** or ***multiplexing***.
When the mode is set to ***mapping***, the *PathAdmin* will create new VCCs for each new *LCh* that it sets up. In mapped mode the CPU usage is normally 0 for a connection and so the ATM FP can support a great many more mapped mode connections than it can multiplexed mode connections. Connections whose *maximumTransmissionUnit* is exactly 45 will use the SPO adaption layer to efficiently fit a single voice frame into a single cell with minimum overhead. All other connections will use the AAL5 adaption layer protocol.
When the mode is set to ***multiplexing***, the *PathAdmin* will look at the attribute *atmConnection* which points to a second provisioned ATM VCC. The *PathAdmin* will then multiplex voice frames onto this second VCC using a proprietary Short Path Oriented adaption layer which encapsulates one voice frame into one voice cell with low overhead. The *PathAdmin* will multiplex all non voice traffic over the *Trunk/n AtmAccess atmConnection* VCC using the AAL5 protocol.

## GROUP Trk Pa Atm Prov

Properties: Provisioned

Description: This group of attributes provides the parameters used by the *AtmAccess* component for specifying access to an ATM interface.

### ATTRIBUTE Trk Pa Atm atmConnection (ac)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the component name of the ATM Virtual Circuit that the *AtmAccess* component will use. The format of the component name is *AtmIf/n Vcc/x.y Nep* |
| Values | Link (Service, applicationName) |
| Default | No default |

### ATTRIBUTE Trk Pa Atm mode (mode)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the operating mode of the PathAdmin. When set to ***multiplexing*** the *PathAdmin* to multiplex voice calls to the given atmConnection using single cell per voice packet transport. All other calls will be multiplexed using AAL5 over the Trunk's VCC. When set to ***mapping*** the *PathAdmin* will allocate a VCC per *LCh/n*. In ***mapping*** mode the *atmConnection* should not be set. The VCC chosen for a given connection can be seen in the *LCh localConnection* attribute. |
| Values | multiplexing (mux)<br>mapping (map) |
| Default | multiplexing |

### COMPONENT Trk LogicalChannel (LCh)

| | |
|---|---|
| Instance | Decimal (1..65535) |
| Groups | "GROUP Trk LCh Oper" |
| Scope | Application |
| Description | *Trunk/n LogicalChannel/n*<br>This component is automatically created when a new path sets up over the *Trunk* and is deleted when that path terminates. An application component name followed by a series of |

*LogicalChannel* component names followed by an application component name serve to uniquely identify a path. Issuing a *clear* to this component will cause the entire path to collapse and all resources to be freed. Normally the end point components will attempt to reroute after a clear and may even reroute over this same trunk.

## VERB CLEAR Trk LCh

Impact: Service

Description: *Clear [-hotSwap] <component name>*
Clearing an *LCh* (with no options specified) causes the entire path to be abruptly terminated and its resources freed. The end point applications see a disruption in service while their *LC*s attempt to find new routes. It is possible that the new route may go right back over the trunk from which it was cleared. Clearing is normally used in conjunction with a trunk lock. The trunk is locked and its *LCh/n* manually cleared. This is more controlled than to *lock force* a trunk.

**Options:**
*-hotSwap*
If this option is present, the entire path is not terminated abruptly. Instead, the end point application sends traffic using the existing path while its *LC* attempts to find an alternate route. If an alternate route is found and a path is established, the data traffic is swapped from the current path to the alternate path, the current path is terminated, and the alternate path becomes the current path. Otherwise, if an alternate route is not found, the existing path continues to be used.

When '*clear -hotSwap*' is issued against an *LCh/n* which is on a ***manual*** or ***forced*** path, the path gets re-setup.

## GROUP Trk LCh Oper

Properties: Operational

| | |
|---|---|
| Description | This group contains all operational attributes pertaining to the *Logical Channel* component owned by this trunk. |

### ATTRIBUTE Trk LCh nextHop (nhop)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | The *nextHop* is the name of the component across the bus which is forwarding packets to us. Inversely the *nextHop* of our *nextHop* component is us. More precisely, *LCh/n* components point to each other across the bus via their *nextHop* attributes. In the case where the next hop is an application the *nextHop* attribute will indicate the component name of this application. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Trk LCh setupPriority (sp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the priority at which a path is established. Zero (0) is the highest priority and four (4) is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (or numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Trk LCh holdingPriority (hp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the priority that a path holds once it is established. Zero (0) is the highest priority and four (4) is the |

lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (or numerically less) than the existing path's *holdingPriority*.

Values: Decimal (0..4)

Default: No default

### ATTRIBUTE Trk LCh emissionPriority (ep)

Access: Read: All
Write: Illegal

Description: This attribute indicates the urgency with which packets on the *LCh*'s path are emitted by this trunk. The *emissionPriority* translates into the trunk's emission queue. Zero (0) indicates the highest *emissionPriority*, while three (3) indicates the lowest. Packets with a higher *emissionPriority* (or numerically less) are put on an emission queue which is serviced before a queue which accepts packets of a lower *emissionPriority* and hence experience smaller delays traversing congested trunks.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Trk LCh discardPriority (dp)

Access: Read: All
Write: Illegal

Description: This attribute indicates the importance of the packets on the path. Zero (0) is used for paths carrying the most important traffic, and two (3) is used for paths carrying the least important traffic. In times of congestion, the *discardPriority* is used by packet forwarding on the trunk to determine which packets are discarded first to reduce the load. Packets with a higher *discardPriority* (or numerically less) are discarded after packets with a lower *discardPriority* (or numerically higher).

Values: Decimal (0..3)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Trk LCh requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the bandwidth (in bits per second units) reserved by this *LCh/n* for emitting packets on the trunk. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Trk LCh requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the bandwidth (in bits per second units) reserved by this *LCh/n* for receiving packets on the trunk. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Trk LCh mode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the operational mode of the *LogicalChannel* component. It indicates what kind of transport is being performed on the packets in the channel. There are 7 possible values of this attribute as follows:<br><br>***unknown*** - not currently in busy state, type of forwarding not determined yet.<br><br>***hdlcFrmMux*** **-** frames are being multiplexed (multiple *LCh/n* on same port or channel) using HDLC encapsulation. |

***aal5FrmMux*** - frames are being multiplexed (multiple *LCh/n* on same ATM VCC) using the AAL5 segmentation and recombination protocol.

***spoFrmMux*** - frames are being multiplexed (multiple *LCh/n* on same ATM VCC) using the Short Path Oriented segmentation and recombination protocol. This is a proprietary protocol which encapsulates voice frames into a single ATM cell unlike AAL5 which would require two cells to transport the 45 byte voice frames.

***aal5FrmMap*** - frames are being mapped (a single *LCh/n* per ATM VCC) using the AAL5 segmentation and recombination protocol. AAL5 mapped frames are forwarded by hardware in both directions and require no CPU intervention.

***spoFrmMap*** - frames are being mapped (a single *LCh/n* per ATM VCC) using the Short Path Oriented segmentation and recombination protocol. SPO mapped frames are forwarded by hardware in both directions and require no CPU intervention in all but one special case. In particular CPU is required only if frames are being forwarded to an *LCh/n* whose *mode* is ***spoFrmMux***.

***cellMap*** - ATM cells are being relayed directly over the bus with no segmentation and recombination protocol. The segmentation and recombination is only done at transition points between frame based cards and ATM cell based cards so this hop represents a pure tandem cell hop, ATM card to ATM card. No CPU is required to process these cells.

Values

unknown (unknwn)
hdlcFrmMux (hdlcMx)
aal5FrmMux (al5Mux)
spoFrmMux (spoMux)
spoFrmMap (spoMap)
aal5FrmMap (al5Map)
cellMap (celMap)

Default

No default

### ATTRIBUTE Trk LCh maximumTransmissionUnit (mtu)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives the size of the largest frame this service will send. A value of 0 means that the *Mtu* is unknown. A value of 45 or less (but non zero) means that ATM single cell transport will be used wherever possible. Otherwise ATM AAL5 adaption layer transport will be required to handle all frames. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Trk LCh localConnection (lcon)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | The *localConnection* attribute specifies the name of the connection on the local interface. On ATM hardware this is in the form *AtmIf/n Vcc/x.y*. On non ATM hardware this attribute is empty. |
| Values | The name of the component |
| Default | No default |

### COMPONENT Trk PorsStatistics (PorsStats)

| | |
|---|---|
| Groups | "GROUP Trk PorsStats Operational (Oper)" |
| Scope | Application |
| Description | *Trunk/n PorsStatistics*<br>This is a dynamic subcomponent of a *Trunk* which appears when a *PathAdmin* component is provisioned under the *Trunk* supporting interrupting priority queue. It contains statistics associated with PORS traffic for a *Trunk* component. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Trk PorsStats Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This operational group provides the PORS Trunks interrupting and normal traffic statistics for operator console display. |

## ATTRIBUTE Trk PorsStats porsNormPktFromIf (normPkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of normal priority packets received on the PORS Trunk normal priority queue. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Trk PorsStats porsNormDiscUnforwardFromIf (normDisc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of normal priority packets discarded from the PORS Trunk normal priority queue. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Trk PorsStats porsNormOctetFromIf (normOctet)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of normal priority bytes received on the PORS Trunk normal priority queue.This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Trk PorsStats porsIntPktFromIf (intPkt)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of interrupting priority packets received on the PORS Trunk interrupting priority queue. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Trk PorsStats porsIntDiscUnforwardFromIf (intDisc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of interrupting priority packets discarded from the PORS Trunk interrupting priority queue. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Trk PorsStats porsIntOctetFromIf (intOctets)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of interrupting priority bytes received on the PORS Trunk interrupting priority queue. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Trk PorsStats pktFromIfByPrio (pktBp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of PORS packets received by the *Trunk*. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*. These counters wrap around to zero when the maximum value is exceeded. |

| | | |
|---|---|---|
| Array of | Long Integer | |
| Row | ep<br>ep1<br>ep2] | [ep0 |
| Column | dp<br>dp1<br>dp2<br>dp3] | [dp0 |
| Default | No default | |

### ATTRIBUTE Trk PorsStats discPktFromIfByPrio (discBp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of PORS packets received from the remote module that have been discarded. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*. These counters wrap around to zero when the maximum value is exceeded. |

| Column | dp<br>dp1<br>dp2<br>dp3] | [dp0 |
| Default | No default | |

### ATTRIBUTE Trk DprsStats octetFromIfByPrio (octBp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of DPRS octets received by the *Trunk*. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*. These counters wrap around to zero when the maximum value is exceeded. |

| | | |
|---|---|---|
| Array of | Long Integer | |
| Row | ep<br>ep1<br>ep2] | [ep0 |
| Column | dp<br>dp1<br>dp2<br>dp3] | [dp0 |
| Default | No default | |

## COMPONENT Trk Address (Addr)

| | |
|---|---|
| Instance | String (1..40, ASCII) |
| Groups | "GROUP Trk Addr Prov" |
| Scope | Application |
| Description | *Trunk/n Address*<br>This subcomponent is optionally added to the *Trunk* component to specify an NSAP address of a single destination that can be reached through that trunk, or to specify an NSAP address prefix which describes a set of destinations that can be reached through that trunk. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Trk Addr Prov

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes specifies the provisionable characteristics of the *TrkReachableAddress* component. |

## ATTRIBUTE Trk Addr cost (cost)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a cost of using the trunk to reach a destination or destinations described by *TrkReachableAddress* component. The value is assigned by the network administrator to represent the network cost of using this trunk. It can be related to distance, speed, dollars, or any other factor that could be taken into consideration. |
| Values | Decimal (0..65435) |
| Default | 200 |

# COMPONENT TransportResource (Trm)

| | |
|---|---|
| Scope | Network |
| Description | *TransportResource*<br>This component resides on all Passport modules and is responsible for managing link resources. It acts as an intermediary between a link and all the routing systems that use the link. |
| Dyn. Subcomp. | "COMPONENT Trm Link (Lk)"<br>"COMPONENT Trm LinkGroup (Lg)" |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Trm Link (Lk)

| | |
|---|---|
| Instance | Decimal (1..1023) |
| Groups | "GROUP Trm Lk Operational (Oper)"<br>"GROUP Trm Lk ForwardingStatistics (FwdStats)" |
| Scope | Network |
| Description | *Trm Link/<n>*<br>This component is a dynamic subcomponent of *TransportResource*. It has operational attributes only which are stored and maintained by this component for listing links. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP Trm Lk Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | *Trm Lk/<n> Operational*<br>This group of attributes is used to list links. These links are all registered with Transport Resource Manager. They have a status which reflects the current view of the link. |

## ATTRIBUTE Trm Lk status

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the inactive link is disabled, joining, waiting to join, or in standby mode.<br><br>***inactive*** - The link is known to TRM but is not active. This can mean that it is disabled, or has not yet started to join.<br>***joining*** - The link has requested to join the routing systems.<br>***online***- The link is active and has joined one or more routing systems. |
| Values | inactive<br>joining<br>online |
| Default | No default |

## ATTRIBUTE Trm Lk throughput

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the throughput of the link in kbit/s. This value represents a nominal bandwidth available for connectionless traffic, after the maximum reserved for path-oriented traffic has been subtracted from trunk bandwidth. If a |

| | |
|---|---|
| | trunk speed override is specified, it is used instead. The “throughput” value can be exceeded by connectionless traffic whenever path-oriented traffic is not using it’s reserved bandwidth. |
| Values | Decimal (1..640000000) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Trm Lk maxTxUnit

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum data unit in bytes of this link. It represents the maximum frame length (including user data and routing headers) that can be sent on the link. |
| Values | Decimal (1..65535) |
| Units | bytes |
| Default | No default |

### ATTRIBUTE Trm Lk linkComponentName

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the link’s component name. A link is either a trunk or a gateway to another module. The component name may be used to obtain additional information from the link system. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Trm Lk delay

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the round trip delay of the link in milliseconds. This value represents a nominal delay for connectionless traffic. Connectionless traffic is biased away from trunks carrying path-oriented traffic by increasing this value. The |

| | |
|---|---|
| | value of this attribute is a function of the percentage of reserved path-oriented bandwidth and takes a maximum value of 1500 msec for 100% path-oriented trunks. If a delay override is specified, it will be used instead. |
| Values | Decimal (1.0..1500.0) |
| Units | msec |
| Default | No default |

### GROUP Trm Lk ForwardingStatistics (FwdStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes is used to display egress statistics collected by packet forwarding on this link. The statistics can be used to monitor congestion conditions and packet discards on a link. |

### ATTRIBUTE Trm Lk fciSet

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets whose FCI bits are set by packet forwarding due to congestion on this link, and when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..2147483647) |
| Default | No default |

### ATTRIBUTE Trm Lk overflowAttempts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times DPRS packet forwarding attempts to overflow packets to another link in a link group due to congestion on this link. It is used only when the *forwardingPolicy* attribute in the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. |

| | |
|---|---|
| | This counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..2147483647) |
| Default | No default |

### ATTRIBUTE Trm Lk pathOverflowAttempts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times DPRS packet forwarding<br>attempts to overflow packets to another link group due to congestion on the link group of this link. It is used only when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This counter wraps around to zero when the maximum value is reached. |
| Values | Decimal (0..2147483647) |
| Default | No default |

### ATTRIBUTE Trm Lk discardCongested

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets that have been discarded by packet forwarding due to congestion on this link and when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***.<br><br>This attribute is a vector with three entries. Each entry corresponds to a discard priority of the packet. The first entry represents the discard count of packets with discard priority 1, the second entry discard priority 2, and the third entry discard priority 3. Each entry (counter) wraps around to zero when the maximum value is reached. |
| Vector of | Decimal (0..2147483647) |
| Index | discardPriority_1 (dp1)<br>discardPriority_2 (dp2)<br>discardPriority_3 (dp3) |

| | |
|---|---|
| Default | No default |

## COMPONENT Trm LinkGroup (Lg)

| | |
|---|---|
| Instance | String (1..12, ASCII) |
| Scope | Network |
| Description | *Trm LinkGroup /<neighborNodeName>*<br>This component is a dynamic subcomponent of *TransportResource*. It has operational attributes only which are stored and maintained by this component for the purpose of displaying link groups.<br><br>A link group contains 1 to 4 links, all of which are active.<br><br>The neighbor node name is the node name provisioned in the *Module* component on the remote Passport module if the link group connects to a Passport switch. Otherwise it is the remote module node name provisioned in the components of gateways in this link group.<br><br>Links in a link group can have differing throughputs and round trip delays. If the difference within the set of throughputs, or within the set of delays is significant, some links may not be used. The rule that is applied is that links within 50% of the throughput of the highest throughput link are used for the throughput RCOS. similarly links within 50% of the delay of the lowest delay link are used for the throughput RCOS. As links are added or removed from the link group, the set of links which are used is re-evaluated. |
| Dyn. Subcomp. | "COMPONENT Trm Lg Link (Lk)"<br>"COMPONENT Trm Lg LogicalNetworkNumber (LNN)" |

## COMPONENT Trm Lg LogicalNetworkNumber (LNN)

Instance: Decimal (0..2047)

Groups: "GROUP Trm Lg LNN Operational (Oper)"

Scope: Network

Description: *Trm Lg/<neighborNodeName> LNN /<logical network number>*
This component is a dynamic subcomponent of *LinkGroup*. It has operational attributes only which are stored and maintained by this component for displaying address plans supported over this link group. A logical network number (which is used as an instance to this component) uniquely identifies an address plan and its traffic in a Passport network.

Common Verbs:
Help
List
Display

## GROUP Trm Lg LNN Operational (Oper)

Properties: Operational

Description: *Trm Lg/<neighborNodeName> LNN/<logical network number> Operational*
This group of attributes is the information associated with an address plan.

## ATTRIBUTE Trm Lg LNN linkType

Access: Read only

| | |
|---|---|
| Description | This attribute indicates how the LNN is transported over the link group. It can be one of three types:<br>*trunk* - the LNN is supported by Topology over a Passport to Passport link<br>*internal gateway* - the LNN is supported by an address plan (but not Topology) over a Passport to Passport link<br>*external gateway* - the LNN is supported by an address plan (but not Topology) over a Passport to non-Passport link |
| Values | trunk<br>internalGateway<br>externalGateway |
| Default | No default |

### ATTRIBUTE Trm Lg LNN addressPlanComponentName (addrPlanCompName)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the component name of the address plan which owns the logical network number of this component. |
| Values | The name of the component |
| Default | No default |

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Usc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Usc* component. |

## ATTRIBUTE Usc linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor that the *UmtsSubscriberControl (Usc)* and its subcomponents are provisioned on.<br><br>Changing the value of this attribute causes the card to be reset and all the subscribers using this *Usc* component will be disconnected. |

| | |
|---|---|
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Usc sgsnNumber (sgsnNum)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the designated E.164 number for this USGSN. This is used to associate the USGSN in the Home Location Register (HLR) with the MSC-VLR, to identify the USGSN in the SS7 network, and to identify the routing capabilities.<br><br>Changing the value of this attribute causes the card to be reset and all the subscribers using this *Usc* component will be disconnected. |
| Values | String (8..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Usc maxAttachedSubscribers (maxSubs)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum attached subscribers for this instance of UMTS Subscriber Control (*Usc*).<br><br>The current attached subscribers can be obtained from the attribute *currentlyAttached* defined in the *GprsMobilityManagement (Gmm)* component.<br><br>Changing the value of this attribute causes the card to be reset and all the subscribers using this *Usc* component will be disconnected.<br><br>This attribute together with currentlyAttached are used to |

| | |
|---|---|
| | determine when subscriber count overload occurs (Refer to *Usc* subCountOvldAttachesDiscarded). |
| Values | Decimal (1..1000000) |
| Default | 500 |

### ATTRIBUTE Usc maxActiveSessions (maxActSess)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum simultaneous active sessions supported in this UMTS Subscriber Control (*Usc*).<br><br>Changing the value of this attribute causes the card to be reset and all the subscribers using this *Usc* component will be disconnected |
| Values | Decimal (1..600000) |
| Default | 1500 |

### ATTRIBUTE Usc linkToDnsAgent (lToDns)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to the *DnsAgent* to be used by the *UmtsSubscriberControl* entities. |
| Values | Link (Service, linkToDnsClient) |
| Default | No default |

### ATTRIBUTE Usc linkToLisp

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to the *LawfulIntercept* to be used by the *UmtsSubscriberControl* entities. |
| Values | Link (Service, linkToLiClient) |

Default No default

### ATTRIBUTE Usc localPointCode (localPc)

Access Read: All
Write: All

Description This attribute specifies the point code of the node that the MAP layer manages.

The point code must be provisioned in one of the following formats:

***basic***: The point code is provisioned as a decimal number in the range 1..16383 if the value of the attribute *sccpVariant* in *Usc/n MapClient* is set to ***itu.***

The point code is provisioned as a decimal number in the range ***1..16777215*** if the value of the attribute *sccpVariant* in *Usc/n MapClient* is set to ***ansi*** or ***ituChinese.***

***segmented***: The point code is provisioned as three integers, separated by dots.

If the value of the attribute *sccpVariant* in *Usc/n MapClient* is set to ***itu,*** the first integer must be in the range ***0..7***, the second integer must be in the range ***0..255***, and the third integer must be in the range ***0..7***. A value of ***0.0.0*** is not valid.

If the value of the attribute *sccpVariant* in *Usc/n MapClient* is set to ***ansi*** or ***ituChinese,*** all the three integers must be in the range ***0..255***.

A value of ***0.0.0*** or ***0*** is not valid.

Values Integer Sequence

Default No default

### GROUP Usc OsiState (State)

Properties Operational

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Usc adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Usc operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Usc usageState (osiUsage)

Access

Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

## ATTRIBUTE Usc availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

### ATTRIBUTE Usc proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Usc controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Usc alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Usc standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Usc unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Usc Statistics (Stats)

Properties
Operational

Description
This group contains the statistical attributes for the Mobile Subscriber Purge functionality on the (UMTS) Serving GPRS Support Node (USGSN or SGSN).

### ATTRIBUTE Usc explicitDetachPurge (expDetPurge)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated due to an explicit mobile detach. Mobile Subscriber Purge requests are initiated upon explicit detach when the *purgeOnExplicitDetach* attribute in (U) SGSN MobileSubscriberPurge is enabled.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc operatorInitiatedPurge (opInitPurge)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated by the operator.<br><br>An operator initiated the Mobile Subscriber Purge request by issuing the *clear* command on an (U) SGSN *Imsi* component.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc contextReusePurge (crPurge)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated due to context reuse.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Usc periodicAuditPurge (auditPurge)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated due to periodic audit. During a periodic audit, Mobile Subscribers whose age is greater than the value specified by the auditPurgeMinimumInactiveAge attribute in (U) SGSN MobileSubscriberPurge are considered candidates for purge.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc msPurgeAckFailures (ackFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge Acknowledgement Failures received from the Home Location Register (HLR).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc msPurgeSendFailures (sendFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests that were not sent from the (UMTS) Serving GPRS Support Node (USGSN or SGSN) due to network related faults such as SIG failure.<br><br>The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a |

| | |
|---|---|
| | mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc OvldScOper

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for overload controls for the *Gsc* and *Usc* components. |

### ATTRIBUTE Usc cpuOvldAttachesDiscarded (cpuOvldAttDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of GPRS Mobility Management (GMM) attach request messages that are discarded due to a CPU overload condition on the GSC and USC applications.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc cpuOvldActivationsDiscarded (cpuOvldActDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Session Management (SM) session activate request messages that are discarded due to CPU overload on the GSC and USC applications.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc subCountOvldAttachesDiscarded (subOvldAttDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of GPRS Mobility Management (GMM) attach request messages that are discarded due to subscriber count overload, which occurs when the value of the *currentlyAttached* attribute is equal to the value of the *maxAttachedSubscribers* attribute.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc OvldOper

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for overload controls. |

### ATTRIBUTE Usc cpuOvldMovingAvg (cpuOvldAvg)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the CPU moving average calculated from within the defined moving window, the size of which is determined by the value of *cpuOvldWindowSize attribute*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Usc cpuOvldWindowSize (cpuOvldWinSz)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the CPU moving average window size. The window size is the duration over which the CPU usage |

measurements are taken before the average CPU usage is calculated. CPU measurements are separated by a fixed interval.

Values: Decimal (0..4294967295)

Units: seconds

Default: 60

# COLLECTED STATS UsgsnSubscriberControl

Description: The statistics record generated by the UsgsnSubscriberControl component.

### ATTRIBUTE Usc cpuOvldAttachesDiscarded (cpuOvldAttDisc)

Description: This attribute counts the number of GPRS Mobility Management (GMM) attach request messages that are discarded due to a CPU overload condition on the GSC and USC applications.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc cpuOvldActivationsDiscarded (cpuOvldActDisc)

Description: This attribute counts the number of Session Management (SM) session activate request messages that are discarded due to CPU overload on the GSC and USC applications.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc subCountOvldAttachesDiscarded (subOvldAttDisc)

Description: This attribute counts the number of GPRS Mobility Management (GMM) attach request messages that are discarded due to subscriber count overload, which occurs when the value of the *currentlyAttached* attribute is equal to the value of the *maxAttachedSubscribers* attribute.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc cpuOvldMovingAvg (cpuOvldAvg)

| | |
|---|---|
| Description | This attribute indicates the CPU moving average calculated from within the defined moving window, the size of which is determined by the value of *cpuOvldWindowSize* attribute.<br><br>The value of the attribute is set at the end of the collection interval. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Usc explicitDetachPurge

| | |
|---|---|
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated due to an explicit mobile detach. Mobile Subscriber Purge request are initiated upon explicit detach when the *purgeOnExplicitDetach* attribute in (U) SGSN MobileSubscriberPurge is enabled.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc operatorInitiatedPurge

| | |
|---|---|
| Description | This attribute counts the number of Mobile Subscriber (MS) Purge requests initiated by the operator.<br><br>An operator initiates the Mobile Subscriber Purge request by issuing the *clear* command on an (U) SGSN *Imsi* component.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc contextReusePurge

| | |
|---|---|
| Description | This attribute counts the number of Mobile Subscriber (MS) Purge requests initiated due to memory reuse.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc periodicAuditPurge

Description: This attribute counts the number of Mobile Subscriber (MS) Purge requests initiated due to periodic. During a periodic audit, detached Mobile Subscribers whose age is greater than the value specified by the auditPurgeMinimumInactiveAge attribute in (U) SGSN MobileSubscriberPurge are considered candidates for purge.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc msPurgeAckFailures

Description: This attribute counts the Mobile Subscriber (MS) Purge Acknowledgement Failures received by the (UMTS) Serving GPRS Support Node (USGSN or SGSN) from the Home Location Register (HLR).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc msPurgeSendFailures

Description: This attribute counts the Mobile Subscriber (MS) Purge requests that were not sent from the (UMTS) Serving GPRS Support Node (USGSN or SGSN) due to network related faults such as SIG failure and so on.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Usc GtpC

Groups:
"GROUP Usc GtpC Provisioned (Prov)"
"GROUP Usc GtpC Operational (Oper)"
"GROUP Usc GtpC WlcCustomCounters (WlcCustomCntr)"
"GROUP Usc GtpC OsiState (State)"

"COLLECTED STATS UsgsnSubscriberControl GtpC"

Scope: Application

| | |
|---|---|
| Description | *Usc/n GtpC*<br><br>This component represents the control plane (signalling traffic) of the GPRS Tunnelling Protocol (GTP) layer used over the Gn and Gp interfaces. |
| Dyn. Subcomp. | "COMPONENT Usc GtpC GtpPath (Path)" |
| Common Verbs | Help<br>List<br>Display |

### VERB Zero Usc GtpC

| | |
|---|---|
| Impact | Service |
| Description | *Zero Usc/n GtpC*<br><br>This command resets all the peak attributes in the *Usc/n GtpC* component. |

### GROUP Usc GtpC Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the control plane (signalling traffic) of the GPRS Tunnelling Protocol layer (GTP-C) used over the Gn and Gp interfaces. |

### ATTRIBUTE Usc GtpC maxGtpPaths (maxPaths)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of paths that can be setup between this UMTS Serving GPRS Support Node (USGSN) and the GPRS Support Nodes (GSNs). Each path contains one or more tunnels which may be used by, for example, PDP Contexts.<br><br>The peak number of paths can be obtained from the attribute *peakGtpPaths*. The current number of paths can be obtained from |

the attribute *currentGtpPaths.*

Changing the value of this attribute causes the card to be reset and all outstanding transactions will be affected.

Values: Decimal (1..65535)

Default: 10

### ATTRIBUTE Usc GtpC maxTransactions (maxTr)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies the maximum number of outstanding GPRS Tunneling Protocol (GTP) messages that can be simultaneously waiting for responses or acknowledgments from the peer GPRS Support Nodes (GSNs).

The peak number of transactions can be obtained from the attribute *peakTransactions*. The current number of transactions can be obtained from the attribute *currentTransactions.*

Changing the value of this attribute causes the card to be reset and all outstanding transactions will be affected.

Values: Decimal (10..65535)

Default: 100

### ATTRIBUTE Usc GtpC linkToPort (lToPort)

Access: Read: All
Write: All

Description: This attribute specifies the IP Address and the UDP port numbers that the GPRS Tunneling Protocol (GTP) version 0 and version 1 respectively use to communicate with the Gateway GPRS Support Node (GGSN).

The IP Address and UDP Port are specified by setting this attribute to link to the correct *Gips IpAddress Port Udp*

component.

The standards recommend the value of the first member of this list (used by GTP Version 0) to be set to ***Gips IpAddress/ <ipaddress> Port Udp/3386***

The standards recommend the value of the second member of this list (used by GTP Version 1) to be set to ***Gips IpAddress/ <ipaddress> Port Udp/2352***

Changing the value of this attribute causes all the outstanding transactions to be affected.

| | |
|---|---|
| List of | Link (Service, linkToApplication) |
| Default | No default |

### GROUP Usc GtpC Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes of the control plane (signalling traffic) of the GPRS Tunnelling Protocol (GTP) layer used over the Gn and Gp interfaces. |

### ATTRIBUTE Usc GtpC peakGtpPaths (peakGtpP)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the peak number of managed paths that have been setup between this UMTS Serving GPRS Support Node (USGSN) and the GPRS Support Nodes (GSNs).<br><br>The maximum value is provisioned in the attribute *maxGtpPaths* and the current value is indicated by the *currentGtpPaths* attribute. The value of this attribute indicates the peak value attained by the *currentGtpPaths* attribute.<br><br>The *Zero* verb resets the value of this attribute to the current number of GTP paths. |
| Values | Decimal (0..65535) |

Default — No default

### ATTRIBUTE Usc GtpC pathFailures (pathFail)

Access — Read: All
Write: Illegal

Description — This attribute counts the path failures detected by GTPC, based on the attribute *strictPathSupervision*, provisioned in *Usgsn Usc*.

If *strictPathSupervision* has the value ***enabled,*** failure of the remote end to respond to any GTP request will result in path failure being declared.

If *strictPathSupervision* has the value ***disabled***, then failure of the remote end to respond to an echo request will be marked as a path failure, but all other failures will not be detected.

The counter wraps to zero when its maximum value is exceeded.

Values — Decimal (0..4294967295)

Default — No default

### ATTRIBUTE Usc GtpC peakTransactions

Access — Read: All
Write: Illegal

Description — This attribute indicates the peak number of transactions between this UMTS Serving GPRS Support Node (USGSN) and the GPRS Support Nodes (GSNs).

The maximum value is provisioned in the *maxTransactions* attribute and the current value is indicated by the *currentTransactions* attribute. The value of this attribute indicates the peak value attained by the *currentTransactions* attribute.

The *Zero* verb resets the value of this attribute to the current number of Transactions.

Values — Decimal (0..65535)

Default — No default

### ATTRIBUTE Usc GtpC currentGtpPaths (currGtpP)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of managed paths currently maintained that have been setup between this UMTS Serving GPRS Support Node (USGSN) and the GPRS Support Nodes (GSNs).<br><br>The maximum value is provisioned in the *maxGtpPaths* attribute and the peak value attained by this attribute is indicated by the *peakGtpPaths* attribute. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Usc GtpC currentTransactions (currTr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of outstanding transactions between this UMTS Serving GPRS Support Node (USGSN) and the GPRS Support Nodes (GSNs). It is the sum of the outstanding requests in each path.<br><br>The maximum value is provisioned in the *maxTransactions* attribute and the peak value attained by this attribute is indicated by the *peakTransactions* attribute. |
| Values | Decimal (0..65535) |
| Default | No default |

### GROUP Usc GtpC WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usc GtpC customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc GtpC customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc GtpC customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc GtpC OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Usc GtpC adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Usc GtpC operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Usc GtpC usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## COLLECTED STATS UsgsnSubscriberControl GtpC

Description
The statistics record generated by the UsgsnSubscriberControl GtpC component.

### ATTRIBUTE Usc GtpC echoRqstsTx

Description
This attribute indicates the number of Echo Request Messages sent over the collection interval.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc GtpC gnEchoRespTx

Description This attribute indicates the number of Echo Response Messages sent on the Gn Interface over the collection interval.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc GtpC pathFailures

Description This attribute indicates the number of path failures detected by GTPC, based on the attribute *strictPathSupervision* in *Usgsn Usc*, over the collection interval.

If *strictPathSupervision* has the value ***enabled,*** failure of the remote end to respond to any GTP request will result in path failure being declared.
If *strictPathSupervision* has the value ***disabled***, then failure of the remote end to respond to an echo request will be marked as a path failure, but all other failures will not be detected.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc GtpC idenRqstMsgsTx

Description This value indicates the number of times the USGSN sent a IDENTIFICATION REQUEST message to the Mobile Station (MS) over the collection interval.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc GtpC sgsnCntxtRqstMsgsTx

Description This attribute indicates the number of times the USGSN sent a SGSN CONTEXT REQUEST Message to the Mobile Station over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc GtpC sgsnCntxtAckRqstMsgsTx

Description

This value indicates the number of times the USGSN sent a SGSN CONTEXT ACKNOWLEDGE REQUEST Message to the Mobile Station.

The count is taken at the end of the collection interval.

Values

Decimal (0..4294967295)

*Usc/n GtpC GtpPath/<ipaddress>*
*Gsc/n GtpMgmt GtpPath/<ipaddress>*

This component represents paths managed by the signaling part of the GPRS Tunneling Protocol (GTP) protocol layer. Paths are set up between this (UMTS) Serving GPRS Support Node ((U) SGSN) and the GPRS Support Nodes (GSNs).

### GROUP Usc GtpC Path OsiState (State)

Properties

Operational

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Usc GtpC Path adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Usc GtpC Path operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Usc GtpC Path usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Usc GtpC Path WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usc GtpC Path customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Usc GtpC Path customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc GtpC Path customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Usc MemoryPoolManager (Mpm)

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n MemoryPoolManager*<br>*Gsd/n MemoryPoolManager*<br>*Gtl/n MemoryPoolManager*<br>*DnsAgent/<vr>,n MemoryPoolManager*<br><br>This component represents the memory resources of a given GPRS application that are managed as pools of objects. |

## COMPONENT Usc Mpm MemoryPoolClient (Mpc)

Instance String (1..30, ASCII)

Scope Application

Description *Gsc/n Mpm MemoryPoolClient/<name>*
*Gsd/n Mpm MemoryPoolClient/<name>*
*SgGtl/n Mpm MemoryPoolClient/<name>*
*DnsAgent/<vr>,n Mpm MemoryPoolClient/<name>*

This component represents a pool of objects of a particular class that a GPRS application currently owns as well as all the objects that could be owned by that application. All the objects in the pool are of the same class. The instance value of this component is a string which is the class name of the objects in the pool.

## GROUP Usc HlrC Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes of the *HlrCache* in this UMTS Serving GPRS Support Node (USGSN).

## ATTRIBUTE Usc HlrC maxRecords (maxRecs)

Access
Read: All
Write: All

Criticality Process

Description This attribute specifies the maximum number of records that can be stored in the Home Location Register (HLR) Cache. The maximum number of records in HLR Cache can be greater than the *maxSubscribers* (defined in the parent *Usc* component) because in addition to active records, the HLR Cache also stores inactive records, which are reused when the inactive subscribers become active.

The current number of active and inactive records that are stored by the HLR Cache are indicated by the attributes *recordsActive* and *recordsInactive* respectively.

Changing the value of this attribute causes the card to be reset and all outstanding transactions will be affected.

Values Decimal (1..150000)

Default 5000

### ATTRIBUTE Usc HlrC maxPdpContexts (maxPdpC)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of Packet Data Protocol (PDP) context subscription data records that can be stored in the *HlrCache*.<br><br>The current number of PDP Contexts that are stored in the Home Location Register (HLR) Cache is indicated by the attribute *currHlrCachePdpContexts*.<br><br>Changing the value of this attribute causes the card to be reset and all outstanding transactions will be affected. |
| Values | Decimal (1..750000) |
| Default | 1500 |

### GROUP Usc HlrC Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *HlrCache*. |

### ATTRIBUTE Usc HlrC currHlrCachePdpContexts (currPdpC)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the current number of Packet Data Protocol (PDP) context subscription data records that are stored in the Home Location Register (HLR) Cache.<br><br>The maximum number of PDP contexts that can be stored in the HLR Cache is provisioned in the attribute *maxPdpContexts*. |
| Values | Decimal (0..3000000) |
| Default | No default |

### ATTRIBUTE Usc HlrC cacheHits

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the times the Home Location Register (HLR) Cache had the subscriber information locally and did not need to retrieve information from the HLR.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc HlrC cacheMisses (cacheMiss)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the times the Home Location Register (HLR) Cache does not have the subscriber information locally and must retrieve information from the HLR.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc HlrC recordsInactive (recInact)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of Home Location Register (HLR) Cache Records that are currently inactive, that is, the number of records for which subscribers are detached from the UMTS Serving GPRS Support Node (USGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc HlrC recordsActive (recAct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of Home Location Register (HLR) Cache Records that are currently active, that is, the number of records that are active and the UPDATE GPRS LOCATION RESPONSE has been received from the HLR. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc HlrC recordsWaitingForHlrConf (hlrConf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of Home Location Register (HLR) Cache Records that are active and waiting for HLR Confirmation, that is, number of records which are yet to receive UPDATE GPRS LOCATION RESPONSE from the HLR. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc HlrC WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usc HlrC customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE Usc HlrC customCounter2 (customCntr2)

Access Read: All
Write: Illegal

Description This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc HlrC customCounter3 (customCntr3)

Access Read: All
Write: Illegal

Description This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS UsgsnSubscriberControl HlrCache

Description The statistics record generated by the UsgsnSubscriberControl HlrCache component.

### ATTRIBUTE Usc HlrC currHlrCachePdpContexts

Description This attribute indicates the number of Packet Data Protocol (PDP) context subscription data records that are stored in the Home Location Register (HLR) Cache.

The maximum number of PDP contexts that can be stored in the HLR Cache is provisioned in the attribute *maxPdpContexts*, at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc HlrC cacheHits

Description This attribute counts the times the Home Location Register (HLR) Cache had the subscriber information locally and did not need to retrieve information from the HLR.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc HlrC cacheMisses

Description This attribute counts the times the Home Location Register (HLR) Cache does not have the subscriber information locally and must retrieve information from the HLR.

It counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc HlrC recordsInactive

Description This attribute indicates the number of Home Location Register (HLR) Cache Records that are currently inactive, that is, the number of records for which subscribers are detached from the UMTS Serving GPRS Support Node (USGSN).

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc HlrC recordsActive

Description This attribute indicates the number of Home Location Register (HLR) Cache Records that are currently active, that is, the number of records that are active and the UPDATE GPRS LOCATION RESPONSE has been received from HLR.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc HlrC recordsToBeReset

Description

This attribute indicates the Home Location Register (HLR) Cache Records currently waiting to be reset. When a RESET message is received from a HLR, all Location Confirmation flags of the HLR Cache Records, corresponding to the HLR is set to false. The GPRS Mobility Management (GMM) is notified to request UPDATE GPRS LOCATION for the HLR Cache Records corresponding to the reset HLR.

The count is taken at the end of the collection interval.

Values

Decimal (0..4294967295)

### ATTRIBUTE Usc HlrC recordsWaitingForHlrConf

Description

This attribute indicates the number of Home Location Register (HLR) Cache Records that are currently active and waiting for HLR Confirmation, that is, the number of records which are yet to receive UPDATE GPRS LOCATION RESPONSE from the HLR.

The count is taken at the end of the collection interval.

Values

Decimal (0..4294967295)

### COMPONENT Usc HlrC RefreshAudit

Groups

"GROUP Usc HlrC RefreshAudit WlcRefreshAuditProv (AuditProv)"
"GROUP Usc HlrC RefreshAudit WlcRefreshAuditOper (AuditOper)"

Scope

Application

Description

*Gsc/n Hlrc RefreshAudit*
*Usc/n Hlrc RefreshAudit*

This component represents the subscriber refresh audit functionality of the *HlrCache (HlrC)* component. The purpose of the audit is to request new subscriber profile data from the Home

Location Register (HLR). The audit initiates the Update GPRS Location Dialogue to the HLR for all attached subscribers.

Common Verbs

Help
List
Display

### VERB START Usc HlrC RefreshAudit

Impact: Service

Description: *start Gsc/n Hlrc RefreshAudit*
*start Usc/n Hlrc RefreshAudit*

This command starts the refresh audit to request subscriber information from the Home Location Register for all the attached subscribers.

### VERB STOP Usc HlrC RefreshAudit

Impact: Service

Description: *stop Gsc/n Hlrc RefreshAudit*
*stop Usc/n Hlrc RefreshAudit*

This command stops the refresh audit in progress. If the audit is currently running, it is immediately stopped. If the audit has not started or has already finished running, this command does nothing.

### GROUP Usc HlrC RefreshAudit WlcRefreshAuditProv (AuditProv)

Properties: Provisioned

Description: This group contains the provisionable attributes for the *RefreshAudit* component.

### ATTRIBUTE Usc HlrC RefreshAudit autoStart

Access: Read: All
Write: All

Description: This attribute specifies whether the refresh audit function is ***enabled*** or ***disabled.*** When enabled, the *HlrCache* component

will automatically initiate a process to refresh subscriber profiles whenever certain optional supplementary services, such as Location Services and Short Message Services, are provisioned. When disabled, the *HlrCache* component will not start the audit automatically.

Values: enabled
disabled

Default: enabled

### GROUP Usc HlrC RefreshAudit WlcRefreshAuditOper (AuditOper)

Properties: Operational

Description: This group contains the operational attributes for the *RefreshAudit* component.

### ATTRIBUTE Usc HlrC RefreshAudit auditPercentComplete (percentComplete)

Access: Read: All
Write: Illegal

Description: This attribute indicates the current completion percentage of the refresh audit.

A value of ***0%*** means the refresh audit is not currently running but may need to run due to recent activation of a feature that normally triggers the audit. The refresh audit is not running because the value of the *autoStart* attribute is ***disabled*** or the audit was manually interrupted by the *stop* command.
A value of ***1-99%*** means the refresh audit is currently running.
A value of ***100%*** means the refresh audit has been completed.

Values: Decimal (0..100)

Units: %

Default: No default

### COMPONENT Usc SessionManagement (Sm)

Groups: "GROUP Usc Sm PdpOper"

### ATTRIBUTE Usc Sm usgsnInitModifies (usgsnM)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Packet Data Protocol (PDP) context Modifications initiated from the UMTS Serving GPRS Support Node (USGSN), for example, as a result of QoS renegotiations with the Mobile Station (MS). This counter is pegged only during a Routing Area Update (RAU) scenario.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm currentRoamers

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This value indicates the number of mobiles that have entered the PLMN that is not their home PLMN, and are served by the UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm attemptedActivationsPdpContexts (attActPdpC)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Packet Data Protocol (PDP) contexts that the Mobile Station or the SGSN Session Management Entity has attempted to activate. This counter includes the successful activations counted by the *mobileInitActivations* attribute. This attribute counts both attempted PDP context activations using static addresses and PDP context activations using dynamic PDP addresses. This attribute does not count Inter Routing Area Update (IRAU) activations.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm activationFailuresPdpContexts (actFailPdpC)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Packet Data Protocol (PDP) contexts initiated by the Mobile Station (MS) or the SGSN Session Management Entity that were rejected by the Serving GPRS Support Node (SGSN). This attribute counts both the failures for PDP context activations using static addresses and failures for |

PDP context activations using dynamic PDP addresses. This attribute does not count Inter Routing Area Update (IRAU) activation failures.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Sm actFailSgsnInsufficientResources (actFailSgsnInsufRes)

Access: Read: All
Write: Illegal

Description: This attribute counts the activations initiated by the Mobile Station (MS) or the SGSN Session Management Entity, and rejected by the Serving GPRS Support Node (SGSN) due to the cause code NO RESOURCES AVAILABLE. This counter is incremented due to the SGSN having insufficient resources for the session. The value of this attribute is included in the count of *activationFailuresPdpContexts*.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Sm actFailMissingOrUnknownApn (actFailMissOrUnkn)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) or an SGSN Session Management Entity initiated activation due to the requested service being rejected by the external packet data network. The service is rejected because the required Access Point Name (APN) was not included or the APN was not resolved. The value of this attribute is included in the count of *activationFailuresPdpContexts*.

The counter wraps to zero when it exceeds the maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm actFailUnknownPdpAddrOrPdpType (actFailUnknPdpAddType)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a CREATE PDP CONTEXT RESPONSE message was received from the Gateway GPRS Support Node (GGSN) with the cause code “Unknown PDP address or PDP type”. This could be due to the requested service being rejected by the external packet data network because the Packet Data Protocol (PDP) address or the PDP type was not recognized. This event is also counted by the *activationFailuresPdpContexts* attribute.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm actFailUserAuthentications (actFailUserAuth)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a CREATE PDP CONTEXT REQUEST message was received from the Gateway GPRS Support Node (GGSN) with the cause code USER AUTHENTICATION FAILED. This could be due to the requested service being rejected by the external packet data network due to a failed user authentication. The value of this attribute is included in the count of *activationFailuresPdpContexts*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm actFailRejectedByGgsn (actFailRejGgsn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) or an SGSN Session Management Entity initiated activation due to the requested service being rejected by the Gateway GPRS Support Node (GGSN) with a cause code that does not map to a cause code in the ACTIVATE PDP CONTEXT REJECT message. The value of this attribute is included in the count of *activationFailuresPdpContexts*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm actFailGgsnInsufficientRessources (actFailGgsnInsufRes)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated activations rejected by the Serving GPRS Support Node (SGSN) due to the cause code NO RESOURCES AVAILABLE. This counter is incremented due to the Gateway GPRS Support Node (GGSN) returning a cause code of NO RESOURCES AVAILABLE in the CREATE PDP CONTEXT RESPONSE message. The value of this attribute is included in the count of *activationFailuresPdpContexts*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm attemptedActivationsDynPdpC (attActDynPdpC)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the Packet Data Protocol (PDP) contexts that the Mobile Station or the SGSN Session Management Entity has attempted to activate and that requires the use of a dynamic PDP address. This attribute does not count Inter Routing Area Update (IRAU) activations.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm activationFailuresDynPdpC (actFailDynPdpC)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a PDP context activation initiated by a Mobile Station (MS) or an SGSN Session Management Entity and that requires the use of a dynamic PDP address. This attribute does not count Inter Routing Area Update (IRAU) activation failures.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Sm customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc Sm PdpModOper

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes of the Session Management (SM) protocol layer associated with the Packet Data Protocol (PDP) context modification. |

### ATTRIBUTE Usc Sm sgsnInitModifyAttempts (sgsnInitMod)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN), for example, as a result of QoS renegotiations with the Mobile Station (MS). This counter is pegged only during SGSN Initiated PDP Context Modification.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm sgsnInitFailAtMs (sgsnInitMsFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the Mobile Station (MS).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm sgsnInitFailAtGgsn (sgsnInitGgsnFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the Gateway GPRS Support Node (GGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm sgsnInitFailAtSgsn (sgsnInitSgsnFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the SGSN.<br><br>The counter wraps to zero when it exceeds the maximum value. |

| Default | No default |

### ATTRIBUTE Usc Sm msInitFailAtGgsn (msInitGgsnFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the Gateway GPRS Support Node (GGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Sm msInitFailAtSgsn (msInitSgsnFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the Serving GPRS Support Node (SGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## GROUP Usc Sm UmtsPdpModOper

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes of the UMTS Session Management (SM) protocol layer associated with the Packet Data Protocol (PDP) context modification. |

## ATTRIBUTE Usc Sm sgsnInitFailAtRnc (sgsnInitRncFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the UMTS Serving GPRS Support Node (USGSN) that failed at the Radio Network Controller (RNC).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Usc Sm msInitFailAtMs (msInitMsFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the MS.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Usc Sm msInitFailAtRnc (msInitRncFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) |

that failed at the Radio Network Controller (RNC).

The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS UsgsnSubscriberControl SessionManagement

Description The statistics record generated by the UsgsnSubscriberControl SessionManagement component.

### ATTRIBUTE Usc Sm currentPdpContexts

Description This attribute indicates the number of currently active Packet Data Protocol (PDP) contexts.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm mobileInitActivations

Description This attribute indicates the number of successful Mobile-Initiated Packet Data Protocol (PDP) context activations.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm mobileInitDeacts

Description This attribute counts the successful Packet Data Protocol (PDP) context deactivations initiated by the Mobile Station (MS).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm ggsnInitDeacts

Description This attribute indicates the number of Packet Data Protocol (PDP) context deactivations initiated by the Gateway GPRS

Support Node (GGSN).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm usgsnInitDeacts

Description This attribute indicates the number of Packet Data Protocol (PDP) context deactivations initiated locally from the UMTS Serving GPRS Support Node (USGSN) (for example, an implicit session deactivation as a result of a Gateway GPRS Support Node (GGSN) restart or path failure).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm hlrInitDeacts

Description This attribute indicates the number of Packet Data Protocol (PDP) context deactivations initiated by the Home Location Register (HLR), for example, Delete Subscriber Data (DSD) withdrawing subscription for an active session.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm usgsnInitModifies

Description This attribute indicates the number of Packet Data Protocol (PDP) context Modifications initiated from the UMTS Serving GPRS Support Node (USGSN), for example, as a result of QoS renegotiations with the Mobile Station (MS). This counter is pegged only during a Routing Area Update (RAU) scenario.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm currentRoamers

Description This value indicates the number of mobiles that have entered the PLMN, which is not their home PLMN, and are served by the

USGSN.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm tRabAssgtTimeouts

Description This value indicates the number of times the tRabAssgtTimer expires. If the value of this attribute increases consistently, the value of the tRabAssgtTimer can be increased.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm usgsnInitModifyExhaust (usgsnME)

Description This value indicates the number of times the *usgsnInitModifies* attribute is exhausted during Inter-SGSN Routing Area Update. This counter is incremented in the new SGSN.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm attemptedActivationsPdpContexts (attActPdpC)

Description This attribute indicates the Packet Data Protocol (PDP) contexts that the Mobile Station or the SGSN Session Management Entity has attempted to activate during the collection interval. This counters includes the successful activations counted by the *mobileInitActivations* attribute. This attribute counts both attempted PDP context activations using static addresses and PDP context activations using dynamic PDP addresses.This attribute does not count Inter Routing Area Update (IRAU) activations.

This counter includes static as well as dynamic PDP addresses.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm activationFailuresPdpContexts (actFailPdpC)

Description This attribute indicates the Packet Data Protocol (PDP) contexts, initiated by the Mobile Station (MS) or the SGSN Session Management Entity, that were rejected by the Serving GPRS Support Node (SGSN). This attribute counts both the failures for

PDP context activations using static addresses and failures for PDP context activations using dynamic PDP addresses. This attribute does not count Inter Routing Area Update (IRAU) activation failures.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm actFailSgsnInsufficientResources (actFailSgsnInsufRes)

Description This attribute indicates, for the collection interval, the activations initiated by the Mobile Station (MS) or the SGSN Session Management Entity, and rejected by the Serving GPRS Support Node (SGSN) due to the cause code NO RESOURCES AVAILABLE. This counter is incremented due to the SGSN having insufficient resources for the session. The value of this attribute is included in the count of *activationFailuresPdpContexts*.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm actFailMissingOrUnknownApn (actFailMissOrUnkn)

Description This attribute indicates, for the collection interval, the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) or an SGSN Session Management Entity initiated activation due to the requested service being rejected by the external packet data network. The service is rejected because the required Access Point Name (APN) was not included or the APN was not resolved. The value of this attribute is included in the count of *activationFailuresPdpContexts*.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm actFailUnknownPdpAddrOrPdpType (actFailUnknPdpAddType)

Description This attribute indicates, for the collection interval, the number of times a CREATE PDP CONTEXT RESPONSE message was received from the Gateway GPRS Support Node (GGSN) with the cause code “Unknown PDP address or PDP type”. This could be due to the requested service being rejected by the external packet data network because the Packet Data Protocol (PDP)

address or the PDP type was not recognized. This event is also counted by the *activationFailuresPdpContexts* attribute.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm actFailUserAuthentications (actFailUserAuth)

Description This attribute indicates, for the collection interval, the number of times a CREATE PDP CONTEXT REQUEST message was received from the Gateway GPRS Support Node (GGSN) with the cause code USER AUTHENTICATION FAILED. This could be due to the requested service being rejected by the external packet data network due to a failed user authentication. The value of this attribute is included in the count of *activationFailuresPdpContexts*.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm actFailRejectedByGgsn (actFailRejGgsn)

Description This attribute indicates, for the collection interval, the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) or an SGSN Session Management Entity initiated activation, due to the requested service being rejected by the Gateway GPRS Support Node (GGSN) with a cause code that does not map to a cause code in the ACTIVATE PDP CONTEXT REJECT message. The value of this attribute is included in the count of *activationFailuresPdpContexts*.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm actFailGgsnInsufficientResources (ggsnInsufRes)

Description This attribute indicates, for the collection interval, the activations initiated by the Mobile Station (MS) or the SGSN Session Management Entity, and rejected by the Serving GPRS Support Node (SGSN) due to the cause code NO RESOURCES AVAILABLE. This counter is incremented due to the Gateway GPRS Support Node (GGSN) returning a cause code of NO RESOURCES AVAILABLE in the CREATE PDP CONTEXT RESPONSE message. The value of this attribute is included in the count of *activationFailuresPdpContexts*.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm attemptedActivationsDynPdpC (attActDynPdpC)

Description: This attribute indicates, for the collection interval, the Packet Data Protocol (PDP) contexts that the Mobile Station or the SGSN Session Management Entity has attempted to activate and that requires the use of a dynamic PDP address. This attribute does not count Inter Routing Area Update (IRAU) activations.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Sm activationFailuresDynPdpC (actFailDynPdpC)

Description: This attribute indicates, for the collection interval, the number of times the Serving GPRS Support Node (SGSN) rejected a PDP context activation initiated by a Mobile Station (MS) or an SGSN Session Management Entity and that requires the use of a dynamic PDP address. This attribute does not count Inter Routing Area Update (IRAU) activation failures.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Sm maxSubsWithActivationsPdpC (maxSubsActPdpC)

Description: This attribute displays the highest recorded value for the number of subscribers with an active Packet Data Protocol (PDP) context. The value is obtained by comparing on an update of the actual number of subscribers with activated PDP contexts in the SGSN, with the currently maximal value in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Sm sgsnAttemptedModificationsPdpC (sgsnAttModPdpC)

Description: This attribute indicates the Packet Data Protocol (PDP) contexts that the Service GPRS Support Node (SGSN) has attempted to modify during the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Sm attemptedNetworkDeactivationsPdpC (attNwkDeactPdpC)

Description: This attribute indicates, for the collection interval, the Packet Data Protocol (PDP) context deactivations initiated by the Gateway GPRS Support Node (GGSN), the UMTS Gateway

GPRS Support Node (USGSN) or the Home Location Register (HLR).

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm sgsnInitModifyAttempts

Description This attribute counts the number of Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN), for example, as a result of QoS renegotiations with the Mobile Station (MS). This counter is pegged only during SGSN Initiated PDP Context Modification.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm sgsnInitFailAtMs

Description This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the Mobile Station (MS).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm sgsnInitFailAtGgsn

Description This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the Gateway GPRS Support Node (GGSN).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm sgsnInitFailAtSgsn

Description This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the SGSN.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm msInitModifyAttempts

Description This attribute counts the number of Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm msInitFailAtGgsn

Description This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the Gateway GPRS Support Node (GGSN).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm msInitFailAtSgsn

Description This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the SGSN.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm sgsnInitFailAtRnc

Description This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the UMTS Serving GPRS Support Node (USGSN) that failed at the Radio Network Controller (RNC).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Sm msInitFailAtMs

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the MS.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Sm msInitFailAtRnc

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the Radio Network Controller (RNC).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

## ATTRIBUTE Usc Gmm simultaneousTransientContexts (simulTransContexts)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the percentage of subscribers expected to be in transient mobile states (for example, attaching, detaching, authenticating) at any one given time. It is expressed as a percentage of the *maxAttachedSubscribers* attribute within the *Usc/n* component.<br><br>This attribute is used to reserve a pool of memory set aside for the transient contexts.<br><br>This value of this attribute may be increased from the default value in increments of 10, after consulting a Nortel Networks support personnel.<br><br>The value of this attribute may need to be increased if the values of the attributes *attachRejectMsgs*, *rauRejectMsgs*, and *authAndCiphRejectMsgs* are increasing. |
| Values | Decimal (0; 10; 20; 30; 40; 50; 60; 70; 80; 90; 100) |
| Units | % |
| Default | 10 |

## GROUP Usc Gmm GmmStats

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes which maintain various statistics for the GMM layer of the UMTS Serving GPRS Support Node (USGSN). |

## ATTRIBUTE Usc Gmm pmmIdleStateSubscribers (pmmIdleStSubs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of mobile subscribers that are GPRS-attached and in the PMM-IDLE state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Usc Gmm pmmConnectedStateSubscribers (pmmConnStSubs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of mobile subscribers that are GPRS-attached and in the PMM-CONNECTED state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Usc Gmm currentlyAttached (currAttached)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Mobile Stations (MS) that are currently GPRS-attached and in the PMM-IDLE or PMM-CONNECTED state.<br><br>The maximum subscribers that can be GPRS-attached is provisioned in the *maxAttachedSubscribers* attribute of the parent *UmtsSubscriberControl (Usc)* component.<br><br>This attribute together with maxAttachedSubscribers are used to |

| | |
|---|---|
| | determine when subscriber count overload occurs (Refer to *Usc* subCountOvldAttachesDiscarded). |
| Values | Decimal (0..1000000) |
| Default | No default |

### ATTRIBUTE Usc Gmm authenticationRequests (authReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the authentication procedure is initiated by the SGSN.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm attachesSuccessful (attachSuccess)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this UMTS Serving GPRS Support Node (USGSN) that were successful.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm attachesRejected (attRej)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this UMTS Serving GPRS Support Node (USGSN) that were rejected.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE Usc Gmm attachesWithKnownPtmsi (attachWKPtmsi)

Access Read: All
Write: Illegal

Description This attribute counts the ATTACH REQUEST messages received with a Packet-Temporary Mobile Subscriber Identity (P-TMSI) previously assigned by this UMTS Serving GPRS Support Node (USGSN).

This includes all successful and unsuccessful attempts.

The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Gmm attachesWithUnknownPtmsi (attachWUPtmsi)

Access Read: All
Write: Illegal

Description This attribute counts the ATTACH REQUEST messages received with a Packet-Temporary Mobile Subscriber Identity (P-TMSI) not assigned by this UMTS Serving GPRS Support Node (USGSN).

This includes all successful and unsuccessful attempts.

The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Gmm attachesWithImsi (attachWImsi)

Access Read: All
Write: Illegal

Description This attribute counts the ATTACH REQUEST messages received with an International Mobile Subscriber Identity (IMSI) as an

identifier.

This includes all successful and unsuccessful attempts.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm serviceRequestsForData (servReqData)

Access: Read: All
Write: Illegal

Description: This attribute counts the successful SERVICE REQUEST messages sent by mobile stations (MS) requesting a resource reservation for active PDP contexts.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm serviceRequestsForSignalling (servReqSig)

Access: Read: All
Write: Illegal

Description: This attributes counts the successful SERVICE REQUEST messages sent by mobile stations (MS) requesting a signalling connection in order to send uplink signalling messages (such as ATTACH REQUEST, PDP CONTEXT REQUEST, and so on).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm serviceRequestsForPagingResponse (servReqPR)

Access: Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute counts the successful SERVICE REQUEST messages sent by mobile stations (MS) indicating a paging response.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm detachesSuccessful (detachSuccess)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the successful DETACHes that are either mobile or network initiated.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm msDetachRejected (msDR)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated GPRS-DETACH REQUEST messages which have been rejected by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm normalIntraUsgsnRaUpdate (normIntraURU)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the normal intra-UMTS Serving GPRS Support Node (USGSN) ROUTING AREA UPDATE REQUEST |

messages received from the Mobile Station (MS).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm periodicIntraUsgsnRAUpdate (periodIURAU)

Access: Read: All
Write: Illegal

Description: This attribute counts the periodic intra-UMTS Serving GPRS Support Node (USGSN) ROUTING AREA UPDATE REQUEST messages from the Mobile Station (MS).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm normalInterUsgsnRaUpdate (normInterURU)

Access: Read: All
Write: Illegal

Description: This attribute counts the inter-UMTS Serving GPRS Support Node (USGSN) ROUTING AREA UPDATE REQUEST messages from the Mobile Station (MS).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm initialPsPageRequests (initPPR)

Access: Read: All
Write: Illegal

Description: This attribute counts the initial PS (Packet-Switched) PAGE REQUEST messages sent to the Mobile Station (MS).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm reattemptPsPageRequests (reattempPPR)

Access: Read: All
Write: Illegal

Description: This attribute counts the re-attempt PS (Packet-Switched) PAGE REQUEST messages sent to the Mobile Station (MS) after the initial page request.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm intraSgsnRaUpdateRejects (rauReject)

Access: Read: All
Write: Illegal

Description: This attribute counts the ROUTING AREA UPDATE REJECT messages sent during an Intra-SGSN Routing Area Update to the Mobile Station (MS). This counters includes the failures due to one of the following conditions:

IMSI Unknown In HLR
Service Not Allowed
PLMN Not Allowed
Roaming Not Allowed
Network Failure
Unspecified Protocol Error
Invalid Mandatory Information
Conditional Information Element Error

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Gmm interSgsnRaUpdateRejects (irauReject)

Access Read: All
Write: Illegal

Description This attribute counts the ROUTING AREA UPDATE REJECT messages sent from this SGSN, while acting in the role of new SGSN, to the Mobile Station (MS). This counter includes the failures due to one of the following conditions:

IMSI Unknown In HLR
Service Not Allowed
PLMN Not Allowed
Roaming Not Allowed
Network Failure
Unspecified Protocol Error
Invalid Mandatory Information
Conditional Information Element Error

The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Gmm psPagingProcFailures (psPagProcFail)

Access Read: All
Write: Illegal

Description This attribute counts the PS (Packet-Switched) paging procedures initiated by the UMTS Serving GPRS Support Node (USGSN) over the Iu interface that are rejected.

The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Gmm securityModeRequests (secuModeReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Security Mode procedure is initiated by the UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc Gmm GmmStatusRxStats (StStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes which count the status messages received by the UMTS Serving GPRS Support Node (USGSN). |

### ATTRIBUTE Usc Gmm retriesUponEntry (nEntry)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a status message from a Mobile Station (MS) to indicate a retry upon entry into a new cell.<br><br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm incorrectMsgs (incorrMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a status message from a Mobile Station (MS) indicating that a semantically incorrect message was |

received by the MS.

The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm invalidMandatoryInfos (invMandInfos)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of mobile originated messages containing invalid mandatory information that are received by the UMTS Serving GPRS Support Node (USGSN).

The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm unimplementedMsgs (uniMsgs)

Access: Read: All
Write: Illegal

Description: This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a status message from a Mobile Station (MS) indicating an unimplemented or unrecognized message was received by the MS.

The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm incompatibleMsgsType (incMsgsT)

Access: Read: All
Write: Illegal

Description: This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a status message from a Mobile Station

(MS) indicating a message type received by the MS was not compatible with the protocol state of the MS.

The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm unimplementedInfos (uniInfos)

Access: Read: All
Write: Illegal

Description: This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a status message from a Mobile Station (MS) indicating an unimplemented or unrecognized information element inside a message was received by the MS.

The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm conditionalIeErrors (condIeErrs)

Access: Read: All
Write: Illegal

Description: This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a status message from a Mobile Station (MS) indicating that a message containing a conditional information element error was received by the MS.

The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Gmm incompatibleMsgs (incMsgs)

Access: Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a status message from a Mobile Station (MS) indicating a message received by the MS was not compatible with the protocol state of the MS.<br><br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm unspecifiedProtocolErrors (unPerrs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a status message from the Mobile Station (MS) indicating that the MS received a message containing an unspecified protocol error.<br><br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm miscStatusRx (mStRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the times the UMTS Serving GPRS Support Node (USGSN) received a miscellaneous status message from a Mobile Station (MS).<br><br>The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc Gmm GmmMsgCountsStats (MsgCounts)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains attributes that maintain counts of messages received or sent by the GMM layer of the UMTS Serving GPRS Support Node (USGSN). |

### ATTRIBUTE Usc Gmm attachRequestMsgs (attachReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated ATTACH REQUEST messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm attachAcceptMsgs (attachAcc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ATTACH ACCEPT messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm attachCompleteMsgs (attachCompl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated ATTACH COMPLETE messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm attachRejectMsgs (attachRej)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ATTACH REJECT messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm msDetachRequestMsgs (msDetachReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated DETACH REQUEST messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm msDetachAcceptMsgs (detachAcc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated DETACH ACCEPT messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Usc Gmm nwkDetachRequestMsgs (nwkDetachReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the DETACH REQUEST messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm nwkDetachAcceptMsgs (nwkDetach)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the DETACH ACCEPT messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm rauRequestMsgs (rauReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated ROUTING AREA UPDATE REQUEST messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm rauAcceptMsgs (rauAcc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ROUTING AREA UPDATE ACCEPT messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm rauCompleteMsgs (rauCompl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated ROUTING AREA UPDATE COMPLETE messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm rauRejectMsgs (rauRej)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ROUTING AREA UPDATE REJECT messages sent successfully by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm ptmsiReallocCommandMsgs (ptmsiReallocCommand)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the P-TMSI REALLOCATION COMMAND messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm ptmsiReallocCompleteMsgs (ptmsiReallocCompl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated P-TMSI REALLOCATION COMPLETE messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm authAndCiphRequestMsgs (authAndCiphReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the AUTHENTICATION AND CIPHERING REQUEST messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm authAndCiphResponseMsgs (authAndCiphResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated AUTHENTICATION AND CIPHERING RESPONSE messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm authAndCiphFailureMsgs (authAndCipFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated AUTHENTICATION AND CIPHERING FAILURE messages received by this Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm authAndCiphRejectMsgs (authAndCiphRej)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the AUTHENTICATION AND CIPHERING REJECT messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm identityRequestMsgs (idReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IDENTITY REQUEST messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm identityResponseMsgs (idResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated IDENTITY RESPONSE messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm msGmmStatusMsgs (msGmmSt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated GMM STATUS messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm nwkGmmStatusMsgs (nwkGmmSt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GMM STATUS messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers. This counter excludes the GMM Status messages sent by the Signalling Gateway (SG) due to invalid mobile identity, invalid message type, or missing mandatory Information Elements found in the incoming GMM messages.<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm gmmInformationMsgs (gmmInfo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GMM INFORMATION messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm serviceRequestMsgs (serviceReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated SERVICE REQUEST messages received by this UMTS Serving GPRS Support Node (USGSN).<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Usc Gmm serviceAcceptMsgs (serviceAcc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the SERVICE ACCEPT messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm serviceRejectMsgs (serviceRej)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the SERVICE REJECT messages sent by this UMTS Serving GPRS Support Node (USGSN) to mobile subscribers.<br><br>The counter wraps to zero when it exceeds the maximum value |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc Gmm WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usc Gmm customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a |

| | |
|---|---|
| | mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Gmm customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS UsgsnSubscriberControl GprsMobilityManagement

| | |
|---|---|
| Description | The statistics record generated by the UsgsnSubscriberControl GprsMobilityManagement component. |

### ATTRIBUTE Usc Gmm pmmIdleStateSubscribers

| | |
|---|---|
| Description | This attribute indicates the number of mobile subscribers that are GPRS-attached and in the PMM-IDLE state at the end of the collection interval. |

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm pmmConnectedStateSubscribers

Description This attribute indicates the number of mobile subscribers that are GPRS-attached and in the PMM-CONNECTED state at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm currentlyAttached

Description This attribute indicates the Mobile Stations (MS) that are currently GPRS-attached and in the PMM-IDLE or PMM-CONNECTED state.
The maximum subscribers that can be GPRS-attached is provisioned in the maxAttachedSubscribers attribute of the parent UmtsSubscriberControl (*Usc*) component.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm attachesSuccessful

Description This attribute indicates the number of GPRS-attaches to this UMTS Serving GPRS Support Node (USGSN) that were successful over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm attachesWithKnownPtmsi

Description This attribute indicates the number of ATTACH REQUEST messages received with a Packet-Temporary Mobile Subscriber Identity (P-TMSI) previously assigned by this UMTS Serving GPRS Support Node (USGSN).

This includes all successful and unsuccessful attempts.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm attachesWithUnknownPtmsi

Description: This attribute indicates the number of ATTACH REQUEST messages received with a Packet-Temporary Mobile Subscriber Identity (P-TMSI) not assigned by this UMTS Serving GPRS Support Node (USGSN) over the collection interval.

This includes all successful and unsuccessful attempts.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm attachesWithImsi

Description: This attribute indicates the number of ATTACH REQUEST messages received with an International Mobile Subscriber Identity (IMSI) as an identifier, over the collection interval. This includes all successful and unsuccessful attempts.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm authenticationRequests

Description: This attribute indicates the number of times the authentication procedure was initiated by the UMTS Serving GPRS Support Node (USGSN).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm serviceRequestsForSignalling

Description: This attributes counts the successful SERVICE REQUEST messages sent by mobile stations (MS) requesting a signalling connection in order to send uplink signalling messages (such as ATTACH REQUEST, PDP CONTEXT REQUEST, and so on.), over the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm serviceRequestsForData

Description: This attribute counts the successful SERVICE REQUEST messages sent by mobile stations (MS) requesting a resource reservation for active PDP contexts, over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm serviceRequestsForPagingResponse

Description This attribute counts the successful SERVICE REQUEST messages sent by mobile stations (MS) indicating a paging response, over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm detachesSuccessful

Description This attribute counts the successful DETACHes that are either mobile or network initiated.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm msDetachRejected

Description This attribute counts the Mobile Station (MS) initiated GPRS-DETACH REQUEST messages which have been rejected by this UMTS Serving GPRS Support Node (USGSN).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm normalIntraUsgsnRaUpdate

Description This attribute counts the normal intra-Serving GPRS Support Node ROUTING AREA UPDATE REQUEST messages received from the Mobile Station (MS).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm periodicIntraUsgsnRaUpdate

Description This attribute counts the periodic intra-Serving GPRS Support Node ROUTING AREA UPDATE REQUEST messages from the Mobile Station (MS).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm normalInterUsgsnRaUpdate

Description This attribute counts the inter-UMTS Serving GPRS Support Node ROUTING AREA UPDATE REQUEST messages from the Mobile Station (MS).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm initialPsPageRequests

Description This attribute counts the initial PS (Packet-Switched) PAGE REQUEST messages sent to the Mobile Station (MS).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm reattemptPsPageRequests

Description This attribute counts the re-attempt PS (Packet-Switched) PAGE REQUEST messages sent to the Mobile Station (MS) after the initial page request.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm interSgsnRaUpdateAccepts (irauAccept)

Description This attribute counts the ROUTING AREA UPDATE ACCEPT messages sent from this SGSN, while acting in the role of new SGSN, to the Mobile Station (MS) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm interSgsnRaUpdateRejects (irauReject)

Description This attribute indicates the ROUTING AREA UPDATE REJECT messages sent from this SGSN, while acting in the role of new

SGSN, to the Mobile Station (MS). This attribute includes one of the following conditions:

IMSI Unknown In HLR
Service Not Allowed
PLMN Not Allowed
Roaming Not Allowed
Network Failure
Unspecified Protocol Error
Invalid Mandatory Information
Conditional Information Element Error

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm intraSgsnRaUpdateRejects (rauReject)

Description: This attribute counts the ROUTING AREA UPDATE REJECT message sent during an Intra-SGSN Routing Area Update to the Mobile Station (MS). This attribute includes one of the following conditions:

IMSI Unknown In HLR
Service Not Allowed
PLMN Not Allowed
Roaming Not Allowed
Network Failure
Unspecified Protocol Error
Invalid Mandatory Information
Conditional Information Element Error

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm periodicRaUpdateRejects (periodicRauReject)

Description: This attribute counts the ROUTING AREA UPDATE REJECT message sent during Periodic Routing Area Updates to the Mobile Station (MS) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm psPagingProcFailures (psPagProcFail)

Description: This attribute indicates the PS (Packet-Switched) paging procedures initiated by the UMTS Serving GPRS Support Node (USGSN) over the Iu interface that are rejected by the Mobile Station (MS).

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Gmm securityModeRequests

Description: This attribute counts the number of times the Security Mode procedure was initiated by the UMTS Serving GPRS Support Node (USGSN).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Usc RemoteApplicationConnection (RaConn)

Instance: appType [String (1..8, ASCII)]
shelfId [Decimal (0..15)]
n [Decimal (1..15)]

Groups: "GROUP Usc RaConn OsiState (State)"
"GROUP Usc RaConn WlcCustomCounters (WlcCustomCntr)"

Scope: Application

Description: *... RemoteApplicationConnection/<appType, shelfId, n>*

This component represents the Remote Application Connection information of an application that talks to applications on other shelves. For each application that it can communicate with, one of these connection components is created and is instantiated with the name of the remote application, the Id of the shelf on

which the application runs, and the instance number of the application. ShelfId ***0*** represents the Master shelf.

Dyn. Subcomp. "COMPONENT Usc RaConn AtmConnection (AtmCon)"

## GROUP Usc RaConn OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Usc RaConn adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Usc RaConn operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Usc RaConn usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Usc RaConn WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usc RaConn customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc RaConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc RaConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Usc RaConn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Usc RaConn AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Usc RaConn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

## ATTRIBUTE Usc RaConn AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

## COMPONENT Usc MapClient (Mc)

Groups
"GROUP Usc Mc Provisioned (Prov)"
"GROUP Usc Mc Statistics (Stats)"
"GROUP Usc Mc MapClientSccpUserInfo (McSccpUI)"
"GROUP Usc Mc OsiState (State)"
"GROUP Usc Mc WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS UsgsnSubscriberControl MapClient"

Scope
Application

Description
*Usc/n MapClient*

This component represents the *MapClient* functionality of the *UmtsSubscriberControl (Usc)*. The *MapClient* component provides the Mobile Application Part (MAP) over SS7 to interact with the Home Location Register (HLR) via the SS7-IP Gateway.

Common Verbs
Help
List
Display

## GROUP Usc Mc Provisioned (Prov)

Properties
Provisioned

Description
This group contains provisionable attributes to specify the Port Number and the SS7-IP Gateway information that this *MapClient* uses.

## ATTRIBUTE Usc Mc mscE164Address (mscEAddr)

Access
Read: All
Write: All

Description
This attribute supplies the E.164 number associated with the local MSC SCCP subsystem on the SGSN. This E.164 number will be used in the global title address field of the Calling Party Address (CgPA) when the USC MAP Client attribute *mapCgpaRoutingIndicator* is set to ***globalTitle***.

If this attribute is changed after the MAP Client has registered

with the MAP Stack, the MAP Client will need to deregister with the MAP Stack and then re-register. Any outstanding MAP transactions will be lost as a result of the re-registration.

If this attribute is empty, the value of the USC's or GSC's E.164 address specified in the *sgsnNumber* attribute is used for the MAP Client's E.164 address.

| | |
|---|---|
| Values | String (0..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Usc Mc linkToMapStack (mapLink)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the *MapStack* used by this *MapClient*. |
| Values | Link (Service, linkToMapStackUsers) |
| Default | No default |

### GROUP Usc Mc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *MapClient* application. |

### ATTRIBUTE Usc Mc currentTransactions (curTr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates how many MAP transactions are currently being handled by the MAP Client. *currentTransactions* is expressed as a percentage utilization of the number of MAP transactions the MAP Client is capable of handling concurrently.<br><br>A SET alarm is generated by the MAP Client when the percentage utilization reaches a high threshold. A CLEAR alarm is generated by the MAP Client when the percentage utilization reaches a low threshold and an outstanding SET alarm exists. |

| | |
|---|---|
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Usc Mc uglMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-UPDATE GPRS LOCATION messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc uglResponseMsgs (uglResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the successful MAP-UPDATE GPRS LOCATION RESPONSE messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc isdMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc isdResponseMsgs (isdResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-INSERT SUBSCRIBER DATA RESPONSE messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc dsdMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-DELETE SUBSCRIBER DATA messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc dsdResponseMsgs (dsdResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-DELETE SUBSCRIBER DATA RESPONSE messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc clMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the MAP-CANCEL LOCATION messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc clResponseMsgs (clResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-CANCEL LOCATION RESPONSE messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc rstMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-RESET messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc saiMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-SEND AUTHENTICATION INFO messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Usc Mc saiResponseMsgs (saiResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-SEND AUTHENTICATION INFO ACK messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc transLimitDiscards (trDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the transactions rejected by the MAP Client when the maximum number of concurrent MAP transactions supported by the MAP Client has been exceeded. The maximum number of MAP transactions is constrained by the MAP Client internal memory available to store the transactions. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc tmrExpiries (tmrEx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the times the *mcTimer* (defined in component *Sgsn GprsSubscriberControl* and *Usgsn UmtsSubscriberControl*) expires before receiving a response from the Home Location Register (HLR). This can be used to determine if the provisionable attribute *mcTimer* must be changed, or a problem exists between the Serving GPRS Support Node (SGSN) or Umts Serving General Support Node (USGSN) |

| | |
|---|---|
| | and the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc afrMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the AUTHENTICATION FAILURE REPORT message sent to HLR from MAP Client in the collection interval. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc afrResponseMsgs (afrResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the AUTHENTICATION FAILURE REPORT RESPONSE messages sent to MAP Client from HLR in the collection interval. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc sccpServiceRequestTimeouts

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP Stack Service request timeouts. This could occur if the MAP Stack was not responding to Service requests from the MAP Clients, or if there was an SS7-IP Gateway (SIG) or IP network problem.<br><br>Retries of the Service request are infinite since the MAP Client |

can not send or receive MAP messages until it is successfully registered with the MAP Stack.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc decodeErrors

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of MAP messages received from the peer nodes that are not decodable. The inability to decode the MAP message is caused by the MAP Client receiving a message with invalid data. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc dataMissingRespSent

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of “data missing” error responses sent to the peer nodes. This error may occur when optional data is missing from a MAP message received, when required data is missing from a MAP message received, or when an internal data structure is missing data. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc unexpectedDataValuesRespSent (unexpDataRespSent)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of “unexpected data value” error responses sent to the peer nodes. This error may occur when the parameter type is correct in the MAP message received but

contains data which is not relevant for the type of MAP service being invoked. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc unidentifiedSubscribersRespSent (unidentSubRespSent)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of “unidentified subscriber” error responses sent to the peer nodes. This error may occur when the subscriber is not contained in the subscriber database resulting in the failure to establish a call. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc dataMissingRespRecv

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of data missing errors received from the peer nodes. This error may occur when optional data is missing from a MAP message sent, when required data is missing from a MAP message sent, or when an internal data structure is missing data. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc unexpectedDataValuesRespRecv (unexpDataRespRecv)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of “unexpected data value” error responses received from the peer nodes. This error may

occur when the parameter type is correct in the MAP message sent but contains data which is not relevant for the type of MAP service being invoked. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc systemFailuresRespRecv (sysFailRespRecv)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of “system failure” error responses received from the peer nodes. This error may occur when a task specified in a MAP message sent cannot be performed because of a problem with another entity. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc unknownSubscribersRespRecv (unkSubRespRecv)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of “unknown subscriber” error responses received from the peer nodes. This error may occur when a message sent is processed for a subscription that does not exist. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc roamingNotAllowedRespRecv (noRoamRespRecv)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of “roaming not allowed” error responses received from the peer nodes. This error may

occur when a location update attempt is made in an area not covered by the subscription. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc invalidMessages

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of invalid messages received by the MAP Client. This may occur if the MAP Client receives an unsolicited message, a message with an invalid header, or an invalid dialogue ID. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc isdMsgsUpdateLocation (isdMsgsUpdLoc)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) during a GPRS Update Location procedure. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Mc isdMsgsHlrSubUpdate (isdMsgsHlrSubUp)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of MAP-INSERT SUBSCRIBER DATA messages received from the Home

| | |
|---|---|
| | Location Register (HLR) due to an HLR operator intervention. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc isdFailures (isdFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-INSERT SUBSCRIBER DATA messages sent to the Home Location Register (HLR) that could not be processed due to one of the following errors:<br><br>Data Missing<br>Unexpected Data Value<br>Unidentified Subscriber<br>Decode errors<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc clMsgsHlrDetach (clMsgsHlrDetach)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) due to an HLR initiated Detach. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc clMsgsSgsnChange (clMsgsSgsnChg)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) due to a Service GPRS Support Node (SGSN) change. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc clMsgsHlrOther (clMsgsHlrOther)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) with a cancellation type other than a Service GPRS Support Node (SGSN) change or an HLR initiated Detach. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc clFailures (clFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) that could not be processed due to one of the following errors:<br><br>Data Missing<br>Unexpected Data Value<br>Decode errors<br><br>The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc dsdFailures (dsdFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-DELETE SUBSCRIBER DATA messages sent to the Home Location Register (HLR) that could not be processed due to one of the following errors:<br><br>Data Missing<br>Unexpected Data Value<br>Unidentified Subscriber<br>Decode errors<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc uAbortMsgSent

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP USER ABORT messages sent by the MAP Client to the peer nodes. This message may be sent as a result of a resource limitation caused by congestion or as a result of the unavailability of resources. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc pAbortMsgRecv

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the number of MAP PROVIDER ABORT messages received by the MAP Client from the peer nodes. This message indicates to the MAP service-user to abort a MAP dialogue. This message may be received due to a MAP service-provider malfunction, supporting dialogue/transaction release, resource limitation, maintenance activity, version incompatibility, or an abnormal MAP dialogue. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc uAbortMsgRecv

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP USER ABORT messages received by the MAP Client from the peer nodes. This message indicates to the MAP service-provider to abort a MAP dialogue. This message may be received due to a resource limitation caused by congestion or by unavailability of resources. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc pmsMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Mobile Subscriber Purge messages sent to the Home Location Register (HLR).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc pmsResponseMsgs (pmsRes)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Mobile Subscriber Purge Response messages received from the Home Location Register (HLR).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc pslMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the MAP-PROVIDE SUBSCRIBER LOCATION messages received by the MAP Client from the Gateway Mobile Location Center (GMLC).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc pslRespMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the MAP-PROVIDE SUBSCRIBER LOCATION response messages sent by the MAP Client to the Gateway Mobile Location Center (GMLC).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc unauthorizedReqNetworkRespSent (unauthReqNetRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of “Unauthorized Requested Network” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when a Location Request is denied due to the GMLC not being in the home country.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc unauthorizedLcsClientRespSent (unauthLcsCliRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of “Unauthorized LCS Client” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when a Location Request is denied due to privacy restrictions.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Mc positionMethodFailureRespSent (posMethFailRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of “Positioning Method Failure” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when the position of the mobile cannot be retrieved.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Usc Mc absentSubscriberRespSent (absentSubRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of “Absent Subscriber” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when the subscriber is International Mobile Subscriber Identity (IMSI) detached, in a restricted area, or does not respond to paging.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc Mc MapClientSccpUserInfo (McSccpUI)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes of the Sccp User Information of the *MapClient* application |

### ATTRIBUTE Usc Mc mapCgpaRoutingIndicator (mapRtInd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies routing by global title or point code. If set to ***globalTitle*** the MAP Client sets the CgPA routing indicator to route on global title and supply global title information. If set to ***pointCode*** the MAP Client sets the CgPA routing indicator to route on SSN and supply point code and subsystem number in the CgPA. |
| Values | globalTitle (gt)<br>pointCode (pc) |
| Default | globalTitle |

### ATTRIBUTE Usc Mc mapSgsnSubsystemNumber (msssn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the MAP SGSN SSN. This SSN is used by SCCP for subsystem routing. |
| Values | Decimal (1..255) |
| Default | 149 |

### ATTRIBUTE Usc Mc sccpServiceRequestTimer

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Client waits for a response after sending a Service Request primitive to the MAP Protocol Stack.<br><br>The count of timeouts is available in the *sccpServiceRequestTimeouts* attribute.<br><br>Retries of the Service request are infinite since the MAP Client can not send or receive MAP messages until it is successfully registered with the MAP Stack. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Usc Mc sccpVariant

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SCCP variant used by the MAP Client on this SS7 network for the SCCP Called Party Address that is based on the E.212 or E.214 Mobile Subscriber number. |

| | |
|---|---|
| Values | itu<br>ansi<br>ituChinese |
| Default | itu |

### GROUP Usc Mc OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Usc Mc adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Usc Mc operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Usc Mc usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Usc Mc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

## ATTRIBUTE Usc Mc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Usc Mc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Usc Mc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

## COLLECTED STATS UsgsnSubscriberControl MapClient

Description The statistics record generated by the UsgsnSubscriberControl MapClient component.

### ATTRIBUTE Usc Mc uglMsgs

Description This attribute indicates the MAP-UPDATE GPRS LOCATION messages sent to the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc uglResponseMsgs (uglResp)

Description This attribute indicates the successful MAP-UPDATE GPRS LOCATION RESPONSE messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc isdMsgs

Description This attribute indicates the MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc isdResponseMsgs (isdResp)

Description This attribute indicates the MAP-INSERT SUBSCRIBER DATA RESPONSE messages sent to the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc dsdMsgs

Description This attribute indicates the MAP-DELETE SUBSCRIBER DATA messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc dsdResponseMsgs (dsdResp)

| | |
|---|---|
| Description | This attribute indicates the MAP-DELETE SUBSCRIBER DATA RESPONSE messages sent to the Home Location Register (HLR) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Mc clMsgs

| | |
|---|---|
| Description | This attribute indicates the MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Mc clResponseMsgs (clResp)

| | |
|---|---|
| Description | This attribute indicates the MAP-CANCEL LOCATION RESPONSE messages sent to the Home Location Register (HLR) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Mc rstMsgs

| | |
|---|---|
| Description | This attribute indicates the MAP-RESET messages received from the Home Location Register (HLR) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Mc saiMsgs

| | |
|---|---|
| Description | This attribute indicates the MAP-SEND AUTHENTICATION INFO messages sent to the Home Location Register (HLR) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Mc saiResponseMsgs (saiResp)

| | |
|---|---|
| Description | This attribute indicates the MAP-SEND AUTHENTICATION INFO RESPONSE messages received from the Home Location Register (HLR) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Mc transLimitDiscards (trDisc)

Description: This attribute indicates the number of transactions rejected by the MAP Client when the maximum number of concurrent MAP transactions supported by the MAP Client has been exceeded. The maximum number of MAP transactions is constrained by the MAP Client internal memory available to store the transactions. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc tmrExpiries (tmrEx)

Description: This attribute indicates the times the *mcTimer* (defined in component *Sgsn GprsSubscriberControl* and *Usgsn UmtsSubscriberControl*) expires before receiving a response from the Home Location Register (HLR). This can be used to determine if the provisionable attribute *mcTimer* must be changed, or a problem exists between the Serving GPRS Support Node (SGSN) or the UMTS Serving General Support Node (USGSN) and the Home Location Register (HLR). This counter counts the value in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc afrMsgs

Description: This attribute indicates the AUTHENTICATION FAILURE REPORT messages sent to the Home Location Register (HLR) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc afrResponseMsgs (afrResp)

Description: This attribute indicates the ATHENTICATION FAILURE REPORT RESPONSE messages received from the Home Location Register (HLR) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc currentTransactions (curTr)

Description: This attribute indicates how many MAP transactions are currently being handled by the MAP Client. *currentTransactions* is

expressed as a percentage utilization of the number of MAP transactions the MAP Client is capable of handling concurrently.

A SET alarm is generated by the MAP Client when the percentage utilization reaches a high threshold. A CLEAR alarm is generated by the MAP Client when the percentage utilization reaches a low threshold and an outstanding SET alarm exists.

The value reported is the value at the end of the collection interval.

Values: Decimal (0..100)

### ATTRIBUTE Usc Mc sccpServiceRequestTimeouts

Description: This attribute indicates the MAP Stack Service request timeouts in the collection interval. This could occur if the MAP Stack was not responding to Service requests from the MAP Clients, or if there was an SS7-IP Gateway (SIG) or IP network problem.

Retries of the Service request are infinite since the MAP Client can not send or receive MAP messages until it is successfully registered with the MAP Stack.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc decodeErrors

Description: This attribute indicates, over the collection interval, the number of MAP messages received from the peer nodes that are not decodable. The inability to decode the MAP message is caused by the MAP Client receiving a message with invalid data.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc dataMissingRespSent

Description: This attribute indicates, over the collection interval, the number of “data missing error” responses sent to the peer nodes. This error may occur when optional data is missing from a MAP message received, when required data is missing from a MAP message received, or when an internal data structure is missing data.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc unexpectedDataValuesRespSent (unexpDataRespSent)

Description This attribute indicates, over the collection interval, the number of “unexpected data value” error responses sent to the peer nodes. This error may occur when the parameter type is correct in a MAP message received but contains data which is not relevant for the type of MAP service being invoked.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc unidentifiedSubscribersRespSent (unidentSubRespSent)

Description This attribute indicates, over the collection interval, the number of “unidentified subscriber” error responses sent to the peer nodes. This error may occur when the subscriber is not contained in the subscriber database resulting in the failure to establish a call.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc dataMissingRespRecv

Description This attribute indicates, over the collection interval, the number of “data missing” error responses received from the peer nodes. This error may occur when optional data is missing from a MAP message sent, when required data is missing from a MAP message sent, or when an internal data structure is missing data.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc unexpectedDataValuesRespRecv (unexpDataRespRecv)

Description This attribute indicates, over the collection interval, the number of “unexpected data value” error responses received from the peer nodes. This error may occur when the parameter type is correct in a MAP message sent but contains data which is not relevant for the type of MAP service being invoked.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc systemFailuresRespRecv (sysFailRespRecv)

Description: This attribute indicates, over the collection interval, the number of “system failure” error responses received from the peer nodes. This error may occur when a task specified by a MAP message sent cannot be performed because of a problem with another entity.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc unknownSubscribersRespRecv (unkSubRespRecv)

Description: This attribute indicates, over the collection interval, the number of “unknown subscriber” error responses received from the peer nodes. This error may occur when a message sent is processed for a subscription that does not exist.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc roamingNotAllowedRespRecv (noRoamRespRecv)

Description: This attribute indicates, over the collection interval, the number of “roaming not allowed” error responses received from the peer nodes. This error may occur when a location update attempt is made in an area not covered by the subscription.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc invalidMessages

Description: This attribute indicates, over the collection interval, the number of invalid messages received by the MAP Client. This may occur if the MAP Client receives an unsolicited message, a message with an invalid header, or an invalid dialogue ID.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc isdMsgsUpdateLocation (isdMsgsUpdLoc)

Description: This attribute indicates, over the collection interval, the number of MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) during a GPRS Update Location procedure.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc isdMsgsHlrSubUpdate (isdMsgsHlrSubUp)

Description: This attribute indicates, over the collection interval, the number of MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) due to an updated mobile subscription.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc isdFailures (isdFail)

Description: This attribute indicates the number of MAP-INSERT SUBSCRIBER DATA messages sent to the Home Location Register (HLR) that could not be processed due to one of the following errors:

Data Missing
Unexpected Data Value
Unidentified Subscriber
Decode errors

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc clMsgsHlrDetach (clMsgsHlrDetach)

Description: This attribute indicates, over the collection interval, the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) due to an HLR initiated Detach.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc clMsgsSgsnChange (clMsgsSgsnChg)

Description: This attribute indicates, over the collection interval, the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) due to a Service GPRS Support Node (SGSN) change.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc clMsgsHlrOther (clMsgsHlrOther)

Description: This attribute indicates, over the collection interval, the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) with a cancellation type other than a Service GPRS Support Node (SGSN) change or an HLR initiated Detach.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc clFailures (clFail)

Description: This attribute counts the MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) that could not be processed due to one of the following errors:

Data Missing
Unexpected Data Value
Decode errors

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc dsdFailures (dsdFail)

Description: This attribute indicates the number of MAP-DELETE SUBSCRIBER DATA messages sent to the Home Location Register (HLR) that could not be processed due to one of the following errors:

Data Missing
Unexpected Data Value
Unidentified Subscriber
Decode errors

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc uAbortMsgSent

Description: This attribute indicates, over the collection interval, the number of MAP USER ABORT messages sent by the MAP Client to the

peer nodes. This message may be sent as a result of a resource limitation caused by congestion or as a result of the unavailability of resources.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc pAbortMsgRecv

Description This attribute indicates, over the collection interval, the number of MAP PROVIDER ABORT messages received by the MAP Client from the peer nodes. This message indicates to the MAP service-user to abort a MAP dialogue. This message may be received due to a MAP service-provider malfunction, supporting dialogue/transaction release, resource limitation, maintenance activity, version incompatibility, or an abnormal MAP dialogue.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc uAbortMsgRecv

Description This attribute indicates, over the collection interval, the number of MAP USER ABORT messages received by the MAP Client from the peer nodes. This message indicates to the MAP service-provider to abort a MAP dialogue. This message may be received due to a resource limitation caused by congestion or by unavailability of resources.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc pmsMsgs

Description This attribute indicates the number of Mobile Subscriber Purge messages sent to the Home Location Register (HLR).

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc pmsResponseMsgs (pmsRes)

Description This attribute indicated the number of Mobile Subscriber Purge Response messages received from the Home Location Register (HLR).

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc pslMsgs

Description This attribute counts the MAP-PROVIDE SUBSCRIBER LOCATION messages received by the MAP Client from the Gateway Mobile Location Center (GMLC).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc pslRespMsgs

Description This attribute counts the MAP-PROVIDE SUBSCRIBER LOCATION response messages sent by the MAP Client to the Gateway Mobile Location Center (GMLC).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc unauthorizedReqNetworkRespSent (unauthReqNetRespSent)

Description This attribute counts the number of “Unauthorized Requested Network” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when a Location Request is denied due to the GMLC not being in the home country.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc unauthorizedLcsClientRespSent (unauthLcsCliRespSent)

Description This attribute counts the number of “Unauthorized LCS Client” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when a Location Request is denied due to privacy restrictions.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Mc positionMethodFailureRespSent (posMethFailRespSent)

Description: This attribute counts the number of “Positioning Method Failure” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when the position of the mobile cannot be retrieved.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Mc absentSubscriberRespSent (absentSubRespSent)

Description: This attribute counts the number of “Absent Subscriber” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when the subscriber is International Mobile Subscriber Identity (IMSI) detached, in a restricted area, or does not respond to paging.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Usc Ranap

Groups: "GROUP Usc Ranap Operational (Oper)"
"GROUP Usc Ranap WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS UsgsnSubscriberControl Ranap"

Scope: Application

Description: *Usc/n Ranap*

This component represents the RANAP protocol layer of the UMTS Serving GPRS Support Node (USGSN).

Common Verbs:
- Help
- List
- Display

### GROUP Usc Ranap Operational (Oper)

Properties: Operational

| | |
|---|---|
| Description | This group contains operational attributes of the RANAP sub-component under the *Usc* component |

### ATTRIBUTE Usc Ranap rabAssignmentMsgs (rabAssgn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RAB ASSIGNMENT messages that were sent to the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap rabSetupRequestMsgs (rabSetupRqstMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RAB SETUP REQUEST messages that were sent to the RNC.The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap rabReleaseRequestMsgs (rabReleaseRqstMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RAB RELEASE REQUEST messages that were sent to the RNC.The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap iuReleaseRequestRxMsgs (iuReleaseRqstRxMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Iu RELEASE REQUEST messages that were received from the RNC. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap iuReleaseCommandTxMsgs (iuRelCmdTxMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Iu RELEASE COMMAND messages that were sent to the RNC.The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap relocRequestMsgs (relocReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Relocation Request messages that were sent to the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap pagingMsgs (paging)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the Paging messages that were sent to the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap resetMsgs (reset)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Reset messages that were received from the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap initialUeMsgs (inUe)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Initial UE messages that were received from the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap errorIndicationMsgsRx (errIndRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Error Indication messages that were received from the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap errorIndicationMsgsTx (errIndTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Error Indication messages that were sent to the RNC.The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap locationReportingControlMsgs (lcsControl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Location Reporting Control messages that are sent to the Radio Network Controller.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Ranap locationReportMsgs (lcsReport)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Location Report messages that are received from the Radio Network Controller.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## GROUP Usc Ranap WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

## ATTRIBUTE Usc Ranap customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Usc Ranap customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Usc Ranap customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

## COLLECTED STATS UsgsnSubscriberControl Ranap

Description The statistics record generated by the UsgsnSubscriberControl Ranap component.

### ATTRIBUTE Usc Ranap rabAssignmentMsgs

Description This attribute indicates the number of RAB ASSIGNMENT messages that were sent to the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap rabSetupRequestMsgs

Description This attribute indicates the number of RAB SETUP REQUEST messages that were sent to the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap rabReleaseRequestMsgs

Description This attribute indicates the number of RAB RELEASE REQUEST messages that were sent to the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap iuReleaseRequestRxMsgs

Description This attribute indicates the number of Iu RELEASE REQUEST messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap iuReleaseCommandTxMsgs

Description This attribute indicates the number of Iu RELEASE COMMAND messages that were sent to the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap relocRequestMsgs

Description This attribute indicates the number of RELOCATION REQUEST messages that were sent to the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap pagingMsgs

Description This attribute indicates the number of PAGING messages that were sent to the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap resetMsgs

Description This attribute indicates the number of RESET messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap initialUeMsgs

Description This attribute indicates the number of INITIAL UE messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap errorIndicationMsgsRx

Description This attribute indicates the number of ERROR INDICATION messages that were received from the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap errorIndicationMsgsTx

Description This attribute indicates the number of ERROR INDICATION messages that were sent to the RNC over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ranap locationReportingControlMsgs

| | |
|---|---|
| Description | This attribute indicates the number of Location Reporting Control messages that are sent to the Radio Network Controller over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Ranap locationReportMsgs

| | |
|---|---|
| Description | This attribute indicates the number of Location Report messages that are received from the Radio Network Controller over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usc Ranap rabAssgnRqstSetupFailureMsgs

| Values | Decimal (0..4294967295) |

### COMPONENT Usc ServiceSwitchingFunction (Ssf)

| | |
|---|---|
| Groups | "GROUP Usc Ssf Provisioned (SsfProv)"<br>"GROUP Usc Ssf OsiState (State)" |

"GROUP Usc Ssf Operational (SsfOp)"
"GROUP Usc Ssf WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS UsgsnSubscriberControl ServiceSwitchingFunction"

Scope: Application

Description: *Gsc/n ServiceSwitchingFunction*
*Usc/n ServiceSwitchingFunction*

This component represents the Service Switching Function (SSF) functionality of the SGSN (2G) and USGSN (3G). The Service Switching Function is responsible for handling communication between the SGSN (2G and 3G) and one or more Service Control Points (SCP). An SCP is an external entity present in a wireless network supporting CAMEL (Customized Application for Mobile Network Enhanced Logic). It provides prepaid services.

The SSF maintains the state of the CAMEL dialogues between the SGSN and the external SCPs with which it communicates.

Common Verbs: Help
List
Display

## GROUP Usc Ssf Provisioned (SsfProv)

Properties: Provisioned

Description: This group contains provisioning data for the *Ssf* component.

## ATTRIBUTE Usc Ssf maxCamelDialogues (maxDialogues)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies the maximum number of CAMEL dialogs that can be active at any time.

The current number of active CAMEL dialogs is indicated by the *currentCamelDialogues* attribute, and the total number of

dialogues created since the creation of this component is counted by *totalCamelDialogues*.

Values: Decimal (1..150000)

Default: 20000

### ATTRIBUTE Usc Ssf linkToTcapStack (tcapLink)

Access: Read: All
Write: All

Description: This attribute specifies the TCAP (Transaction Capabilities Application Part) Stack used by this *Ssf*. The TCAP Stack provides services to the CAMEL Application Part (CAP) and facilitates network communication required by CAMEL.

Values: Link (Service, linkToTcapStackUsers)

Default: No default

### GROUP Usc Ssf OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Usc Ssf adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is

administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Usc Ssf operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Usc Ssf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Usc Ssf Operational (SsfOp)

Properties
Operational

Description
This group contains the operational data of the *Ssf* component.

### ATTRIBUTE Usc Ssf currentCamelDialogues (currDialogues)

Access
Read: All
Write: Illegal

Description
This attribute indicates the number of CAMEL dialogues that are currently active.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Usc Ssf pdpContextsRedirected (pdpRedir)

Access
Read: All
Write: Illegal

Description
This attribute counts the number of PDP (Packet Data Protocol) Contexts redirected to a different APN (Access Point Name) by the SCP (Service Control Point).

If the counter is increasing rapidly, the operator may want to examine the network configuration to determine why so many PDP contexts are being redirected. It is possible that the current network configuration is not optimal and that the SCP is redirecting PDP contexts to avoid undesirable or expensive network access paths.

The counter wraps to zero when its maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Ssf attemptedCamelDialogues (attDialogues)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of CAMEL dialogue establishments attempted by this *Ssf* component. The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Ssf unsuccessfulCamelDialogues (unsuccDialogues)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of unsuccessful CAMEL dialogue establishment attempts caused by errors or reject messages received from an SCP. The counter wraps to zero when it exceeds it maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Ssf totalTssfTimeouts (totTssfTimeouts)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of Tssf timeouts for this *Ssf* component. The timeout period is specified by the *ssfTimer* attribute of the *Sgsn Gsc* component.

The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Ssf totalDefaultGprsHandlings (totDefHand)

Access Read: All
Write: Illegal

Description This attribute counts the total number of times the SSF (Service Switching Function) detected an error and had to refer to the Default Gprs Handing field of the related mobile's CAMEL Subscriber Information (CSI) to determine whether to continue or fail the PDP (Packet Data Protocol) Context.

If this counter is rapidly increasing, the *totalProtocolErrors* and *totalNoCopFailures* attributes can be examined for information about why the Default Gprs Handling field is so often referenced. The counter wraps to zero when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Ssf totalProtocolErrors (totProtoErr)

Access Read: All
Write: Illegal

Description This attribute counts the total number of protocol errors detected in CAP (CAMEL Application Part) messages from the SCP (Service Control Point).

If this counter is rapidly increasing, there may be a mismatch in the protocol version being used by the SCP and the version being used by the SGSN. The counter wraps to zero when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Ssf totalNoCopFailures (totNoCopFail)

Access Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute counts the total number of PDP (Packet Data Protocol) Contexts that have failed because an IRAU (Inter Routing Area Updates) occurred when the Change Of Position (COP) trigger was not in the TDP (Trigger Detection Point) list of the subscriber for which the PDP Context was requested.<br><br>If this value is rapidly increasing, it may indicate that roaming should be disabled for CAMEL users or that Camel Subscriber Information (CSI) is not properly specified in the HLR for some users. The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usc Ssf WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usc Ssf customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |

|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a |

mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Ssf customCounter3 (customCntr3)

Access Read: All
Write: Illegal

Description This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS UsgsnSubscriberControl ServiceSwitchingFunction

Description The statistics record generated by the UsgsnSubscriberControl ServiceSwitchingFunction component.

### ATTRIBUTE Usc Ssf pdpContextsRedirected (pdpRedir)

Description This attribute indicates the number of PDP (Packet Data Protocol) Contexts that have been redirected to a different APN (Access Point Name) by an SCP (Service Control Point) during the collection interval.

If this attribute is continuously reporting a high value during each collection interval, the operator may want to examine the network configuration to determine why so many PDP contexts are being redirected. It is possible that the current network configuration is not optimal and that the SCP is redirecting PDP contexts to avoid undesirable or expensive network access paths.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ssf attemptedCamelDialogues (attDialogues)

Description: This attribute indicates the total number of CAMEL dialogues that this *Ssf* component has attempted to establish during the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Ssf unsuccessfulCamelDialogues (unsuccDialogues)

Description: This attribute indicates the total number of unsuccessful CAMEL dialogues establishment attempts caused by errors or reject messages received from an SCP during the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Ssf totalTssfTimeouts (totTssfTimeouts)

Description: This attribute indicates the total number of Tssf timeouts during the collection interval. The timeout period is specified by the *ssfTimer* attribute of the *Sgsn Gsc* component.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Ssf totalDefaultGprsHandlings (totDefHand)

Description: This attribute indicates the number of times during the collection interval the SSF (Service Switching Function) detected an error and had to refer to the Default Gprs Handing field of the related mobile's CAMEL Subscriber Information (CSI) to determine whether to continue or fail the PDP (Packet Data Protocol) Context.

If this attribute is continuously reporting a high value during each collection interval, the *totalProtocolErrors* and *totalNoCopFailures* attributes can be examined for information about why the Default Gprs Handling field is so often referenced.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Ssf totalProtocolErrors (totProtoErr)

Description: This attribute indicates the total number of protocol errors detected in CAP (CAMEL Application Part) messages from an SCP (Service Control Point) during the collection interval.

If this attribute is continuously reporting a high number of errors during each collection interval, there may be a mismatch in the protocol version being used by the SCP and the version being used by the SGSN.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ssf totalNoCopFailures (totNoCopFail)

Description This attribute indicates the total number of PDP (Packet Data Protocol) Contexts that have failed during the collection interval because an IRAU (Inter Routing Area Updates) occurred when the Change Of Position (COP) trigger was not in the TDP (Trigger Detection Point) list of the subscriber for which the PDP Context was requested.

If this attribute is continuously reporting a high number of errors during each collection interval, it may indicate that roaming should be disabled for CAMEL users or that Camel Subscriber Information (CSI) is not properly specified in the HLR for some users.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Ssf currentCamelDialogues (currDialogues)

Description This attribute indicates the number of CAMEL dialogues active at the end of the collection interval.

Values Decimal (0..4294967295)

### COMPONENT Usc LocationServices (Lcs)

Groups "GROUP Usc Lcs WlcLcsProv (Prov)"
"GROUP Usc Lcs UmtsLcsProv (UmtsProv)"
"GROUP Usc Lcs OsiState (State)"
"GROUP Usc Lcs WlcLcsOper (Oper)"
"GROUP Usc Lcs UmtsLcsOper (UmtsOper)"

"COLLECTED STATS UsgsnSubscriberControl LocationServices"

Scope Application

Description *Usc/n LocationServices*

This component represents the *LocationServices* functionality of the *UmtsSubscriberControl (Usc)* component. The LCS functions include LCS coordination, managing the location request, and authorization and operation of the LCS services. LCS furnishes its clients with information about the physical location of a mobile terminal. This positioning information is typically used for value-added services, charging, law enforcement, or emergency services.

The LCS function is not available for all LCS-enabled subscribers until the audit represented by the *Usc/n Hlrc RefreshAudit* component has completed.

## GROUP Usc Lcs WlcLcsProv (Prov)

Properties Provisioned

Description This group contains the provisionable attributes for the *LocationServices* component.

## ATTRIBUTE Usc Lcs maxLcsSubscribers (maxLcsSubs)

Access Read: All
Write: All

Description This attribute specifies the maximum number of subscribers that can have Location Services capabilities.

When this attribute is set to a lower value, the new value will not take effect until the card is reset.

This attribute value must be less than or equal to the value specified by the *maxAttachedSubscribers* attribute.

| | |
|---|---|
| Values | Decimal (1..1000000) |
| Default | No default |

### ATTRIBUTE Usc Lcs privacyProfileAlarmsThreshold (priProfileThreshold)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the percentage threshold at which the warning PrivacyProfileUsage alarm is set. The memory for storing the privacy profile information is allocated based on the value of the *maxLcsSubscribers* attribute.<br><br>A SET major PrivacyProfileUsage alarm is set when the memory usage for privacy profile information reaches 100%. This alarm is cleared when the usage drops by 5%.<br><br>A SET warning PrivacyProfileUsage alarm is set when the memory usage for privacy profile information reaches the value of the *privacyProfileAlarmsThreshold* attribute. This alarm is cleared when the usage drops by 5% below the value of the *privacyProfileAlarmsThreshold* attribute. |
| Values | Decimal (50..95) |
| Units | % |
| Default | 90 |

### ATTRIBUTE Usc Lcs maxCurrentTransactions (maxlcsTrans)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of maximum Location Services (LCS) subscribers that can concurrently use the LCS functionality on the SGSN/USGSN.<br><br>When this attribute is set to a lower value, the new value will not take effect until the card is reset.<br><br>This attribute value must be less than or equal to the value specified by *maxLcsSubscribers* attribute. |

| Values | Decimal (1..1000000) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsContextAlarmsThreshold (lcsContextThreshold)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the percentage threshold at which the warning LcsContextUsage alarm is set. The memory for storing the location services context information is allocated based on the value of the *maxCurrentTransactions* attribute.<br><br>A SET major LcsContextUsage alarm is set when the memory usage for location services context information reaches 100%. This alarm is cleared when the usage drops by 5%.<br><br>A SET warning LcsContextUsage alarm is set when the memory usage for location services context information reaches the value of the *lcsContextAlarmsThreshold* attribute. This alarm is cleared when the usage drops by 5% below the value of the *lcsContextAlarmsThreshold* attribute. |
| Values | Decimal (50..95) |
| Units | % |
| Default | 90 |

### ATTRIBUTE Usc Lcs maxLcsExternalClientBlocks (maxlcsExtClientBk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of memory blocks used for storing lists of external clients in the Subscriber Location Privacy Profiles. Each block holds data for up to five external clients. A minimum of one block is needed per list (session related or session unrelated) per Location Services (LCS) subscriber.<br><br>When this attribute is set to a lower value, the new value will not take effect until the card is reset. |

This attribute value must be less than or equal to 14 times the value specified by the *maxLcsSubscribers* attribute.

Values: Decimal (1..14000000)

Default: No default

### ATTRIBUTE Usc Lcs externalClientAlarmsThreshold (extClientThreshold)

Access: Read: All
Write: All

Description: This attribute specifies the percentage threshold at which the warning ExternalClientUsage alarm is set. The memory for storing the external client index information is allocated based on the value of the *maxLcsExternalClientBlocks* attribute.

A SET major ExternalClientUsage alarm is set when the memory usage for external client index information reaches 100%. This alarm is cleared when the usage drops by 5%.

A SET warning ExternalClientUsage alarm is set when the memory usage for external client index information reaches the value of the *externalClientAlarmsThreshold* attribute. This alarm is cleared when the usage drops by 5% below the value of the *externalClientAlarmsThreshold* attribute.

Values: Decimal (50..95)

Units: %

Default: 90

### GROUP Usc Lcs UmtsLcsProv (UmtsProv)

Properties: Provisioned

Description: This group contains the provisionable attributes for the *LocationServices* component of the *UmtsSubscriberControl* component.

### ATTRIBUTE Usc Lcs locationReportTimer (tLcsr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time Location Services waits for the Radio Network Controller (RNC) to respond to a location request.<br><br>The timer is started when the Location Reporting Control message is sent to the RNC.<br><br>The expiries of this timer are counted by the attribute *lcsReportExpiries*.<br><br>This attribute must be set to the same value for all the *Location Services* components on the same shelf. |
| Values | Decimal (3..60) |
| Units | seconds |
| Default | 11 |

### ATTRIBUTE Usc Lcs locationNotifyTimer (tLcsn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time Location Services waits for the Mobile Subscriber (MS) to respond to a Location Notification message.<br><br>The timer is started when the Location Notification message is sent to the MS.<br><br>The expiries of this timer are counted by the attribute *lcsNotifyExpiries*.<br><br>This attribute must be set to the same value for all the *Location Services* components on the same shelf. |
| Values | Decimal (10..20) |

| | |
|---|---|
| Units | seconds |
| Default | 10 |

### GROUP Usc Lcs OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Usc Lcs adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Usc Lcs operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Usc Lcs usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Usc Lcs WlcLcsOper (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *LocationServices* component. |

### ATTRIBUTE Usc Lcs lcsCurrentEnabledSubscribers (enabledSubs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current number of location services enabled subscribers. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsCurrentTransactions (currentTrans)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current number of location transactions that are being processed. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsCurrentExternalClientBlocks (currentExtClientBks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current number of external client blocks that are being utilized for storing the external client index information. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsMtRequests (mtReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total mobile terminated location requests.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsMtFailures (mtFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total unsuccessful mobile terminated location requests.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsPagingRequests (pagingReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total paging requests sent by the *LocationServices* component.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsPagingFailures (pagingFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total unsuccessful paging requests sent by the *LocationServices* component.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsRequestTypeNotSupported (reqTypeNotSupp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to a requested location that is not supported.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsDataMissing (dataMiss)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to missing information. For example, Imsi or Msisdn is missing in the location request message.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsSubscriberNotAttached (subNotAttach)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to the subscriber not currently attached. |

| | |
|---|---|
| | The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsUnauthorizedGmlc (unauthGmlc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to location requests messages received from an unauthorized Gateway Mobile Location Center.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsUnauthorizedClient (unauthClient)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to location requests messages received from an unauthorized client.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsServiceBusy (servBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to another location request already in progress for the same subscriber.<br><br>The counter wraps to 0 when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsNotificationNotPossible (notifyNotPossible)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to the reason that it is impossible to send a notification message to the mobile.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsGadShapeNotSupported (gadShapeNotSupp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to the obtained location estimates using a Geographical Area Description (GAD) shape, that is not supported in the Location Request message.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsInterrupted (interrupted)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to information received from the Radio Network Controller (RNC) showing that the Location Services (LCS) entity has been interrupted. For example, LCS can be interrupted by an Inter-SGSN Routing Area Update (IRAU). |

The counter wraps to 0 when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Lcs lcsQosNotAttained (qosNotAttained)

Access: Read: All
Write: Illegal

Description: This attribute counts the total failed location requests due to the quality of service information not matching the requested quality of service in the Provide Subscriber Location (PSL) message from the Gateway Mobile Location Center (GMLC).

The counter wraps to 0 when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### GROUP Usc Lcs UmtsLcsOper (UmtsOper)

Properties: Operational

Description: This group contains the operational attributes for the *LocationServices* component of the *UmtsSubscriberControl* component.

### ATTRIBUTE Usc Lcs lcsNotificationRequests (notifyRequest)

Access: Read: All
Write: Illegal

Description: This attribute counts the total notification requests to the mobile subscribers.

The counter wraps to 0 when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usc Lcs lcsNotificationFailures (notifyFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total unsuccessful notification requests to the mobile subscribers.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsReportExpiries (reportExpiries)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timer expiries associated with the *locationReportTimer* attribute.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsNotifyExpiries (notifyExpiries)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the timer expiries associated with the *locationNotifyTimer* attribute.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usc Lcs lcsClientDeniedByMs (deniedByMs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description This attribute counts the location requests that are failed due to the subscriber denying the request.

The counter wraps to 0 when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Usc Lcs lcsRncPositioningFailure (rncPosFail)

Access Read: All
Write: Illegal

Description This attribute counts the total failed location requests due to the Radio Network Controller (RNC) failing to determine the location of the subscriber.

The counter wraps to 0 when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS UsgsnSubscriberControl LocationServices

Description The statistics record generated by the UsgsnSubscriberControl LocationServices component.

### ATTRIBUTE Usc Lcs lcsMaxCurrentEnabledSubscribers (maxEnabledSubs)

Description This attribute indicates the current number of location services enabled subscribers.

The value reported is the peak value for the duration of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsMtRequests (mtReq)

Description This attribute counts the total mobile terminated location requests.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsMtFailures (mtFail)

Description This attribute counts the total unsuccessful mobile terminated location requests.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsPagingRequests (pagingReq)

Description This attribute counts the total paging requests sent by the *LocationServices* component.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsPagingFailures (pagingFail)

Description This attribute counts the total unsuccessful paging requests sent by the *LocationServices* component.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsRequestTypeNotSupported (reqTypeNotSupp)

Description This attribute counts the total failed location requests due to a requested location that is not supported.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsDataMissing (dataMiss)

Description This attribute counts the total failed location requests due to missing information. For example, Imsi or Msisdn is missing in the location request message.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsSubscriberNotAttached (subNotAttach)

Description This attribute counts the total failed location requests due to the subscriber not currently attached.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsUnauthorizedGmlc (unauthGmlc)

Description This attribute counts the total failed location requests due to location requests messages received from an unauthorized Gateway Mobile Location Center.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsUnauthorizedClient (unauthClient)

Description This attribute counts the total failed location requests due to location requests messages received from an unauthorized client.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsServiceBusy (servBusy)

Description This attribute counts the total failed location requests due to another location request already in progress for the same subscriber.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsNotificationNotPossible (notifyNotPossible)

Description: This attribute counts the total failed location requests due to the reason that it is impossible to send a notification message to the mobile.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsGadShapeNotSupported (gadShapeNotSupp)

Description: This attribute counts the total failed location requests due to the obtained location estimates using a Geographical Area Description (GAD) shape that are not supported in the Location Request message.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsInterrupted (interrupted)

Description: This attribute counts the total failed location requests due to information received from the Radio Network Controller (RNC) showing that the Location Services (LCS) entity has been interrupted. For example, LCS can be interrupted by an Inter-SGSN Routing Area Update (IRAU).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsQosNotAttained (qosNotAttained)

Description: This attribute counts the total failed location requests due to the quality of service information not matching the requested quality of service in the Provide Subscriber Location (PSL) message from the Gateway Mobile Location Center (GMLC).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsNotificationRequests (notifyRequest)

Description: This attribute counts the total notification requests to the mobile subscribers.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsNotificationFailures (notifyFail)

Description: This attribute counts the total unsuccessful notification requests to the mobile subscribers.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsReportExpiries (reportExpiries)

Description: This attribute counts the timer expiries associated with the *locationReportTimer* attribute.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsNotifyExpiries (notifyExpiries)

Description: This attribute counts the timer expiries associated with the *locationNotifyTimer* attribute.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Usc Lcs lcsClientDeniedByMs (deniedByMs)

Description: This attribute counts the location requests that fail due to the subscriber denying the request.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

## ATTRIBUTE Usc Lcs lcsRncPositioningFailure (rncPosFail)

| | |
|---|---|
| Description | This attribute counts the total failed location requests due to the Radio Network Controller (RNC) failing to determine the location of the subscriber.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

## GROUP Usd Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of this component. |

## ATTRIBUTE Usd linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor that the *UmtsSubscriberDataPath (Usd)* and its subcomponents are provisioned on. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

## ATTRIBUTE Usd maxActiveSessions (maxSc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of active session contexts allowed for this instance of *UmtsSubscriberDataPath* |

*(Usd).*

The current number of active sessions allowed is indicated by the attribute *currentActiveSessions.*

Values Decimal (0..300000)

Default 15000

### GROUP Usd OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Usd adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Usd operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Usd usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Usd availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be

applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Usd proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |

| Default | No default |

### ATTRIBUTE Usd controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Usd alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is |

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Usd standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default

notSet

### ATTRIBUTE Usd unknownStatus (osiUnknw)

Access

Read only

Description

This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values

false
true

| | |
|---|---|
| Default | false |

### GROUP Usd Stats

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of the *Usd/n* component. |

### ATTRIBUTE Usd currentActiveSessions (currActSess)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current number of active session contexts for this instance of *UmtsSubscriberDataPath (Usd).*<br><br>The maximum number of active sessions allowed is provisioned in the attribute *maxActiveSessions.* |
| Values | Decimal (0..6000000) |
| Default | No default |

### ATTRIBUTE Usd pdusToUtran

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Protocol Data Units (PDUs) sent to the UMTS Terrestrial Radio Access Network (UTRAN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usd pdusFromUtran

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Protocol Data Units (PDUs) received from the UMTS Terrestrial Radio Access Network (UTRAN). |

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usd pdusToNetwork (pdusToNwk)

Access: Read: All
Write: Illegal

Description: This attribute counts the GPRS Tunneling Protocol (GTP-U) Protocol Data Units (PDUs) transmitted to the Gateway GPRS Support Node (GGSN).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usd pdusFromNetwork (pdusFromNwk)

Access: Read: All
Write: Illegal

Description: This attribute counts the GPRS Tunneling Protocol (GTP-U) Protocol Data Units (PDUs) received from the Gateway GPRS Support Node (GGSN).

This includes PDUs counted in the attribute *discardedPdus.*

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Usd discardedPdus (discPdus)

Access: Read: All
Write: Illegal

Description: This attribute counts the discarded Protocol Data Units (PDUs) received from the GPRS Support Nodes (GSNs) or UMTS

| | |
|---|---|
| | Terrestrial Radio Access Network (UTRAN). This includes packets dropped due to GPRS Tunneling Protocol (GTP-U) protocol errors, packets received with no currently linked session context, packets received without a path to send them or packets dropped due to the Tiered Subscription feature policing downlink data.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usd WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usd customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usd customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Usd customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS UsgsnSubscriberDatapath

| | |
|---|---|
| Description | The statistics record generated by the UsgsnSubscriberDatapath component. |

### ATTRIBUTE Usd currentActiveSessions (currActSess)

| | |
|---|---|
| Description | This attribute indicates the current number of active session contexts allowed for this instance of *UmtsSubscriberDataPath (Usd)* over the collection interval. |
| Values | Decimal (0..6000000) |

### ATTRIBUTE Usd pdusToUtran

| | |
|---|---|
| Description | This attribute indicates the number of Protocol Data Units (PDUs) sent to the UMTS Terrestrial Radio Access Network (UTRAN) over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usd pdusFromUtran

| | |
|---|---|
| Description | This attribute indicates the number of Protocol Data Units (PDUs) received from the UMTS Terrestrial Radio Access Network (UTRAN) over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usd pdusToNetwork (pdusToNwk)

| | |
|---|---|
| Description | This attribute indicates the number of GPRS Tunneling Protocol User Plane (GTP-U) Protocol Data Units (PDU) transmitted to the Gateway GPRS Support Node (GGSN) over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usd pdusFromNetwork (pdusFromNwk)

| | |
|---|---|
| Description | This attribute indicates the number of GPRS Tunneling Protocol User Plane (GTP-U) Protocol Data Units (PDU) received from the Gateway GPRS Support Node (GGSN) over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Usd discardedPdus (discPdus)

| | |
|---|---|
| Description | This attribute indicates the number of discarded Protocol Data Units (PDUs) received from the GPRS Support Nodes (GSNs) or UMTS Terrestrial Radio Access Network (UTRAN). This includes packets dropped due to GPRS Tunneling Protocol (GTP-U) protocol errors, packets received with no currently linked session context, packets received without a path to send them or packets dropped due to the Tiered Subscription feature policing downlink data.<br><br>The counter counts events in the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Usd MemoryPoolManager (Mpm)

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n MemoryPoolManager*<br>*Gsd/n MemoryPoolManager*<br>*Gtl/n MemoryPoolManager*<br>*DnsAgent/<vr>,n MemoryPoolManager* |

This component represents the memory resources of a given GPRS application that are managed as pools of objects.

Dyn. Subcomp. "COMPONENT Usd Mpm MemoryPoolClient (Mpc)"

Common Verbs
Help
List
Display

## COMPONENT Usd Mpm MemoryPoolClient (Mpc)

Instance String (1..30, ASCII)

Scope Application

Description *Gsc/n Mpm MemoryPoolClient/<name>*
*Gsd/n Mpm MemoryPoolClient/<name>*
*SgGtl/n Mpm MemoryPoolClient/<name>*
*DnsAgent/<vr>,n Mpm MemoryPoolClient/<name>*

This component represents a pool of objects of a particular class that a GPRS application currently owns as well as all the objects that could be owned by that application. All the objects in the pool are of the same class. The instance value of this component is a string which is the class name of the objects in the pool.

## COMPONENT Usd RemoteApplicationConnection (RaConn)

Instance appType [String (1..8, ASCII)]
shelfId [Decimal (0..15)]
n [Decimal (1..15)]

Groups "GROUP Usd RaConn OsiState (State)"
"GROUP Usd RaConn WlcCustomCounters (WlcCustomCntr)"

Scope Application

Description *... RemoteApplicationConnection/<appType, shelfId, n>*

This component represents the Remote Application Connection information of an application that talks to applications on other shelves. For each application that it can communicate with, one of these connection components is created and is instantiated with the name of the remote application, the Id of the shelf on which the application runs, and the instance number of the application. ShelfId ***0*** represents the Master shelf.

## GROUP Usd RaConn OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Usd RaConn adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Usd RaConn operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Usd RaConn usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

| | |
|---|---|
| | The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Usd RaConn WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usd RaConn customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usd RaConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usd RaConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Usd RaConn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Usd RaConn AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Usd RaConn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE Usd RaConn AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |

| | |
|---|---|
| Default | No default |

## COMPONENT Usd TieredSubscription (Ts)

| | |
|---|---|
| Groups | "GROUP Usd Ts Statistics (Stats)"<br>"GROUP Usd Ts WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS UsgsnSubscriberDatapath TieredSubscription"

| | |
|---|---|
| Scope | Application |
| Description | *Gsd/n TieredSubscription*<br>*Usd/n TieredSubscription*<br><br>This component represents the differentiated tiers of service on the (UMTS) Serving GPRS Support Node (SGSN or USGSN) per Packet Data Protocol (PDP) context basis for downlink traffic. The maximum average bandwidth associated with each tier is not guaranteed at all times but indicates the upper bound on the average data rate for the service. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Usd Ts Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of this component. |

## ATTRIBUTE Usd Ts activePdpCServiced (actPdpCSer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the active PDP contexts for each tier. The value is incremented on a PDP context activation for a tier and decremented when a PDP context is deactivated for the tier. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |
| Default | No default |

### GROUP Usd Ts WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usd Ts customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usd Ts customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

## COLLECTED STATS UsgsnSubscriberDatapath TieredSubscription

Description The statistics record generated by the UsgsnSubscriberDatapath TieredSubscription component.

### ATTRIBUTE Usd Ts pktsPerTierToMobile (pktsToM)

Description This attribute counts the number of packets successfully sent by the SGSN or USGSN for each tier in the down link direction in the collection interval.

Vector of Decimal (0..4294967295)

Index Decimal (1..9)

### ATTRIBUTE Usd Ts octetsPerTierToMobile (octToM)

Description This attribute counts the number of octets successfully sent by the SGSN or USGSN for each tier in the down link direction in the collection interval.

Vector of Decimal (0..4294967295)

Index Decimal (1..9)

### ATTRIBUTE Usd Ts pktsDropped (pktsDr)

Description This attribute counts the packets dropped by the Tiered Subscription of the SGSN or USGSN for each tier in the collection interval.

For example, if the peak throughput for a context is 56kbit/s and there is a burst of downlink data packets exceeding 56kbit/s, then the excess packets will be dropped, and the *pktsDropped* attribute is incremented every time a packet is dropped.

Vector of Decimal (0..4294967295)

Index Decimal (1..9)

### ATTRIBUTE Usd Ts activePdpCServiced (actPdpCSer)

| | |
|---|---|
| Description | This attribute indicates the current number of PDP contexts that are active for each tier. The value is incremented on a PDP context activation for a tier and decremented when a PDP context is deactivated for the tier.<br>This value reported is the value at the end of the collection interval. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |

### ATTRIBUTE Usd Ts peakPdpCServiced (peakPdpCSer)

| | |
|---|---|
| Description | This attribute indicates the maximum number of PDP contexts serviced for the tier during the collection interval. The value is incremented every time *currentPdpCServiced* for that tier exceeds the current value of *peakPdpCServiced* for that tier. It is reset to<br>*currentPdpCServiced* after every data collection. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |

### COMPONENT Usd GtpUserPlane (GtpU)

| | |
|---|---|
| Groups | "GROUP Usd GtpU Provisioned (Prov)"<br>"GROUP Usd GtpU WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |

# COMPONENT UmtsServingGprsSupportNode (Usgsn)

| | |
|---|---|
| Groups | "GROUP Usgsn Provisioned (Prov)"<br>"GROUP Usgsn VolumeCounts (Vc)" |
| Scope | Application |
| Description | *UmtsServingGprsSupportNode*<br><br>This component represents the UMTS Serving GPRS Support Node (USGSN) functionality. It contains the common provisioning data for all the USGSN features on this shelf.<br><br>If the USGSN spans multiple shelves, each shelf will have to be provisioned separately.<br><br>It is strongly recommended that the provisioning for each shelf be done the same way so that the behavior of the network at any given time does not depend on which shelf is handling the traffic. |

| | |
|---|---|
| Subcomponents | "COMPONENT Usgsn Shelf (Sh)"<br>"COMPONENT Usgsn DnsAgent (DnsAg)" |
| Opt. Subcomp. | "COMPONENT Usgsn UmtsSubscriberControl (Usc)"<br>"COMPONENT Usgsn TieredSubscription (Ts)"<br>"COMPONENT Usgsn PlmnImsiEntry (PlmnImsi)"<br>"COMPONENT Usgsn MobileCountryCode (Mcc)"<br>"COMPONENT Usgsn Accounting (Acct)"<br>"COMPONENT Usgsn DifferentiatedService (Ds)"<br>"COMPONENT Usgsn EquivalentPlmn (EquivPlmn)" |
| Dyn. Subcomp. | "COMPONENT Usgsn InternationalMobileSubscriberId (Imsi)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Usgsn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains general provisioning data for *UmtsServingGprsSupportNode (Usgsn)* including Software Optionality Control (SOC). |

## ATTRIBUTE Usgsn networkOpId (nwOpId)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Network Operator Identity, used to identify the operator. This attribute is used by the Lawful Interception functionality. |
| Values | String (1..37, ASCII) |
| Default | No default |

### ATTRIBUTE Usgsn maxSubscribers (maxSubs)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the total number of ‘UMTS-Attached’ subscribers this Umts Serving GPRS Support Node (USGSN) can support simultaneously. It does this by limiting the total of all the individual *maxAttachedSubscribers* attribute in all the *UmtsSubscriberControl (Usc)* components.<br><br>The sum of the ‘maxAttachedSubscribers’ values of all ‘Usc’ instances should be less than or equal to the value of this attribute.<br><br>For example, if this USGSN has two FP *UmtsSubscriberControl* provisioned, the first *UmtsSubscriberControl* provisioned to support ***5000*** subscribers and the second to support ***2500*** subscribers, this attribute must be provisioned with a value of ***7500*** or greater. The value of this attribute cannot be greater than the number authorized by the access code. The access code (attribute *maxSubsAccessCode*) is unique for each USGSN. Please contact your local Nortel Networks Customer Service representative for more information.<br><br>The current number of ‘UMTS-Attached’ subscribers can be obtained from the sum of the *currentlyAttached* attribute defined in the *Usc UscGprsMobilityManagement* component for all the *Usc* instances. |
| Values | Decimal (1000..5000000) |
| Default | 1000 |

### ATTRIBUTE Usgsn maxSubsAccessCode (mSubsCode)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the access code that allows the *maxSubscribers* attribute to be changed to a higher value. The access code must be obtained from an authorized Nortel Networks representative. Each UMTS Serving GPRS Support |

Node (USGSN) requires a unique access code for each and every increase to the *maxSubscribers* attribute.

Values: BCD (0..18)

Default: No default

### ATTRIBUTE Usgsn longMncMccs (longMnc)

Access: Read: All
Write: All

Description: This attribute specifies which Mobile Country Codes (MCC) use a three digit Mobile Network Code (MNC). All MCCs not in this list are assumed to use a two digit MNC.

This information is used to construct an APN-Operator Identity in the format mnc<MNC digits>.mcc<MCC digits>.gprs for APN translations during DNS queries.

An operator would need to add entries to this list, if he has roamers from another PLMN with 3 digit MNCs for whom he needs to do APN translations.

List of: BCD (3)

Default: No default

### GROUP Usgsn VolumeCounts (Vc)

Properties: Provisioned

Description: This group contains provisionable attributes for the *UmtsServingGprsSupportNode (Usgsn)* component to provide traffic volume control.

### ATTRIBUTE Usgsn tariffTimeChangeTrigger (ttcTrig)

Access: Read: All
Write: All

Description: This attribute specifies whether Tariff Time Change Trigger (TTCT) feature is ***enabled*** or ***disabled***. When enabled, SGSN Accounting Server closes existing Change of Charging Condition containers and opens new containers in SGSN Packet Data

Protocol (PDP) Call Detail Records (S-CDRs) to indicate to the down stream billing device that a Tariff Time Change event has occurred. This enables the down stream billing system to use different billing rates for different time containers.

TTCT relies on Time of Day Accounting (TODA) for provisioning the tariff periods. Both the SGSN Accounting Server and the Subscriber Data applications register with TODA for notification of tariff time changes.

When the *tariffTimeChangeTrigger* attribute is enabled, the *collectionTimes* attribute (defined in the *Collector/Accounting* component) must not specify more than 6 periods with no period closer than 4 hours.

| | |
|---|---|
| Values | disabled<br>enabled |
| Default | disabled |

### ATTRIBUTE Usgsn dataVolumeLimit (dvl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies when partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) are generated with a partial record reason of “data volume limit” based upon the number of combined uplink and downlink kilobytes that have been transferred by the active session.<br><br>If this attribute is set to ***disabled***, then a default value of 2 gigabytes for the volume limit is used to trigger the generation of partial S-CDRs. |
| Values | Decimal (128..5120)<br>disabled |
| Units | kbyte |
| Default | disabled |

## COMPONENT Usgsn Shelf (Sh)

| | |
|---|---|
| Groups | "GROUP Usgsn Sh Provisioned (Prov)" |
| Scope | Application |
| Description | *Usgsn Shelf*<br><br>This component represents a shelf in a Multi Shelf USGSN configuration.<br><br>The *Shelf* component is the control entity for a passport shelf and for a network of shelves. A shelf in a multishelf configuration is either a Master or a Slave shelf. Only one shelf can be provisioned as a master shelf.<br><br>A master shelf is one that has at least one *ConnectionToSlave* component provisioned. A slave shelf is one that has the *ConnectionToMaster* component provisioned. |
| Opt. Subcomp. | "COMPONENT Usgsn Sh ConnectionToMaster (ConM)"<br>"COMPONENT Usgsn Sh ConnectionToSlave (ConS)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Usgsn Sh Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data of the *Shelf (Sh)* component. |

## ATTRIBUTE Usgsn Sh atmLocalEsi (atmEsi)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the End System Identifier (ESI) of the ATM NSAP address used by this shelf. The full ATM address is constructed by prepending the *nodeprefix* (taken from the *ModuleData* component) to the *atmLocalEsi*. |

| | |
|---|---|
| Values | String (14, ASCII) |
| Default | No default |

### COMPONENT Usgsn Sh ConnectionToMaster (ConM)

| | |
|---|---|
| Groups | "GROUP Usgsn Sh ConM Provisioned (ConM)"<br>"GROUP Usgsn Sh ConM WlcCustomCounters (WlcCustomCntr)"<br>"GROUP Usgsn Sh ConM OsiState (State)" |
| Scope | Application |
| Description | *Sgsn Sh ConnectionToMaster*<br>*Usgsn Sh ConnectionToMaster*<br><br>This component represents a Slave shelf in a Multi Shelf SGSN configuration. This component is provisioned with the ATM Address (NSAP) of the Master Nodal Manager. |
| Dyn. Subcomp. | "COMPONENT Usgsn Sh ConM AtmConnection (AtmCon)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Usgsn Sh ConM Provisioned (ConM)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the *Shelf (Sh)* provisioning data for the slave shelf. |

### ATTRIBUTE Usgsn Sh ConM masterAddress (mAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Module |
| Description | This attribute specifies the full ATM NSAP Address of the Master shelf. It is constructed by prepending the *nodeprefix* |

| | |
|---|---|
| | (taken from the *ModuleData* component) to the *atmLocalEsi* (taken from the *Sgsn Shelf* component) of the Master Shelf.<br><br>Changing the value of this attribute causes a system reload on the shelf. |
| Values | String (40, NativeAESANsapAddress) |
| Default | No default |

### GROUP Usgsn Sh ConM WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Usgsn Sh ConM customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usgsn Sh ConM customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Usgsn Sh ConM customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Usgsn Sh ConM OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Usgsn Sh ConM adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Usgsn Sh ConM operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Usgsn Sh ConM usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

### ATTRIBUTE Usgsn Sh ConM availabilityStatus (osiAvail)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is

unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

### ATTRIBUTE Usgsn Sh ConM controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Usgsn Sh ConM alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of
underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

### ATTRIBUTE Usgsn Sh ConM standbyStatus (osiStby)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| Default | No default |

### GROUP Usgsn Sh ConS OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Usgsn Sh ConS adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it |

is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Usgsn Sh ConS operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Usgsn Sh ConS usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Usgsn Sh ConS availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is |

***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

### COMPONENT Usgsn DnsAgent (DnsAg)

| | |
|---|---|
| Groups | "GROUP Usgsn DnsAg Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn DnsAgent*<br><br>This component represents the Domain Name System (DNS) Agent. |
| Opt. Subcomp. | "COMPONENT Usgsn DnsAg StaticCacheEntry (Static)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Usgsn DnsAg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the *DnsAgent* provisioning data of the Serving GPRS Support Node (SGSN). |

### ATTRIBUTE Usgsn DnsAg retryTimer (tRetry)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how long the *DnsAgent* waits for a response from a Domain Name System (DNS) Server following the initial query. Intervals for subsequent retries if required, are computed using an algorithm based on this attribute.<br><br>The timer must be provisioned to a value that is greater than the |

| | |
|---|---|
| | maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (2..20) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Usgsn DnsAg maxRetries (nRetry)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of retries for a Domain Name System (DNS) query. After *maxRetries* expiry, if there is no response from the DNS Server, the *DnsAgent* sends an error indication to the application. |
| Values | Decimal (0..5) |
| Default | 2 |

### ATTRIBUTE Usgsn DnsAg refreshTime (tRefresh)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how often a Domain Name System (DNS) cache table entries are refreshed. After the timer expires for a given entry, the next client query for that entry's Logical Name causes the DNS Name Server to be queried again to update the Logical Name information. |
| Values | Decimal (0..14400) |
| Units | minutes |
| Default | 10080 |

### ATTRIBUTE Usgsn DnsAg staleIpAddressReuse (staleIpReuse)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies whether the last stale Internet Protocol (IP) address for a given Access Point Name (APN) is reused by the *DnsAgent* component when all Domain Name System (DNS) query retries fail.<br><br>If a value of ***enabled*** is specified, the *DnsAgent* cache table is not emptied even if the *DnsAgent refreshTime* or *ttl* attribute values have expired for the cache entries. If all DNS query retries fail, the last dynamic entry in the *DnsAgent* cache table is reused. If a value of ***disabled*** is specified, the *DnsAgent* cache table behavior is unaffected. |
| Values | disabled<br>enabled |
| Default | disabled |

## COMPONENT Usgsn DnsAg StaticCacheEntry (Static)

### GROUP Usgsn Usc SessionManagement (Sm)

Properties Provisioned

Description This group contains the common provisionable attributes for the Session Management protocol layer of the UMTS Serving GPRS Support Node (USGSN) on this shelf.

### ATTRIBUTE Usgsn Usc nwkPdpDeactTimer (t3395)

Access Read: All
Write: All

Description This attribute specifies the timer value used in the UMTS Serving GPRS Support Node (USGSN) or in the Gateway GPRS Support Node (GGSN) initiated Packet Data Protocol (PDP) Context Deactivation procedures.

This timer is started when a DEACTIVATE PDP CONTEXT REQUEST message is sent to the Mobile Station (MS) and is stopped when a DEACTIVATE PDP CONTEXT ACCEPT message is received from the MS.

If this timer expires before the receipt of a DEACTIVATE PDP CONTEXT ACCEPT message, the USGSN or GGSN initiated PDP Context deactivation procedure is retried for a maximum of *nwkPdpDeactRetries.*

The timer must be provisioned to a value that is greater than the

| | |
|---|---|
| | maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 8 |

### ATTRIBUTE Usgsn Usc nwkPdpDeactRetries (n3395)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the timer *nwkPdpDeactTimer(t3395)* expires during a UMTS Serving GPRS Support Node (USGSN) or Gateway GPRS Support Node (GGSN)-initiated PDP Context Deactivation procedure. |
| Values | Decimal (0..4) |
| Default | 4 |

### ATTRIBUTE Usgsn Usc defApnOperatorId (defApnOp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the default Access Point Name (APN) Operator Identifier for this Public Land Mobile Network (PLMN). It is a fully qualified domain name according to the Domain Name System (DNS) naming conventions and consists of three labels (that is, <DNS-label>.<DNS-label>.gprs).<br><br>It is expected that the operator uses this attribute to fill in a human-readable format of the APN Operator Identifier (that is, an APN Operator Identifier not in the mnc<*MNC* digits>.mcc<*MCC* digits>.gprs format).<br><br>The selected APN Operator identifier for a particular session can be displayed as part of the *selectedApnOperatorId* attribute (defined in the component *Usgsn Imsi/n SessionContext)*. |
| Values | String (1..37, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Usgsn Usc nwkPdpModifyTimer (t3386)

| Default | 8 |

### ATTRIBUTE Usgsn Usc nwkPdpModifyRetries (n3386)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the timer *nwkPdpModifyTimer(t3386)* expires during a UMTS Serving GPRS Support Node (USGSN) or Gateway GPRS Support Node (GGSN)-initiated PDP Context Modification procedure. |
| Values | Decimal (0..4) |

| | |
|---|---|
| Default | 4 |

### ATTRIBUTE Usgsn Usc tRabAssgtTimer

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer value used in the Radio Access Bearer (RAB) Assignment Request procedures.<br><br>This timer is started when a RAB ASSIGNMENT REQUEST message is sent to the Radio Network Controller (RNC) and is stopped when a RAB ASSIGNMENT ACCEPT message is received from the RNC.<br><br>If this timer expires before the receipt of a RAB ASSIGNMENT ACCEPT message, the USGSN or GGSN initiated RAB Assignment procedure is retried for a maximum of *tRabAssgtRetries*.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..50) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE Usgsn Usc tRabAssgtRetries

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the timer *tRabAssgtTimer* expires during a Radio Access Bearer (RAB) Assignment Request procedure. |
| Values | Decimal (0..5) |
| Default | 1 |

## ATTRIBUTE Usgsn Usc defApnNetworkId (defApnNwk)

Access

Read: All
Write: All

Description

This attribute specifies the default Access Point Name (APN) Network Identifier for the Packet Data Protocol (PDP) types like X.25, IP and PPP.

The operator fills in the default network identifiers for each of these types, in the following manner:
x25 <string for X.25 address > ip <string for IP address> ppp <string for PPP address>.
The address used to identify the GGSN depends on which of these types of network is being connected to.

Each of the strings is a label (for example “corporation”) or a set of labels separated by dots, which is a fully qualified domain name according to the Domain Name System (DNS) naming conventions (for example, "company.com"). Only alphanumeric characters and ‘-’ character are allowed in the label.

The *defApnNetworkId* must not start with the strings “.”, “-”, “*rnc*”, "*rac*", "*lac*" or "*sgsn*" and it must not end in ".gprs". It must also not take the value "*". In order to guarantee uniqueness of the APN Network Identifier across all GPRS PLMNs, an APN Network Identifier containing more than one label corresponds to an Internet domain name. This name must only be allocated by the Public Land Mobile Network (PLMN) to an organization that has officially reserved this name in the Internet domain. Other types of APN Network Identifiers are not guaranteed to be unique within the GPRS PLMN(s).

This *defApnNetworkId* is used if the Mobile Station (MS) does not send the APN Network Identifier as part of the ACTIVATE PDP CONTEXT REQUEST and if its subscription record received from the HLR has a wildcard (*) APN. If the *defApnNetworkId* is not entered in such a case, the ACTIVATE PDP CONTEXT REQUEST message is rejected.

The selected APN Network Identifier for a particular session can

be displayed as part of the *apnNetworkIdentifier* attribute (defined in *Usgsn Imsi/<imsi> SessionContext).*

Vector of: String (1..63, ASCII)

Index: x25

ppp

Default: No default

## GROUP Usgsn Usc GprsMobilityManagement (Gmm)

Properties: Provisioned

Description: This group contains the common provisionable attributes for the GPRS Mobility Management protocol layer of the UMTS Serving GPRS Support Node (USGSN) on this shelf.

## ATTRIBUTE Usgsn Usc resetTimer (t12)

Access: Read: All
Write: All

Description: This attribute specifies the reset timer used for a *UmtsSubscriberControl (Usc).*

This timer is started when an FP on which a *Usc* component is provisioned comes up. During the reset timer period, the USC is considered to have recently experienced a restart, and the GPRS Mobility Management (GMM) ignores and discards messages from the mobile (except ATTACH Requests and ROUTING AREA UPDATE Requests).

If the reset timer has expired, and the mobile subscriber has not performed a subsequent GPRS-Attach, any received messages are considered a protocol violation and responded to with the appropriate reject or a GMM STATUS message, until the mobile performs another GPRS-Attach.

Values: Decimal (0..255)

Units: minutes

Default: No default

### ATTRIBUTE Usgsn Usc mobileReachableTimer (tReachable)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the MOBILE REACHABLE Timer for the GPRS Mobility Management (GMM) state transition.<br><br>The timer value must be at least four minutes longer than the longest *periodicRaUpdateTimer (t3312)* (defined in component *Usgsn Mcc/n Mnc/n Lac/n RoutingAreaCode/n).*<br><br>The timer is started when the Mobile Station (MS) drops from PMM-CONNECTED state to PMM-IDLE state or when the MS is forced to PMM-IDLE state.<br><br>When the timer expires, the USGSN clears the Paging Proceed Flag (PPF) which causes the USGSN to stop paging the MS. The PPF is set when the next activity from the MS is detected. The MM and PDP contexts are kept in the USGSN.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (5..255) |
| Units | minutes |
| Default | 58 |

### ATTRIBUTE Usgsn Usc pagingTimer (t3313)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used for the GPRS Paging procedure.<br><br>Upon expiry of the *pagingTimer*, if the Paging procedure is not completed, the GPRS Paging procedure is restarted for a maximum of *pagingRetries (*n3313). |

| | |
|---|---|
| | The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 8 |

### ATTRIBUTE Usgsn Usc pagingRetries (n3313)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *pagingTimer (t3313)* expires. |
| Values | Decimal (0..4) |
| Default | 1 |

### ATTRIBUTE Usgsn Usc nwkInitiatedDetachTimer (t3322)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used in the Network-Initiated Detach procedure. Upon expiry of *nwkInitiatedDetach*Timer, if the Detach procedure is not completed, the Network-Initiated Detach procedure is restarted for a maximum of *nwkInitDetachRetries (n3322).*<br><br>If the maximum number of retries is exceeded, the mobile goes to the PMM_DETACHED state.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Usgsn Usc nwkInitDetachRetries (n3322)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *nwkInitiatedDetachTimer (t3322)* expires. |
| Values | Decimal (0..8) |
| Default | 4 |

### ATTRIBUTE Usgsn Usc idRequestTimer (t3370)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used in Identification procedure. Upon expiry of the i*dRequestTimer*, if the Identification procedure is not finished, the identification procedure is restarted for a maximum of *idRequestRetries* (n3370).<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 6 |

### ATTRIBUTE Usgsn Usc idRequestRetries (n3370)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *idRequestTimer (t3370)* expires. |
| Values | Decimal (0..8) |
| Default | 4 |

### ATTRIBUTE Usgsn Usc ptmsiReallocTimer (t3350)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used in the Packet-Temporary Mobile Subscriber Identity (P-TMSI) Reallocation procedure. The P-TMSI reallocation procedure can also be performed within the Attach or Routing Area Update procedures, as well. Upon expiry of the *ptmsiReallocTimer*, if the P-TMSI Reallocation procedure is not finished, P-TMSI Reallocation procedure is restarted for a maximum of *ptmsiReallocationRetries (n3350)*. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 6 |

### ATTRIBUTE Usgsn Usc ptmsiReallocationRetries (n3350)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *ptmsiReallocTimer (t3350)* expires. |
| Values | Decimal (0..8) |
| Default | 4 |

### ATTRIBUTE Usgsn Usc authCipheringTimer (t3360)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the timer used in Authentication and Ciphering procedure. Upon expiry of the *t3360* timer, if the Authentication and Ciphering procedure is not finished, this procedure is restarted for a maximum of *authCipheringRetries (n3360)*.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |

| | |
|---|---|
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 6 |

### ATTRIBUTE Usgsn Usc authCipheringRetries (n3360)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retry attempts after the *authCipheringTimer (t3360)* expires. |
| Values | Decimal (0..8) |
| Default | 4 |

### ATTRIBUTE Usgsn Usc authEvents

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number, N, which indicates that at every Nth event requiring authentication, the Authentication procedure is initiated with the mobile subscriber.<br><br>For example, when this value is set to never, the Authentication procedure is never performed, when the value is set to 1, the Authentication procedure is performed every time an event that triggers authentication occurs.<br><br>The provisioning of any other value N for this attribute indicates that every Nth event that can be authenticated undergoes this Authentication procedure. This parameter is not per Mobile Station (MS); rather, it is used to count events over all the affected procedures per *UmtsSubscriberControl (Usc).* |
| Values | Decimal (1..255)<br>never |
| Default | 20 |

### ATTRIBUTE Usgsn Usc subsRegisterRecoveryUpdateTimer (tSubsReg)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum recovery delay time used by the UMTS Serving GPRS Support Node (USGSN) to re-create the association between the Home Location Register (HLR), in the case of the HLR Reset, and a Mobile Station (MS). The timer is started on a receipt of a valid MS message following the HLR Reset. When the timer expires the appropriate procedure is initiated by the GPRS Mobility Management (GMM).<br><br>The actual timer used is a randomized value less than this value in order to distribute the traffic to HLR after an HLR Reset when a MAP-UPDATE GPRS LOCATION (UGL) is performed.<br><br>If the value of this attribute is set to ***0***, the timer is not started. |
| Values | Decimal (0..10) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Usgsn Usc t3TunnelTimer (t3Tunnel)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time that the old USGSN will continue to forward packets to the new USGSN during an Inter SGSN Routing Area Update (IRAU).<br><br>The timer is started in the old SGSN when it receives a GTP SGSN CONTEXT REQUEST message and there is at least one active Packet Data Protocol (PDP) context. Upon timer expiry, the packets are no longer forwarded to the new USGSN. |
| Values | Decimal (1..40) |
| Units | seconds |
| Default | 20 |

### ATTRIBUTE Usgsn Usc iuReleaseTimer (iuRt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the network waits for an IuReleaseComplete message once the IuReleaseCommand message is sent. |
| Values | Decimal (1..15) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Usgsn Usc cipheringAlgorithms (ciphAlgo)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Ciphering Algorithms supported on this UMTS Serving GPRS Support Node (USGSN) in descending order of preference.<br><br>The mobile provides a list of the ciphering algorithms it supports to the USGSN. The USGSN compares the mobile provided values with the values listed in this attribute. The first value provisioned in this attribute that is also in the mobile provided list is chosen as the ciphering algorithm for use in communicating with this mobile.<br><br>The possible values for the attribute are:<br>***noCiphering***: No Ciphering is used.<br>***geav1***: GPRS Encryption Algorithm Version 1. |
| Vector of | noCiphering<br>geav1 |
| Index | Decimal (1..2) |
| Default | (noCiphering, noCiphering) |

### GROUP Usgsn Usc GtpC

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the common provisionable attributes for the signalling part of the GPRS Tunneling Protocol layer (GtpC) of the UMTS Serving GPRS Support Node (USGSN) on this shelf. |

### ATTRIBUTE Usgsn Usc t3ResponseTimer (t3Resp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute defines the time that the UMTS Serving GPRS Support Node (USGSN) will wait for a response to a GTP signalling request on the interface to a GPRS Support Node (GSN).<br><br>Upon expiry of this timer, the request is resent for a maximum of *requestRetries t*imes. If this number is exceeded, a failure notification is sent back to the application invoking the request.<br><br>The attribute must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). |
| Values | Decimal (1..25) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Usgsn Usc n3Request (n3Req)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute defines the number of times that the UMTS Serving GPRS Support Node (USGSN) will attempt to send a GTP signalling request to the GPRS Support Node (GSN).<br><br>If this number is exceeded, a failure notification is sent back to the application invoking the request. |
| Values | Decimal (1..20) |
| Default | 4 |

### ATTRIBUTE Usgsn Usc echoRequest (echoReq)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies if the ECHO REQUEST message is to be sent out for signaling path to the GPRS Support Node (GSN). |
| Values | disabled<br>enabled |
| Default | enabled |

### ATTRIBUTE Usgsn Usc echoTimeInterval (echoInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time interval at which ECHO REQUESTS are sent on a signaling path in use from the UMTS Serving GPRS Support Node (USGSN) to the GPRS Support Node (GSN). |
| Values | Decimal (1..300) |
| Units | minutes |
| Default | 2 |

### ATTRIBUTE Usgsn Usc pathHistoryExpireTimeInterval (pathHistExpInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies time interval at which the path history is reset. When the value is set to ***disabled,*** it is never reset. |
| Values | Decimal (1..300)<br>disabled |
| Units | minutes |
| Default | 10 |

### ATTRIBUTE Usgsn Usc strictPathSupervision (stPathSup)

Access
Read: All
Write: All

Description
This attribute specifies whether GTP-C will declare path failure if a response to any message to a GSN is not received, or if an echo-request goes unanswered. When a link failure is detected between the USGSN and a GSN, the GSN is marked as unreachable.

If the value of the attribute is set to ***enabled,*** failure of the remote end to respond to any GTP request will result in path failure being declared.

If the value of this attribute is set to ***disabled***, then failure of the remote end to respond to an echo request will be marked as a path failure, but all other failures will not be detected.

The number of link failures detected is indicated by the attribute *pathFailures*, in the *Usc GtpC* component.

Values
enabled
disabled

Default
disabled

### ATTRIBUTE Usgsn Usc gtpV0Version (gtpVer)

Access
Read: All
Write: All

Description
This attribute specifies the version of 3GPP specification 09.60 GPRS Tunnelling Protocol (GTP) across the Gn and Gp interfaces that the UMTS Serving GPRS Support Node (USGSN) is compliant with.

This attribute is applicable only to GTP version 0, which is used if the Release 99 compliant GTP version 1 cannot be negotiated with a neighboring Gprs Support Node (GSN). This attribute is important for network operators because USGSNs that support v7.6 cannot perform Inter USGSN Routing Area Updates (IRAUs) with USGSNs that support version v7.3 due to non-

backwards compatible changes present in the GTP specification.

If the value of this attribute is set to ***ver7-3,*** this USGSN supports version 7.3 of 09.60 and can perform IRAUs with other USGSNs supporting this same version of the specification.

If the value of this attribute is set to ***ver7-6***, this USGSN supports version 7.6 of 09.60 and can perform IRAUs with other USGSNs supporting this same version of the specification.

Values
ver7-3
ver7-6

Default
ver7-6

### GROUP Usgsn Usc HlrCache (HlrC)

Properties
Provisioned

Description
This group contains the common provisionable attributes for all the *UmtsSubscriberControl/n HlrCache* instances on this shelf.

### ATTRIBUTE Usgsn Usc authTripletsReuse (authTrip)

Access
Read: All
Write: All

Description
This attribute specifies the number of times an Authentication Triplet can be reused when authenticating a subscriber. The reuse of the Authentication Triplets is done only in abnormal situations, when new triplets cannot be received from the Home Location Register (HLR) due to connectivity breakdown between the UMTS Serving GPRS Support Node (USGSN) and the HLR.

Values
Decimal (0..5000)

Default
5000

### GROUP Usgsn Usc MapClientProv (Mc)

Properties
Provisioned

Description
This group contains the common provisionable attributes for the *MapClient* subcomponents of *UmtsSubscriberControl* on the FPs. The *MapClient* subcomponent provides Mobile Application Part

(MAP) over SS7 to interact with the Home Location Register (HLR) via the SS7-IP Gateway.

### ATTRIBUTE Usgsn Usc mcTimer (tMc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the *MapClient* allows for a response from the Home Location Register (HLR). The timer is started when messages MAP-SEND AUTHENTICATION INFO, stand-alone MAP-INSERT SUBSCRIBER DATA, MAP-UPDATE GPRS LOCATION, MAP-PURGE MS, or READY-FOR-SMS are sent to the HLR.<br><br>The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU) and greater than the longest timer provisioned in the *MapStack* component for messages sent to the HLR. |
| Values | Decimal (1..32) |
| Units | seconds |
| Default | 27 |

### ATTRIBUTE Usgsn Usc uglRetries (nUgl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the times the Serving GPRS Support Node (SGSN) can send the MAP-UPDATE GPRS LOCATION to the Home Location Register (HLR) upon no reception of the MAP-UPDATE GPRS LOCATION ACK. |
| Values | Decimal (0..4) |
| Default | 1 |

### ATTRIBUTE Usgsn Usc saiRetries (nSai)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the times the Serving GPRS Support Node (SGSN) can send the MAP-SEND AUTHENTICATION INFO to the Home Location Register (HLR) upon no reception of the MAP-SEND AUTHENTICATION INFO ACK. |
| Values | Decimal (0..4) |
| Default | 1 |

### ATTRIBUTE Usgsn Usc afrRetries (nAfr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the times the Serving GPRS Support Node (SGSN) can send the MAP Authentication Failure Report to the Home Location Register (HLR) upon no reception of the MAP Authentication Failure Report Acknowledge. |
| Values | Decimal (0..4) |
| Default | 1 |

### ATTRIBUTE Usgsn Usc mcFallbackTimer (tFbMc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the MAP Client allows to reset the MAP Client Fallback Table. The Fallback Table is used by the MAP Client to track the messaging version supported by each Home Location Register (HLR). If the *mcFallbackTimer* attribute changes or the timer expires, the Fallback Table is deleted and the messaging version is renegotiated with each HLR. The timer is also restarted with either the existing timeout value if the timer expired or the modified value if the value was modified.<br><br>If the timer is set to ***disabled***, the timer is not started and the Fallback Table is not deleted. Message version renegotiation with the HLR does not take place until the timer is set to a value other than ***disabled***. |

| | |
|---|---|
| Values | Decimal (1..365)<br>disabled |
| Units | days |
| Default | 30 |

### ATTRIBUTE Usgsn Usc mscEmulationMode (mscEmMode)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether the SGSN should emulate an MSC when messaging with the Short Message Service Center (SMSC). Currently the MAP specification requires that the MSC SSN be used in the Calling Party Address (CgPA) when the SGSN addresses an entity that does not support inter-working with the SGSN.<br><br>When this attribute is set to ***on***, the SGSN emulates an MSC when messaging with the SMSC. The SMSC is either the Short Message Service Interworking MSC (SMS-IWMSC) or the Short Message Service Gateway MSC (SWS-GMSC).<br><br>When this attribute is set to ***off***, the SGSN's SSN is used when messaging with the SMSC. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Usgsn Usc mscSubsystemNumber (mscSubsysNum)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the MAP SGSN SubSystem Number (SSN). This SSN is only used if the *mscEmulationMode* attribute is set to ***on***. Otherwise this attribute is ignored.<br><br>If this attribute is changed after the MAP Client has registered with the MAP Stack, any outstanding MAP transactions will be lost. |

| | |
|---|---|
| Values | Decimal (1..255) |
| Default | 8 |

### GROUP Usgsn Usc Gsn

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the common provisionable attributes for all of the UmtsSubscirberContro/n Gsn instances on this shelf. |

### ATTRIBUTE Usgsn Usc maxIncomingRequests (maxInReq)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of outstanding incoming Gn requests. Increasing the value causes more memory to be allocated for these requests. |
| Values | Decimal (10..100) |
| Default | 56 |

### GROUP Usgsn Usc SsfGlobalProv (Ssf)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains general provisioning data for all *Ssf* components on the shelf. |

### ATTRIBUTE Usgsn Usc tssfTimer (tssf)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the SSF will wait for an SCP response while in the Waiting for Instructions state.<br><br>Each new CAP (CAMEL Application Part) message from an SCP stops the Tssf timer. The timer is started when the SSF enters the Waiting for Instructions state. If a response is not received in the amount of time specified by this attribute, the SSF will give up and use the Default GPRS Handling field of the related mobile's CAMEL Subscriber Info (CSI) to determine the appropriate action to take. |

| | |
|---|---|
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Usgsn Usc ssfChargingGuardTimer (ssfCGuardTimer)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the SSF will wait for a reply from an SCP once an ApplyChargingReportGPRS CAP message has been sent and successfully received by the SCP. Valid responses from the SCP are the ApplyCharging, ReleaseGPRS or CancelGPRS messages. If a response if not received in the amount of time specified by this attribute, the SSF will give up and used the Default GPRS Handling field of the related mobile's CAMEL Subscriber Info (CSI) to determine the appropriate action to take.<br><br>This attribute also specifies the amount of time the SSF will wait for a reply from an SCP indicating that one of the following SGSN initiated messages has been received: ApplyChargingReportGPRS, EventReportGPRS, EntityReleasedGPRS, and InitialDPGPRS.<br><br>If an acknowledgement is not received from the SCP in the amount of time specified by this attribute for any of the messages listed above, the message is sent again to the SCP. The SSF will continue to retransmit the previous CAP message after each timeout until the number of consecutive timeouts reaches the value specified by the *ssfCGuardRetryAtt* attribute. If the maximum number of timeouts is reached, the SSF will give up and use the DefaultGprsHandling field of the related mobile's CAMEL Subscriber Info (CSI) to determine the appropriate action to take. |
| Values | Decimal (1..20) |
| Units | seconds |
| Default | 3 |

### ATTRIBUTE Usgsn Usc ssfTcapStackRegistrationTimer (ssfTcapRegTmr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time the SSF will wait for a registration response from the TCAP Stack after sending a registration request. If the timer expires, the SSF sends another registration request. The SSF continues to send registration requests whenever the timer expires until registration is successful. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Usgsn Usc ssfChargingGuardRetryAttempts (ssfCGuardRetryAtt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of retry attempts after the *ssfChargingGuardTimer* expires. |
| Values | Decimal (0..5) |
| Default | 0 |

### ATTRIBUTE Usgsn Usc ssfCgpaRoutingIndicator (ssfCgpaRtInd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SCCP routing indicator used for SGSN Calling Party Addresses (CgPA). Two methods are supported.<br><br>***globalTitle***- CAP subsystem sets the CgPA routing Indicator to route on Global Title and supplies Global Title information.<br><br>***pointCode*** - CAP subsystem sets the CgPA routing Indicator to route on Point Code and supplies the Subsystem Number and Point Code in the CgPA. |

| | |
|---|---|
| Values | globalTitle (gt)<br>pointCode (pc) |
| Default | globalTitle |

### ATTRIBUTE Usgsn Usc ssfCapSsn (ssfSsn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the CAP (CAMEL Application Part) SGSN SubSystem Number (SSN). This SSN is used by SCCP for subsystem routing. The value of this attribute must match the value the corresponding subsystem number specified on the SS7 IP Gateway (SIG). |
| Values | Decimal (1..255) |
| Default | 146 |

### ATTRIBUTE Usgsn Usc ssfRoamerService (ssfRoamServ)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies if CAMEL roaming subscribers are supported.<br><br>If *ssfRoamerService* is set to ***disabled*** and a CAMEL subscriber roams into an area served by this SGSN, active PDP (Packet Data Protocol) contexts are dropped and new contexts cannot be created.<br><br>If *ssfRoamerService* is set to ***enabled*** and a CAMEL subscriber roams into an area served by this SGSN, existing PDP Contexts are maintained and new contexts are created when requested.<br><br>***enabled***- enable roamer service, allowing roaming subscribers.<br><br>***disabled-*** disable roamer service, refusing roaming subscribers. |
| Values | enabled<br>disabled |

| | |
|---|---|
| Default | enabled |

### ATTRIBUTE Usgsn Usc ssfSupportedCamelPhase (ssfSupportedPhase)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the highest phase of CAMEL supported by the SGSN or USGSN.<br><br>If ***notSupported*** is specified, it indicates to all *Ssf* components that CAMEL is not supported by the network. |
| Values | Decimal (3)<br>notSupported |
| Default | notSupported |

### GROUP Usgsn Usc MobileSubscriberPurge (MsPurge)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the Mobile Subscriber (MS) Purge functionality on the (UMTS) Serving GPRS Support Node (USGSN or SGSN). |

### ATTRIBUTE Usgsn Usc msPurgeFunction (msPurge)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether Mobile Subscriber Purge function is enabled or disabled. If this attribute is set to ***disabled,*** then no purge shall be sent out of the (UMTS) Serving GPRS Support Node (USGSN or SGSN). |
| Values | disabled<br>enabled |
| Default | disabled |

### ATTRIBUTE Usgsn Usc purgeOnExplicitDetach (purgeExplicit)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies whether Mobile Subscribers are purged immediately upon an explicit detach.<br><br>The *msPurgeFunction* attribute must be set to ***enabled*** for this attribute to have an effect. |
| Values | disabled<br>enabled |
| Default | disabled |

### ATTRIBUTE Usgsn Usc purgeMinimumInactiveMobileAge (purgeMinAge)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the minimum time that a detached Mobile Subscriber's Data is kept on the (UMTS) Serving GPRS Support Node (USGSN or SGSN). Once a Mobile Subscriber remains detached beyond the specified value, the Mobile Subscriber becomes a candidate for purge during an audit.<br><br>The *msPurgeFunction* attribute must be set to ***enabled*** for this attribute to have an effect. |
| Values | Decimal (1..744)<br>disabled |
| Units | hours |
| Default | disabled |

### COMPONENT Usgsn TieredSubscription (Ts)

| | |
|---|---|
| Groups | "GROUP Usgsn Ts Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn TieredSubscription*<br>*Usgsn TieredSubscription*<br><br>This component represents the differentiated tiers of service on the (UMTS) Serving GPRS Support Node (SGSN or USGSN) on a per Packet Data Protocol (PDP) context basis for downlink traffic. The maximum average bandwidth associated with each |

tier is not guaranteed at all times but indicates the upper bound on the average data rate for the service. If this component is not provisioned, the data rate for every context will be best effort.

## GROUP Usgsn Ts Provisioned (Prov)

Properties: Provisioned

Description: This group contains the *Tiered Subscription (Ts)* provisioning data of the (UMTS) Serving GPRS Support Node (SGSN or USGSN).

## ATTRIBUTE Usgsn Ts roamerTier

Access: Read: All
Write: All

Description: This attribute specifies the peak bit rate (tier) that can be assigned to a PDP context for mobiles that are not in their Home PLMN. Tier 0 through Tier 9 map to peak throughput classes 0 through 9. Peak throughput class 0 represents the subscribed peak throughput class for a PDP context. Peak throughput classes 1 through 9 represent peak bit rates of 8 kbit/s, 16 kbit/s, 32 kbit/s, 64 kbit/s, 128 kbit/s, 256 kbit/s, 512 kbit/s, 1024 kbit/s and 2048 kbit/s respectively. The Tiered Subscription service uses this information during a PDP context activation for a roamer to determine the maximum average throughput for the context.
If the *roamerTier* is provisioned as ***0***, then the peak throughput for the context is the lower of the peak throughput class of the mobile requested QoS and the mobile's subscribed QoS.
If the *roamerTier* is a value between ***1*** and ***9***, then the peak throughput class for the context is the peak throughput associated with that tier.

Values: 0
1

| | |

| | 2<br>3<br>4<br>5<br>6<br>7<br>8<br>9 |
| Default | 0 |

### ATTRIBUTE Usgsn Ts averagingWindow (avgWin)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the size of the averaging window used to compute the average bandwidth used by a PDP context.<br><br>User traffic is policed per context using the peak throughput rate. In order to police the average peak data rate per context in the down link direction, Tiered Subscription (TS) monitors the amount of data passed over a specified period of time, which is defined by the *averagingWindow*. In other words, the user data rate is throttled in terms of how many bytes are passed over the averaging Window time frame.<br>Tiered Subscription (TS) limits the data transfer to the data rate (bits/s) multiplied by the *averagingWindow* (s). The larger the *averagingWindow*, the more burst size is accommodated. |
| Values | Decimal (1..10) |
| Units | seconds |
| Default | 5 |

### COMPONENT Usgsn PlmnImsiEntry (PlmnImsi)

| | |
|---|---|
| Instance | Decimal (1..1000) |
| Groups | "GROUP Usgsn PlmnImsi PlmnImsi" |
| Scope | Application |

Description *Usgsn PlmnImsiEntry/n*

This component represents an entry in a table of the International Mobile Subscriber Identity (IMSI) digits ranges. If a particular IMSI has a digit range that does not match any entry in the table, then it does not belong to this Public Land Mobile Network (PLMN).

## GROUP Usgsn PlmnImsi PlmnImsi

Properties Provisioned

Description This group contains the Mobile Country Code (MCC), Mobile Network Code (MNC) range for this Public Land Mobile Network (PLMN). All Mobile Stations (MS) whose MCC and MNC do not belong to the current PLMN are considered roamers.

The *fromPrefix* and *toPrefix* attributes represent decimal number value ranges that fit the IMSI specification of 15 digits. All digits must be 0 through 9 inclusive. When the *fromPrefix* or the *toPrefix* value is less than 15 digits, the value in attribute *fromPrefix* is always extended with 0's, and the value in attribute *toPrefix* is always extended with 9's.

A complete range (*fromPrefix* and *toPrefix* forming a range of IMSI digits) must not overlap any previously entered range.

## ATTRIBUTE Usgsn PlmnImsi fromPrefix (frPrefix)

Access Read: All
Write: All

Description This attribute specifies the lower limit of the range of the International Mobile Subscriber Identity (IMSI) digits which are

| | |
|---|---|
| | considered as home subscribers. The value in attribute *fromPrefix* is always extended with 0's. |
| Values | BCD (1..15) |
| Default | No default |

## GROUP Usgsn Imsi Mc MobilityContext (Mc)

Properties: Operational

Description: This group displays the Mobility Context information of a subscriber.

## ATTRIBUTE Usgsn Imsi Mc gmmState (gmmSt)

Access: Read: All
Write: Illegal

Description: This attribute indicates the GPRS Mobility Management (GMM) state for a mobile. Upon initialization, this attribute value is in ***pmmIdle*** state.

The states have the following meaning:

***pmmDetached*** - There is no communication between the Mobile Station (MS) and the UMTS Serving GPRS Support Node (USGSN). The MS and the USGSN contexts hold no valid location or routing area information for the mobile.

***pmmIdle*** - The MS location is known in the UMTS Serving GPRS Support Node (USGSN) with an accuracy of a routing area. Paging is required in order to reach the MS.

***pmmConnected*** - The PS signalling connection has been established between the MS and the UMTS Serving GPRS Support Node (USGSN). The MS can send or receive the Point To Point Protocol Data Units (PTP PDUs) in this state.

Values: pmmDetached
pmmIdle
pmmConnected

Default No default

### ATTRIBUTE Usgsn Imsi Mc routingAreaIdentifier (rai)

Access
Read: All
Write: Illegal

Description
This attribute indicates the current routing area of the Mobile Station (MS). The routing area is transmitted to the UMTS Serving GPRS Support Node (USGSN) during a Routing Area Update procedure or Attach procedure.

The routing area identifier includes the Mobile Country Code (MCC) in BCD format in the first 3 digits, the Mobile Network Code (MNC) in BCD format in the next 3 digits, the Location Area Code (LAC) in the next 2 octets, and the Routing Area Code (RAC) in the last octet.

For a 2 digit MNC, a padding of F is used in place of the first digit so that it always occupies 3 digits. For the MNC and the MCC, the order of digits is reversed in every byte.

For example, the RAI consisting of :
208 (MCC), 12 (MNC), 34 (LAC), 15 (RAC) will be encoded as, 02F821003415.

Values String (6, Hex)

Default No default

### ATTRIBUTE Usgsn Imsi Mc ptmsi

Access
Read: All
Write: Illegal

Description
This attribute indicates the P-TMSI used to identify the context of the Mobile Station (MS) within the UMTS Serving GPRS Support Node (USGSN). This is one of the main reference keys that is used to identify an MS in the USGSN.

Values String (4, Hex)

Default No default

### ATTRIBUTE Usgsn Imsi Mc serviceAreaCode (sac)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the last known Service Area Code (SAC) when an INITIAL UE message was received from the Radio Network Controller (RNC), or when a Location Reporting procedure was executed. |
| Values | String (2, Hex) |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Mc msNetworkCapability (msNwkCap)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network portion of the Mobile Station (MS) classmark. The classmark contains specific information about a Mobile Station (MS). |

No default

## ATTRIBUTE Usgsn Imsi Sc ReqQos trafficClass (traffClass)

Access

Read: All
Write: Illegal

Description

This attribute indicates the type of application for which the UMTS bearer service is optimized. By including the traffic class itself as an attribute, the UMTS Sgsn can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:

***subscribed*** - This value specifies that the traffic class to be optimized is that indicated by the "subscribed traffic class" field of the user's HLR record.

***conversational*** - This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video

conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a man or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background, for eg., emails, SMS and database downloads. This is characterized by the destination not expecting the data within a certain time.

| | |
|---|---|
| Values | subscribed (sub)<br>conversational (conv)<br>streaming (strm)<br>interactive (int)<br>background (bkgr) |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Sc ReqQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDUs). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Sc ReqQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to UMTS in the uplink direction within a period of time, divided by the duration of the period. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Sc ReqQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered by UMTS in the downlink direction within a period of time, divided by the duration of the period. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Sc ReqQos residualBitErrorRate (resBer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered Signalling Data Units (SDUs).<br><br>This attribute can take up values ranging from 1 through 9, representing:<br><br>1 -> 5*10 -2<br>2 -> 1*10 -2<br>3 -> 5*10 -3 |

4 -> 4*10 -3
5 -> 1*10 -3
6 -> 1*10 -4
7 -> 1*10 -5
8 -> 1*10 -6
9 -> 6*10 -8

Values: Decimal (1..9)

Default: No default

### ATTRIBUTE Usgsn Imsi Sc ReqQos sduErrorRatio (sduErrRatio)

Access: Read: All
Write: Illegal

Description: This attribute indicates the fraction of SDUs lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4
5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values: Decimal (1..7)

Default: No default

### ATTRIBUTE Usgsn Imsi Sc ReqQos trafficHandlingPriority (traffHndlPr)

Access: Read: All
Write: Illegal

Description: This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the values ***interactive.***

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Usgsn Imsi Sc ReqQos transferDelay (transfDelay)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP. |
| Values | Decimal (10..4100) |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Sc ReqQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Sc ReqQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute |

has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s.

Values: Decimal (0..8640)

Default: No default

### COMPONENT Usgsn Imsi Sc NegotiatedQos (NegQos)

Groups: "GROUP Usgsn Imsi Sc NegQos QosProfile (Qos)"

Scope: Application

Description: *Usgsn Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos*
This component represents the negotiated Quality of Service received by the mobile subscriber for this session.

Common Verbs:
Help
List
Display

### GROUP Usgsn Imsi Sc NegQos QosProfile (Qos)

Properties: Operational

Description: This group contains the QOS profile. It contains either the requested Qos, the negotiated Qos, or the subscribed QOS based on which component contains this group.

### ATTRIBUTE Usgsn Imsi Sc NegQos deliveryOrder (delOrd)

Access: Read: All
Write: Illegal

Description: This attribute indicates whether the Signalling Data Units (SDUs) order of delivery is guaranteed.

Values: withDeliveryOrder
withoutDeliveryOrder

Default: No default

### ATTRIBUTE Usgsn Imsi Sc NegQos deliveryOfErroneousSdus (delErrSdus)

Access: Read: All
Write: Illegal

Description

This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.

The erroneous SDUs can be handled in one of the following ways:

***subDeliveryOfSdus***: The Signalling Data Units (SDUs) are delivered according to the Subscriber's profile.

***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.

***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.

***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded.

Values

subDeliveryOfSdus
noDetect
errSdusDelivered
errSdusNotDelivered

Default

No default

### ATTRIBUTE Usgsn Imsi Sc NegQos trafficClass (traffClass)

Access

Read: All
Write: Illegal

Description

This attribute indicates the type of application for which the UMTS bearer service is optimized. By including the traffic class itself as an attribute, the UMTS Sgsn can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:

***subscribed*** - This value specifies that the traffic class to be optimized is that indicated by the "subscribed traffic class" field of the user's HLR record.

***conversational*** - This class includes real time conversation,

characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a man or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background, for eg., emails, SMS and database downloads. This is characterized by the destination not expecting the data within a certain time.

| | |
|---|---|
| Values | subscribed (sub)<br>conversational (conv)<br>streaming (strm)<br>interactive (int)<br>background (bkgr) |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Sc NegQos maxSduSize (maxSduSize)

| | |

| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Usgsn Imsi Sc NegQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute |

has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s.

Values: Decimal (0..8640)

Default: No default

## COMPONENT Usgsn Imsi SubscriptionRecord (Sr)

Scope: Application

Description: *Usgsn Imsi/<imsi> SubscriptionRecord*

This component represents the subscription information downloaded from the Home Location Register (HLR). The *HlrCache* on the *UmtsSubscriberControl* (*Usc*) contains the active subscriber data. A *SubscriptionRecord* instance is created to represent an active subscriber tuple of an HLR Cache in the UMTS Subscriber Control (Usc).

Dyn. Subcomp.: "COMPONENT Usgsn Imsi Sr PdpContext (PdpC)"

|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the addressing type, such as X.121, IPv4, or IPv6. |
| Values | x121<br>ipv4<br>ipv6 |

Default — No default

### ATTRIBUTE Usgsn Imsi Sr PdpC apnNetworkIdentifier (apnNwkId)

Access — Read: All
Write: Illegal

Description — This attribute indicates the Access Point Name (APN), or the Logical Name, or the network address of the packet data network, with which this Packet Data Protocol (PDP) context is associated.

The APN Network Identifier can be the one received from the mobile as part of the ACTIVATE PDP CONTEXT REQUEST message, can be selected from the subscription record against which this session has been activated, or it can be the *defaultApnNetworkId* (defined in *Usgsn UmtsSubscriberControl*)

Values — String (1..63, ASCII)

Default — No default

### ATTRIBUTE Usgsn Imsi Sr PdpC vplmnAddressAllowed (vplmnAddr)

Access — Read: All
Write: Illegal

Description — This attribute indicates whether the Mobile Station (MS) is allowed to use the Access Point Name (APN) in the domain of the Visiting Public Land Mobile Network (VPLMN).

Values — no
yes

Default — No default

### COMPONENT Usgsn Imsi Sr PdpC SubscribedQos (SubsQos)

Groups — "GROUP Usgsn Imsi Sr PdpC SubsQos QosProfile (Qos)"

Scope — Application

Description — *Usgsn Imsi/<imsi> SubscriptionRecord PdpContext/<nsapi> SubscribedQos*
This component represents the Quality of Service (QOS) profile

of the subscriber downloaded from the Home Location Register (HLR).

Common Verbs

## GROUP Usgsn Acct Provisioned (Prov)

Properties: Provisioned

Description: This group contains the Accounting (Acct) provisioning data of the Serving GPRS Support Node (SGSN).

## ATTRIBUTE Usgsn Acct cdrCapture (cdrCap)

Access: Read: All
Write: All

Description: This attribute specifies which of the following Call Detail Records (CDRs) are generated:

***scdr:*** SGSN Packet Data Protocol (PDP) CDRs
***mcdr*** Mobility CDRs
***smoCdr***: SGSN Short Message Origination CDRs
***smtCdr***: SGSN Short Message Termination CDRs

Set of: sgsn
mobility
smo
smt

Default: No default

## ATTRIBUTE Usgsn Acct locationBasedBilling (lbb)

Access: Read: All
Write: All

Description: This attribute specifies whether location based billing for the generation of partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) upon routing area changes is ***enabled***

or ***disabled***. When ***enabled***, every S-CDR will contain only the traffic data volume counts for a single routing area, allowing the operator to bill based on geographic location.

Values
disabled
enabled

Default
disabled

### ATTRIBUTE Usgsn Acct transferInterval (trInt)

Access
Read: All
Write: All

Description
This attribute specifies the interval at which currently spooled closed Call Detail Records (CDRs) are to be transferred to the Charging Gateway Functionality (CGF).

When set to ***noDelay,*** closed CDRs are transferred to the CGF with minimal delay. When set to a value between 15 and 1440 (minutes), the SGSN Accounting Server (SAS) starts a timer upon startup. At every expiration of this timer, closed CDRs on the hard disk are sent to the CGF.

The values that can be set are ***noDelay*** and multiples of 15 minutes.

Values
Decimal (15..1440)
noDelay

Units
minutes

Default
30

### ATTRIBUTE Usgsn Acct updateInterval (updateInt)

Access
Read: All
Write: All

Description
This attribute specifies the interval at which Session Management (SM) is queried for traffic data volume for all open SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs). It also specifies the interval at which GPRS Mobility Management (GMM) is queried to find out if the mobile is still attached for all

open Mobility Call Detail Records (M-CDRs).

The *updateInterval* must be less than the *scdrPartialRecordInterval*.

Only values that are multiples of 15 minutes can be set for this attribute.

| | |
|---|---|
| Values | Decimal (15..1440) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE Usgsn Acct scdrPartialRecordInterval (scdrInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the interval at which the partial SGSN Packet Data Protocol (PDP) Call Detail Records (S-CDRs) are generated.<br><br>When set to a value other than ***noPartialRecords***, S-CDRs that have been open longer than *scdrPartialRecordInterval* are closed with a partial record reason of “time (duration) limit”.<br><br>The *scdrPartialRecordInterval* must be greater than or equal to the *updateInterval*.<br><br>The values that can be set are ***noPartialRecords*** and multiples of 15 minutes. |
| Values | Decimal (15..1440)<br>noPartialRecords |
| Units | minutes |
| Default | noPartialRecords |

|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the interval at which the partial Mobility Call Detail Records (M-CDRs) are generated.<br><br>When set to a value other than ***noPartialRecords***, M-CDRs that have been open longer than *mcdrPartialRecordInterval* are closed with a partial record reason of “time (duration) limit”.<br><br>The *mcdrPartialRecordInterval* must be greater than or equal to the *updateInterval*.<br><br>The values that can be set are ***noPartialRecords*** and multiples of 15 minutes. |
| Values | Decimal (15..1440)<br>noPartialRecords |
| Units | minutes |
| Default | noPartialRecords |

### ATTRIBUTE Usgsn Acct mcdrMaxContainers (mcdrMaxC)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of Change of Location Containers allowed in an Mobility Call Detail Record (M-CDR). Once this number of Containers is exceeded, a partial M-CDR is generated with a partial record reason of “maximum number mobility changes”. |
| Values | Decimal (1..10) |
| Default | 5 |

### ATTRIBUTE Usgsn Acct echoRequestInterval (echoReqInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the interval at which ECHO REQUEST messages are to be sent to the Charging Gateway Functionality (CGF). |
| Values | Decimal (1..60) |

| | |
|---|---|
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Usgsn Acct primaryCgfIpAddress (priCgfIp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Primary Charging Gateway Functionality (CGF) IP address for the SGSN. This is the address used by the SGSN Accounting Server (SAS) when transferring closed Call Detail Records (CDRs) to the CGF. If the primary CGF is not in service, the SGSN uses the provisioned Secondary CGF IP<br>Address. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Usgsn Acct secondaryCgfIpAddress (secCgfIp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Secondary Charging Gateway Functionality (CGF) IP address for the SGSN. In the event of failure of the primary provisioned CGF, the SGSN tries to send Call Detail Records (CDRs) to the secondary provisioned CGF. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Usgsn Acct cdrTransferTime (tCdrTr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the initial waiting time in seconds for the response message for a Call Detail Record (CDR) transfer request. The request message can contain one or more CDRs.<br><br>The timer doubles after each successive retransmission of the |

same CDR.

| | |
|---|---|
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Usgsn Acct cdrRetries (nCdr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times the SGSN tries to resend a billing record to the Charging Gateway Functionality (CGF) when the SGSN does not get the acknowledgment before the *tCdrXfer* expires.<br><br>If maximum value of *nCdrRetries* is reached and there is no secondary CGF, the CDRs will be sent to the CGF whenever the CGF is back in service. The SGSN knows that the CGF is alive either by the ECHO REQUEST message or the NODE ALIVE message. |
| Values | Decimal (1..3) |
| Default | 1 |

### ATTRIBUTE Usgsn Acct primaryCgfAsn1Encoding (priCgfAsn1Enc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the encoding for the GPRS Tunnelling Protocol (GTP) communications between the SGSN and the primary Charging Gateway Functionality (CGF). The following are the encodings supported:<br>***ber***: Basic Encoding Rules<br>***per***: Packed Encoding Rules<br><br>The encoding selected must match the encoding used by the CGF. |
| Values | ber<br>per |

| | |
|---|---|
| Default | ber |

### ATTRIBUTE Usgsn Acct secondaryCgfAsn1Encoding (secCgfAsn1Enc)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the encoding for the GPRS Tunnelling Protocol (GTP) communications between the SGSN and the secondary Charging Gateway Functionality (CGF). The following are the encodings supported:<br>***ber***: Basic Encoding Rules<br>***per***: Packed Encoding Rules<br><br>The encoding selected must match the encoding used by the CGF. |
| Values | ber<br>per |
| Default | ber |

### ATTRIBUTE Usgsn Acct timeOffset (to)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time difference between the local time and the Universal time. The time is represented as minutes.<br>Eg. 105 represents an offset of 1 hr 45 min. |
| Values | Signed (-720..900) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Usgsn Acct genAuditFiles (genAf)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether the generation of CDR audit files is ***enabled*** or ***disabled***. When ***enabled***, files are created which can be used to audit the closed CDRs that were generated by this SGSN and transferred to a CGF. |

| | |
|---|---|
| Values | disabled<br>enabled |
| Default | disabled |

### ATTRIBUTE Usgsn Acct auditFileLife (afLife)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of days the CDR audit file will remain on the 2pGPDsk before being deleted. |
| Values | Decimal (1..10) |
| Units | days |
| Default | 5 |

### ATTRIBUTE Usgsn Acct roamerCapture (roamCap)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether CDRs should be generated for all subscribers or only Roamers.<br><br>When set to ***all***, CDRs are captured without regard to the mobiles home GGSN. When set to ***roamers***, CDRs are only captured for mobile stations that are roaming outside their home GGSN.<br><br>The values that can be set are ***all*** and ***roamers***. |
| Values | all<br>roamers |
| Default | all |

### ATTRIBUTE Usgsn Acct asn1EncoderVersion (asn1EncoderVer)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the ASN.1 Encoder Version used by all *Sas* components on the shelf. |

Modifying this attribute after the component is initially activated causes the new encoder version to be used on the next set of spooled and closed Call Data Records (CDR) to be transferred to the Call Gateway Function (CGF). If a *Sas* component is processing a set of CDRs when this attribute is changed the new encoder version does not take effect until the processing of the current set of CDRs is complete.

The version of the ASN1 Encoder should be changed to 3.6 when the downstream CGF is upgraded to handle the decoding of version 3.6 encoded CDRs.

Values: 3dot2
3dot6

Default: 3dot2

### ATTRIBUTE Usgsn Acct scdrMaxContainers (scdrMaxC)

Access: Read: All
Write: All

Description: This attribute specifies the maximum number of Change of Charging Condition Containers allowed in an SGSN Packet Data Protocol Call Detail Record (S-CDR). Once this number of containers is exceeded, a partial S-CDR is generated with a partial record reason of “maximum number of charging condition changes”.

Values: Decimal (1..10)

Default: 5

### COMPONENT Usgsn DifferentiatedService (Ds)

Groups: "GROUP Usgsn Ds Provisioned (Prov)"

Scope: Application

Description: *Sgsn DifferentiatedService*
*Usgsn DifferentiatedService*

This component represents the differentiated service (QOS) on the (UMTS) Serving GPRS Support Node (SGSN or USGSN),

that governs the behavior of packets and contexts that pass through this node. If this component is not provisioned, the data rate for every context will be best effort.

Subcomponents "COMPONENT Usgsn Ds AllocationRetention (Ar)"

## GROUP Usgsn Ds Provisioned (Prov)

Properties Provisioned

Description This group contains the *Differentiated Service (Ds)* provisioning data of the (UMTS) Serving GPRS Support Node (SGSN or USGSN).

## ATTRIBUTE Usgsn Ds signalingDscpMark

Access
Read: All
Write: All

Description This attribute specifies the Differentiated Service (DS) Code Point (DSCP) value for signalling traffic. It is used for all signaling traffic.

The Expedited Forwarding (EF) Per Hop Behaviors (PHB) can be used to build an assured bandwidth end-to-end service through DS domains with low loss, low latency and low jitter.
Assured Forwarding (AF) PHB group allows a DS domain to offer different levels of forwarding assurances for IP packets received. Four AF classes and three drop Precedences are defined.
A DEfault (DE) PHB defined in [DS Field] is the common, best-effort forwarding behavior available in existing routers as standardized in [RFC1812].
The Class Selector (CS) PHB and associated code points are used to support legacy (non-DS-compliant) routers and switches in a DiffServ-compliant network.

| Default | de |

### ATTRIBUTE Usgsn Ds defaultRoamerAr

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the allocation and retention priority assigned to a mobile that is a roamer.<br><br>The actual allocation and retention priority of a roamer will be limited to the value of this attribute. The roamer's subscribed QOS value will be used if it does not exceed the value of this attribute; otherwise the attribute value will be used. |
| Values | Decimal (1..3) |
| Default | 3 |

## COMPONENT Usgsn Ds AllocationRetention (Ar)

| | |
|---|---|
| Instance | Decimal (1..3) |
| Scope | Application |
| Description | *Sgsn Ds AllocationRetention/n*<br>*Usgsn Ds AllocationRetention/n*<br><br>This component represents the allocation and retention priority on the SGSN or USGSN.<br><br>This allocation and retention levels are the relative importance compared to other Radio access bearers for allocation and retention of the Radio access bearer. The most important level has the value of ***1***. The allocation is larger and retention is longer for buffers under the most important level. |
| Subcomponents | "COMPONENT Usgsn Ds Ar TrafficClass (Tc)" |
| Common Verbs | Help<br>List<br>Display<br>Add |

## COMPONENT Usgsn Ds Ar TrafficClass (Tc)

| | |
|---|---|
| Instance | conversational (conv)<br>streaming (str)<br>interactive (int)<br>background (bkgr) |
| Groups | "GROUP Usgsn Ds Ar Tc Provisioned (Prov)" |
| Scope | Application |
| Description | *Sgsn Ds Ar TrafficClass*<br>*Usgsn Ds Ar TrafficClass*<br><br>This component represents the traffic class on the SGSN or USGSN.<br><br>The Traffic Class distinguishes the delay sensitivity, error rate. |

Conversational class is meant for traffic which is very delay sensitive while Background class is the most delay insensitive traffic class. Interactive class and Background class provide better error rate. The main difference between Interactive and Background class is that Interactive class is mainly used by interactive applications while Background class is meant for background traffic. Background applications use transmission resources only when interactive applications do not need them.

This component provides a mapping from "allocation and retention priority" and "traffic class" to a DS codepoint.

| | |
|---|---|
| Properties | Provisioned |
| Description | This group provides the set of parameters for theVcTester component |

### ATTRIBUTE Vct logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the logical processor on which the VcTester will run |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Vct vcName (vcn)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the type of vc (fvc or gvc) which will be used by VcTester. |
| Values | gvc<br>fvc |
| Default | gvc |

### COMPONENT Vct DataNetworkAddress (Dna)

| | |
|---|---|
| Groups | "GROUP Vct Dna Address"<br>"GROUP Vct Dna OutgoingOptions"<br>"GROUP Vct Dna IncomingOptions"<br>"GROUP Vct Dna CallOptions" |
| Scope | Application |
| Description | *Fruni/n Dna*<br>This is the description of the generic application *Dna* component. It includes the superset of all attributes which may apply to a *Vc*. Particular applications will typically offer only a subset of these attributes by providing a definition of their own *Dna* subcomponent. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vct Dna ClosedUserGroup (Cug)"<br>"COMPONENT Vct Dna HuntGroupMember (HgM)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vct Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | *Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 attributes. String of address digits is complemented by type of address and Npi. These attributes are used to interpret format of the address digits. |

## ATTRIBUTE Vct Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE Vct Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | *Dna* attribute contains digits which form unique identifier of the customer interface. It can be compared (approximation only) to telephone number where phone number identifies unique |

telephone set. *Dna* digits are selected and assigned by network operators.

Values: BCD (1..15)

Default: No default

### GROUP Vct Dna OutgoingOptions

Properties: Provisioned

Description: *OutgoingOptions* group defines call options of a *Dna* for calls which are made out of the interface represented by *Dna*. All these options are not used for calls arriving to the interface represented by *Dna*.

### ATTRIBUTE Vct Dna outCalls (ouc)

Access: Read and write

Description: This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) can be made using this particular *D*na. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for *Dnas* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Vct Dna outNormalCharge (onc)

Access: Read and write

Description: This attribute, if set to a value of ***allowed*** indicates that outgoing normal charged calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.

| | |
|---|---|
| Values | disallowed<br>allowed |
| Default | allowed |

### ATTRIBUTE Vct Dna outReverseCharge (orc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to a value of ***allowed*** indicates that outgoing reverse charged calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, outCalls is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | allowed |

### ATTRIBUTE Vct Dna outForceReverseCharge (ofr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether to force outgoing reverse charged calls. This attribute, if set to a value of ***yes*** forces reverse charging on all outgoing calls (from the DTE to the network) using this particular *Dna* unless the caller specifies a NUI in which case the call is charged to the NUI. If set to a value of ***no*** then reverse charging is not forced for outgoing calls.<br>This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.This attribute must be semantically consistent with the corresponding attribute, *outReverseChargeCalls*. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Vct Dna outNormalPriority (onp)

| | |
|---|---|
| Access | Read and write |

Description

This attribute, if set to a value of ***allowed*** indicates that outgoing normal priority calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.

This option can be also included in X.25 signaling, in such case it will be overruled.

Values

disallowed
allowed

Default

allowed

### ATTRIBUTE Vct Dna outHighPriority (ohp)

Access

Read and write

Description

This attribute, if set to a value of ***allowed*** indicates that outgoing high priority calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.

This option can be also included in X.25 signaling, in such case it will be overruled.

Values

disallowed
allowed

Default

allowed

### ATTRIBUTE Vct Dna outDefaultPriority (odf)

Access

Read and write

Description

This attribute, if set to ***normal*** indicates that the default priority for outgoing calls (from the DTE to the network) using this particular *Dna* is normal priority - if the priority is not specified by the DTE. If this attribute is set to ***high*** then the default priority for outgoing calls using this particular *Dna* is high priority.

It can be overridden by the discardPriority under DLCI Direct Call subcomponent.

This option can be also included in X.25 signaling, in such case it will be overruled.

Values
normal
high

Default
normal

### ATTRIBUTE Vct Dna outIntl (oic)

Access
Read and write

Description
This attribute, if set to a value of ***allowed*** indicates that outgoing international calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE.

This attribute also currently controls access to the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls are allowed.

This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.

Values
disallowed
allowed

Default
disallowed

### ATTRIBUTE Vct Dna outFsRestrictedResponse (ofrc)

Access
Read and write

Description
This attribute, if set to a value of ***allowed*** indicates that outgoing fast select calls (from the DTE to the network) with a restricted response can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.

| | |
|---|---|
| Values | disallowed<br>allowed |
| Default | disallowed |

### ATTRIBUTE Vct Dna outFsUnrestrictedResponse (ofu)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to a value of ***allowed*** indicates that outgoing fast select calls (from the DTE to the network) with an unrestricted response can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE.<br>This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### ATTRIBUTE Vct Dna outPathSensitivitySignal (oss)

| | |
|---|---|
| Access | Read and write |
| Description | This is the sensitivity signaling. If this attribute is set to ***allowed***, the signaled value on sensitivity will be used. |
| Values | allowed<br>disallowed |
| Default | disallowed |

### ATTRIBUTE Vct Dna outDefaultPathReliability (opr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default class of routing for reliability routing for all outgoing calls (from the DTE to the network) using this particular *Dna*. The chosen default class of routing applies to all outgoing calls established using this *Dna*, and applies to the packets travelling in both directions on all outgoing calls (local to remote, and remote to local). For incoming calls, the default class of routing is chosen by the calling party (as |

opposed to DPN, where either end of the call can choose the default routing class).
This attribute, if set to a value of ***normal***, indicates that the default class of routing is normal reliability routing. If set to a value of ***high***, then the default class of routing is high reliability routing.
High reliability is the standard choice for most DPN and Passport services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the *Vc* handles the duplication and disordering to ensure that packets are delivered to the DTE properly.
For the Frame Relay service, duplication of packets is not desired, in which case, ***normal*** reliability may be chosen as the preferred class of routing.

| | |
|---|---|
| Values | normal<br>high |
| Default | high |

### ATTRIBUTE Vct Dna outPathReliabilityOverRide (oro)

| | |
|---|---|
| Access | Read and write |
| Description | If outReliabilityOverRide set in the call request, the called end will use the calling end provisioning data on reliability to override his provisioning data. |
| Values | yes<br>no |
| Default | no |

### ATTRIBUTE Vct Dna outPathReliabilitySignal (ores)

| | |
|---|---|
| Access | Read and write |
| Description | *outPathReliabilitySignal* is reliability routing signaling. If this attribute is set to ***allowed***, the signaled value on reliability will be used. |

| | |
|---|---|
| Values | allowed<br>disallowed |
| Default | disallowed |

### ATTRIBUTE Vct Dna outAccess (oua)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is an extension of the Closed User Group (CUG) facility, as follows:<br>This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) to the open (non-CUG) part of the network are permitted. It also permits outgoing calls to DTE's that have Incoming Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE.<br>This attribute corresponds to the ITU-T 'Closed User Group with Outgoing Access' feature for *Dna's* in that outgoing access is granted if this attribute is set to a value of ***allowed***. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### ATTRIBUTE Vct Dna defaultTransferPriority (dtp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default transfer priority to network for all outgoing calls using this particular *Dna*. It is overRidden by the *transferPriority* provisioned in the *DLCI* Direct Call sub-component.<br><br>The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.<br><br>Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput). |

When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay.

When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput.

The default of *defaultTransferPriority* is ***normal.***

Values
normal
high

Default
normal

### ATTRIBUTE Vct Dna transferPriorityOverRide (tpor)

Access
Read and write

Description
When this attribute is set to ***yes***, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority.

For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority.*

The default of *transferPriorityOverRide* is ***no***.

Values
yes
no

Default
no

### GROUP Vct Dna IncomingOptions

Properties
Provisioned

Description
*IncomingOptions* defines set of options for incoming calls. These options are used for calls arriving to the interface represented by *Dna*. For calls originated from the interface, *IncomingOptions* attributes are not used.

### ATTRIBUTE Vct Dna incCalls (inc)

Access
Read and write

Description

This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for *Dna's* in that incoming calls are barred if this attribute is set to a value of ***disallowed***.

Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.

Values

disallowed
allowed

Default

allowed

### ATTRIBUTE Vct Dna incHighPriorityReverseCharge (ihp)

Access

Read and write

Description

This attribute, if set to a value of ***allowed*** indicates that incoming high priority, reverse charged calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***,then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.
This attribute, together with *the incNormalPriorityReverseChargeCalls* attribute corresponds to the ITU-T 'Reverse Charging Acceptance' feature for *Dna's* in that reverse charged calls are accepted if both attributes are set to a value of ***allowed***.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values

disallowed
allowed

Default

allowed

### ATTRIBUTE Vct Dna incNormalPriorityReverseCharge (inp)

Access

Read and write

Description

This attribute, if set to a value of ***allowed*** indicates that incoming normal priority, reverse charged calls (from the network to the

DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.
This attribute, together with th*e* *incHighPriorityReverseChargeCalls* attribute corresponds to the ITU-T 'Reverse Charging Acceptance' feature for *Dna's* in that reverse charged calls are accepted if both attributes are set to a value of ***allowed***.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Vct Dna incIntlNormalCharge (iin)

Access: Read and write

Description: This attribute, if set to a value of ***allowed*** indicates that incoming international normal charged calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.
This attribute also currently controls access to/from the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls (also normal charged) are allowed.
This attribute is ignored if the corresponding attribute, ***incCalls*** is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Vct Dna incIntlReverseCharge (iir)

Access: Read and write

Description: This attribute, if set to a value of ***allowed*** indicates that incoming international reverse charged calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by

the local DCE.
This attribute also currently controls access to/from the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls (also normal charged) are allowed.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Vct Dna incFastSelect (ifs)

Access: Read and write

Description: This attribute specifies whether fast select calls may be received. This attribute, if set to a value of ***allowed*** indicates that incoming fast select calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.
This attribute corresponds to the ITU-T 'Fast Select Acceptance' feature for *Dnas* in that incoming fast select calls are accepted if this attribute is set to a value of ***allowed***.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: disallowed

### ATTRIBUTE Vct Dna incSameService (iss)

Access: Read and write

Description: This attribute, if set to a value of ***allowed*** indicates that incoming calls from the same service type (eg: X.25, ITI, SNA) (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

| | |
|---|---|
| Values | disallowed<br>allowed |
| Default | allowed |

### ATTRIBUTE Vct Dna incChargeTransfer (ict)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to a value of ***yes*** indicates that the charges for incoming normal charged calls from a DTE with the same DNIC (calls from the network to the DTE) will be transferred to the called DTE. If set to a value of ***no***, then charges will not be transferred.<br>This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Vct Dna incAccess (ina)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is an extension of the Closed User Group (CUG) facility, as follows:<br>This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTE's that have Outgoing Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.<br>This attribute corresponds to the ITU-T 'Closed User Group with Incoming Access' feature for *Dnas* in that incoming access is granted if this attribute is set to a value of ***allowed***. |
| Values | disallowed<br>allowed |
| Default | disallowed |

## GROUP Vct Dna CallOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | *CallOptions* group defines additional options for calls not related directly to direction of a call. |

## ATTRIBUTE Vct Dna serviceCategory (cat)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is assigned for each different type of service within which this *Dna* is configured. It is placed into the Service Category attribute in the accounting record by both ends of the *Vc*. |
| Values | gsp<br>x25<br>enhancedIti<br>ncs<br>mlti<br>sm<br>ici<br>dsp3270<br>iam<br>mlhi<br>term3270<br>iti<br>bsi<br>hostIti<br>x75<br>hdsp3270<br>api3201<br>sdlc<br>snaMultiHost<br>redirectionServ<br>trSnaTpad<br>offnetNui<br>gasServer<br>vapServer<br>vapAgent<br>frameRelay |

| | |
|---|---|
| | ipiVc<br>gvcIf |
| Default | frameRelay |

### ATTRIBUTE Vct Dna packetSizes (pks)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the allowable packet sizes supported for call setup using this *Dna*. ITU-T recommends that packet size ***128*** always be supported. Attributes defaultRecvFrmNetworkPacketSize and defaultSendToNetworkPacketSize are related to this attribute. |
| Set of | 16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | (128, 256, 512) |

### ATTRIBUTE Vct Dna defaultRecvFrmNetworkPacketSize (rps)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the default local receive packet size from network to DTE for all calls using this particular *Dna*. Attribute packetSizes has to be set with corresponding value. |
| Values | 16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |

| | |
|---|---|
| Default | 128 |

### ATTRIBUTE Vct Dna defaultSendToNetworkPacketSize (sps)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the default local send packet size from DTE to network for all calls using this particular *Dna*. Attribute packetSizes has to be set with corresponding value. |
| Values | 16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | 128 |

### ATTRIBUTE Vct Dna defaultRecvFrmNetworkThruputClass (drt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the default receive throughput class for all calls using this particular *Dna*. |
| Values | Decimal (3..15) |
| Default | 10 |

### ATTRIBUTE Vct Dna defaultSendToNetworkThruputClass (dst)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the default send throughput class for all calls using this particular *Dna*. |
| Values | Decimal (0..15) |
| Default | 10 |

### ATTRIBUTE Vct Dna defaultRecvFrmNetworkWindowSize (rws)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the default number of data packets that can be received by the DTE from the DCE before more packets can be received. This view is oriented with respect to the DTE. |
| Values | Decimal (1..7) |
| Default | 2 |

### ATTRIBUTE Vct Dna defaultSendToNetworkWindowSize (sws)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the number of data packets that can be transmitted from the DTE to the DCE and must be acknowledged before more packets can be transmitted. |
| Values | Decimal (1..7) |
| Default | 2 |

### ATTRIBUTE Vct Dna packetSizeNegotiation (psn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to ***local*** indicates that packet sizes can be negotiated locally at the interface irrespective of the remote interface. If set to ***endtoEnd***, then local negotiation is not permitted and packet sizes are negotiated between 2 ends of *Vc*. |
| Values | endToEnd<br>local |
| Default | endToEnd |

### ATTRIBUTE Vct Dna cugFormat (cft)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which cug format is used when DTE signals CUG indices, basic or extended.<br>This attribute, if set to ***extended*** indicates that the DTE signals and receives CUG indices in extended CUG format. If set to a |

value of ***basic***, then the DTE signals and receives CUG indices in the basic CUG format.

Values
basic
extended

Default
basic

### ATTRIBUTE Vct Dna cug0AsNonCugCall (cnc)

Access
Read and write

Description
This attribute, if set to ***allowed*** indicates that when a CUG index of 0 is signaled in a call request packet, the call is treated as a non-CUG call. If this attribute is set to ***disallowed***, then a CUG index of 0 is treated as an index, and an attempt is made to find the particular CUG corresponding with the *Dna*.

Values
disallowed
allowed

Default
disallowed

### ATTRIBUTE Vct Dna signalPreferentialCugToLink (spc)

Access
Read and write

Description
This attribute, if set to ***no***, indicates that, at the destination (called) DTE, when a CUG call is received using the called DTE's preferential CUG, the preferential CUG's index is not signaled to the called DTE in the incoming call request packet. Otherwise, the preferential CUG's index is signaled to the link in the incoming call request packet.

Values
no
yes

Default
no

### ATTRIBUTE Vct Dna signalIntlAddressToLink (sia)

Access
Read and write

Description
This attribute, if set to ***yes***, indicates that all addresses presented by the network (DCE) to the link (DTE) within incoming call request., call connected and clear packets are presented in

international format with no prefix digit. International format includes DNIC in the address.

Values
no
yes

Default
no

### ATTRIBUTE Vct Dna fastSelectCallsOnly (fso)

Access
Read and write

Description
This attribute, if set to ***yes***, indicates that the service is permitted restricted fast select calls in both the incoming and the outgoing directions using this *Dna*. If set to ***no***, then non fast select calls are permitted as well.

Values
no
yes

Default
no

### ATTRIBUTE Vct Dna preselectRpoa (prp)

Access
Read and write

Description
This attribute, if set to ***yes***, indicates that this *Dna* subscribes to a pre-selected RPOA, in which case, the pre-selected RPOA is contained in the *rpoa* attribute described below. If set to ***no***, then a pre-selected RPOA is not subscribed.

Values
no
yes

Default
no

### ATTRIBUTE Vct Dna accountClass (acl)

Access
Read and write

Description
This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator and it is an arbitrary number.

| | |
|---|---|
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE Vct Dna accountCollection (aco)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates that accounting records are to be collected by the network for the various reasons: billing, test, study, auditing. The last of the parameters, force, indicates that accounting records are to be collected irrespective of other collection reasons. If none of these reasons are set, then accounting will be suppressed. |
| Set of | bill<br>test<br>study<br>audit<br>force |
| Default | (bill) |

### ATTRIBUTE Vct Dna serviceExchange (sre)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is an arbitrary number, entered by the network operator. The value of *serviceExchange* is included in the accounting record generated by *Vc*. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE Vct Dna egressAccounting (ega)

| | |
|---|---|
| Access | Read and write |
| Description | *egressAccounting* specifies if Egress accounting is enabled by Frame Relay service. Disabling of Egress accounting means that only segment counts are collected by VC and there are no frame relay counts in accounting records for Frame Relay service. |

Enabling of Egress accounting means that the accounting records for Frame Relay contain frame relay specific counts.

Values
yes
no

Default
no

### ATTRIBUTE Vct Dna rpoa

Access
Read and write

Description
*rpoa* - Recognized Private Operating Agency is a ITU-T specified facility which allows the user to specify--at call setup time--the next transit network the call should use. The *rpoa* can override all routing decisions.
If *Dna* subscribes to *preselectRpoa* as indicated by the previously described attribute, (*preselectRpoa* set to ***yes***) then this attribute contains preselected *rpoa*. If the *preselectRpoa* attribute is set to ***no***, then this attribute can be left at its default.
This preselected *rpoa* will be used for all outgoing call request packets using this *Dna* if an *rpoa* is not explicitly specified in the call request. The *rpoa* represents the *dnic* of the directly connected network through which the call will be routed in the presence of the *rpoa*.

Values
BCD (4)

Default
0000

### ATTRIBUTE Vct Dna dataPath (dpa)

Access
Read and write

Description
This attribute specifies the data path to be used by Virtual Circuits on this interface. If the connection has a *DirectCall* component then the value can be overridden by the *dataPath* attribute of the *DirectCall* component.

This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.

The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.

A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value.

***dprsOnly*** - dynamic packet routing system is used

***dprsMcsOnly*** - dprs Multi-Service Cut-Through Switching path is used.

***dprsMcsFirst*** - dprs Multi-Service Cut-Through Switching path is used if it is available. If it is not available ***dprsOnly*** is used.

Values
dprsOnly
dprsMcsOnly
dprsMcsFirst

Default
dprsOnly

## COMPONENT Vct Dna ClosedUserGroup (Cug)

Instance
Decimal (0..255)

Groups
"GROUP Vct Dna Cug CugOptions"

Scope
Application

Description
*Fruni/n Dna Cug*
*ClosedUserGroup* options defines options associated with national or international *Cug* Identifier. Other *Dna's* in the network can have *Cug's* defined which groups these *Dna's* by *Cug interlockCode*. If *Dna's* are defined with *Cugs*, calls from *Dna's* which do not have the same *interlockCode* defined are refused. Attributes *incAccess* and *outAccess* can override this rule.

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vct Dna Cug CugOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines options for. Attributes in this group defines *ClosedUserGroup* options associated with *interlockCode*. *Dna's* with the same *Cug* (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same *Cug* group are defined here. |

### ATTRIBUTE Vct Dna Cug type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Cug type - the Cug is either a national Cug, or an international Cug. International closed user groups are usually established between DTE's for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTE's for which there is no X.75 Gateway between. (National Cugs cannot normally traverse an X.75 Gateway).<br>If this attribute is set to ***national***, then the *Cug* is a national *Cug*, in which case, the *dnic* should be left at its default value since it is not part of a national *Cug*. If this attribute is set to ***international***, then the *Cug* is an international *Cug*, in which case, the *dnic* should be set appropriately as part of the *Cug interlockCode*. |
| Values | national<br>international |
| Default | national |

### ATTRIBUTE Vct Dna Cug dnic

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *dnic* (Data Network ID Code) of the *Cug* by which packet networks are identified. This attribute is not applicable if the *Cug* is a ***national*** *Cug*, as specified by the Cug *type* attribute. There are usually 1 or 2 *dnics* assigned per country, for public networks. The U.S. is an exception where each BOC has a *dnic*. Also, a group of private networks can have its own *dnic*.<br><br>*dnic* value is not an arbitrary number. It is assigned by international agreement and controlled by ITU-T. |
| Values | BCD (4) |
| Default | 0000 |

### ATTRIBUTE Vct Dna Cug interlockCode (ilc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *Cug* identifier of a national or international *Cug* call. It is an arbitrary number and it also can be called Cug in some descriptions. Interfaces (*Dna's*) defined with this number can make calls to *Dna's* with the same *interlockCode*. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vct Dna Cug preferential (pre)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to ***yes*** indicates that this *Cug* is the preferential *Cug*, in which case it will be used during the call establishment phase if the DTE has not explicitly specified a *Cug* index in the call request packet. If set to ***no***, then this *Cug* is not the preferential *Cug*.<br>Only one of the *Cugs* associated with a particular *Dna* can be the preferential *Cug* - only one *Cug* can have this attribute set to ***yes***. |

| | |
|---|---|
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Vct Dna Cug outCalls (ouc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to ***allowed*** indicates that outgoing calls (from the DTE into the network) can be made using this particular *Cug*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.<br>This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for *cugs* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | allowed |

### ATTRIBUTE Vct Dna Cug incCalls (inc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular *Cug*. If set to ***disallowed***, then incoming calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.<br>This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for *Cugs* in that incoming calls are barred if this attribute is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | allowed |

### ATTRIBUTE Vct Dna Cug privileged (pri)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute, if set to ***yes*** indicates that this *Cug* is a privileged *Cug*. In DPN, at least one side of a call setup within a *Cug* must have the *Cug* as a privileged *Cug*. If set to ***no***, then the *Cug* is not privileged.<br>If both the local DTE and the remote DTE subscribe to the *Cug*, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTE's in which case the other DTE's cannot call one another, but can call the host. In this example, the host would have the privileged *Cug*, and the other DTE's would belong to the same *Cug*, but it would not be privileged. |
| Values | no<br>yes |
| Default | yes |

## COMPONENT Vct Dna HuntGroupMember (HgM)

| | |
|---|---|
| Groups | "GROUP Vct Dna HgM Interface (If)"<br>"GROUP Vct Dna HgM Operational (Op)" |
| Scope | Application |
| Description | *GvcIf/n Dna/n HgMember*<br>This component specifies the Hunt Groups to which this member belongs. A hunt group member subscribes to at least one hunt group. |
| Subcomponents | "COMPONENT Vct Dna HgM HuntGroupAddress (HgAddr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vct Dna HgM Interface (If)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the interface parameters between the *HuntGroupMember* and the Hunt Group server. |

### ATTRIBUTE Vct Dna HgM availabilityUpdateThreshold (aut)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the number of channels that have to be freed or occupied before the Availability Message Packet (AMP) is sent to the Hunt Group Server informing it of the status of this interface. |
| Values | Decimal (0..4096) |
| Default | 1 |

### GROUP Vct Dna HgM Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *HuntGroupMember* component. |

### ATTRIBUTE Vct Dna HgM maxAvailableChannels (maxAc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of available channels for this *HuntGroupMember.* |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Vct Dna HgM availableChannels (ac)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of available channels reported to the hunt group in the Availability Message Packet (AMP). It is modified by adding 1 by the application when a channel is freed and subtracting 1 when a channel is occupied. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Vct Dna HgM availabilityDelta (ad)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the net change in the available channels since the last Availability Message Packet (AMP) was sent to the Hunt Group. Once the absolute value of this attribute reaches the *availabilityUpdateThreshold* an AMP is sent to the host and the *availabilityDelta* is reset to 0.<br>If this attribute is positive it means an increase of the number of available channels. If it is negative it means a decrease in the number of available channels. |
| Values | Signed (-4096..4096) |
| Default | No default |

### COMPONENT Vct Dna HgM HuntGroupAddress (HgAddr)

| | |
|---|---|
| Instance | Decimal (0..1) |
| Groups | "GROUP Vct Dna HgM HgAddr Address (Addr)" |
| Scope | Application |
| Description | *GvcIf/n Dna/n HgM HuntGroupAddress/n*<br>This component specifies the Hunt Group address to which this member belongs. A hunt group member belongs to at least one hunt group. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vct Dna HgM HgAddr Address (Addr)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes.<br>String of address digits complemented by the NPI. |

### ATTRIBUTE Vct Dna HgM HgAddr numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute indicates the Numbering Plan Indicator (NPI) the *Dna* that is entered. Address may belong to X.121 or E.164 plans. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE Vct Dna HgM HgAddr dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains digits which form unique identifier of the customer interface. It can be compared (approximation only) telephone number where phone number identifies unique telephone set. *Dna* digits are selected and assigned by network operators. |
| Values | BCD (1..15) |
| Default | No default |

### COMPONENT Vct DirectCall (Dc)

| | |
|---|---|
| Instance | Decimal (1..10) |
| Groups | "GROUP Vct Dc Options" |
| Scope | Application |
| Description | *Fruni/n Dlc*i/n dc<br>This component defines direct call options for calls issued without operator intervention. Connection is complete and can be initiated automatically. Frequency of connection tries is controlled by retry timer. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vct Dc Options

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | *Options* group defines attributes associated with direct call. It defines complete connection in terms of path and call options. This connection can be permanent (pvc) or switched (svc). It can have facilities. The total number of bytes of facilities including the facility codes, and all of the facility data from all of the four classes of facilities:<br>ITU-T_Facilities<br>DTE_Facilities<br>National_Facilities<br>International_Facilities<br>must not exceed maximum subnet packet size defined for the whole network in ModuleData Vcs component. |

### ATTRIBUTE Vct Dc localNpi (lnpi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Numbering Plan Indicator (NPI) of the *localDna*. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE Vct Dc localDna (ldna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Data Network Address (*Dna*) of the local DTE. This address is used in formatting of call request to *remoteDna*. |
| Values | BCD (0..15) |
| Default | No default |

### ATTRIBUTE Vct Dc remoteNpi (rnpi)

| | |
|---|---|
| Access | Read and write |
| Description | Remote numbering Plan Indicator (Npi) indicates the numbering plan used in the *remoteDna*. |

| | |
|---|---|
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE Vct Dc remoteDna (rdna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Data Network Address (*Dna*) of the remote. This is the called (destination) DTE address (*Dna*) to which this direct call will be sent. Initially, the called DTE address attribute must be present, that is, there must be a valid destination address. However, it may be possible in the future to configure the direct call with a mnemonic address, in which case, this attribute will contain a zero-length *Dna*, and the mnemonic address will be carried as one of the facilities. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Vct Dc remoteLcn (rlcn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the remote LCN (Logical Channel Number) - it is used only for PVCs, where attribute *type* is set to ***permanentMaster*** or ***permanentSlave*** or ***permanentBackupSlave***.<br>In ***switched*** case, value of *remoteLcn* is not known when call request is made. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vct Dc type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of *Vc* call:<br>***switched,***<br>***permanentMaster***, |

***permanentSlave***,
***permanentSlaveWithBackup,***
***permanentBackupSlave***,
***spvcMaster***,
***spvcSlave***,
***spvcSlaveWithBackup,***
***spvcBackupSlave***.

If the value of this attribute is set to ***switched*** then the remote end must also be provisioned as ***switched***. No information at the remote
end is defined about this switched interface.

If the value is set to ***permanentMaster,*** then a permanent connection will be established between 2 ends. The remote end must be defined as a ***permanentSlave***, ***permanentBackupSlave*** or ***permanentSlaveWithBackup***. The connection cannot be established if the remote end is defined as anything else. The end defined as ***permanentMaster*** always initiates the calls. It will attempt to call once per minute.

If the value is set to ***permanentSlave*** then a permanent connection will be established between 2 ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote end is defined as anything else. The ***permanentSlave*** *end* will attempt to call once per minute.

If the value is set to ***permanentSlaveWithBackup*** then a permanent connection will be established between the two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote interface end is defined as anything else. The ***permanentSlaveWithBackup*** *end* will attempt to call once per minute. When *type* is set to ***permanentSlaveWithBackup*** connection will be cleared if interface becomes unavailable. This enables a retry of the connection which can be redirected to ***permanentBackupSlave***.

If the value is set to ***permanentBackupSlave*** then a permanent connection will be established between the 2 ends only if the ***permanentMaster*** end is disconnected from the ***permanentSlaveWithBackup*** end and a backup call is established

by the redirection system. If the ***permanentSlaveWithBackup*** interface becomes visible again, the ***permanentBackupSlave*** end is disconnected and the ***permanentSlaveWithBackup*** end is reconnected to the ***permanentMaster*** end. The ***permanentBackupSlave*** end does not try to establish pvc call.

Values
switched (svc)
permanentMaster (master)
permanentSlave (slave)
permanentBackupSlave (backSl)
permanentSlaveWithBackup (slavWB)
spvcMaster (spvcM)
spvcSlave (spvcS)
spvcBackupSlave (spvcBackS)
spvcSlaveWithBackup (spvcSWBack)

Default
switched

### ATTRIBUTE Vct Dc svcAutoCallRetry (acr)

Access
Read and write

Description
*svcAutoCallRetry* is used only for ***switched*** calls, in which case the attribute *type* is set to ***switched***. Otherwise, this attribute is ignored by the *Vc*s.
This attribute, if set to ***yes*** for Svc, indicates that the *Vc* will continually try to establish the SVC rather than clearing the *Vc* after the first unsuccessful call attempt. Further, if the call fails while in data transfer phase, then the *Vc* will automatically attempt to reconnect. The call attempts are made by the *Vc* once per time provisioned in *InterfaceOptions* as *callRetryTimer*, repeatedly. If set to ***no*** for SVCs, then the *Vc* behaves in the standard mode, making a single call attempt.

Values
no
yes

Default
no

### ATTRIBUTE Vct Dc userData (usd)

Access
Read and write

Description

This attribute contains the user data, if present. *userData* is a 0 to 16 length string which is appended to the call request packet that is presented to the called (destination) DTE.

User data can be a 0 to 128 byte string for fast select calls; otherwise it is 0 to 16 byte string.

Fast select calls are indicated as such using the X.25 ITU-T facility for 'Reverse Charging'.

The length of the user data attribute is not verified during service provisioning. If more than 16 bytes of user data is specified on a call without the fast select option, then the call is cleared with a clear cause of 'local procedure error', and a diagnostic code of 39 (as defined in the ITU-T X.25 Recommendation).

Values

String (0..128, Hex)

Default

No default

### ATTRIBUTE Vct Dc discardPriority (dp)

Access

Read and write

Description

This attribute specifies the discard priority for outgoing call using this *DLCI*.

The discard priority has three provisioning values: ***normal, high,*** and ***useDnaDefPriority***. Traffic with ***normal*** priority are discarded first than the traffic with ***high*** priority. The *Dna* default value (provisioned by *outDefaultPriority*) is taken if this attribute is set to the value ***useDnaDefPriority***.

The default of *discardPriority* is ***useDnaDefPriority***.

Values

normal
high
useDnaDefPriority

Default

useDnaDefPriority

### ATTRIBUTE Vct Dc dataPath (dpa)

Access

Read and write

Description

This attribute specifies the data path to be used by Virtual Circuits on this interface. The value of the *dataPath* attribute in the *Dna* component is overridden by this attribute if the value is not ***useDnaValue***.

This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.

The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.

A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value.

***dprsOnly*** - dynamic packet routing system is used

***dprsMcsOnly*** - dprs Multi-Service Cut-Through Switching path is used.

***dprsMcsFirst*** - dprs Multi-Service Cut-Through Switching path is used if it is available. If it is not available ***dprsOnly*** is used.

***useDnaValue*** - use the value provisioned in *Dna* component.

Values

dprsOnly (dpOnly)
dprsMcsOnly (mcOnly)
dprsMcsFirst (mcFrst)
useDnaValue (dnaVal)

Default

dprsOnly

## ATTRIBUTE Vct Dc cugIndex (ci)

Access

Read and write

Description

This attribute specifies the CUG index which is to be signaled in PVC call requests to the remote end.

The type of CUG signaling is defined in attribute *cugType* in this component.

Values: Decimal (0..255)

Default: 0

### ATTRIBUTE Vct Dc cugType (ct)

Access: Read and write

Description: This attribute specifies the type of CUG signaling to be used in PVC call request. Index of CUG to be used is defined in attribute *cugIndex* in this component.

Possible values are:
*cug* - signal cug
*cugOa* - signal cug with outgoing access
*doNotSignal* - no CUG in call request

Values:
cug
cugOa
doNotSignal

Default: doNotSignal

### ATTRIBUTE Vct Dc ccittFax (cfa)

Access: Read and write

Description: This is the i'th ITU-T facility required for this direct call. Within the provisioning system, the user specifies the facility code along with the facility parameters. The facility is represented internally as a hexadecimal string following the X.25 ITU-T representation for facility data.
The user specifies the facility code when adding, changing or deleting a facility. The upper two bits of the facility code indicate the class of facility. From the class of the facility, one can derive the number of bytes of facility data, as follows:
Class A - 1 byte of fax data
Class B - 2 bytes of fax data
Class C - 3 bytes of fax data
Class D - variable length of fax data.

| | |
|---|---|
| Values | String (0..128, Hex) |
| Replication | Hex (H.1; H.2; H.3; H.4; H.9; H.42; H.43; H.44; H.47; H.48; H.49; H.c4; H.c6) |
| Default | No default |

### ATTRIBUTE Vct Dc dteFax (dfa)

| | |
|---|---|
| Access | Read and write |
| Description | This is the i'th DTE facility required for this direct call. Within the provisioning system, the user specifies the facility code along with the facility parameters. The facility is represented internally as a hexadecimal string following the X.25 ITU-T representation for facility data. |
| Values | String (0..128, Hex) |
| Replication | Hex (H.a; H.b; H.c9; H.ca; H.cb; H.d2; H.d3) |
| Default | No default |

### ATTRIBUTE Vct Dc intlFax (ifa)

| | |
|---|---|
| Access | Read and write |
| Description | This is the i'th International facility required for this direct call. Within the provisioning system, the user specifies the facility code along with the facility parameters. The facility is represented internally as a hexadecimal string following the X.25 ITU-T representation for facility data. |
| Values | String (0..128, Hex) |
| Replication | Hex (H.1..H.ff) |
| Default | No default |

## COMPONENT Vct Vc

| | |
|---|---|
| Groups | "GROUP Vct Vc CallData (Cad)"<br>"GROUP Vct Vc IntervalData (Intd)"<br>"GROUP Vct Vc Statistics (Stats)" |
| Scope | Application |
| Description | ... *Vc()*<br>This component defines display of general Vc dynamic attributes |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vct Vc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to General *Vc*. It can be displayed only for General *Vc* which is created by application. |

## ATTRIBUTE Vct Vc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the type of call, ***pvc*** or ***svc***. *type* is provided at provisioning time. |
| Values | pvc<br>svc |
| Default | No default |

## ATTRIBUTE Vct Vc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***. |

| | |
|---|---|
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE Vct Vc previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE Vct Vc diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vct Vc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vct Vc calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE Vct Vc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Vct Vc calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vct Vc callingNpi

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE Vct Vc callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Vct Vc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vct Vc accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Vct Vc fastSelectCall

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Vct Vc localRxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of send packets. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE Vct Vc localTxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of send packets. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512<br>1024 |

| | |
|---|---|
| | 2048<br>4096 |
| Default | No default |

### ATTRIBUTE Vct Vc localTxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the send window size provided on incoming call packets or the default when a call request packet does not explicitly provide the window size. |
| Values | Decimal (0..127) |
| Default | No default |

### ATTRIBUTE Vct Vc localRxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the receive window size provided on incoming call packets or the default when a call request does not explicitly provide the window sizes. |
| Values | Decimal (0..127) |
| Default | No default |

### ATTRIBUTE Vct Vc pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE Vct Vc accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |

| | |
|---|---|
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE Vct Vc priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE Vct Vc segmentSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Vct Vc subnetTxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of the data packets on this *Vc*. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vct Vc subnetTxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the current send window size of *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Vct Vc subnetRxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of receive packets. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE Vct Vc subnetRxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the receive window size provided on incoming call packets and to the default when a call request does not explicitly provide the window sizes. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Vct Vc maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the maximum packet size allowed on *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Vct Vc transferPriorityToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the priority in which data is transferred to the network.<br><br>The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.<br><br>Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput).<br><br>When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay.<br><br>When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE Vct Vc transferPriorityFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the priority in which data is transferred from the network.<br><br>The transfer priority is a preference specified by an application |

according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.

Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput).

When the transfer priority is set at ***high***, and the trunk queue is set to high, the routing metric is set to delay.

When the transfer priority is set at ***normal***, the trunk queue is set to normal, and the routing metric is set to throughput.

Values: normal
high

Default: No default

### GROUP Vct Vc IntervalData (Intd)

Properties: Operational

Description: This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.

### ATTRIBUTE Vct Vc elapsedTimeTillNow

Access: Read only

Description: This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.

Values: Decimal (0..16777215)

Default: No default

### ATTRIBUTE Vct Vc segmentsRx

Access: Read only

Description: This attribute displays the number of segments received at the time command was issued. This is the segment received count

maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.

Values Decimal (0..16777215)

Default No default

### ATTRIBUTE Vct Vc segmentsSent

Access Read only

Description This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.

Values Decimal (0..16777215)

Default No default

### ATTRIBUTE Vct Vc startTime

Access Read only

Description This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.

Values Time (DHMS)

Default No default

### ATTRIBUTE Vct Vc callReferenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Vct Vc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | ... *Statistics(Stats)*<br>This group defines general attributes collected by general *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.<br>Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. |

### ATTRIBUTE Vct Vc ackStackingTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of ack stacking timer expiries. It is used as an indicator of the acknowledgment behavior across the subnet when ack stacking is in effect. If it expires often, usually this means end users will experience longer delay.<br>The ack stacking timer specifies how long the *Vc* will wait before finally sending the subnet acknowledgment. if this attribute is set to a value of 0, then the *Vc* will automatically return acknowledgment packets without delay. If this attribute is set to a value other than zero, then the *Vc* will wait for this amount of |

time in an attempt to piggyback the acknowledgment packet on another credit or data packet. If the *Vc* cannot piggyback the acknowledgment packet within this time, then the packet is returned without piggybacking.

Values: Decimal (0..5000)

Default: No default

### ATTRIBUTE Vct Vc outOfRangeFrmFromSubnet

Access: Read only

Description: This attribute counts the number of subnet frames discarded due to the sequence number being out of range.
Two Categories apply for the General *Vc*
1) lost Acks (previous Range)
2) unexpected Packets (next Range)
*Vc* internally maintains its own sequence number of packet order and sequencing. Due to packet retransmission, *Vc* may receive duplicate packets that have the same *Vc* internal sequence number. Only 1 copy is accepted by the *Vc* and other copies of the same packets are detected through this count. This attribute can be used to record the frequency of packet retransmission due to *Vc* and other part of the subnet.

Values: Decimal (0..5000)

Default: No default

### ATTRIBUTE Vct Vc duplicatesFromSubnet

Access: Read only

Description: This attribute counts the number of subnet packets discarded due to duplication. It is used to detect software error fault or duplication caused by retransmitting.

Values: Decimal (0..5000)

Default: No default

### ATTRIBUTE Vct Vc frmRetryTimeouts

Access: Read only

| | |
|---|---|
| Description | This attribute counts the number of frames which have retransmission time-out.<br>If packets from *Vc* into the subnet are discarded by the subnet, the source *Vc* will not receive any acknowledgment. The retransmission timer then expires and packets will be retransmitted again. Note that the *Vc* idle probe may be retransmitted and is included in this count. This statistics does not show the distribution of how many times packets are retransmitted (e.g. first retransmission results in successful packet forwarding). |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vc peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of the retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vc peakOoSeqQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of the out of sequence queue.<br>This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vc peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the peak size of the sequence packet queue.<br>This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets, which by the receipt of an expected packet have been transformed to expected packets. The number of times this peak is reached is not recorded as it is traffic dependent. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vc peakStackedAcksRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of wait acks.<br>This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest collective acknowledgment. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vc subnetRecoveries

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of successful *Vc* recovery attempts.<br>This attribute is used as an indicator of how many times the *Vc* path is broken but can be recovered. This attribute is useful to record the number of network path failures. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vc windowClosuresToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of window closures to subnet. A packet may have been sent into the subnet but its acknowledgment from the remote *Vc* has not yet been received. |

| | |
|---|---|
| | This is a 8 bit sequence number.This number is useful in detecting whether the *Vc* is sending any packet into the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vc windowClosuresFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of window closures from subnet. This attribute is useful in detecting whether the *Vc* is receiving any packet from the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vc wrTriggers

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of times the *Vc* stays within the W-R region. The W-R region is a value used to determined the timing of credit transmission. Should the current window size be beneath this value, the credits will be transmitted immediately. Otherwise, they will be transmitted later with actual data. The wrTriggers statistic is therefore used to analyze the flow control and credit mechanism. |
| Values | Decimal (0..5000) |
| Default | No default |

### COMPONENT Vct Vcfr

| | |
|---|---|
| Groups | "GROUP Vct Vcfr CallData (Cad)"<br>"GROUP Vct Vcfr IntervalData (Intd)"<br>"GROUP Vct Vcfr FrameRelayData (Frd)" |
| Scope | Application |

Description

This component defines the statistics collected by Frame Relay Vc. It is needed for lightweight vc.

Common Verbs

## VERB Ping Vct Vcfr

Impact

Passive

Description

*Ping [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] FrUni/<n> Dlci/<n> Vc*

*Ping* causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the *ping* query packet will be the same as that of the Frame Relay data except at the source and destination module. The *ping* packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the *roundTripDelay* option is specified, the command reports the time taken to reach the destination and back. For the *roundTripDelay* option, the path taken by the query

packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the *ping* packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The *ping* command supports the following options:

*-roundTripDelay (-rtd):* If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

*-sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default packet data size, 128 octets, will be used. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the

ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default packet data size, 128 octets, will be used. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

## GROUP Vct Vcfr CallData (Cad)

Properties: Operational

Description: This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application.

## ATTRIBUTE Vct Vcfr type

Access: Read only

Description: This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***.

Values:
pvc
svc
spvc
frf10spvc

Default: No default

## ATTRIBUTE Vct Vcfr state

Access: Read only

Description: This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***.

| | |
|---|---|
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE Vct Vcfr previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE Vct Vcfr diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vct Vcfr previousDiagnosticCode

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vct Vcfr calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE Vct Vcfr calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Vct Vcfr calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vct Vcfr callingNpi

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE Vct Vcfr callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Vct Vcfr callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vct Vcfr accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Vct Vcfr fastSelectCall

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Vct Vcfr pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE Vct Vcfr accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE Vct Vcfr priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE Vct Vcfr segmentSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Vct Vcfr maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum packet size allowed on the *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Vct Vcfr rcosToNetwork (rcosto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the routing metric routing class of service to<br>the network. |
| Values | throughput<br>delay<br>multimedia |
| Default | No default |

### ATTRIBUTE Vct Vcfr rcosFromNetwork (rcosfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the routing metric Routing Class of Service from the Network. |
| Values | throughput<br>delay<br>multimedia |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vct Vcfr emissionPriorityToNetwork (epto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority to the<br>network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE Vct Vcfr emissionPriorityFromNetwork (epfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority from the network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE Vct Vcfr dataPath (dapa)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value.<br><br>If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system)<br><br>If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed. |

If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed.

Values: String (0..32, ASCII)

Default: No default

### ATTRIBUTE Vct Vcfr dprsMcsEndPoint (dmep)

Access: Read only

Description: This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components.

If the connection is using ***dprsOnly*** data path, this attribute is empty.

If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint.

List of: The name of the component

Default: No default

### GROUP Vct Vcfr IntervalData (Intd)

Properties: Operational

Description: This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.

### ATTRIBUTE Vct Vcfr elapsedTimeTillNow

Access: Read only

Description: This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.

Values: Decimal (0..16777215)

Default: No default

### ATTRIBUTE Vct Vcfr segmentsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE Vct Vcfr segmentsSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE Vct Vcfr startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. |

| | |
|---|---|
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Vct Vcfr callReferenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Vct Vcfr FrameRelayData (Frd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines Frame Relay attributes collected by Frame Relay *Vc*.<br>The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.<br>Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.<br>Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers |

### ATTRIBUTE Vct Vcfr frmCongestedToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr cannotForwardToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr notDataXferToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr outOfRangeFrmFromSubnet

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vct Vcfr combErrorsFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc* |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr duplicatesFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr notDataXferFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery. |

| | |
|---|---|
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr frmLossTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr ooSeqByteCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr peakOoSeqPktCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr sendSequenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame. |
| Values | Decimal (0..1048575) |
| Default | No default |

### ATTRIBUTE Vct Vcfr pktRetryTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr subnetRecoveries

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of successful *Vc* recovery attempts. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Vct Vcfr ooSeqPktCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vct Vcfr peakOoSeqByteCount

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the frame relay peak byte count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..50000) |
| Default | No default |

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vmg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Vmg* component. |

### ATTRIBUTE Vmg linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor that this component and its subcomponents are associated with. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Vmg linkToPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies a link to a *Gips IpAddress Udp Port* component. This determines the IP Address and UDP port that the Media Gateways use to address this Virtual Media Gateway. The *linkToPort* attribute must be set.<br><br>Changing this value will cause all the Media Gateway interfaces associated with this component to be restarted. |
| Values | Link (Service, linkToApplication) |
| Default | No default |

### ATTRIBUTE Vmg relTimer

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the amount of time that Q.2630 will wait for a RLC (release confirm) from the RNC in response to a Q2630 release message.<br>The timer is started when a REL message is sent.<br>The timer is stopped when an RLC message is received.<br>Upon timer expiration, the resource is released and a reset procedure is initiated. |
| Values | Decimal (2..60) |

| | |
|---|---|
| Units | seconds |
| Default | 4 |

### ATTRIBUTE Vmg relRetries

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of times that Q.2630 will retry the REL (release) command and wait for a RLC (release confirm) command from the RNC. |
| Values | Decimal (0..5) |
| Default | 0 |

### ATTRIBUTE Vmg linkToCsDomain

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attributes specifies the signalling gateway that utilizes the Virtual Media Gateway (VMG) represented by this component to create bearer connections between an RNC and a Call Server.<br><br>Changing this value will cause all the Media Gateway interfaces associated with this component to be restarted.<br><br>This attribute must be set to *Sg/n CsDomain.* |
| Values | Link (Service, linkToVirtualMediaGateway) |
| Default | No default |

### ATTRIBUTE Vmg usageSetThresh (setThr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the threshold at which the Virtual Media Gateway (VMG) High Usage alarm is set.<br><br>The alarm is set when the percentage of call channels used in the |

VMG exceeds the threshold value of the *usageSetThresh* attribute. This value must be greater than or equal to the threshold value of the *usageClrThresh* attribute.

It is recommended that there is a reasonable gap between the value of usageSetThresh and usageClrThresh to avoid continuous setting and clearing of alarm.

Values: Decimal (50..90)

Units: %

Default: 75

### ATTRIBUTE Vmg usageClrThresh (clrThr)

Access: Read: All
Write: All

Description: This attribute specifies the threshold at which the Virtual Media Gateway (VMG) High Usage alarm is cleared.

If the High Usage alarm is active and the percentage of call channels used in the VMG drops below the threshold value of the *usageClrThresh* attribute, the VMG High Usage alarm is cleared. The value of this threshold must be less than or equal to the value of the *usageSetThresh* attribute.

It is recommended that there is a reasonable gap between the value of usageSetThresh and usageClrThresh to avoid continuous setting and clearing of alarm.

Values: Decimal (1..90)

Units: %

Default: 70

### GROUP Vmg OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vmg adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vmg operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available

for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vmg usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vmg Stats

Properties
Operational

Description
This group contains the operational attributes of this component.

### ATTRIBUTE Vmg estReqMsgs (erm)

Access
Read: All
Write: Illegal

Description
This attribute counts Q.2630 ERQ (establish request) messages that were received from the RNC.

The counter wraps to 0 when it exceeds its maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg connectedCalls (connCalls)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of calls that are in the connected state.<br><br>The value of this attribute should be equal to the sum of the *connectedCalls* attribute of all the *Vmg/n MgIf/n* subcomponents. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg rejectedCalls (rejCalls)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of calls rejected by the Media Gateways controlled by this component.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg resets

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts Q.2630 RES (reset) messages that were received from the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg blocks

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts Q.2630 BLK (block) messages that were received from the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg unknownMsgs (unkMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts messages of unknown type that were received from the RNC.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg peakUsedPercentage (pkPct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the peak percentage of the provisioned DS0s for this component that are in a non-idle state. |
| Values | Decimal (0..100) |
| Default | No default |

### ATTRIBUTE Vmg totalChannels (totChnl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the number of DS0s provisioned for this component. This value is the summation of all Tdm resources under the VMG component. The value is updated when provisioning changes. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg unavailableChannels (unavailChnl)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of DS0s provisioned for this component that is unavailable. This includes unequipped, resource conflict and Out of Service DS0s. The value is updated when resource status changes or provisioning changes. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Vmg WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Vmg customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS VirtualMediaGateway

| | |
|---|---|
| Description | The statistics record generated by the VirtualMediaGateway component. |

### ATTRIBUTE Vmg estReqMsgs (erm)

| | |
|---|---|
| Description | This attribute counts Q.2630 ERQ (establish request) messages that were received from the RNC.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Vmg rejectedCalls (rejCalls)

| | |
|---|---|
| Description | This attribute counts the number of calls rejected by the Media Gateways controlled by this component. |

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Vmg peakUsedPercentage (pkPct)

Description This attribute indicates the peak percentage of provisioned DS0s for this component that are in a non-idle state.

The value is set to the current percentage at the beginning of the collection interval.

Values Decimal (0..100)

### COMPONENT Vmg MediaGatewayInterface (MgIf)

Instance Decimal (0..255)

Groups "GROUP Vmg MgIf Provisioned (Prov)"
"GROUP Vmg MgIf OsiState (State)"
"GROUP Vmg MgIf Operational (Oper)"
"GROUP Vmg MgIf WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS VirtualMediaGateway MediaGatewayInterface"

Scope Application

Description *Vmg/n MediaGatewayInterface/n*

This component represents an interface to a single Media Gateway, a Voice Services Processor (VSP) card, controlled by the *VirtualMediaGateway/n* component. The Media Gateway Interface manages resources associated with the Media Gateway and initiates connection requests and releases.

Opt. Subcomp. "COMPONENT Vmg MgIf TdmResource (Tdm)"

## GROUP Vmg MgIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of this component. |

## ATTRIBUTE Vmg MgIf mgAtmAddress (mgAtmAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the ATM Address of the Media Gateway associated with this component. |
| Values | String (1..44, AESANsapAddress) |
| Default | No default |

## ATTRIBUTE Vmg MgIf mgIPAddr (ip)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP Address of the Media Gateway associated with this component. This value must match the IP Address specified by the attribute *ipAddress* provisioned in the *Nsta Vgs Control* component.<br><br>Changing the value of this attribute will cause outstanding transactions to be affected. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vmg MgIf mgUdpPort (port)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the UDP port of the Media Gateway associated with this component. This value must match the UDP port specified by the instance value of the *Nsta Vgs Control UdpPort* component associated with the Media Gateway. |

| | |
|---|---|
| | Changing this value will cause outstanding transactions to be affected. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vmg MgIf mediaGatewayName (mgName)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the name of the Media Gateway associated with this component.<br><br>This value must be the same as the value of the *hostname* attribute of the *Nsta/n Vgs* component associated with the corresponding Media Gateway. |
| Values | String (1..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vmg MgIf crcxAckTimer (crcxT)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the ASPEN connection request timer.<br><br>The timer is started when the Media Gateway Interface sends a Create Connection (CRCX) message to the Media Gateway.<br><br>The timer is stopped when either an ACK or a NACK is received from the Media Gateway.<br><br>If the timer expires, and the number of retries exceeds *crcxRetries*, the call is taken down, the ASPEN state machine goes to the Beat state, and a heartbeat message is sent to the Media Gateway. If the number of timer expiries exceeds *crcxRetries*, the attribute *crcxRetriesExhausted* is incremented.<br><br>The product of *crcxTimer* and *crcxRetries* - 1, that is, the total |

| | |
|---|---|
| | delay for a connection establishment, should not exceed 30 seconds. |
| Values | Decimal (1..15) |
| Units | seconds |
| Default | 2 |

### ATTRIBUTE Vmg MgIf crcxRetries (crcxR)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retries for the *crcxAckTimer.* |
| Values | Decimal (1..5) |
| Default | 2 |

### ATTRIBUTE Vmg MgIf dlcxAckTimer (dlcxAckT)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the ASPEN Delete Connection Timer.<br><br>This timer is started when the VMG sends an ASPEN DLCX message to the Media Gateway.<br><br>The timer is stopped when it receives either an ACK or a NACK from the Media Gateway.<br><br>If the timer expires, and the number of retries exceeds *crcxRetries*, the call is taken down, the ASPEN state machine goes to the Beat state, and a heartbeat message is sent to the Media Gateway. If the number of timer expiries exceeds *dlcxRetries*, the attribute *dlcxRetriesExhausted* is incremented.<br><br>The product of *dlcxAckTimer* and *dlcxRetries* - 1, that is, the total delay for a connection deletion, should not exceed 30 seconds. |
| Values | Decimal (1..15) |

| | |
|---|---|
| Units | seconds |
| Default | 1 |

### ATTRIBUTE Vmg MgIf dlcxRetries (dlcxR)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the number of retries for the *dlcxAckTimer.* |
| Values | Decimal (1..5) |
| Default | 2 |

### ATTRIBUTE Vmg MgIf rinfAckTimer (rinfAckT)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the ASPEN Request for Information (RINF) Timer.<br><br>The timer is started when the Media Gateway Interface sends an ASPEN Request for Information (RINF) message to the Media Gateway.<br><br>The timer is stopped when an ACK or a NACK is received from the Media Gateway.<br><br>Upon timer expiry, the RINF message is resent one time to the Media Gateway. If no response is received for the second message, the ASPEN state machine goes to the Beat state, and a heart beat message is sent to the Media Gateway. The number of times no response is received for the resent message is indicated by the attribute *rinfRetriesExhausted.* |
| Values | Decimal (1..15) |
| Units | seconds |
| Default | 1 |

## ATTRIBUTE Vmg MgIf svidAckTimer (svidAckT)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the value of the ASPEN Server Identification (SVID) timer.<br><br>The timer is started when the VMG sends an ASPEN Server Identification (SVID) message to the Media Gateway.<br><br>When an ACK is received from the Media Gateway, the timer is stopped, and the ASPEN layer goes to the Active state.<br><br>Upon timer expiry, the message is resent an unlimited number of timer until an ACK is received from the Media Gateway.<br><br>The number of timeouts of this timer is indicated by the attribute *svidTimeouts*. |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 5 |

## ATTRIBUTE Vmg MgIf beatAckTimer (beatAckT)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This timer is started when the VMG sends an ASPEN BEAT message to the Media Gateway.<br><br>The timer is stopped in either of the two cases:<br>An ACK is received from the Media Gateway: In this case, the ASPEN protocol layer goes to the Active State.<br><br>A Restart In Progress (RSIP) message is received from the Media Gateway: In this case, the ASPEN protocol goes to the Inactive state because the reception of this message indicates that the Media gateway just got restarted. |

The ASPEN protocol state for the Media Gateway corresponding to this component is indicated by the state attribute.

Upon timer expiry, the message is resent an unlimited number of times until an ACK is received from the Media Gateway.

Values: Decimal (1..30)

Units: seconds

Default: 1

### ATTRIBUTE Vmg MgIf mdcxAckTimer (mdcxAckT)

Access: Read: All
Write: All

Description: This attribute specifies the value of the ASPEN Modify Connection (MDCX) timer.

The MDCX timer is started when the Virtual Media Gateway (VMG) sends an ASPEN Modify Connection (MDCX) message to the Media Gateway (MG). Upon timer expiry, the MDCX message is resent once to the MG. If no response is received after this retry, the ASPEN state machine transitions to the Beat state, and a heart beat message is sent to the MG.

Values: Decimal (1..15)

Units: seconds

Default: 1

### ATTRIBUTE Vmg MgIf rlrsAckTimer (rlrsAckT)

Access: Read: All
Write: All

Description: This attribute specifies the value of the ASPEN Release Resources (RLRS) timer.

The RLRS timer is started when the Virtual Media Gateway (VMG) sends an ASPEN Release Resource (RLRS) message to the Media Gateway (MG). If this timer expires before either an ACK or NACK is received from the MG, the RLRS message is

| | |
|---|---|
| | resent MG. If no response if received after this retry, the ASPEN state machine transitions to the Beat state, and a heart beat message is sent to the MG. |
| Values | Decimal (1..15) |
| Units | seconds |
| Default | 1 |

### GROUP Vmg MgIf OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vmg MgIf adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vmg MgIf operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vmg MgIf usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vmg MgIf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of this component. |

### ATTRIBUTE Vmg MgIf state (st)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of the Media gateway Interface.<br><br>The different states mean the following:<br>***inactive***: The ASPEN protocol is trying to establish a connection to the Media Gateway that has just restarted.<br>***active***: The connection with the Media Gateway has been established.<br>***beat:*** After going to the active state, connection to the Media Gateway was lost, and heart beat messages are being sent to the Media Gateway. |
| Values | inactive<br>active<br>beat |
| Default | No default |

### ATTRIBUTE Vmg MgIf connectedCalls (connCalls)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of calls in the connected state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg MgIf callsPending (callsPend)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of calls being setup which have not yet reached the connected state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg MgIf idleResources (idleRsrc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of DS0s that are available for new call attempts. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg MgIf crcxRetriesExhausted (crcxRetrEx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the maximum retries for the CRCX Timer, specified by the attribute *crcxRetries* is exhausted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg MgIf dlcxRetriesExhausted (dlcxRetEx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the maximum retries for the DLCX Timer, specified by the attribute *dlcxRetries* is |

exhausted.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Vmg MgIf rinfRetriesExhausted (rinfRetrEx)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of times the maximum retries of the RINF Timer, that is, one retry, is exhausted.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Vmg MgIf svidTimeouts

Access: Read: All
Write: Illegal

Description: This attribute counts the number of timeouts of the *svidTimer*.

The counter wraps to zero when it reaches the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Vmg MgIf beatTimeouts

Access: Read: All
Write: Illegal

Description: This attribute counts the number of timeouts of the *beatAckTimer*.

The counter wraps to zero when it reaches the maximum value.

Values: Decimal (0..4294967295)

| | |
|---|---|
| Default | No default |

### GROUP Vmg MgIf WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Vmg MgIf customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg MgIf customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg MgIf customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS VirtualMediaGateway MediaGatewayInterface

Description The statistics record generated by the VirtualMediaGateway MediaGatewayInterface component.

### ATTRIBUTE Vmg MgIf crcxMsgs (crcxMsgs)

Description This attribute indicates the number of CONNECTION REQUEST messages sent to the Media Gateway over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Vmg MgIf dlcxMsgs (dlcxMsgs)

Description This attribute indicates the number of DELETE REQUEST messages sent to the Media Gateway over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Vmg MgIf rinfMsgs (rinfMsgs)

Description This attribute indicates the number of REQUEST FOR INFORMATION messages sent to the Media Gateway over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Vmg MgIf resetMsgs (resetMsgs)

Description This attribute indicates the total number of RESET messages sent in either direction over the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Vmg MgIf crcxAckMsgs (crcxAckMsgs)

Description This attribute indicates the number of CONNECTION REQUEST ACKNOWLEDGE messages received from the Media Gateway over the collection interval.

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Vmg MgIf dlcxAckMsgs (dlcxAckMsgs)

| | |
|---|---|
| Description | This attribute indicates the number of DELETE REQUEST ACKNOWLEDGE messages received from the Media Gateway over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Vmg MgIf updateCicInfo (updateCicInfo)

| | |
|---|---|
| Description | This attribute indicates the number of UPDATE CIC INFO messages received from the Media Gateway over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Vmg MgIf sigFailMsgs (sigFailMsgs)

| | |
|---|---|
| Description | This attribute indicates the number of SIGNALLING FAILURE messages received from the Media Gateway over the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Vmg MgIf sigOkMsgs (sigOkMsgs)

| | |
|---|---|
| Description | This attribute indicates the number of SIGNALLING OK messages received from the Media Gateway over the collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT Vmg MgIf TdmResource (Tdm)

| | |
|---|---|
| Instance | Decimal (0..200) |
| Groups | "GROUP Vmg MgIf Tdm Provisioned (Prov)"<br>"GROUP Vmg MgIf Tdm OsiState (State)"<br>"GROUP Vmg MgIf Tdm WlcCustomCounters (WlcCustomCntr)" |
| Scope | Device |

Description *Vmg/n MgIf/n TdmResource/n*

This component represents a TDM resource used by a Media Gateway, an E1 or T1 span.

Dyn. Subcomp. "COMPONENT Vmg MgIf Tdm DS0Resource (DS0)"

Common Verbs

List
Display
Add
DELete
LOCK
Unlock

## GROUP Vmg MgIf Tdm Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes of this component.

## ATTRIBUTE Vmg MgIf Tdm startingCic (startcic)

Access Read: All
Write: All

Criticality Component

Description The *startingCic* attribute provides a unique logical identifier for a particular E1 resource. The Signalling System Number 7 (SS7) Circuit Identification Codes (CICs) associated with the Digital Signal Level 0 (DS0s) managed by this resource are numbered beginning with the *startingCic* attribute value and ending with *startingCic* + 30, inclusive. CIC numbers are assigned to all 31 DS0s in the *timeslots* attribute whether they are in use or not on this *TdmResource* component.

The *startingCic* attribute value for an E1 resource must not fall between the *startingCic* and *startingCic*+30 of any other E1 resource under the same Virtual Media Gatway.

If a CCS channel exists on the E1 resource, the DS0 for that

channel will be assigned a CIC, however this CIC will never be allocated for use by the Call Server.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Vmg Mglf Tdm bearerType

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the bearer type supported by this *TdmResource* component. The value specified by the *bearerRate* attribute must correspond to a rate supported by the bearer type specified.

***speech*** - speech is supported at the following rates: 4.75 kbit/s, 5.15 kbit/s, 5.9 kbit/s, 6.7 kbit/s, 7.4 kbit/s, 7.95 kbit/s, 10.2 kbit/s, and 12.2 kbit/s
***data*** - data is supported at the following rates: 14.4 kbit/s and 64 kbit/s

Values: speech
data

Default: speech

### ATTRIBUTE Vmg Mglf Tdm timeslots (ts)

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the block of timeslots controlled by this *TdmResource* component. There are 31 timeslots within an E1 span that can be controlled. Since this component is used to represent an E1 or T1 span, a maximum of 31 timeslots is used in this attribute.

One timeslot may be reserved for signalling.

More than one *MgIf* component can utilize a single E1/T1 span specified by the *interfaceName* attributes of a *TdmResource* subcomponent. The *timeslots* attribute allows the operator to divide up the timeslots of a given E1/T1 span among multiple *MgIf* components. Two *MgIf* components cannot control the same timeslot; so, the operator must ensure that no two *MgIf* components using a *TdmResource* attribute with the same *interfaceName* attribute specify any of the same values for this attribute. If more than one *TdmResource* component specifies the same timeslots, an alarm is generated when the components are activated, and only one of the *TdmResource* components is enabled. This will be the component that has registered first with the Voice Services Processor (VSP) card for reservation of the timeslots.

By default, this attribute specifies 30 timeslots omitting timeslot 31 for signalling. If a VSP is controlled by two different *MgIf* components, this attribute must be set to specify only the timeslots that this *MgIf* component controls as described above.

There may be no more than one timeslot omitted from the sequence of timeslots specified by this attribute. The timeslot blocks (1,2,3,4) and (1,2,3,5) are valid, but the timeslot block (1,2,4,6) is not valid because two timeslots are omitted from the sequence. The omitted timeslot must be used for signalling and cannot be specified by the *timeslots* attribute of another *TdmResource* component using this span. In addition, the *AmrBrag* component on the VSP represented by this *TdmResource* component must have an *Mtp2* subcomponent with an instance value equal to the number of the omitted timeslot.

Not every E1 span uses a timeslot for signalling. If the *AmrBrag* component or *CsdBrag* component associated with the span represented by this *TdmResource* does not have an *Mtp2* subcomponent, there is no need to omit a timeslot on any of the *TdmResource* components that divide up this span. Additionally in this case, the *timeslots* attribute of the *Chan* component associated with the VSP's *AmrBrag* component or *CsdBrag* component must be set to specify timeslots 1 through 30 inclusive.

In the case when this *TdmResource* component is controlling a T1 (DS1) resource on a VSP this attribute will not allow the use of timeslots 25 through 31 inclusive.

Set of — Decimal (1..31)

Default — (1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30)

### ATTRIBUTE Vmg Mglf Tdm interfaceName (ifName)

Access — Read: All
Write: All

Criticality — Component

Description — This attribute specifies the Time Division Multiplexing (TDM) connection component hierarchy on the Voice Services Processor (VSP) associated with this *TdmResource* component.

The value specified depends on the TDM interface card type in use on the Media Gateway. For the 32pE1Aal card type, this attribute is set to the value specified by the *Nsta/n Vgs AmrBrag/n interfaceName* attribute or *Nsta/n Vgs CsdBrag/n interfaceName* attribute. For the 4pOc3ChSmIr card type, this attribute is set to the component hierarchy provisioned for this TDM resource on the Media Gateway. The first two format examples below illustrate how this attribute should be set when the 4pOc3ChSmIr card type is in use on the Media Gateway.

If Line Automatic Protection Switching (LAPS) is configured, then in the case of a switchover, this attribute may not match the attribute on the Media Gateway (MG) as discussed above. In this case, changes are not required to this attribute value. The VSP card on the MG ensures that the resource names are interpreted correctly when a LAPS switchover occurs.

The *interfaceName* attribute must have one of the following formats:

*Lp/n Sdh/n Vc4/j Vc12/k,l,m E1 Chan/n*
*Lp/n Sonet/n Sts/j Vt12/l,m DS1 Chan/n*
*Lp/n E1/n Chan/n*

| | |

| Values | String (1..80, ASCII) |
| Default | No default |

### GROUP Vmg Mglf Tdm OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vmg Mglf Tdm adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vmg Mglf Tdm operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vmg Mglf Tdm usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vmg Mglf Tdm WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Vmg Mglf Tdm customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg Mglf Tdm customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vmg Mglf Tdm customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

## COMPONENT Vmg MgIf Tdm DS0Resource (DS0)

| Description | Vmg/n MgIf/n TdmResource/n DS0Resource/n<br><br>This operational component represents a DS0 Resource that is controlled by the Media Gateway. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vmg MgIf Tdm DS0 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *DS0Resource* component. |

## ATTRIBUTE Vmg MgIf Tdm DS0 cic (cic)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the SS7 Circuit Identifier Code (CIC) associated with this DS0. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Vmg MgIf Tdm DS0 state (st)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description

This attribute indicates the current state of the DS0.
The states of the DS0 are:
***unknown*** - This DS0 is not controlled by this Virtual Media Gateway (VMG).
***regPending*** - Registration to the Media Gateway is pending.
***oos*** - The Media Gateway reports the DS0 as being out of service.
***idle*** - No call is active, and the DS0 is ready to be used in a new call.
***connectionSetup*** - A connection has been requested and bearer signalling establishment is being awaited.
***connectionPending*** - A connection is established and Media Gateway acknowledgment is being awaited.
***connected*** - The call is active.
***releasing*** - The call is disconnecting.

Values

unknown
regPending
oos
idle
connectionSetup
connectionPending
connected
releasing

Default

No default

## ATTRIBUTE Vmg Mglf Tdm DS0 blockState (bst)

Access

Read: All
Write: Illegal

Description

This attribute indicates the current blocking state of the DS0 circuit.
The local blocking states of the DS0 circuit are:
***locallyBlocked*** - The DS0 circuit is blocked at the local node and may be blocked at the remote node at the same time.
***remotelyBlocked*** - The DS0 circuit is blocked at the remote node.
***unblocked*** - The DS0 circuit is unblocked at both the local and remote nodes.

Values

locallyBlocked
remotelyBlocked
unblocked

| | |
|---|---|
| Default | No default |

### GROUP Vmg Mglf Tdm DS0 WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|

| | |
|---|---|
| Scope | Application |
| Description | *Vm/n Interface/n*<br>This component represents a logical interface to the *VirtualMedia*. The given *VirtualMedia* instance can have at most one *Interface* linked to a *ProtocolPort* of a given *VirtualRouter.* |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vm If MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the media base component. |

### ATTRIBUTE Vm If linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP Vm If CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Vm If customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Vm If IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Vm If ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

### ATTRIBUTE Vm If ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Vm If OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vm If snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vm If OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state |

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vm If adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vm If operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available

for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vm If usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vm If Provisioned (Prov)

Properties
Provisioned

Description
This group contains the provisionable attributes for the *If* component.

### ATTRIBUTE Vm If mode

Access
Read and write

Criticality
Component

Description
This attribute specifies the mode of operation of the *Vm If*. The following modes are supported: ***alwaysUpInterface***,

***alwaysUpSummaryInterface*** and ***interVrConnection***.

***alwaysUpInterface***: This mode limits the *Vm If* to provide the functionality of an 'always up interface' only. Inter-VR communcation is not possible when this mode is selected. Memory consumption by the *Vm If* is significantly less on the FP when this mode is selected. Hence this mode should be used when the sole purpose of the *Vm If* is to provide an always up interface for an application like BGP4.

***alwaysUpSummaryInterface***: This mode limits the *Vm If* to provide the functionality of an 'always up interface' in which more than one host can be sumarized. Inter-VR communcation is not possible when this mode is selected. Memory consumption by the *Vm If* is significantly less on the FP when this mode is selected. Hence this mode should be used when the sole purpose of the *Vm If* is to provide an always up interface for an application like VPN in which specific host information is configured by the user.

***interVrConnection***: This mode provides the full capability of VirtualMedia, that is, 'always up interface' and inter-VR communication.

| | |
|---|---|
| Values | alwaysUpInterface<br>interVrConnection<br>alwaysUpSummaryInterface |
| Default | alwaysUpInterface |

# COMPONENT VoiceNetworkingCallServer (Vncs)

| | |
|---|---|
| Instance | Decimal (1..16) |
| Groups | "GROUP Vncs Provisioned (Prov)"<br>"GROUP Vncs Statistics (Stats)" |

"COLLECTED STATS VoiceNetworkingCallServer"

| | |
|---|---|
| Scope | Network |
| Description | *Vncs/n*<br>The *Vncs* component provides the information to the Path Oriented Routing System (PORS) required during switched voice call establishment. It translates the directory number prefix into the routing information and the voice service profile parameters. Each instance of this component represents one numbering plan. |
| Subcomponents | "COMPONENT Vncs DiallingPlan (DP)"<br>"COMPONENT Vncs VoiceProfile (Vp)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vncs Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents the provisionable attributes of the VNCS server. |

### ATTRIBUTE Vncs commentText

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the name of the customer that is using this VNCS server. Typical use of this attribute is to store customer name. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Vncs voiceRoutes (vRoutes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates which *VoiceRoute* components are using this *Vncs*. |
| List of | Link (Service, voiceNetworkingCallServer) |
| Default | No default |

### GROUP Vncs Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides data for the *Vncs* component. |

### ATTRIBUTE Vncs totalTranslations

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of translation requests received by VNCS. This counter wraps to zero when it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COLLECTED STATS VoiceNetworkingCallServer

| | |
|---|---|
| Description | The statistics record generated by the VoiceNetworkingCallServer component. |

### ATTRIBUTE Vncs totalTranslations

| | |
|---|---|
| Description | This spooled statistic counts the number of translation requests received by *Vncs* in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE Vncs completeTranslations

| | |
|---|---|
| Description | This spooled statistic counts the number of completed translations handled under each *DiallingPlan* component in the last statistics collection interval. The complete translations are the one that resulted in the return by VNCS server of the reply message with the routing information and *VoiceProfile* parameters associated with the directory number prefix supplied in the translation request message. |
| Vector of | Decimal (0..65535) |
| Index | Decimal (0..2) |

### ATTRIBUTE Vncs incompleteTranslations

| | |
|---|---|
| Description | This spooled statistic counts the number of incomplete translations handled under each *DiallingPlan* component in the last statistics collection interval. The incomplete translations are the one that require more digits in the directory number prefix to uniquely identify routing attributes. |
| Vector of | Decimal (0..65535) |
| Index | Decimal (0..2) |

### ATTRIBUTE Vncs failedTranslations

| | |
|---|---|
| Description | This spooled statistic counts the number of failed translations handled under this *DiallingPlan* component in the last statistics collection interval. The failed translations are the one for which the directory number prefix could not be found in the database. |
| Vector of | Decimal (0..65535) |
| Index | Decimal (0..2) |

## ATTRIBUTE Vncs usageCount

| | |
|---|---|
| Description | This spooled statistic counts the number of times each *VoiceProfile* useage count is accessed to set up a connection in the last statistics collection interval. |
| Vector of | Decimal (0..65535) |
| Index | Decimal (1..16) |

## COMPONENT Vncs DiallingPlan (DP)

| | |
|---|---|
| Instance | Decimal (0..2) |
| Groups | "GROUP Vncs DP Statistics (Stats)" |
| Scope | Network |
| Description | *Vncs/n diallingPlan/x*<br>The *DiallingPlan* subcomponent contains part of the Voice Networking Call Server database that belongs under one dialling plan. There are three dialling plans supported, dialling plan 0, dialling plan 1 and dialling plan 2. |
| Opt. Subcomp. | "COMPONENT Vncs DP DirectoryNumber (Dn)" |
| Common Verbs | Help<br>List<br>Display<br>Add |

## GROUP Vncs DP Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational components for the *AccessCode* component. It displays total DirectoryNumber components under this access code, total translation requests received and total requests failed under this access code. |

## ATTRIBUTE Vncs DP completeTranslations

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total number of complete translations handled under this *AccessCode* component. The complete translations are the one that resulted in the return by VNCS server of the reply message with the routing information and voice profile parameters associated with the directory number prefix supplied in the translation request message. This counter wraps to zero when it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vncs DP incompleteTranslations

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of incomplete translations handled under this *AccessCode* component. The incomplete translations are the one that require more digits in the directory number prefix to uniquely identify routing attributes. This counter wraps to zero when it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vncs DP failedTranslations

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of failed translations handled under this *AccessCode* component. The failed translations are the one for which the directory number prefix could not be found in the database. the value wraps up when it reaches maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vncs DP DirectoryNumber (Dn)

| | |
|---|---|
| Instance | BCD (1..40, Wildcarded) |

| | |
|---|---|
| Groups | "GROUP Vncs DP Dn Provisioned (Prov)" |
| Scope | Network |
| Description | *Vncs/n DP/x DirectoryNumber/x*<br>The *DirectoryNumber* subcomponent represents a prefix directory number excluding the access code. The instance value must be 1 to 40 digits each of value 0 through 9 or wildcard digit. The wildcard digit is represented by “?”. It is used to indicate to VNCS that the digit in that position should be ignored for routing purposes. Wildcard inconsistencies must not exist. If a prefix directory number already exists with a digit in a particular position, a new prefix may not be added with a wild card in that position and if the prefix already exists with a wild card in the particular position, a new prefix may not be added with a specific digit in the same position. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vncs DP Dn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents attributes that the prefix directory number maps to. |

## ATTRIBUTE Vncs DP Dn destinationNodeId (nodeId)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute in conjunction with the *destinationComponentId* attribute identifies the destination of a voice connection.<br>The *destinationNodeId* and the *destinationComponentId* attributes are being replaced by the *DataNetworkAddress (Dna)* attribute.<br>For the migration procedure consult NTP 241-7001-410 “Passport Voice Networking User Guide”.<br>If the *destinationComponentId*, the *destinationNodeId* and the |

*Dna* attributes are all set, the call routing is based on the *destinationNodeId* and the *destinationComponentId*, unless the call is initiated from the Magellan Passport Access (MPA) module, which will use the *Dna* attribute.
The valid destination call identifier settings are:
1. *destinationNodeId* and *destinationNodeId* attributes set
2. *destinationNodeId*, *destinationNodeId* and *Dna* attributes set
3. *Dna* attribute set
For calls initiated from the MPA, only options 2 and 3 are valid.

Values: Decimal (0..4095)

Default: 0

### ATTRIBUTE Vncs DP Dn destinationComponentId (dci)

Access: Read: All
Write: All

Description: This attribute in conjunction with the *destinationNodeId* attribute identifies the destination of a voice connection. The only valid component name for this attribute value is *vroute*.
The *destinationNodeId* and the *destinationComponentId* attributes are being replaced by the *DataNetworkAddress (Dna)* attribute.
For the migration procedure consult NTP 241-7001-410 “Passport Voice Networking User Guide”.
If the *destinationComponentId*, the *destinationNodeId* and the *Dna* attributes are all set, the call routing is based on the *destinationNodeId* and the *destinationComponentId*, unless the call is initiated from the Magellan Passport Access (MPA) module, which will use the *Dna* attribute.
The valid destination call identifier settings are:
1. *destinationNodeId* and *destinationNodeId* attributes set
2. *destinationNodeId*, *destinationNodeId* and *Dna* attributes set
3. *Dna* attribute set
For calls initiated from the MPA, only options 2 and 3 are valid.

Values: The name of the component

Default: No default

### ATTRIBUTE Vncs DP Dn voiceProfileNumber (vpn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute identifies the voice profile number. |
| Values | Decimal (1..16) |
| Default | 1 |

### ATTRIBUTE Vncs DP Dn numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* of the destination component. An address may belong to the X.121 or E.164 numbering plans. X.121 is used in packet switched data networks. |
| Values | x121<br>e164 |
| Default | e164 |

### ATTRIBUTE Vncs DP Dn dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Description | The *Dna* attribute contains digits which form a unique identifier of the destination of a voice connection.<br>This attribute is used instead of the *destinationNodeId* and *destinationComponentId* attributes to identify the destination of the voice connection.<br>This attribute is only used if the *destinationNodeId* and the *destinationComponentId* attributes are not set or if the call is initiated from the Magellan Passport Access (MPA) module. |
| Values | BCD (0..15) |
| Default | No default |

### COMPONENT Vncs VoiceProfile (Vp)

| | |
|---|---|
| Instance | Decimal (1..16) |

| | |
|---|---|
| Groups | "GROUP Vncs Vp LogicalConnectionOptions (LCOps)"<br>"GROUP Vncs Vp FramerOptions (FrOps)"<br>"GROUP Vncs Vp Statistics (Stats)" |
| Scope | Network |
| Description | *Vncs/n VoiceProfile/n*<br>A *VoiceProfile* component contains all provisionable logical connection attributes and framer attributes used to set up a virtual circuit. Directory-number prefixes are mapped to *VoiceProfile* instances by the *Vncs Dp Dn* component. Many directory-number prefixes use the same profile. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vncs Vp LogicalConnectionOptions (LCOps)

| | |
|---|---|
| Properties | Provisioned |
| Description | The attributes of this group collectively form part of a template used to describe and set up a switched logical connection. The attributes of a switched logical connection are similar to the attributes of a permanent logical connection. |

## ATTRIBUTE Vncs Vp setupPriority (spri)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |

Default 2

### ATTRIBUTE Vncs Vp holdingPriority (hpri)

Access Read and write

Description This attribute specifies the priority that a path holds once it is established. Zero is the highest priority and four is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.*

Values Decimal (0..4)

Default 2

### ATTRIBUTE Vncs Vp bumpPreference (bpref)

Access Read and write

Description This attribute specifies when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *setupPriority* in order to acquire its bandwidth and be established. By default, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. A connection may be set to bump in order to use the best available route it may have.

Values bumpWhenNecessary
bumpToObtainBestRoute

Default bumpWhenNecessary

### ATTRIBUTE Vncs Vp requiredTrafficType (rttyp)

Access Read and write

Description This attribute specifies the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection

determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection.

Values

voice
data
video
trafficType1 (tt1)
trafficType2 (tt2)
trafficType3 (tt3)
trafficType4 (tt4)
trafficType5 (tt5)

Default

voice

## ATTRIBUTE Vncs Vp permittedTrunkTypes (pttyp)

Access

Read and write

Description

This attribute specifies up to eight types of trunks that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS chooses only trunks whose *trunkType*s are in the *permittedTrunkTypes* for the path.

Set of

terrestrial
satellite
trunkType1 (tt1)
trunkType2 (tt2)
trunkType3 (tt3)
trunkType4 (tt4)
trunkType5 (tt5)
trunkType6 (tt6)

| | |
|---|---|
| Default | (terrestrial, satellite, trunkType1, trunkType2, trunkType3) |

### ATTRIBUTE Vncs Vp requiredSecurity (rsec)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.* |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Vncs Vp requiredCustomerParm (rcparm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the allowed customer defined parameter of the trunks on the route. Its value, a number from zero to seven, is chosen by network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path. |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Vncs Vp pathAttributeToMinimize (pamin)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. |

The delay of a selected route is the sum of the trunk delay metric for all trunks included in the route.

Values
cost
delay

Default
cost

### ATTRIBUTE Vncs Vp maximumAcceptableCost (maxCost)

Access
Read and write

Description
This attribute specifies an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done for any minimization criterion. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.

Values
Decimal (0..65535)

Default
1280

### ATTRIBUTE Vncs Vp maximumAcceptableDelay (maxDelay)

Access
Read and write

Description
This attribute specifies an upper bound on the delay of a route, which is the sum of the delays of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512-byte packet. Remember, that the trunk during its staging measures a *measuredRoundTripDelay.* This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512-byte packet is used to perform the measurement.
If for any trunk the half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not

| | |
|---|---|
| | considered during the route selection.<br>While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay.* |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | 100000 |

### ATTRIBUTE Vncs Vp emissionPriority (epri)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the urgency with which packets on the path are emitted by the trunks on the route. *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher). |
| Values | Decimal (0..2) |
| Default | 0 |

### ATTRIBUTE Vncs Vp discardPriority (dpri)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the importance of the packets on the path. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically). |
| Values | Decimal (1..3) |
| Default | 1 |

### ATTRIBUTE Vncs Vp pathFailureAction (pfa)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails, the application is informed of the failure.<br>With this option set to ***reRoutePath***, the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.<br>All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends. |
| Values | reRoutePath<br>disconnectConnection |
| Default | reRoutePath |

### ATTRIBUTE Vncs Vp optimization (opt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether this connection should attempt to optimize its path when requested by the *Rtg Pors* component. Every path is optimal when it is established, but as network traffic patterns and configurations change this path may no longer be optimal. The PORS connection manager on a module requests circuits to optimize at the *optimizationInterval*. |
| Values | disabled<br>enabled |
| Default | enabled |

### ATTRIBUTE Vncs Vp maximumAcceptableGatewayCost (maxGateCost)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates an upper bound on the gateway cost metric of a route, which is the sum of the gateway cost metrics of |

all gateway links on the route. It has the same semantics as the *maximumAcceptableCost* except that gateway cost metrics are used instead of trunk cost metrics. Gateway cost metrics are provisioned under *Trunk Address* component of a gateway link specifying a gateway costs of reaching an address through the link.

Values: Decimal (0..65535)

Default: 2048

## GROUP Vncs Vp FramerOptions (FrOps)

Properties: Provisioned

Description: This group contains attributes which define how audio data is carried across the Passport network.

## ATTRIBUTE Vncs Vp silenceSuppression

Access: Read and write

Description: This attribute specifies when silence suppression is desired during voice traffic on an audio call.

If *silenceSuppression* is ***off***, silence suppression is never desired.
If *silenceSuppression* is ***on***, silence suppression is always desired.
If *silenceSuppression* is ***congested***, silence suppression is desired only when the network is congested.
If *silenceSuppression* is ***slow***, silence suppression is desired only after 20 seconds without audio.
If *silenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are desired.

The negotiated silence suppression is available in *Vsr Svs Framer negotiatedSilenceSuppression*.

Values:
off
on
congested
slow
slowAndCongested

Default: on

### ATTRIBUTE Vncs Vp silenceSuppressionFactor

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected savings (percent reduction) in required bandwidth if silence suppression is used. If silence suppression is used, the bandwidth required for the connection will be lower than if silence suppression is not used. However, the routing system will not be aware of the unused bandwidth unless that bandwidth is specified by this attribute.<br>If the value specified for the expected savings is too low, then some bandwidth made available by the use of silence suppression will be wasted. If the value specified for the expected savings is too high, then some connections may fail to set up because the routing system will over-calculate the amount of bandwidth available.<br>The effectiveness of silence suppression can be influenced by language related speech patterns. |
| Values | Decimal (0..60) |
| Units | % |
| Default | 40 |

### ATTRIBUTE Vncs Vp dataCallsAccepted (dca)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether data calls are allowed if this profile is used. |
| Values | no<br>yes |
| Default | yes |

### ATTRIBUTE Vncs Vp faxIdleSuppressionG711G726

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Description | This attribute specifies the fax idle suppression parameter used during negotiation with the remote end across the subnet. It applies only to fax traffic, not voice or modem traffic. |

The negotiated G.711/G.726 fax idle suppression is available in *Vsr Svs Framer negotiatedFisG711G726.*

Values
off
on

Default
on

## ATTRIBUTE Vncs Vp insertedOutputDelay

Access
Read: Passive
Write: Service

Description
This attribute specifies the amount of added output delay used to compensate for cross network delay variations. It applies to voice, modem and fax traffic. It is required to add output delay so that the statistical variation in the transit time of cells crossing the network does not cause gaps in speech. Backbone networks where high priority traffic consumes a high percentage of trunk bandwidth will require a higher *insertedOutputDelay* to compensate for the greater cell delay variation (CDV).

This attribute is ignored if this call runs on a ***1pDS1V*** or ***1pE1V*** card.

Values
5
15
22
30
35
40
45
50
75
100
125
150

Units

### ATTRIBUTE Vncs Vp dtmfRegeneration (detGen)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Description | This attribute specifies the DTMF regeneration parameter used during negotiation with the remote end across the subnet.<br><br>If *dtmfRegeneration* is ***on***, it is desired that DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is desired to be generated before being sent to the link.<br><br>If *dtmfRegeneration* is ***off***, it is desired that DTMF tones are transported transparently as audio.<br><br>DTMF regeneration is not supported on ***1pDS1V***, ***1pE1V***, and ***J2MV*** cards. On these cards, the value of *dtmfRegeneration* is ignored.<br><br>The negotiated DTMF regeneration is available in *Vsr Svs Framer negotiatedDtmfRegeneration*. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Vncs Vp v17EncodedAsG711G726

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies how services using this *VoiceProfile* negotiate with V.17 fax machines. This attribute is not used unless the negotiated ***fax*** encoding, available in *Vsr Svs Framer negotiatedEncoding*, is ***v29V27Relay*** and the negotiated ***modemFax*** encoding, available in *Vsr Svs Framer negotiatedEncoding*, is ***g711***, ***g726*** or ***g711G726***.<br><br>If *v17EncodedAsG711G726* is ***no,*** it is desired that V.17 fax |

machines be instructed to use V.29 so that V.29 fax traffic sent by fax machines can be demodulated and encoded using fax relay.

If *v17EncodedAsG711G726* is ***yes***, it is desired that V.17 fax machines be permitted to use V.17 so that V.17 fax traffic sent by fax machines can be encoded using G.711 or G.726. The actual encoding performed depends on the negotiated minimum and maximum ***modemFax*** rates, available in *Vsr Svs Framer negotiatedRates*.

The actual negotiation between services using this *VoiceProfile* and V.17 fax machines is available in *Vsr Svs Framer* ***negotiatedV17AsG711G726***.

Values
no
yes

Default
no

## ATTRIBUTE Vncs Vp voiceRates

Access
Read: Passive
Write: Service

Description
This attribute specifies the minimum and maximum ***voice*** rate parameters used during negotiation with the remote end across the subnet. For ***g711G726*** encoding, rates can change during voice traffic due to congestion in the network. Therefore, you can have differing minimum and maximum rates for ***g711G726*** encoding. All other encodings have a fixed rate for the duration of voice traffic and so their minimum and maximum rates can not be modified.

The negotiated minimum and maximum ***voice*** rates are available in *Vsr Svs Framer negotiatedRates*.

Array of
Decimal (8.0; 16.0; 24.0; 32.0; 64.0)

| | |
|---|---|
| Units | kbit/s |
| Row | encoding [g711Only<br>g711G726<br>g728Only<br>g729Only] |
| Column | rate [min<br>max] |
| Default | (64.0, 64.0, 24.0, 64.0, 16.0, 16.0, 8.0, 8.0) |

### ATTRIBUTE Vncs Vp voiceEncodingChoice

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Description | This attribute specifies preferences regarding the encoding of voice traffic. During the setup of an audio call, the local and remote ends negotiate a common encoding to use. The local end's ordered list of preferred encodings is given by all *voiceEncodingChoice* elements that are not set to *none*. Prior to negotiation, the local end removes encodings from its list that it cannot use for a particular call. For example, the card for a particular call may not support certain encodings. After this local check, the local end sends its voice encoding preferences to the remote end. The remote end chooses the most preferred encoding that it can support from the list and this encoding is the one used during voice traffic. If the remote end cannot support any encodings on the local end's list, a call does not proceed and an alarm is issued.<br><br>The current encoding and encoding rate are available in *Vsr Svs currentEncoding* and *Vsr Svs currentRate*.<br><br>The encoding choice ***g711Only*** specifies that pulse code modulation (PCM) defined by ITU-T G.711 should be performed to encode voice traffic for calls using this profile. In this case, all voice traffic is carried uncompressed at 64 kbit/s.<br><br>The encoding choice ***g711G726*** specifies that either pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T |

G.726 should be performed to encode voice traffic for calls using this profile. The actual encoding performed depends on congestion in the network and the settings of the ***g711G726*** row of the *voiceRates* attribute.

The encoding choice of ***g728Only*** specifies that the Low Delay Coded Excited Linear Predictive Coder (LD-CELP) algorithm defined by ITU-T G.728 should be performed to encode voice traffic for calls using this profile. In this case, all voice traffic is carried at 16 kbit/s.

The encoding choice of ***g729Only*** specifies that the Conjugated Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) algorithm defined by ITU-T G.729 should be performed to encode voice traffic for calls using this profile. In this case, all voice traffic is carried at 8 kbit/s.

The encoding choice of ***none*** specifies the end of the encoding choice list. No other encoding choice can appear after ***none***, and ***none*** cannot appear as the first choice. The only encoding choice that can appear more than once in *voiceEncodingChoice* is ***none***.

G.728 and G.729 encoding cannot be performed on a ***1pDS1V***, ***1pE1V*** or ***J2MV*** card.

The negotiated ***voice*** encoding is available in *Vsr Svs Framer negotiatedEncoding*.

| | |

## ATTRIBUTE Vncs Vp modemFaxEncodingChoice

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |

Description

This attribute specifies preferences regarding the encoding of modemFax and fax traffic. During the setup of an audio call, the local and remote ends negotiate one common encoding to use during modemFax traffic and one common encoding to use during fax traffic. The local end's ordered list of preferred encodings is given by all *modemFaxEncodingChoice* elements that are not set to ***none***. Prior to negotiation, the local end removes encodings from its list that it cannot use for a particular call. For example, the card for a particular call may not be able to support certain encodings, or in the case of ***relay***, the rate of the sending machine may not be supported. After this local check, the local end sends its modem/fax encoding preferences to the remote end. The remote end uses the two most preferred encodings that it can support from the list to determine the encoding used during modemFax traffic and the encoding used during fax traffic. If the remote end cannot support any encodings on the local end's list, a call does not proceed and an alarm is issued.

The current encoding and encoding rate are available in *Vsr Svs currentEncoding* and *Vsr Svs currentRate*.

The encoding choice ***g711Only*** specifies that pulse code modulation (PCM) defined by ITU-T G.711 should be performed to encode modem/fax traffic for calls using this profile. In this case, all modem/fax traffic is carried uncompressed at 64 kbit/s.

The encoding choice ***g711G726*** specifies that either pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726 should be performed to encode modem/fax traffic for calls using this profile. The actual encoding performed depends on congestion in the network and the settings of the ***g711G726*** row of the *modemFaxRates* attribute.

The encoding choice of ***relay*** specifies that modulated modem/fax traffic is demodulated and sent through the network as Passport cells at the base rate of the sending machine. The types of modulation/demodulation supported are V.29 up to 9.6 kbit/s and V.27 up to 4.8 kbit/s. Only fax traffic can use ***relay***.

If *modemFaxEncodingChoice* is ***relay, none, none***, modem traffic is not supported. If *modemFaxEncodingChoice* is ***none, none, none***, all traffic is treated like voice traffic.

Fax relay cannot be performed on ***1pDS1V, 1pE1V*** or ***J2MV*** cards.

The negotiated ***modemFax*** and ***fax*** encodings are available in *Vsr Svs Framer negotiatedEncoding*.

## GROUP VRoute Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of a Voice Networking *VoiceRoute* component. |

## ATTRIBUTE VRoute commentText

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | Use of this attribute is at the discretion of the system administrator. Typically, it specifies the name of the customer that is using this *VoiceRoute*. |
| Values | String (0..40, ASCII) |
| Default | No default |

## ATTRIBUTE VRoute typeOfRoute (tor)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the type of calls (either voice, data, or both voice and data) that this *VoiceRoute* will accept from the Passport subnet and the local PBX. If *typeOfRoute* is set to ***voice***, then all data calls from the subnet and the local PBX will be rejected. If *typeOfRoute* is set to ***data***, then all voice calls from the subnet and the local PBX will be rejected. If *typeOfRoute* is set to ***voiceData***, then all data and voice calls will be accepted from the subnet and the local PBX. |
| Values | voice<br>data<br>voiceData |
| Default | voiceData |

## ATTRIBUTE VRoute diallingPlan0 (dp0)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies how to map the numbering plan indication and the type of number into the *Vncs* database *diallingPlan0*. For more information refer to NTP 241-7001-4xx Voice Networking Users Guide. There are three numbering plans that are allowed, unknown, E.164, and private. Within each of these, there are eight possible type of numbers. Since the name for the type of numbers for the private numbering plans varies from protocol to protocol, a generic scheme has been adopted.<br>***unknown*** means that the sending and receiving switches have no knowledge of the numbering plan.<br>***international*** means that the sending switch has identified the number format as matching the E.164 international dialling.<br>***national*** means that the sending switch has identified the number as conforming to the E.164 national dialling plan<br>***subscriber*** means that the number is the address of a customer |

conforming to the local public network.
***p0***, ***p1***, ***p2***, ***p3***, ***p4***, ***p5***, ***p6*** and ***p7*** are private numbering plans, with a type of number zero to seven.
***casUnknown*** means any number received from a Channel Associated Signalling (CAS) trunk.

Description

This attribute specifies how to map the numbering plan indication and the type of number into the *Vncs* database *diallingPlan1*. For more information refer to NTP 241-7001-4xx Voice Networking Users Guide. There are three numbering plans that are allowed, unknown, E.164, and private. Within each of these, there are eight possible type of numbers. Since the name for the type of numbers for the private numbering plans varies from protocol to protocol, a generic scheme has been adopted.
***unknown*** means that the sending and receiving switches have no knowledge of the numbering plan.
***international*** means that the sending switch has identified the number format as matching the E.164 international dialling plan.
***national*** means that the sending switch has identified the number

| | |
|---|---|
| | as conforming to the E.164 national dialling plan<br>***subscriber*** means that the number is the address of a customer conforming to the local public network.<br>***p0***, ***p1***, ***p2***, ***p3***, ***p4***, ***p5***, ***p6*** and ***p7*** are private numbering plans, with a type of number zero to seven.<br>***casUnknown*** means any number received from a Channel Associated Signalling (CAS) trunk. |

## ATTRIBUTE VRoute huntingAlgorithm (rha)

Access

Read: All
Write: All

Criticality

Process

Description

This attribute specifies the type of hunting algorithm that should be used by the *VoiceRoute* and *VoiceSubroutes* when selecting a channel to make an outgoing call.
***bottomUpLinear*** means that a call from the subnet will be passed to the lowest instance of the *VoiceSubroute*s, which in turn will pass the call to the lowest instance of *SwitchedVoiceService*. If there are no available *SwitchedVoiceService*s in that *VoiceSubroute* then the process will be repeated for the next lowest instance of *VoiceSubroute.*
***topDownLinear*** means that a call from the subnet will be passed to the highest instance of the *VoiceSubroutes*, which in turn will

| | |
|---|---|
| | pass the call to the highest instance of *SwitchedVoiceService*. If there are no available *SwitchedVoiceService*s in that *VoiceSubroute* then the process will be repeated for the next highest instance of *VoiceSubroute*. |
| Values | bottomUpLinear<br>topDownLinear |
| Default | bottomUpLinear |

### ATTRIBUTE VRoute minimumDigitsToRoute (mdtr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the number of digits that must be received before an address resolution request will be sent to the *VoiceNetworkingCallServer*. Once this level has been exceeded an address resolution request will be sent for every digit received until the dialled number has been resolved in the database.<br>This number should be set to a value which represents the average number of digits that will allow for a unique end-point to be identified. If the number is set too low, then the number of simultaneous calls that can be handled by the *VoiceNetworkingCallServer* will be reduced since the number of address resolution requests sent for each call will be increased. If it is set too high then address resolution request messages will not be sent to the *VoiceNetworkingCallServer* until the end-of-dial timer has expired (approximately 12 seconds after the last digit has been received). This can result in very long call setup times. |
| Values | Decimal (1..16) |
| Default | 3 |

### ATTRIBUTE VRoute voiceNetworkingCallServer (vncs)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies which *Vncs* instance should be used by all calls into this *VoiceRoute* from the PBX. |
| Values | Link (Service, voiceRoutes) |
| Default | No default |

### ATTRIBUTE VRoute overrideDirectoryNumber (odn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | The number specified here will be used in place of the dialled number to lookup the destination in the *VoiceNetworkingCallServer*. A null string means that the routing decision should be based on the dialled number.<br>The numbering plan type that will be used will be *noAccessCode*. |
| Values | BCD (0..24) |
| Default | "" |

### ATTRIBUTE VRoute privateNetworkIdentifer (pni)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the private network identifier (PNI) value. If the value is zero then connectionless supplementary service transport for TCAP formatted FACILITY messages is not supported. |
| Values | Decimal (0..32700) |
| Default | 0 |

### ATTRIBUTE VRoute subroutes

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies all of the *VoiceSubroutes* which are associated with this *VoiceRoute*. There is a maximum of 16 *VoiceSubroutes* allowed per *VoiceRoute*. |
| List of | Link (Service, voiceRoute) |
| List Size | 16 |
| Default | No default |

### GROUP VRoute CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE VRoute customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

## GROUP VRoute IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

## ATTRIBUTE VRoute ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## ATTRIBUTE VRoute ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

## GROUP VRoute OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE VRoute adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE VRoute operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE VRoute usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP VRoute OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE VRoute snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP VRoute Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *VoiceRoute* component. It contains information relating to calls that originate from the network. |

### ATTRIBUTE VRoute totalCallsFromSubnet

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of calls that have been received from the Passport subnet, including calls that fail.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE VRoute callsClearedNoChannel

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of calls from the subnet that were rejected when all of the in-service channels were busy. When a call is rejected for this reason, the cause code sent to the originator is 34, no circuit/channel available.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE VRoute callsClearedOutOfService

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total number of calls from the subnet that were rejected because all of the channels were out-of-service. A channel is considered out-of-service if it is unavailable for any reason other than it is being engaged in handling a call. That is, an operator lock of any of the components required for the channel's operation, or problems which interfere with the connection to the PBX, will cause the channel to be considered out-of-service. When a call is rejected for this reason, the cause code sent back to the originator is 27, destination out-of-service. The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE VRoute callsRejected

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of calls from the subnet that were rejected because they were:<br>1) voice calls to a *typeOfRoute* which is set *to* ***data***,<br>2) data calls to a *typeOfRoute* which is set to ***voice***,<br>3) using a signalling protocol which is incompatible with this end.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP VRoute Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *VoiceRoute* component. It displays information relating to calls that originate from the Passport subnet. |

### ATTRIBUTE VRoute degradedSubroutes

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates all of the *VoiceSubroute*s that have at least one *SwitchedVoiceService* whose *operationalState* is ***disabled***. |
| List of | The name of the component |
| List Size | 16 |
| Default | No default |

# COLLECTED STATS VoiceRoute

| | |
|---|---|
| Description | The statistics record generated by the VoiceRoute component. |

### ATTRIBUTE VRoute totalCallsFromSubnet

| | |
|---|---|
| Description | This spooled statistic counts the number of calls that have been received from the Passport subnet in the last statistics collection interval, including calls that fail. |
| Values | Decimal (0..65535) |

### ATTRIBUTE VRoute callsClearedNoChannel

| | |
|---|---|
| Description | This spooled statistic counts the number of calls from the subnet that were rejected when all of the in-service channels were busy in the last statistics collection interval. When a call is rejected for this reason, the cause code sent to the originator is 34, no circuit/ channel available. |
| Values | Decimal (0..65535) |

### ATTRIBUTE VRoute callsClearedOutOfService

| | |
|---|---|
| Description | This spooled statistic counts the number of calls from the subnet that were rejected because all of the channels were out-of-service in<br>the last statistics collection interval. A channel is considered out-of-service if it is unavailable for any reason other than it is being engaged in handling a call. That is, an operator lock of any of the components required for the channel's operation, or problems which interfere with the connection to the PBX, will cause the channel to be considered out-of-service. When a call is rejected for this reason, the cause code sent back to the originator is 27, destination out-of-service. |

Values Decimal (0..65535)

### ATTRIBUTE VRoute callsRejected

Description This spooled statistic counts the number of calls from the subnet that were rejected in the last statistics collection interval because they were:
1) voice calls to a *typeOfRoute* which is set *to* ***data***,
2) data calls to a *typeOfRoute* which is set to ***voice***,
3) using a signalling protocol which is incompatible with this end.

Values Decimal (0..65535)

### COMPONENT VRoute VnetRouteDebug (Debug)

Scope Application

Description *VRoute/n Debug*
The *Debug* component defines the debug operational characteristics of the *VoiceRoute* component.

Common Verbs
Help
List
Display

### COMPONENT VRoute Interface

Groups "GROUP VRoute Interface Provisioned (Prov)"

Scope Application

Description *VoiceRoute/n Interface*
This component defines the interface between a voice route and a PBX. It is ignored for calls running on ***1pDS1V*** or ***1pE1V*** cards.

Common Verbs

List
Display

### GROUP VRoute Interface Provisioned (Prov)

Properties Provisioned

| | |
|---|---|
| Description | This group contains attributes specifying the interface to a PBX. |

### ATTRIBUTE VRoute Interface ingressAudioGain

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the gain in dB that is applied to data coming from outside the network before it is transferred across the network. It applies to voice, modem and fax traffic. For example, ingress gain is applied to audio data coming from a PBX. If *ingressAudioGain* is negative, a loss is applied.<br><br>*ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in a network to ensure that the signal level from any point in the network to any other point is correct.<br><br>*ingressAudioGain* is ignored for calls on ***1pDS1V*** and ***1pE1V*** cards. For calls running on these cards, ingress audio gain is not under the user's control and egress audio gain is determined by the *audioGain* attribute in the appropriate *Vncs/m VoiceProfile/n*. |
| Values | Signed (-12..12) |
| Units | dB |
| Default | 0 |

### ATTRIBUTE VRoute Interface egressAudioGain

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the gain in dB that is applied to data leaving the network. It applies to voice, modem and fax traffic. For example, egress gain is applied to audio data going to a PBX. If *egressAudioGain* is negative, a loss is applied.<br><br>*ingressAudioGain* and *egressAudioGain* are used in loss |

planning, which is the configuration of the devices in the network to ensure that the signal level from any point in the network to any other point is correct.

*egressAudioGain* is ignored for calls running on ***1pDS1V*** and ***1pE1V*** cards. For calls running on these cards, egress audio gain is determined by the *audioGain* attribute in the appropriate *Vncs/m VoiceProfile/n*.

| | |
|---|---|
| Values | Signed (-12..12) |
| Units | dB |
| Default | 0 |

### ATTRIBUTE VRoute Interface tandemPassThrough (tpt)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies whether tandem pass through is desired. If *tandemPassThrough* is ***enabled***, tandem pass through is used if possible. If *tandemPassThrough* is ***disabled***, tandem pass through is not used under any circumstances. The actual state of tandem pass through is indicated in *Vsr Svs Framer tptStatus*.<br><br>The negotiated tandem pass through is available in *Vsr Svs Framer negotiatedTandemPassThrough*.<br><br>Tandem pass through is not supported on ***1pDS1V*** and ***1pE1V*** cards, so *tandemPassThrough* is ignored on these cards. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE VRoute Interface comfortNoiseCap

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the maximum level at which comfort noise is generated. The comfort noise is limited by *comfortNoiseCap* before *egressAudioGain* is applied. The default value of ***-40*** dBm0 equates to the maximum level of comfort noise available and effectively disables the *comfortNoiseCap*. |
| Values | Signed (-78; -65; -60; -54; -52; -50; -48; -46; -44; -42; -40) |
| Units | dBm0 |
| Default | -40 |

### ATTRIBUTE VRoute Interface speechHangoverTime

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the time after the end of speech before silence suppression starts. It applies only to voice traffic. It is not used unless *Vsr Svs Framer negotiatedSilenceSuppression* is ***on***, ***congested*** or ***slowAndCongested***.<br><br>Higher values of *speechHangoverTime* reduce undesirable clipping but increase bandwidth usage.<br><br>*speechHangoverTime* is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** cards. |
| Values | Decimal (10..500) |
| Units | msec |
| Default | 150 |

### ATTRIBUTE VRoute Interface faxHangoverTimeG711G726

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the time after the end of fax traffic before G.711/G.726 fax idle suppression starts. It applies only if the |

negotiated fax encoding, available in *Vsr Svs Framer negotiatedEncoding*, is ***g711***, ***g726*** or ***g711G726*** and *Vsr Svs Framer negotiatedFisG711G726* is ***on***.

Higher values of *faxHangoverTimeG711G726* reduce undesirable clipping but increase bandwidth usage.

*faxHangoverTimeG711G726* is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** cards.

Values: Decimal (300..20000)

Units: msec

Default: 1000

### ATTRIBUTE VRoute Interface modemFaxSpeechDiscrim (fsd)

Access: Read: Passive
Write: Service

Criticality: Process

Description: This attribute specifies whether this *VoiceRoute* differentiates between modemFax traffic and speech. If *modemFaxSpeechDiscrim* is ***on*** and a false 2100 Hz tone is detected, any *Svs* using this route reverts to speech mode when speech is detected.

*modemFaxSpeechDiscrim* is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** cards.

Values: on
off

Default: on

### ATTRIBUTE VRoute Interface echoTailDelay

Access: Read and write

Criticality: Process

Description: This attribute specifies the maximum echo canceller tail delay coverage. It should be selected higher than the summation of the

| | |
|---|---|
| | round trip delay of echo and hybrid response time. A ***32*** msec setting is good for a radius of 2700 km, assuming that the signal is going through 4 exchanges and the hybrid response time is 6 msec. A ***64*** msec setting offers even greater coverage (more distance or more switches), with comparable convergence time. The recommended setting is ***64*** msec. This attribute is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp,*** or ***1pTTC2mMvp*** card. |
| Values | Decimal (32; 64) |
| Units | msec |
| Default | 64 |

### ATTRIBUTE VRoute Interface echoReturnLoss

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the echo return loss parameter of the echo canceller. If the line quality is poor, in terms of echo, selecting a higher value may allow the echo canceller to perform better. A side effect is that the voice level is attenuated by the same amount, which may not always be acceptable. This attribute is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp,*** or ***1pTTC2mMvp*** card. |
| Values | Decimal (0; 3; 6) |
| Units | dB |
| Default | 6 |

### ATTRIBUTE VRoute Interface ecanBypassMode

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies when version 2 internal echo cancellers are placed in bypass mode on this *VoiceRoute*. This attribute only applies if ***v2*** of *echoCancellation* is ***on***. If *ecanBypassMode* is ***g165***, the internal echo canceller is placed in bypass mode as |

per ITU-T G.165. If *ecanBypassMode* is ***g164***, the internal echo canceller is placed in bypass mode as per ITU-T G.164. If *ecanBypassMode* is ***never***, the internal echo canceller is never placed in bypass mode. This mode should only be used for debugging.

This attribute does not apply to ***1pE1V***, ***1pDS1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp,*** or ***1pTTC2mMvp*** cards.

Values
g164
g165
never

Default
g165

## ATTRIBUTE VRoute Interface echoCancellation

Access
Read and write

Criticality
Process

Description
This attribute specifies whether echo cancellation is performed on this *VoiceRoute*. ***v1*** specifies whether echo cancellation is performed by version 1 internal echo cancellers. ***v2*** specifes whether echo cancellation is performed by version 2 echo cancellers. If *echoCancellation* is ***on***, the internal echo canceller is enabled and echo cancellation is performed. If *echoCancellation* is ***off***, the internal echo canceller is placed in transparent bypass mode and echo cancellation is never performed.

## COMPONENT VRoute DataNetworkAddress (Dna)

Groups
"GROUP VRoute Dna Address"

Scope
Application

| | |
|---|---|
| Description | *vroute/n Dna*<br>This is the description of the VRoute *Dna* component. It offers a subset of the generic *Dna* component attributes. |
| Opt. Subcomp. | "COMPONENT VRoute Dna HuntGroupMember (Hgm)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP VRoute Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | *Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 attributes. String of address digits is complemented by type of address and Npi. These attributes are used to interpret format of the address digits. |

## ATTRIBUTE VRoute Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks. |
| Values | x121<br>e164 |
| Default | e164 |

## ATTRIBUTE VRoute Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | *Dna* attribute contains digits which form unique identifier of the customer interface. It can be compared (approximation only) to telephone number where phone number identifies unique |

telephone set. *Dna* digits are selected and assigned by network operators.

Values: BCD (0..15)

Default: No default

## COMPONENT VRoute Dna HuntGroupMember (Hgm)

Groups: "GROUP VRoute Dna Hgm Provisioned (Prov)"
"GROUP VRoute Dna Hgm Operational (Op)"

Scope: Application

Description: *Vroute/n Dna/n HuntGroupMember*
When present under a DNA component, this component specifies that the DNA is a member of a hunt group. Each hunt group member subscribes to at least one hunt group. The hunt group server's DNA must be added to the VnetHuntGroupAddress which is the sub-component of VnetHuntGroupMember. By adding the DNA correct availability of the vroute will be reported to the hunt group to process calls.

Subcomponents: "COMPONENT VRoute Dna Hgm HuntGroupAddress (HgAddr)"

Common Verbs:
- Help
- List
- Display
- Add
- DELete

## GROUP VRoute Dna Hgm Provisioned (Prov)

Properties: Provisioned

Description: This group contains the interface parameters between the *HuntGroupMember* and the hunt group server.

## ATTRIBUTE VRoute Dna Hgm usageDeltaUpdateThreshold (aut)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies by how much the availability of a hunt group member must change before the member's availability is updated to the hunt group server. A value of zero ensures that an update will be sent if the value of the availability changes. The attribute that reports the availability is *currentAvailability.* |
| Values | Decimal (0..4096) |
| Default | 1 |

### GROUP VRoute Dna Hgm Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *HuntGroupMember* component. |

### ATTRIBUTE VRoute Dna Hgm maxAvailableChannels (maxAc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of available channels for this *HuntGroupMember.* |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE VRoute Dna Hgm availableChannels (ac)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of available channels reported to the hunt group in the Availability Message Packet (AMP). It is incremented by the application when a channel is freed and decremented when a channel is active. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE VRoute Dna Hgm availabilityDelta (ad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the delta between the actual availability of a hunt group member and the hunt group member's |

*currentAvailability.* Once the absolute value of this attribute reaches the *usageDeltaUpdateThreshold*, the *currentAvailability* of the hunt group member is updated with the actual availability and the *availabilityDelta* is reset to 0.

If this attribute is positive, the number of available channels has increased since the last Availability Message Packet was sent. If it is negative, the number of available channels has decreased since the last AMP was sent.

Values: Signed (-4096..4096)

Default: No default

## COMPONENT VRoute Dna Hgm HuntGroupAddress (HgAddr)

Instance: Decimal (0..1)

Groups: "GROUP VRoute Dna Hgm HgAddr Address (Addr)"

Scope: Application

Description: *Vroute/n Dna/n HgM HuntGroupAddress/n*
This component specifies the hunt group address to which this member belongs. A hunt group member belongs to at least one hunt group.

Common Verbs:
- Help
- List
- Display
- Add
- DELete

## GROUP VRoute Dna Hgm HgAddr Address (Addr)

Properties: Provisioned

Description: This group contains DNA attributes common to all DNAs.

## ATTRIBUTE VRoute Dna Hgm HgAddr numberingPlanIndicator (npi)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the Numbering Plan Indicator (NPI) of the *DNA* that is entered. The address may belong to the X.121 or E.164 numbering plans. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE VRoute Dna Hgm HgAddr dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the digits that form the unique identifier of the customer interface. It can be compared to a telephone number where phone number identifies unique telephone set. DNA digits are selected and assigned by network operators. |
| Values | BCD (1..15) |
| Default | No default |

### COMPONENT VRoute VoiceAccounting (Acct)

| | |
|---|---|
| Groups | "GROUP VRoute Acct Provisioned (Prov)" |
| Scope | Application |
| Description | *Vroute/n VoiceAccounting*<br>The *VoiceAccounting* component defines the operational characteristics of the accounting system of the *Vroute* component. Accounting record generation for calls on the *Vroute* is managed by this component. |
| Common Verbs | Help<br>List<br>Display |

### GROUP VRoute Acct Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of a *VoiceAccounting* component. |

### ATTRIBUTE VRoute Acct accountCollection (aco)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies that accounting records are to be collected for the various reasons: ***bill***, ***test***, ***study***, ***audit***. The last of the parameters, ***force***, specifies that accounting records are to be collected irrespective of other collection reasons. If none of these reasons is set, then accounting will be suppressed. |
| Set of | bill<br>test<br>study<br>audit<br>force |
| Default | No default |

### ATTRIBUTE VRoute Acct accountClass (acl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. The use of this attribute is decided by the network operator. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE VRoute Acct serviceExchange (sre)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies a user defined value, Data Service Exchange, as entered by the network operator and reported in the accounting record. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE VRoute Acct digitsSuppressed (ds)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the number of trailing digits which will be suppressed in the *calledNumber* in the accounting records. Each of the specified number of trailing digits are replaced with an "X". This option exists to satisfy privacy requirements in a number of countries. |
| Values | Decimal (0..8) |
| Default | 0 |

### ATTRIBUTE VRoute Acct accountingOptions (ao)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies optional settings for the voice networking accounting system. The options are:<br>***suppressTerminatingEndRecords*** - setting this option suppresses the generation of accounting records at the destination node. This reduces the volume of accounting data. This option has local significance only. It only suppresses the generation of accounting records for calls received by this node. |
| Set of | suppressTerminatingEndRecords (ster) |
| Default | No default |

## COMPONENT VRoute IgDigitManipulation (Idm)

| | |
|---|---|
| Groups | "GROUP VRoute Idm Provisioned (Prov)" |
| Scope | Application |
| Description | *VRoute/n IgDigitManipulation*<br>This component specifies ingress digit manipulation properties. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP VRoute Idm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *IgDigitManipulation* component. |

## ATTRIBUTE VRoute Idm variant (var)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the variant of ingress digit manipulation to perform. Selecting ***blindLeading*** specifies ingress digit manipulation is performed on the leading end of the called number. Selecting ***none*** disables ingress digit manipulation. A warning is generated if ***none*** is selected and *digitsToInsert* is not empty or *numDigitsToDelete* is not 0. |
| Values | none<br>blindLeading |
| Default | blindLeading |

## ATTRIBUTE VRoute Idm digitsToInsert (dti)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the digits to insert and only applies when *variant* is ***blindLeading***. There can be up to 16 digits inserted. Acceptable values are the digits 0 through 9 and the characters # (octothorpe) and * (star). An error is generated if any of the digits are not in the acceptable range. A warning is generated if *digitsToInsert* is not empty and the *variant* selection is ***none***. |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE VRoute Idm numDigitsToDelete (ndtd)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of leading digits to delete and only applies when *variant* is ***blindLeading***. There can be up to 16 digits deleted. A warning is generated if *numDigitsToDelete* is not 0 and the *variant* selection is ***none***. |
| Values | Decimal (0..16) |
| Default | 0 |

### ATTRIBUTE VRoute Idm callRouting (cr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether calls are routed before or after performing digit manipulation and only applies when *variant* is ***blindLeading***. Selecting ***routeOnDialledDigits*** specifies that calls are routed prior to performing ingress digit manipulation. Selecting ***routeOnModifiedDigits*** specifies that calls are routed after performing ingress digit manipulation. |
| Values | routeOnDialledDigits<br>routeOnModifiedDigits |
| Default | routeOnModifiedDigits |

## COMPONENT VRoute EgDigitManipulation (Edm)

| | |
|---|---|
| Groups | "GROUP VRoute Edm Provisioned (Prov)" |
| Scope | Application |
| Description | *VRoute/n EgDigitManipulation*<br>This component specifies egress digit manipulation properties. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP VRoute Edm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *EgDigitManipulation* component. |

## ATTRIBUTE VRoute Edm variant (var)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the variant of egress digit manipulation to perform. Selecting ***blindLeading*** specifies egress digit manipulation is performed on the leading end of the called number. Selecting ***none*** disables egress digit manipulation. A warning is generated if ***none*** is selected and *digitsToInsert* is not empty or *numDigitsToDelete* is not 0. |
| Values | none<br>blindLeading |
| Default | blindLeading |

## ATTRIBUTE VRoute Edm digitsToInsert (dti)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the digits to insert and only applies when *variant* is ***blindLeading***. There can be up to 16 digits inserted. Acceptable values are the digits 0 through 9 and the characters # (octothorpe) and * (star). An error is generated if any of the digits are not in the acceptable range. A warning is generated if *digitsToInsert* is not empty and the *variant* selected is ***none***. |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE VRoute Edm numDigitsToDelete (ndtd)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of leading digits to delete and only applies when *variant* is ***blindLeading***. There can be up to 16 digits deleted. A warning is generated if *numDigitsToDelete* is not 0 and the *variant* selected is ***none***. |
| Values | Decimal (0..16) |
| Default | 0 |

### ATTRIBUTE VRoute Edm callHandlingWhenNoDigits (chwnd)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies how calls are handled when no digits remain following egress digit manipulation and only applies when *variant* is ***blindLeading***. Selecting ***releaseCall*** specifies the call is released if no digits remain following egress digit manipulation. Selecting ***attemptCompletion*** specifies that call completion is attempted if no digits remain upon following egress digit manipulation. |
| Values | attemptCompletion<br>releaseCall |
| Default | releaseCall |

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## VERB TELNET Vr

| | |
|---|---|
| Impact | Passive |
| Description | *Telnet -ipAddress(<IP address>) Vr/<string>*<br><br>This command allows access to the Telnet client, attempting to set up a connection from this Passport to the specified IP address within the specified VR's address space.<br><br>Options:<br>*ipAddress* - This mandatory option specifies the IP address of the remote node to which the user wants to Telnet within this VR's address space. |

## GROUP Vr AdministrativeControl (AdminContorl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

## ATTRIBUTE Vr snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | This sets the desired state of this VirtualRouter. The ***up*** state indicates the Vr is operational. The ***down*** state indicates the Vr is not operational. |
| Values | up<br>down<br>testing |
| Default | up |

## ATTRIBUTE Vr managementAccess

| | |
|---|---|
| Access | Read and write |
| Description | This attributes defines the routing capabilities of this Virtual Router |
| Values | disabled<br>enabled |
| Default | No default |

## ATTRIBUTE Vr virtualPrivateIntranetIdentifier (vpiId)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Virtual Private Intranet (VPI) associated with this Virtual Router.<br><br>If this attribute is not set to the default value, it must be unique on the Passport.<br><br>Virtual Routers on different Passports which are interconnected with each other should have the same VPI value. |

| | |
|---|---|
| | Note that this attribute will be obsoleted in the near future. It's functionality is replaced by the *virtualPrivateNetworkIdentifier* attribute. Any affected tools using this attribute should be converted to use the *vpnId* attribute instead. |
| Values | Decimal (0..2047) |
| Default | 0 |

### ATTRIBUTE Vr vpnMode (vpnm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if the virtual router behaves as a carrier Virtual Router or a customer Virtual Router. |
| Values | customer<br>carrier |
| Default | customer |

### ATTRIBUTE Vr virtualPrivateNetworkIdentifier (vpnId)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Virtual Private Network (VPN) associated with this Virtual Router.<br>This is a globally unique identifier composed of a three-octet long Organizationally Unique Identifier (OUI) followed by a four-octet long VPN index.<br>The value "00-00-00-00-00-00-00" identifies an unspecified vpnId and should be set to other non-zero values when the autoDiscovery attribute under same virtual router ***vr***/x ***ip tunnel msep/***y is enabled. |
| Values | String (7, Dashed Hex) |
| Default | 00-00-00-00-00-00-00 |

### ATTRIBUTE Vr virtualRouterProcessor (vrp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the *LogicalProcessor* on which this *VirtualRouter* resides.<br><br>The Management Virtual Router must reside on ***Lp/0***.<br><br>The following card types may support a Virtual Router:<br>***CP***<br>***CPeD***<br>***CPeE***<br>***VpnXc*** |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### GROUP Vr CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Vr customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of |

| | |
|---|---|
| | any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Vr OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Vr operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Vr usageState (osiUsage)

| | |
|---|---|
| Access | Read only |

## COMPONENT Vr Dsd MplsServiceMap (MplsMap)

Instance 0

Scope Application

Description *Vr/<string> Dsd/<domainType> MplsServiceMap/<n>*

The subcomponents of the *MplsServiceMap* component specify mappings used to control how MPLS packets are forwarded over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.

The *MpslServiceMap/0* subcomponent instance is mandatory under a *DifferentiatedServicesDomain* component whose parent is either a *Router* component, or a *VirtualRouter* component that has an *Mpls* subcomponent.

An *MpslServiceMap* subcomponent cannot be added to a *DifferentiatedServicesDomain* component whose parent does not have a *Mpls* subcomponent.

"GROUP Vr Dsd MplsMap ExpMap Operational (Oper)"

Scope

Application

Description

*Vr/<string> Dsd/<domainType> MplsMap/<> ExperimentalBitsMap/<>*

This component specifies a mapping from a three-bit Experimental (EXP) field value in an MPLS label to a *DifferentiatedServicesDomain PerHopBehavior* component instance value.

This mapping controls how an MPLS packet whose three-bit

Experimental (EXP) field value is equal to the *ExperimentalBitsMap* component instance value is treated when the packet is forwarded by a Label Switched Router (LSR) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.

The *MplsServiceMap* component must have eight *ExperimentalBitMap* subcomponents, each with a unique instance value in the range from **0** to **7**. These subcomponents are added automatically when the *MplsServiceMap* component is created.

Groups

"GROUP Vr Dsd MplsMap PhbMap Provisioned (Prov)"
"GROUP Vr Dsd MplsMap PhbMap Operational (Oper)"

Scope

Application

Description

*Vr/<string> Dsd/<domainType> MplsMap/<n> PerHopBehaviorMap/<phb>*

This component specifies a mapping from a *PerHopBehavior* component instance value to a three-bit Experimental (EXP) field value.

This mapping controls how the EXP field in an MPLS label is marked when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.

The *DifferentiatedServicesDomain PerHopBehavior* component instance used to treat the packet prior to label encapsulation is used to select the EXP value for the label. If the *PerHopBehavior* component instance value used to treat the packet is not included among the existing *PerHopBehaviorMap* component instances, then the EXP value indicated by the *PerHopBehaviorMap* component whose instance is equal to 0 is used.

Each *PerHopBehaviorMap* component instance is equal to a decimal value in the range from 0 to 63. The following pairs of *PerHopBehaviorMap* component instances values are equal:
*AF11 = 10,*

*AF12 =12,*
*AF13 =14,*
*AF31 = 26,*
*AF32 = 28,*
*AF33 = 30,*
*AF21 = 18,*
*AF22 = 20,*
*AF23 = 22,*
*AF41 = 34,*
*AF42 =36,*
*AF43 = 38*
*CS0 = 0,*
*CS1 = 8,*
*CS2 =16,*
*CS3 = 24,*
*CS4 =32 ,*
*CS5 = 40,*
*CS6 = 48,*
*CS7 = 56,*
*DF = 0,*
*EF = 46.*

The first item in each pair above is a Per Hop Behavior designation identified in one of following IETF standards: RFC 2764 (“DiffServ Field Definition in IPv4 and IPv6 Headers”), RFC 2597 (“Assured Forwarding PHB Group”) or RFC 3246 (“An Expedited Forwarding PHB”). The the second item in each pair is the IETF recommended Differentiated Services Code Point (DSCP) value.

Each *PerHopBehaviorMap* subcomponent of the *MplsServiceMap* must have a unique instance value. A *PerHopBehaviorMap* subcomponent whose instance value is equal to 0 must exist.

A set of *PerHopBehaviorMap* subcomponents with instance values equal to the *DifferentiatedServicesDomain PerHopBehavior* subcomponent instance values is added automatically when the *MplsServiceMap* component is created.

| Description | This group contains the provisioned attributes of the *PerHopBehaviorMap* component. |

## ATTRIBUTE Vr Dsd MplsMap PhbMap experimentalBits (exp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a three-bit Experimental (EXP) field value in the range from ***0*** to ***7*** that is marked into the MPLS label when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.<br><br>The EXP value is selected according to the *PerHopBehaviorMap* component whose instance value is equal to the instance value of the *DifferentiatedServicesDomain PerHopBehavior* component used to treat the packet prior to label encapsulation.<br><br>This attribute is set automatically to a default value according to a function of the *PerHopBehaviorMap* and *DifferentiatedServicesDomain* component instance values when the *PerHopBehaviorMap* component is created. |
| Values | Decimal (0..7) |
| Default | No default |

## GROUP Vr Dsd MplsMap PhbMap Operational (Oper)

| | |
|---|---|
| Properties | Operational |

Description — This group contains the operational attributes of the *PerHopBehaviorMap* component.

### ATTRIBUTE Vr Dsd MplsMap PhbMap operExperimentalBits (operExp)

Access — Read only

Description — This attribute indicates a three-bit Experimental (EXP) field value in the range from ***0*** to ***7*** that is marked into the MPLS label when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.

The EXP value is selected according to the *PerHopBehaviorMap* component whose instance value is equal to the instance value of the *DifferentiatedServicesDomain PerHopBehavior* component used to treat the packet prior to label encapsulation.

The value of this attribute is equal to the *experimentalBits* provisioned attribute.

Values — Decimal (0..7)

Default — No default

### ATTRIBUTE Vr Dsd MplsMap PhbMap operExperimentalBitsAlternative (operExpAlt)

Access — Read only

Description — This attribute is similar to the *operExperimentalBits* operational attribute, except that it used only on PQC-based access FPs with ASIC Version 2.0 in RFC 2547 networks when an IP packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) via a PQC-based trunk FP. In such situations only, the value of this attribute, instead of the *operExperimentalBits* operational attribute value, is used to mark the Experimental (EXP) field of the MPLS label.

If the *MplsServiceMap* does not have a *MarkingPerformance* subcomponent, then the value of this attribute is equal to the *experimentalBits* provisioned attribute; otherwise the value of this attribute is determined as explained in the next paragraph.

If "***x***" is the *schedulingClass4Queues* operational attribute value of the *DifferentiatedServicesDomain PerHopBehavior* component whose instance value is equal to the *PerHopBehaviorMap* component instance value, then the *PerHopBehaviorMap experimentalBitsAlternative* operational attribute value is equal to the "***x***th" element of the *MarkingPerformance experimentalBitsAlternative* provisioned attribute.

Values — Decimal (0..7)

Default — No default

## COMPONENT Vr Dsd MplsMap MarkingPerformance

Groups — "GROUP Vr Dsd MplsMap MarkingPerformance Provisioned (Prov)"

Scope — Application

Description — *Vr/<string> Dsd/<domainType> MplsMap/<n> MarkingPerformance*

This subcomponent is added to the *MplsServiceMap* component to enable high performance MPLS label encapsulation on some PQC-based ingress access FPs in RFC 2547 networks.

IP packets that are forwarded from access FPs with PQC-ASIC Version 2.0 via PQC-based trunk FPs (any ASIC version) over an MPLS Label Switched Path (LSP) where the *MplsServiceMap* is applied are affected.

Adding this component to the *MplsServiceMap* improves IP packet throughput on the affected access FPs but restricts how the three-bit Experimental (EXP) field of MPLS labels are marked, as explained in the description of the *operExperiementalBitsAlternative* operational attribute of the *MplsServiceMap PerHopBehaviorMap* component.

Without the *MarkingPerformance* subcomponent, IP packets are encapsulated with MPLS labels by a hardware-routed software assisted datapath that does not restrict how the EXP field of

MPLS labels are marked.

The *MarkingPerformance* component can only be added to an *MplsServiceMap* component where the parent of the *DifferentiatedServicesDomain* is a *Router* component.

## GROUP Vr Dsd MplsMap MarkingPerformance Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioned attributes of the *MarkingPerformance* component.

## ATTRIBUTE Vr Dsd MplsMap MarkingPerformance expermentalBitsAlternative (expAlt)

Access: Read and write

Description: This attribute is an array of four values that specifies a mapping of scheduling class values for four queues to three-bit Experimental (EXP) field values for marking MPLS labels.

This array controls the value of the *operExperimentalBitsAlternative* operational attribute of the *MplsServiceMap PerHopBehaviorMap* components, as explained in the description of that attribute.

Each element of this attribute is set automatically to a default value according to a function of the *DifferentiatedServicesDomain* component instance value and the element index when the *MarkingPerformance* component is created.

Description This attribute indicates the *PerHopBehavior* component instance that is assigned to each packet received on an RTVBR connection with Cell Loss Priority (CLP) bit = 1 that will be forwarded over an MPLS Label Switched path (LSP) in a Layer 2 Virtual Private Network (VPN).

This attribute is set automatically according to a function of the *DifferentiatedServicesDomain* component instance value when the *AtmServiceMap* component is created. It must match an existing *DifferentiatedServicesDomain PerHopBehavior* component instance value.

The *TrafficClass* assigned to the *PerHopBehavior* component instance that matches the *rtVbrClp0ToPhb* attribute value should be equal to the *TrafficClass* assigned to the *PerHopBehavior* component instance that matches the *rtVbrClp1ToPhb* attribute value.

The *dropPrecedence* assigned to the *PerHopBehavior* component instance that matches the *rtVbrClp0ToPhb* attribute value should be equal to or less than *dropPrecedence* assigned to the *PerHopBehavior* component instance that matches the *rtVbrClp0ToPhb* attribute value.

Groups

"GROUP Vr Dsd Phb Provisioned (Prov)"
"GROUP Vr Dsd Phb Operational (Oper)"
"GROUP Vr Dsd Phb IpOperational (IpOper)"

Scope

Application

Description

*Vr/<string> Dsd/<domainType> PerHopBehavior/<phb>*

The attributes of the *PerHopBehavior* component specify per-packet traffic management parameters that control how individual packets are forwarded.

A packet is associated with a *PerHopBehavior* component instance by a packet classification mechanism. For IP packets, the associated *PerHopBehavior* component instance is equal to the value of the six-bit Differentiated Services Code Point (DSCP) field in the IP header. For MPLS packets forwarded by a Label Switched Router (LSR) over a Label Switched Path (LSP) where an MplsServiceMap component is appied, the associated *PerHopBehavior* component instance is equal to value of the *perHopBehavior* attribute of the *MplsServiceMap ExperimentalBitsMap* component whose instance is equal to the value of the three-bit Experimental (EXP) field of the MPLS label.
If the *PerHopBehavior* component instance associated with a packet is not included among the existing *PerHopBehavior* subcomponents of the *DifferentiatedServicesDomain*, then the packet is treated according to the *PerHopBehavior* component whose instance is equal to 0.

Each *PerHopBehavior* component instance is equal to a decimal value in the range from 0 to 63. The following pairs of *PerHopBehavior* component instances values are equal:
*AF11 = 10,*
*AF12 =12,*
*AF13 =14,*
*AF31 = 26,*
*AF32 = 28,*
*AF33 = 30,*
*AF21 = 18,*
*AF22 = 20,*
*AF23 = 22,*
*AF41 = 34,*
*AF42 =36,*
*AF43 = 38*
*CS0 = 0,*
*CS1 = 8,*
*CS2 =16,*
*CS3 = 24,*
*CS4 =32 ,*
*CS5 = 40,*
*CS6 = 48,*
*CS7 = 56,*
*DF = 0,*
*EF = 46.*

The first item in each pair above is a Per Hop Behavior designation identified in one of following IETF standards: RFC 2764 (“DiffServ Field Definition in IPv4 and IPv6 Headers”), RFC 2597 (“Assured Forwarding PHB Group”) or RFC 3246 (“An Expedited Forwarding PHB”). The the second item in each pair is the IETF recommended Differentiated Services Code Point (DSCP) value.

Each *PerHopBehavior* subcomponent of the *DifferentiatedServicesDomain* must have a unique instance value. A *PerHopBehavior* subcomponent whose instance value is equal to 0 must exist.

A set of *PerHopBehavior* subcomponents is added automatically

when the *DifferentiatedServicesDomain* component is created. The members of this set is a function of the *DifferentiatedServicesDomain* component instance as indicated below.

## GROUP Vr Dsd Phb Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioned attributes of the *PerHopBehavior* component.

## ATTRIBUTE Vr Dsd Phb trafficClass (tc)

Access: Read and write

Description: This attribute specifies the *TrafficClass* component instance associated with the *PerHopBehavior* component instance. This attribute allows *PerHopBehavior* component instances to be aggregated into groups that specify the same packet scheduling attribute values.

This attribute is set automatically to a default value according to a function of the *PerHopBehavior* component instance value when the *PerHopBehavior* component is created. The default values are listed below.

| *PeHopBehavior* | *trafficClass* |
|---|---|
| *CS7 ( 56 )* | ***critical*** |
| *CS6 ( 48 )* | ***network*** |
| *EF ( 46 )* | ***premium*** |
| *CS5 ( 40 )* | ***premium*** |
| *CS4 ( 32 )* | ***platinum*** |
| *AF41 ( 34 )* | ***platinum*** |
| *AF42 ( 36 )* | ***platinum*** |
| *AF43 ( 38 )* | ***platinum*** |
| *CS3 ( 24 )* | ***gold*** |
| *AF31 ( 26 )* | ***gold*** |
| *AF32 ( 28 )* | ***gold*** |
| *AF33 ( 30 )* | ***gold*** |
| *CS2 ( 16 )* | ***silver*** |
| *AF21 ( 18 )* | ***silver*** |
| *AF22 ( 20 )* | ***silver*** |
| *AF23 ( 22 )* | ***silver*** |
| *CS1 ( 8 )* | ***bronze*** |
| *AF11 ( 10 )* | ***bronze*** |
| *AF12 ( 12 )* | ***bronze*** |
| *AF13 ( 14 )* | ***bronze*** |
| *CS0, DF ( 0 )* | ***standard*** |
| all others | ***standard*** |

The value of this attribute must be equal to an existing *TrafficClass* subcomponent instance of the *DifferentiatedServicesDomain*.

If the *PerHopBehavior* component instance is ***0***, ***cs0***, or ***df***, then the value of this attribute must be ***standard***.

### ATTRIBUTE Vr Dsd Phb dropPrecedence (dp)

Access

Read and write

Description

This attribute specifies the drop precedence value given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a congestion threshold when the packet is placed on a queue that supports multiple congestion thresholds.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue. Generally, the value ***low*** indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The value ***high*** indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the discarding mechanism at the queue.

This attribute is set automatically to a default value according to a function of the *PerHopBehavior* component instance value when the *PerHopBehavior* component is created. The default values are

listed below.

| *PerHopBehavior* | *dropPrecedence* |
|---|---|
| *--CS7 ( 56 )* | ***low*** |
| *CS6 ( 48 )* | ***low*** |
| *EF ( 46 )* | ***low*** |
| *CS5 ( 40 )* | ***low*** |
| *CS4 ( 32 )* | ***low*** |
| *AF41 ( 34 )* | ***low*** |
| *AF42 ( 36 )* | ***medium*** |
| *AF43 ( 38 )* | ***high*** |
| *CS3 ( 24 )* | ***low*** |
| *AF31 ( 26 )* | ***low*** |
| *AF32 ( 28 )* | ***medium*** |
| *AF33 ( 30 )* | ***high*** |
| *CS2 ( 16 )* | ***low*** |
| *AF21 ( 18 )* | ***low*** |
| *AF22 ( 20 )* | ***medium*** |
| *AF23 ( 22 )* | ***high*** |
| *CS1 ( 8 )* | ***low*** |

- standard

Default — No default

### ATTRIBUTE Vr Dsd Phb schedulingClass8Queues (sc8q)

Access — Read only

Description — This attribute indicates a logical scheduling class value in the range from ***0*** to ***7*** given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports eight queues per connection.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically

higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

The value of this attribute is equal to value of the *schedulingClass8Queues* provisioned attribute of the *TrafficClass* component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

Values: Decimal (0..7)

Default: No default

### ATTRIBUTE Vr Dsd Phb schedulingClass4Queues (sc4q)

Access: Read only

Description: This attribute indicates a logical scheduling class value in the range from ***0*** to ***3*** given to a packet that uses the *PerHopBehavior* component.instance. This value is used to select a queue when the packet is transmitted at an interface that supports four queues per connection.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

The value of this attribute is equal to value of the *schedulingClass4Queues* provisioned attribute of the *TrafficClass* component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

| | |
|---|---|
| Values | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE Vr Dsd Phb schedulingClass3Queues (sc3q)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a logical scheduling class value in the range from ***0*** to ***2*** given to a packet that uses the *PerHopBehavior* component.instance. This value is used to select a queue when the packet is transmitted at an interface that supports three queues per connection.<br><br>A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.<br><br>The value of this attribute is equal to value of the *schedulingClass3Queues* operational attribute of the *TrafficClass* component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value. |
| Values | Decimal (0..2) |
| Default | No default |

### ATTRIBUTE Vr Dsd Phb schedulingClass2Queues (sc2q)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a logical scheduling class value in the range from ***0*** to ***1*** given to a packet that uses the *PerHopBehavior* component.instance. This value is used to select a queue when the packet is transmitted at an interface that supports two queues per connection. |

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

The value of this attribute is equal to value of the *schedulingClass2Queues* operational attribute of the *TrafficClass* component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

Values: Decimal (0..1)

Default: No default

### ATTRIBUTE Vr Dsd Phb connectionClass (cos)

Access: Read only

Description: This attribute indicates the connection class value in the range from ***0*** to ***3*** given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a one of up to four link layer connections at the interface where the packet is transmitted. Per-packet selection of egress connections is supported only if these conditions are all true:

i) the egress media is *FrDte*, *AtmMpe*, *IpDlciGroup*, or *IpoDlci*, and
ii) more than one link layer connection is configured to the next hop IP router, and
iii) each connection is configured with a different connection class value.

Normally the packet is transmitted on the connection whose connection class is equal to the connection class given to the packet. If that connection does not exist, then the connection having the next lower connection class is used. If that connection

does not exist also, then the connection having the next higher connection class is used.

Locally generated IP multicast and IP broadcast packets are not eligible for per-packet selection of egress connections. Each of these packets is copied and transmitted individually on each of the available connections to the next hop IP router.

For *AtmMpe* the connection class is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte* the connection class is specified by the *ipCoS* attribute of the *StaticDlci* and *DynamicDlciDef* subcomponents. For *IpDlciGroup* and *IpoDlci* the connection class is specified by the *ipCos* attribute of the *FrConnection* subcomponent.

If each link layer connection is configured to provide different policing and scheduling characteristics, then the forwarding behaviors of IP packets are differentiated as they transit through the link layer network. In general, the scheduling characteristics of the connections should be configured to be better for numerically greater connection class values. For example, if four *AtmConnection* components are associated with *AtmIf* components configured for ATM service classes ***UBR***, ***nrtVBR***, ***rtVBR***, and ***CBR***, then the *ipCos* attributes of the *AtmConnection* components should be either ***0***, ***1***, ***2*** and ***3***, respectively, or ***0***, ***1***, ***3*** and ***2*** respectively.

The value of this attribute is equal to value of the *schedulingClass4Queues* operational attribute of the *TrafficClass* component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

| | |
|---|---|
| Values | Decimal (0..3) |
| Default | No default |

## ATTRIBUTE Vr Dsd Tc schedulingClass4Queues (sc4q)

Access: Read and write

Description: This attribute specifies a logical scheduling class value in the range from ***0*** to ***3*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports four queues per connection. It may also be used to select one of up to four link layer connections at interfaces where per-packet selection of egress connections is supported.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

This attribute is set automatically to a default value according to a function of the *TrafficClass*component instance value when the *TrafficClass* component is created. The default values are listed below. If the *TrafficClass* component instance is ***standard***, then this attribute must be set to ***0***.

Default values for all domains, except *assuredForwarding (af)* :

| *TrafficClass* | *schedulingClass4Queues* |
|---|---|
| *critical* | ***2*** |
| *premium* | ***3*** |
| *network* | ***2*** |
| *platinum* | ***1*** |
| *gold* | ***1*** |
| *silver* | ***1*** |
| *bronze* | ***1*** |
| *standard* | ***0*** |

Default values for *assuredForwarding (af)* domain only:

| *TrafficClass* | *schedulingClass4Queues* |
|---|---|
| *--critical* | ***3*** |
| *premium* | ***3*** |
| *network* | ***3*** |
| *platinum* | ***3*** |

Description — This attribute indicates a logical scheduling class value in the range from ***0*** to ***7*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports eight queues per connection.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A

numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

The value of this attribute is equal to value of the *schedulingClass8Queues* provisioned attribute of the *TrafficClass* component.

Values: Decimal (0..7)

Default: No default

### ATTRIBUTE Vr Dsd Tc operSchedulingClass4Queues (operSc4q)

Access: Read only

Description: This attribute indicates a logical scheduling class value in the range from ***0*** to ***3*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports four queues per connection. It may also be used to select one of up to four link layer connections at interfaces where per-packet selection of egress connections is supported.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

The value of this attribute is equal to value of the *schedulingClass4Queues* provisioned attribute of the *TrafficClass* component.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Vr Dsd Tc operSchedulingClass3Queues (operSc3q)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a logical scheduling class value in the range from ***0*** to ***2*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports three queues per connection.<br><br>A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.<br><br>The value of this attribute is controlled by the *schedulingClass4Queues* provisioned attribute of the *TrafficClass* component. If the *schedulingClass4Queues* attribute value is ***3 or 2***, then the *operSchedulingClass3Queues* attribute value is ***2***; otherwise both values are equal. |
| Values | Decimal (0..2) |
| Default | No default |

### ATTRIBUTE Vr Dsd Tc operSchedulingClass2Queues (operSc2q)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a logical scheduling class value in the range from ***0*** to ***1*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports two queues per connection.<br><br>A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface |

where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

The value of this attribute is controlled by the *schedulingClass4Queues* provisioned attribute of the *TrafficClass* component. If the *schedulingClass4Queues* attribute value is ***3***, then the *operSchedulingClass2Queues* attribute value is ***1***; otherwise it is ***0***.

Values: Decimal (0..1)

Default: No default

## COMPONENT Vr MultiprotocolLabelSwitching (Mpls)

Groups:
"GROUP Vr Mpls Provisioned (Prov)"
"GROUP Vr Mpls Operational (Oper)"
"GROUP Vr Mpls OsiState (State)"
"GROUP Vr Mpls OperationalStatus (OperStatus)"

Scope: Application

Description:
*Vr/<s> MultiprotocolLabelSwitching*
*Rtr/<s> MultiprotocolLabelSwitching*
This component and its subcomponents define a Virtual Router or Router capable of supporting Multiprotocol Label Switching (MPLS). The switch is referred to as a Label Switching Router (LSR) and it supports the MPLS Label Distribution Protocol (LDP).

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Mpls Ldp (Ldp)"<br>"COMPONENT Vr Mpls Path"<br>"COMPONENT Vr Mpls LspGroup (LspG)"<br>"COMPONENT Vr Mpls TrafficEngineering (Te)" |
| Dyn. Subcomp. | "COMPONENT Vr Mpls XcMap"<br>"COMPONENT Vr Mpls RouteSelector (Rs)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Mpls Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains generic provisionable attributes for MPLS. |

### ATTRIBUTE Vr Mpls lsrIdProv

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address for the MPLS Label Switch Router (LSR) and is known as the LSR identifier. A value of 0 indicates that the switch router ID is to be used. This is defined by an IP routing protocol such as OSPF under the same *Vr* component. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Mpls lspGroupPolicy

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute defines the limitations of *LspGroups* going through this LSR.<br><br>A value of ***restrictive*** means that this LSR will only accept LSPs for those *LspGroup*s defined on this LSR;<br><br>A value of ***liberal*** means that this LSR will not accept LSPs for those *LspGroup*s that are administratively disabled but will accept all others. |
| Values | restrictive<br>liberal |
| Default | restrictive |

### ATTRIBUTE Vr Mpls mplsRoutePreference (mplsRtePref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the route preference of all MPLS LSPs. It is used by IP RTM to select the most preferred route from multiple available routes discovered by different protocols such as OSPF, RIP, BGP, and MPLS. More specifically, when an incoming IP packet has more than one best-destAddress-match routes (provided by different protocols) in the IP RTM, the route with higher preference (smaller route preference value) wins.. |
| Values | Decimal (1..63) |
| Default | 10 |

### GROUP Vr Mpls Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for MPLS. |

### ATTRIBUTE Vr Mpls lsrId

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address for this Label Switch Router (LSR). It is either the provisioned attribute *lsrIdProv* or the default IP address of 0.0.0.0. |

| | |
|---|---|
| Values | IP address |
| Default | No default |

### GROUP Vr Mpls OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Mpls adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Vr Mpls operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Vr Mpls usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Vr Mpls OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

## ATTRIBUTE Vr Mpls snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## COMPONENT Vr Mpls Ldp (Ldp)

| | |
|---|---|
| Groups | "GROUP Vr Mpls Ldp LdpPolicy (LdpPolicy)"<br>"GROUP Vr Mpls Ldp Loop (Loop)"<br>"GROUP Vr Mpls Ldp Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<s> Mpls Ldp*<br>*Rtr/<s> Mpls Ldp*<br>This component represents the Label Distribution Protocol (LDP). LDP is a signaling protocol used by Label Switched Routers (LSRs) to establish Label Switched Paths (LSPs) through a network by mapping network-layer routing information directly to data-link layer switched paths.<br><br>There is only one instance of *Ldp* component for each *Mpls* component. |

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Vr Mpls Ldp Binding (Bind)"<br>"COMPONENT Vr Mpls Ldp Peer"<br>"COMPONENT Vr Mpls Ldp Neighbor (Nbr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Mpls Ldp LdpPolicy (LdpPolicy)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes describes the characteristics of remote LSRs that are allowed to establish LDP Peers with this LSR. |

### ATTRIBUTE Vr Mpls Ldp keepAliveHoldTimer (kaTimer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval for keep alive hold timer in seconds for a session. |
| Values | Decimal (1..600) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Vr Mpls Ldp helloTimer (helloTimer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval for hello timer in seconds for a given LDP adjacency. |
| Values | Decimal (1..600) |
| Units | seconds |
| Default | 15 |

### ATTRIBUTE Vr Mpls Ldp failedInitThreshold

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies that the *failedInitSessionThresholdExceeded* notification is generated whenever the value is exceeded. |
| Values | Decimal (1..20) |
| Default | 10 |

### ATTRIBUTE Vr Mpls Ldp signaledPenultimateHopPop (php)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to indicate whether Penultimate Hop Pop is signaled out from this node.<br><br>When the attribute value is ***on***, this LSR will assign and distribute "Implicit Null Label (3)" for its own loopback address to all neighboring LSRs.<br><br>When the attribute value is ***off***, this LSR will distribute label values outside the reserved label values.<br><br>Default is ***on***. |
| Values | on<br>off |
| Default | on |

### GROUP Vr Mpls Ldp Loop (Loop)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains parameters that handle loop detection. |

### ATTRIBUTE Vr Mpls Ldp loopDetection (loopDet)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute enables a mechanism for finding looping LSPs. When the attribute value is ***on***, messages related to the set up of LSPs are checked to see if the path being setup has a loop. There |

| | |
|---|---|
| | is also a limit on the length of a path which is used when loop detection is ***on***. This length is specified in the *hopCountLimit* attribute. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp hopCountLimit (hcLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a limit on the number of hops allowed for each LSP. It is used when setting up LSPs to detect loops. When enabling detection of loops with the *loopDetection* attribute, this attribute should be specified. |
| Values | Decimal (2..40) |
| Default | 10 |

### GROUP Vr Mpls Ldp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the *Mpls Ldp* component. |

### ATTRIBUTE Vr Mpls Ldp establishedPeers (estPeers)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of LDP peers currently established between this LSR and other LSRs in the network. |
| Values | Decimal (0..500) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp establishedSessions (estSessions)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts number of sessions that have been established between LDP peers. This counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp attemptedSessions (as)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total attempted sessions between LDP peers. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Mpls Ldp Binding (Bind)

| | |
|---|---|
| Instance | fecString (fec) [String (9..19, ASCII)]<br>ldpIdString (ldpId) [String (9..21, ASCII)] |
| Groups | "GROUP Vr Mpls Ldp Bind InOperational (In)"<br>"GROUP Vr Mpls Ldp Bind OutOperational (Out)" |
| Scope | Application |
| Description | *Rtr/<s> Ldp Binding/<s>,<s>*<br>This component indicates an LSP through a unique Fec and remote Ldp identifier binding. The LSP in question is always referenced in terms of the relationship to the data path. The *Binding* component is recommended as a good way to view the Transport level LSPs.<br><br>The instance identifier of the *Binding* components is the Fec and the remote Ldp identifier, where the Fec is “IP Address[Fec Prefix Length]”, and the remote Ldp identifier is “IP Address-Label Space Identifier”. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Mpls Ldp Bind InOperational (In)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes bound to a unique Fec and Ldp identifier for the labels generated locally. |

## ATTRIBUTE Vr Mpls Ldp Bind inLabel

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the transport label bound to the unique pairing of Fec and remote Ldp identifier. This is the locally generated label. |
| Values | Decimal (0..1048575) |
| Default | No default |

## ATTRIBUTE Vr Mpls Ldp Bind inUsageState (inUsage)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the usage state of the *inLabel* attribute under the *Binding* component. The three possible states are: ***idle***, ***active***, and ***busy***.<br><br>***idle***: Indicates labels that are supplied but are not used to represent the LSP.<br><br>***active***: Indicates labels that are supplied and are selected for use to represent the LSP. Active labels can accept more users.<br><br>***busy***: Indicates labels that are supplied and are selected for use to represent the LSP. Busy labels cannot accept more users. |
| Values | idle<br>active<br>busy |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Bind inOperationalState (inOp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the operational state of the *inLabel* attribute under the *Binding* component. The two possible states are: ***enabled*** and ***disabled***.<br><br>***enabled***: Indicates labels that are installed in the hardware for data path use.<br><br>***disabled***: Indicates labels that are not installed in the hardware. |
| Values | disabled<br>enabled |
| Default | No default |

### GROUP Vr Mpls Ldp Bind OutOperational (Out)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes bound to a unique Fec and Ldp identifier for the labels supplied by the downstream neighbor. |

### ATTRIBUTE Vr Mpls Ldp Bind outLabel

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the transport label bound to the unique pairing of Fec and remote Ldp identifier. This label value is supplied by the downstream neighbor. |
| Values | Decimal (0..1048575) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Bind outUsageState (outUsage)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the usage state of the *outLabel* attribute under the *Binding* component. The three possible states are: ***idle***, |

***active***, and ***busy***.

***idle***: Indicates labels that are supplied but are not used to represent the LSP.

***active***: Indicates labels that are supplied and are selected for use to represent the LSP. Active labels can accept more users.

***busy***: Indicates labels that are supplied and are selected for use to represent the LSP. Busy labels cannot accept more users.

Values
idle
active
busy

Default
No default

## ATTRIBUTE Vr Mpls Ldp Bind outOperationalState (outOp)

Access
Read: All
Write: Illegal

Description
This attribute indicates the operational state of the *outLabel* attribute under the *Binding* component. The two possible states are: ***enabled*** and ***disabled***.

***enabled***: Indicates labels that are installed in the hardware for data path use.

***disabled***: Indicates labels that are not installed in the hardware.

Values
disabled
enabled

Default
No default

## COMPONENT Vr Mpls Ldp Peer

Instance
IP address

Groups
"GROUP Vr Mpls Ldp Peer Operational (Oper)"

Scope
Application

| | |
|---|---|
| Description | *Vr/<s> Mpls Ldp Peer/x*<br>This component represents an LDP peer instance on this LSR. |
| Dyn. Subcomp. | "COMPONENT Vr Mpls Ldp Peer Session (Session)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Mpls Ldp Peer Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes relevant to an LDP peer relationship. |

## ATTRIBUTE Vr Mpls Ldp Peer helloMode (hm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the LDP peer relationship is maintained over a direct link, or is more than one hop away.<br><br>A value of ***linkHello*** indicates that the peer is directly across an interface on this LSR. Discovery of that peer is initiated using an LDP Link Hello message.<br><br>A value of ***targetedHello*** indicates that the peer is not directly connected. Discovery of that peer is initiated using an LDP Targeted Hello message. |
| Values | linkHello<br>targetedHello |
| Default | No default |

## ATTRIBUTE Vr Mpls Ldp Peer establishedSession (es)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the sessions that have been established to the LDP peer. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..32767) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Peer attemptedSession (as)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the attempted sessions to the LDP peer. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..32767) |
| Default | No default |

### COMPONENT Vr Mpls Ldp Peer Session (Session)

| | |
|---|---|
| Instance | localIpAddress (ipAddr) [IP address]<br>localPort (port) [Decimal (0..65535)] |
| Groups | "GROUP Vr Mpls Ldp Peer Session Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<s> Mpls Ldp Peer/x Session/y*<br>This component represents an LDP session between two peers. Existence of a session indicates that at least one successful Hello adjacency has been established between the two MPLS peers. |
| Dyn. Subcomp. | "COMPONENT Vr Mpls Ldp Peer Session Adjacency (Adj)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Mpls Ldp Peer Session Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes related to a session between two LDP peers. |

### ATTRIBUTE Vr Mpls Ldp Peer Session state

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current state of the session. |

A value of ***nonExistent*** indicates that the LSR is waiting for an adjacency to exist between itself and a potential LDP peer.

A value o***f initialized*** indicates that a TCP connection has been established between the peers. The passive peer is waiting to receive an Initialization message and if received, goes to the ***openRec*** state. The active peer sends an Initialization message and then goes to the ***openSent*** state.

A value of ***openRec*** indicates that the peer is waiting to receive a KeepAlive message. If received, it goes to the ***operational*** state.

A value of ***openSent*** indicates that the LSR is waiting for an Initialization message from the peer in reply to the one it sent. If received, it goes to the ***openRec*** state.

A value of ***operational*** indicates that the peers have exchanged successful Initialization messages and are able to set up label switched paths between them.

| | |
|---|---|
| Values | nonExistent<br>initialized<br>openRec<br>openSent<br>operational |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Peer Session remoteLdpId (remId)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remote LDP identifier and represents a label space. It consists of an IP address assigned to the remote LSR, and a decimal number. Together, this uniquely identifies a label space on that LSR. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Peer Session transportAddress (transpAddr)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the IPv4 address to be used as the source IP address by this LSR when opening an LDP session to its peer over a TCP connection. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Peer Session ldpIfName

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the LDP interface component name associated with the media over which the LDP session occurs. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Peer Session protocolVersion (ver)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the version of the LDP protocol being used in this session. |
| Values | Decimal (0..5) |
| Default | No default |

### COMPONENT Vr Mpls Ldp Peer Session Adjacency (Adj)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Mpls Ldp Peer Session Adj Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<s> Mpls Ldp Peer/x Session/y Adj/z*<br>This component represents a Hello adjacency for an MPLS LDP session. There can be multiple adjacencies per session and as long as one adjacency exists, a session can be maintained. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Mpls Ldp Peer Session Adj Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes for a Hello adjacency between two LDP peers. |

### ATTRIBUTE Vr Mpls Ldp Peer Session Adj ldpIfName

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the LDP interface component name associated with the media over which the LDP adjacency occurs. |
| Values | The name of the component |
| Default | No default |

### COMPONENT Vr Mpls Ldp Neighbor (Nbr)

| | |
|---|---|
| Instance | String (9..21, ASCII) |
| Groups | "GROUP Vr Mpls Ldp Nbr NbrOp (Op)"<br>"GROUP Vr Mpls Ldp Nbr Statistics (Stats)" |
| Scope | Application |
| Description | *Rtr/s Ldp Neighbor/s*<br>This component represents a view of the remote neighbor for the *LDP* component under the *InwRouter* component. There is a 1:1 mapping between the *Neighbor* component and an LDP session.<br><br>The instance identifier of the *Neighbor* component is the remote Ldp identifier, where the remote Ldp identifier is “IP Address-Label Space Identifier”. |
| Dyn. Subcomp. | "COMPONENT Vr Mpls Ldp Nbr Adjacency (Adj)"<br>"COMPONENT Vr Mpls Ldp Nbr LabelIn"<br>"COMPONENT Vr Mpls Ldp Nbr LabelOut" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Mpls Ldp Nbr NbrOp (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Neighbor* component. |

## ATTRIBUTE Vr Mpls Ldp Nbr sessionId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the session identifier for the *Neighbor* component. The session identifier is formed by concatenating the local LDP identifier with the remote LDP identifier. |
| Values | String (22..46, ASCII) |
| Default | No default |

## ATTRIBUTE Vr Mpls Ldp Nbr sessionState

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the session represented by the *Neighbor* component. The session can be in any of the following five states:<br><br>***Non-existent - No Adjacencies***: Indicates that there are no adjacencies for this session.<br><br>***Non Existent - Throttling:*** Indicates that a session has at least one adjacency, but is currently throttling it is session setup with exponential back-off.<br><br>***Non Existent - Establishing TCP***: Indicates that the session is currently attempting to setup a TCP connection (either active or passive).<br><br>***Initialized***: Indicates the transmission of an initialization message in the active role, or the receiving of an acceptable initialization message in the passive role. In the passive role, receiving any other LDP message will cause a state change to ***Non Existent***. |

***Opensent***: Indicates that an acceptable initialization message was received and a KeepAlive message is sent in response. Receiving any other LDP message will cause the value of the *sessionState* attribute to change to ***Non-Existent.***

***Openrecv***: Indicates that an acceptable KeepAlive message has been received. Receiving any other LDP message will cause the value of the *sessionState* attribute to change to ***Non-Existent***.

***Operational***: Indicates that the session is operational and is receiving other LDP messages.

Values
nonExistent-NoAdjacencies
nonExistent-Throttling
nonExistent-EstablishingTCP
initialized
opensent
openrecv
operational

Default
No default

### ATTRIBUTE Vr Mpls Ldp Nbr ldpMode

Access
Read: All
Write: Illegal

Description
This attribute indicates the negotiated LDP Mode. The attribute can have a value of Downstream Unsolicited (***du***) or Downstream On Demand (***dod***).

Values
dod
du

Default
No default

### ATTRIBUTE Vr Mpls Ldp Nbr keepAliveHoldTime

Access
Read: All
Write: Illegal

Description
This attribute indicates the current hold time (in seconds) for the session.

| | |
|---|---|
| Values | Decimal (0..65535) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr nextKeepAlive

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the time (in seconds) left before the next keep alive message is sent to its remote neighbor. |
| Values | Decimal (0..65535) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr keepAliveInterval

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates (in seconds) the keep alive interval time. The interval represents how often a keep alive message is sent to its remote neighbor. |
| Values | Decimal (0..65535) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr tcpUpTime

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates when the TCP connection first became active. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr numberOfAdjacencies

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of adjacencies managed by the *Neighbor* component. |
| Values | Decimal (1..8) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr remoteTcpAddress

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the remote transport address coupled with the TCP port. If the neighbor fails to provide a value for the *remoteTcpAddress* attribute, then the source address from the Hello message is used in its place.<br><br>The port number will be zero until the TCP session is operational. |
| Values | String (9..21, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr localTcpAddress

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the local transport address coupled with the TCP port.<br><br>The port number will be zero until the TCP session is operational. |
| Values | String (9..21, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr localLdpId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the local Ldp identifier. |
| Values | String (9..21, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr lastFailureReason

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the last failure reason of the session.<br>The value of this attribute is only displayed in case of a failure event.<br>The ***rxNot*** failure reasons mean that the session received a critical teardown notification from the remote end. |
| Values | noError<br>internalError<br>userClear<br>userLock<br>userCriticalProvChange<br>localTcpSocketFailure<br>remoteTcpSocketClosure<br>tcpSocketConnectionTimeout<br>tcpSocketCreationFailed<br>unexpectedTcpSocket<br>txOverTcpFailed<br>lastAdjacencyDownHoldTimeExpired<br>lastAdjacencyDown<br>noAdjacency<br>bothSessionsActive<br>rxInitializationMsgInWrongState<br>rxKeepAliveMessageInWrongState<br>rxUnexpectedMessageInWrongState<br>rxPduWithInvalidLength<br>tlvLengthMismatchWithMsgSize<br>msgLengthMismatchWithPduSize<br>rejectPduWithBadProtocolVersion<br>rejectPduWithBadRemoteLdpId<br>rejectInitMsgWithBadLocalLdpId<br>rejectInitMsgMaxPduLength<br>sessionInitialisationTimeout |

Default: No default

### ATTRIBUTE Vr Mpls Ldp Nbr nextHopAddressReceived

Access: Read: All
Write: Illegal

Description: This attribute indicates a complete list of the next hop addresses received on the session.

List of: IP address

Default: No default

### GROUP Vr Mpls Ldp Nbr Statistics (Stats)

Properties: Operational

Description: This group contains the message statistics related to the neighbor component

### ATTRIBUTE Vr Mpls Ldp Nbr initializationMessages (init)

Access: Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute counts the number of Initialization messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr keepAliveMessages (keepAlive)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Keep Alive messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr notificationMessages (notif)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Notification messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr addressMessages (addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Address messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr addressWithdrawMessages (addrWith)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Address Withdraw messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr labelMappingMessages (labelMap)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Label Mapping messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr labelRequestMessages (labelReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Label Request messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr labelWithdrawMessages (labelWith)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Label Withdraw messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr labelReleaseMessages (labelRel)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Label Release messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr labelAbortMessages (labelAbort)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Label Abort messages sent and received. The value of the counter is a snapshot of the real time counter and can be off by up to 5 seconds. This counter wraps to zero when it exceeds the maximum value. |
| Vector of | Decimal (0..4294967295) |
| Index | sent<br>received (rcvd) |
| Default | No default |

### COMPONENT Vr Mpls Ldp Nbr Adjacency (Adj)

| | |
|---|---|
| Instance | localIfAddress (local) [IP address]<br>remoteIfAddress (remote) [IP address] |
| Groups | "GROUP Vr Mpls Ldp Nbr Adj Operational (Op)" |
| Scope | Application |
| Description | *Rtr/<s> Ldp Neighbor/<s> Adjacency/<s>,<s>*<br>This component represents a Hello Adjacency for an *InwRouter Ldp Neighbor* component. There can be multiple adjacencies per |

*Neighbor* component. The *Neighbor* component instance is maintained for as long as there is one adjacency.

### GROUP Vr Mpls Ldp Nbr Adj Operational (Op)

Properties: Operational

Description: This group contains the operational attributes for the *Adjacency* component.

### ATTRIBUTE Vr Mpls Ldp Nbr Adj ldpIfName

Access: Read: All
Write: Illegal

Description: This attribute indicates the interface that the adjacency is currently active on. It relates to the LDP interface component name which is associated with the media over which the LDP adjacency occurs.

Values: The name of the component

Default: No default

### ATTRIBUTE Vr Mpls Ldp Nbr Adj timeStamp (time)

Access: Read: All
Write: Illegal

Description: This attribute indicates when the adjacency was first created.

Values: Time (DHMS)

Default: No default

### COMPONENT Vr Mpls Ldp Nbr LabelIn

Instance: Decimal (0..1048575)

Groups: "GROUP Vr Mpls Ldp Nbr LabelIn Operational (Op)"

Scope: Application

| | |
|---|---|
| Description | *Rtr/<s> Ldp Neighbor/<s> LabelIn/<n>*<br>This component indicates the label received for a given *Neighbor* component. The “In” in the component name reflects the data path direction. In this case, it represents the label that is generated locally. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Mpls Ldp Nbr LabelIn Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *LabelIn* dynamic component. |

### ATTRIBUTE Vr Mpls Ldp Nbr LabelIn fec

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Fec associated to the *Label* component. |
| Values | String (9..19, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr LabelIn timeStamp

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates when the label was allocated by the session. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Vr Mpls Ldp Nbr LabelIn adjacencyList

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates a list of interfaces associated with the adjacency that the incoming label is configured on. It relates to the *LDP* interface component name associated with the media over which the LDP adjacency occurs.<br><br>This attribute includes the usage state and operational state information associated with the *Label* component, to highlight the interface that the label is currently active on.<br><br>The usage state information in the attribute indicates the usage state of the *Label* component. The three possible states are: ***idle***, ***active***, and ***busy***.<br><br>***idle***: Indicates labels that are supplied but are not used to represent the LSP.<br><br>***active***: Indicates labels that are supplied and are selected for use to represent the LSP. Active labels can accept more users.<br><br>***busy***: Indicates labels that are supplied and are selected for use to represent the LSP. Busy labels cannot accept more users.<br><br>The operational state information in the attribute indicates the operational state of the *Label*. The two possible states are: ***enabled*** and ***disabled***.<br><br>***enabled***: Indicates labels that are installed in the hardware for data path use.<br><br>***disabled***: Indicates labels that are not installed in the hardware. |
| List of | String (30..76, ASCII) |

| | |
|---|---|
| Groups | "GROUP Vr Mpls XcMap InSeg Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<vrName> Mpls XcMap/<ppName>,<label>,<direction> InSegment/<inPpName>,<inLabel>*<br>An *InSegment* component represents an LSP in-segment connection of the cross-connect switching entry.<br><br>The *InSegment* indexed instance identifier is composed of the instance identifiers of the corresponding *Vr/<vrName> Pp/ <inPpName> MplsPort InSegment/<inLabel>* component. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Mpls XcMap InSeg Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for the *InSegment* and *OutSegment* subcomponents of *XcMap* representing an LSP segment connection. |

## ATTRIBUTE Vr Mpls XcMap InSeg protocolType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the MPLS signalling protocol used to set up this connection.<br><br>A value of ***ldp*** indicates that LDP (Label Distribution Protocol) was used to set up the LSP.<br><br>A value of ***crLdp*** indicates that CR-LDP (Constraint-Based Routing using Label Distribution Protocol) was used to set up the LSP.<br><br>A value of ***rsvpTe*** indicates that RSVP-TE (Resource Reservation Protocol with Traffic Engineering) was used to set up the LSP. |

| | |
|---|---|
| Values | ldp<br>crLdp<br>rsvpTe |
| Default | No default |

### ATTRIBUTE Vr Mpls XcMap InSeg uniqueLspId

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the unique identifier for the LSP associated with this connection.<br><br>The availability and content of the LSP identifier varies with the signalling protocol.<br><br>When *protocolType* is ***crLdp***, this attribute contains the ingress LSR identifier and the LSP number.<br>Example: *uniqueLspId* = ***"47.35.1.150,159"***<br><br>When *protocolType* is ***rsvpTe***, this attribute contains the source and destination IP addresses, the tunnel identifier, and the LSP number.<br>Example: *uniqueLspId* = ***"47.35.1.150, 47.43.3.100, 5, 2"***<br><br>When *protocolType* is ***ldp***, there is no unique LSP identifier, so this attribute is not displayed. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Mpls XcMap InSeg lspName

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *Vr/<vrName> Mpls LspGroup/ <lspGroupName> Lsp/<lspName>* for the LSP associated with this connection if the node is the originating LSR for that LSP.<br><br>If the LSP is not originating on the node, this attribute is not displayed. |
| Values | The name of the component |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Mpls XcMap InSeg segmentName

| | |
|---|---|
| Access | Read only |
| Description | For *InSegment* components, this attribute indicates the *Vr/<vrName> Pp/<ppName> MplsPort InSegment/<label>* component representing the LSP in-segment connection.<br><br>For *OutSegment* components, this attribute indicates the *Vr/<vrName> Pp/<ppName> MplsPort OutSegment/<label>* component representing the LSP out-segment connection. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Mpls XcMap InSeg mediaConnection

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the media connection associated with this component.<br>Example: ***AtmIf/33 Vcc/0.400*** |
| Values | The name of the component |
| Default | No default |

### COMPONENT Vr Mpls XcMap OutSegment (OutSeg)

| | |
|---|---|
| Instance | ppName (pp) [String (1..20, ASCII)]<br>label (lbl) [String (1..10, ASCII)] |
| Groups | "GROUP Vr Mpls XcMap OutSeg Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<s> Mpls XcMap/<ppName>,<label>,<direction> OutSegment/<outPpName>,<outLabel>*<br>An *OutSegment* component represents the LSP out-segment connection of the cross-connect switching entry.<br><br>The *OutSegment* indexed instance identifier is composed of the |

instance identifiers of the corresponding *Vr/<vrName> Pp/<outPpName> MplsPort OutSeg/<outLabel>* component.

## GROUP Vr Mpls XcMap OutSeg Operational (Oper)

Properties: Operational

Description: This group contains operational attributes for the *InSegment* and *OutSegment* subcomponents of *XcMap* representing an LSP segment connection.

## ATTRIBUTE Vr Mpls XcMap OutSeg protocolType

Access: Read only

Description: This attribute indicates the MPLS signalling protocol used to set up this connection.

A value of ***ldp*** indicates that LDP (Label Distribution Protocol) was used to set up the LSP.

A value of ***crLdp*** indicates that CR-LDP (Constraint-Based Routing using Label Distribution Protocol) was used to set up the LSP.

A value of ***rsvpTe*** indicates that RSVP-TE (Resource Reservation Protocol with Traffic Engineering) was used to set up the LSP.

Values:
ldp
crLdp
rsvpTe

Default: No default

## ATTRIBUTE Vr Mpls XcMap OutSeg uniqueLspId

Access: Read only

Description: This attribute indicates the unique identifier for the LSP associated with this connection.

The availability and content of the LSP identifier varies with the signalling protocol.

When *protocolType* is ***crLdp***, this attribute contains the ingress LSR identifier and the LSP number.
Example: *uniqueLspId* = ***"47.35.1.150,159"***

When *protocolType* is ***rsvpTe***, this attribute contains the source and destination IP addresses, the tunnel identifier, and the LSP number.
Example: *uniqueLspId* = ***"47.35.1.150, 47.43.3.100, 5, 2"***

When *protocolType* is ***ldp***, there is no unique LSP identifier, so this attribute is not displayed.

Values: String (0..255, ASCII)

Default: No default

### ATTRIBUTE Vr Mpls XcMap OutSeg lspName

Access: Read only

Description: This attribute indicates the *Vr/<vrName> Mpls LspGroup/<lspGroupName> Lsp/<lspName>* for the LSP associated with this connection if the node is the originating LSR for that LSP.

If the LSP is not originating on the node, this attribute is not displayed.

Values: The name of the component

Default: No default

### ATTRIBUTE Vr Mpls XcMap OutSeg segmentName

Access: Read only

Description: For *InSegment* components, this attribute indicates the *Vr/<vrName> Pp/<ppName> MplsPort InSegment/<label>* component representing the LSP in-segment connection.

For *OutSegment* components, this attribute indicates the *Vr/*

| | |
|---|---|
| | *<vrName> Pp/<ppName> MplsPort OutSegment/<label>* component representing the LSP out-segment connection. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Mpls XcMap OutSeg mediaConnection

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the media connection associated with this component.<br>Example: ***AtmIf/33 Vcc/0.400*** |
| Values | The name of the component |
| Default | No default |

### COMPONENT Vr Mpls Path

| | |
|---|---|
| Instance | Decimal (1..10000) |
| Scope | Application |
| Description | *Vr/<s> Mpls Path/n*<br>This component represents a list of hops that specifies a route to be taken by the Label Switched Path. Multiple *TrafficEngineering* components can use the same path specified by this component.<br><br>A *Path* component must have at least one *Hop* subcomponent provisioned.<br><br>The maximum total number of *Path* components allowed per *Mpls* component is 3081. |
| Opt. Subcomp. | "COMPONENT Vr Mpls Path Hop" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## COMPONENT Vr Mpls Path Hop

| | |
|---|---|
| Instance | Decimal (1..50) |
| Groups | "GROUP Vr Mpls Path Hop Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<s> Mpls Path/m Hop/n*<br>This component represents an IP address that a traffic engineered path must go through. This component is used to define a specific *Hop* in a *Path*. The order of these components within a *Path* component instance is the order which is used to set up the path.<br><br>The *Ipv4address* attribute of a *Hop* component must be a valid class A, B or C non-reserved address.<br><br>The maximum total number of *Hop* components allowed per *Mpls* is 61620. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Mpls Path Hop Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for MPLS Path *Hop* component. The *Hop* component can be provisioned as ***strict*** or ***loose***. A *Hop* can be an Ipv4 address. |

## ATTRIBUTE Vr Mpls Path Hop ipv4Address (ipv4)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Ipv4 address of this *Hop* component. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Mpls Path Hop ipv4PrefixLen

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies prefix length of Ipv4 address for this *Hop* component. If the length is 32, then the Ipv4 address is treated as a host address, otherwise it is treated as a network prefix. |
| Values | Decimal (8..32) |
| Default | No default |

### ATTRIBUTE Vr Mpls Path Hop hopMode (mode)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if the *Hop* component is treated as ***strict*** or ***loose***. The value ***strict*** means that The value ***strict*** means that the address specified in the *Ipv4Address* attribute of this *Hop* component must be adjacent to the node on which Ipv4Address of the previous *Hop* component resides. For a single ***strict*** hop, the originating node must be adjacent to the Ipv4 address specified in the *Ipv4Address* attribute of the *Hop* component. The value ***loose*** means that *Ipv4Address* attribute of this hop is not necessarily adjacent to the previous hop. The LSR should determine a next hop which is in the same ***direction*** as the specified hop. |
| Values | strict<br>loose |
| Default | strict |

### COMPONENT Vr Mpls LspGroup (LspG)

| | |
|---|---|
| Instance | String (1..18, ASCII) |
| Groups | "GROUP Vr Mpls LspG Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<s> Mpls LspGroup/<s>*<br>An *LspGroup* component represents a group of Label Switched Paths that have a common data flow end point addresses. The multiple Label Switched Paths within an *LspGroup* allow different paths to the destination based on Quality of Service or |

back-up recovery requirements.

The *LspGroup* component instance value is a string that must translate to a numerical value between 1 and 65,535. An *LspGroup* component must have either a *ForwardingEquivalenceClass* or a *AtmSap* subcomponent provisioned.

An *LspGroup* component can be provisioned to supply up to 8 unique MPLS service categories numbered 0 through 7. An MPLS service category is specified by:
-provisioning the *Lspg/<s> Lsp/n Msc serviceCategory* attribute to be a value between ***0*** and ***7.***
-provisioning one or more *PcElspSc/n* subcomponents of the *Lspg/<s> Lsp/n Msc* component. The instance value of the *PcElspSc* component represents one MPLS service category.

No MPLS service category may be repeated under an *LspGroup* component.

Opt. Subcomp. "COMPONENT Vr Mpls LspG AtmServiceAccessPoint (AtmSap)"
"COMPONENT Vr Mpls LspG LspGroupDescriptor (Lgd)"

Opt. Subcomp. "COMPONENT Vr Mpls LspG LabelSwitchedPath (Lsp)"

## GROUP Vr Mpls LspG Operational (Oper)

Properties Operational

Description This group contains operational attributes for an MPLS *LspGroup*.

## ATTRIBUTE Vr Mpls LspG numActiveLsps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of LSPs that are currently used to carry traffic for the LSP group. These LSPs have the *Lsp* component *usageState* attribute value of ***busy***. |
| Values | Decimal (0..65535) |
| Default | No default |

## COMPONENT Vr Mpls LspG AtmServiceAccessPoint (AtmSap)

| | |
|---|---|
| Groups | "GROUP Vr Mpls LspG AtmSap Provisioned (Prov)"<br>"GROUP Vr Mpls LspG AtmSap AAL5Provisioned (AAL5Prov)"<br>"GROUP Vr Mpls LspG AtmSap Operational (Oper)"<br>"GROUP Vr Mpls LspG AtmSap EgressCellBundlingProvisioned (ECBProv)" |
| Scope | Application |
| Description | *Vr/<s> Mpls LspG/<s> AtmServiceAccessPoint*<br>The *AtmServiceAccessPoint* component represents an ATM service access point within the *LspGroup*. It is used to bind one ATM interface (*AtmIf*) to one or more MPLS LSPs. |
| Description | "COMPONENT Vr Mpls LspG AtmSap ConnectionIdentifier (ConnId)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Mpls LspG AtmSap Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes provides the provisioned attributes of the *AtmSap* component. |

### ATTRIBUTE Vr Mpls LspG AtmSap applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ATM application using the *AtmSap*. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### ATTRIBUTE Vr Mpls LspG AtmSap atmServiceCategoryToMsc (ascToMsc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ATM service category to MSC mappings. All ATM service categories must be mapped to the same<br>MSC value. Changing the value of this attribute will disrupt service for the linked ATM application. |
| Vector of | Decimal (0..7) |
| Index | constantBitRate (cbr)<br>rtVariableBitRate (rtVbr)<br>nrtVariableBitRate (nrtVbr)<br>unspecifiedBitRate (ubr) |
| Default | (0, 0, 0, 0) |

### GROUP Vr Mpls LspG AtmSap AAL5Provisioned (AAL5Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute *egressAAL5Detection*. |

### ATTRIBUTE Vr Mpls LspG AtmSap aal5EgressReassembly (aal5EgRe)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the egress AAL5 dection mode of the MPLS datapath for all connections owned by the *AtmSap* |

component. If the value is ***none***, then AAL5 auto-dection is not performed on the connection and no reassembly is done. If the value is ***autoDetect***, the AAL5 data streams are automatically detected and reassembled into frames.

Values: none (n)
autoDetect (a)

Default: none

### GROUP Vr Mpls LspG AtmSap Operational (Oper)

Properties: Operational

Description: This group of attributes provides the operational attributes of the *AtmSap* component.

### ATTRIBUTE Vr Mpls LspG AtmSap serviceConnections (conn)

Access: Read only

Description: This attribute counts the service connections that are currently activated by the *AtmSap* component. An activated service connection is one where the ATM datapath for a VC or VP has been configured to use the receive and transmit service labels.

Values: Decimal (0..4294967295)

Default: No default

### GROUP Vr Mpls LspG AtmSap EgressCellBundlingProvisioned (ECBProv)

Properties: Provisioned

Description: This group contains the provisionable attribute *egressCellBundling*.

### ATTRIBUTE Vr Mpls LspG AtmSap egressCellBundling (egCellBund)

Access: Read: All
Write: All

Description: This attribute specifies the default egress cell bundling mode of the MPLS datapath for all connections owned by the *AtmSap* component. If the value is ***enabled***, the default is to perform bundling on the associated connections. If the value is ***disabled***,

the default is to not perform bundling on the associated connections.

The default egress cell bundling mode can be overridden, per connection, using the *egressCellBundling* attribute of the *ConnId/<x> Labels* component.

If the *aal5EgressReassembly* attribute for this SAP is set to ***autoDetect*** and *egressCellBundling* is ***enabled***, AAL5 reassembly will be performed on connections carrying AAL5 frames, otherwise cell bundling will be performed.

| | |
|---|---|
| Values | disabled (d)<br>enabled (e) |
| Default | disabled |

## COMPONENT Vr Mpls LspG AtmSap ConnectionIdentifier (ConnId)

| | |
|---|---|
| Instance | Integer Sequence |
| Groups | "GROUP Vr Mpls LspG AtmSap ConnId Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<s> Mpls LspG/<s> AtmSap ConnectionIdentifier/vpi.vci*<br>*Vr/<s> Mpls LspG/<s> AtmSap ConnectionIdentifier/vpi*<br>A *ConnectionIdentifier* component identifies the labels used for a specific connection. For a VC connection, the *ConnectionIdentifier* component instance value indicates the VPI and VCI (in the form “VPI.VCI”). The *ConnectionIdentifier* component instance value must not specify a VCI value of 0 or 1. For a VP connection, the *ConnectionIdentifier* component instance value indicates the VPI (in the form “*ConnId*/VPI”). There must be a *ConnectionIdentifier* component for each corresponding *VirtualChannelConnection* and *VirtualPathConnection* component. The *ConnectionIdentifier* component requires an instance of the *Labels* subcomponent. |

### GROUP Vr Mpls LspG Lsp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Mpls LspG Lsp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is |

administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Mpls LspG Lsp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Mpls LspG Lsp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP Vr Mpls LspG Lsp Operational (Oper)

Properties
Operational

Description
This group contains the attributes of an MPLS label switched path.

## ATTRIBUTE Vr Mpls LspG Lsp operStatus

Access
Read only

Description
This attribute indicates the state of an LSP. In the description that follows, “upstream” refers to a peer LSR from which an LDP Request message is received and from which traffic is received. “Downstream” refers to a peer LSR to which traffic will be sent from this LSR.

The values of this attribute are states in the Label Distribution Protocol.

In the ***idle*** state, the LSR has not set up the LSP.

In the ***responseAwaited*** state, the LSR has received and processed an LDP Request message from an upstream LSR or it has received an internal setup request. It has sent a new LDP Request message towards a downstream LSR. The LSR is waiting for the LDP Mapping message from the downstream LSR.

In the ***established*** state, the LSR has received the LDP Mapping message from the downstream LSR and the LSP is up and operational.

In the ***releaseAwaited*** state, the LSR has sent an LDP Withdraw message upstream and is waiting for the LDP Release message before freeing up the label resource.

Values
idle
responseAwaited
established
releaseAwaited

Default
No default

### ATTRIBUTE Vr Mpls LspG Lsp direction (dir)

Access
Read only

Description
This attribute indicates the direction of an LSP. If the attribute value is ***uniDirectionalIn***, then the LSP is terminating to this LSR. If the attribute value is ***uniDirectionalOut***, then the LSP is originating from this LSR toward its endpoint and traffic only flows in that direction.If it is ***biDirectional***, the LSP is both originating and terminating traffic on this LSR.

Values
unidirectionalIn
unidirectionalOut
bidirectional

Default
No default

### ATTRIBUTE Vr Mpls LspG Lsp crossConnectMapName (xcMap)

Access
Read only

Description
This attribute indicates the cross connect map component for this LSP. For LSPs originating from this LSR, the map indicates the outgoing interface and for LSPs terminating on this LSR, the map indicates the incoming interface. LSPs that tandem through this LSR have an incoming and outgoing interface.

Values
The name of the component

Default
No default

### ATTRIBUTE Vr Mpls LspG Lsp retryCount (rCount)

Access
Read only

| | |
|---|---|
| Description | This attribute counts the attempts to set up an originating LSP. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Mpls LspG Lsp pathFailureCount (pfCount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the times an LSP fails to establish. This counter wraps around to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Mpls LspG Lsp lastTearDownReason (tearDown)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates why an originating LSP was torn down. |
| Values | notApplicable<br>badLDPIdentifier<br>badProtocolVersion<br>badPDULength<br>unknownMessageType<br>badMessageLength<br>unknownTLV<br>badTLVLength<br>malFormedTLVValue<br>holdTimerExpired<br>shutdown<br>loopDetected<br>unknownFEC<br>noRoute<br>noLabelResources<br>labelRourcesAvailable<br>sessRejNoHello<br>sessRejParaAdvertMode<br>sessRejParaMaxPDULength |

rsvpRcvIncorrectBandwidth

Default: No default

### ATTRIBUTE Vr Mpls LspG Lsp pathUpDateTime (uTime)

Access: Read only

Description: This attribute indicates the time when the current LSP was established.

Values: Time (DHMS)

Default: No default

### ATTRIBUTE Vr Mpls LspG Lsp alarmControlOper (alarmControlOper)

Access: Read only

Description

This attribute indicates the severity of alarms generated or failure of the LSP. If the value is ***none***, no alarms are generated. If the value is ***major*** or ***critical***, the LSP alarms are generated with the specified severity. The value reflects the provisionable *alarmControl* attribute under the *Te* component.

Values

none
critical (crit)
major (maj)

Default

none

## ATTRIBUTE Vr Mpls LspG Lsp lspProtocolType (protocol)

Access

Read only

Description

This attribute indicates the method used to set up the given LSP: static, LDP protocol, CR-LDP protocol, RSVP-TE protocol.

A value of ***ldp*** indicates that LDP (Label Distribution Protocol) was used to set up the LSP.

A value of ***crLdp*** indicates that CR-LDP (Constraint-Based Routing using Label Distribution Protocol) was used to set up the LSP.

A value of ***rsvpTe*** indicates that RSVP-TE (Resource Reservation Protocol with Traffic Engineering) was used to set up the LSP.

A value of ***static*** indicates that static provisioning was used to set up the LSP.

Values

ldp
crLdp
rsvpTe
static

Default

No default

## ATTRIBUTE Vr Mpls LspG Lsp maxTransmissionUnit (mtu)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the actual maximum packet size parameter (MTU) supported on this particular LSP Tunnel. This is the smallest common denominator MTU of all mpls capable interfaces involved in this LSP Tunnel establishment. The value of this attribute is expressed in octet units. |
| Values | Decimal (1..4294967295) |
| Units | octets |
| Default | No default |

## COMPONENT Vr Mpls LspG Lsp TrafficEngineering (Te)

| | |
|---|---|
| Groups | "GROUP Vr Mpls LspG Lsp Te Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<s> Mpls LspG/<s> Lsp/n TrafficEngineering*<br>This component is used to represent the Traffic Engineering information for this *Lsp*.<br><br>The *Pathname* attribute of the *TrafficEngineering* component must be provisioned to point to an existing MPLS *Path* component.<br><br>When the *PathOnDemand* attribute is set to ***enabled***, the LSP must be a primary CR-LDP LSP with no LSP instances provisioned under the *Msc standbyLsp* attribute.<br><br>If the *Lsp* component has an *LdpQos* component provisioned, the *Pathname* attribute value is ignored. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Mpls LspG Lsp Te Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains parameters for the creation of an LSP between this LSR and a remote endpoint. |

### ATTRIBUTE Vr Mpls LspG Lsp Te pathName

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the path *Vr/<s> Mpls Path/n* to be used by this LSP. The *pathName* attribute must point to a valid *Path* component. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Mpls LspG Lsp Te pathOnDemand (pod)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether to set up this LSP as soon as its provisioning is activated or to wait until an LDP request is received which triggers the establishment of the LSP. For LDP to CR-LDP interworking this involves the triggering of a CR-LDP LSP to continue an LDP segment.<br><br>A value of ***enabled*** means that the LSP is ready to be set up when the Ipv4Address in the fec tlv of a received LDP request message matches the address represented by the *StIpv4Address* component.<br><br>A value of disabled means that the LSP set up is attempted as soon as the provisioning is activated. |
| Values | disabled<br>enabled |
| Default | disabled |

### ATTRIBUTE Vr Mpls LspG Lsp Te alarmControl (alarmControl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the control of the generation of LSP alarms. If the value is ***none***, no alarms are generated. If the value |

is ***major*** or ***critical***, the LSP alarms are generated with the specified severity. The value is reflected in the operational *alarmControlOper* attribute under the *Vr/<s> Mpls LspG/<s> Lsp/n* component.

Values
none
critical (crit)
major (maj)

Default
none

## COMPONENT Vr Mpls LspG Lsp CrLdpQos (CrQos)

Groups
"GROUP Vr Mpls LspG Lsp CrQos Bandwidth (Bw)"
"GROUP Vr Mpls LspG Lsp CrQos Scheduling (Sched)"

Scope
Application

Description
*Vr/<s> Mpls LspG/<s> Lsp/n CrLdpQos*
This component represents the MPLS Quality of Service (QoS) for a Label Switched Path (LSP) using the CR-LDP signaling protocol.

The *CrLdpQos* component, the *LdpQos* component and the *RsvpQos* component are mutually exclusive: only one of the *LdpQos*, *CrLdpQos* or the *RsvpQos* component may be created under the *Vr/<s>Mpls LspG/<s> Lsp/n* component.

The *peakDataRate* and *peakBurstSize* attributes must each be greater than or equal to their corresponding *committedDataRate* and *committedBurstSize* attributes.

When the *frequency* attribute is set to ***veryFrequent***, the *peakDataRate* must equal the *committedDataRate* and the *peakBurstSize* must equal the *committedBurstSize*.

### GROUP Vr Mpls LspG Lsp CrQos Bandwidth (Bw)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioned attributes for MPLS CR-LDP Quality of Service (QOS) bandwidth parameters. |

### ATTRIBUTE Vr Mpls LspG Lsp CrQos peakDataRate (pdr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum rate at which traffic should be sent to the path. |
| Values | Decimal (0..4294967295) |
| Units | octet/s |
| Default | 0 |

### ATTRIBUTE Vr Mpls LspG Lsp CrQos peakBurstSize (pbs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum burst size. |
| Values | Decimal (0..4294967295) |
| Units | bytes |
| Default | 0 |

### ATTRIBUTE Vr Mpls LspG Lsp CrQos committedDataRate (cdr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed data rate. |
| Values | Decimal (0..4294967295) |
| Units | octet/s |
| Default | 0 |

### ATTRIBUTE Vr Mpls LspG Lsp CrQos committedBurstSize (cbs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed burst size. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Units | bytes |
| Default | 0 |

### GROUP Vr Mpls LspG Lsp CrQos Scheduling (Sched)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioned attributes for MPLS CR-LDP Quality of Service (QoS) scheduling parameters. |

### ATTRIBUTE Vr Mpls LspG Lsp CrQos frequency (freq)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies at what granularity the Committed Data Rate (CDR) allocation will be made available to a path. A value of ***veryFrequent*** means that available rate should average at least the CDR when measured over any time interval equal to or longer than the shortest packet time at the CDR. The value ***frequent*** means that the available rate should average at least the CDR when measured over any time interval equal to or longer than a small number of shortest packet times at the CDR. The value ***unspecified*** means that the CDR may be provided at any granularity. |
| Values | unspecified<br>frequent<br>veryFrequent |
| Default | unspecified |

### COMPONENT Vr Mpls LspG Lsp MplsServiceCategory (Msc)

| | |
|---|---|
| Groups | "GROUP Vr Mpls LspG Lsp Msc Provisioned (Prov)"<br>"GROUP Vr Mpls LspG Lsp Msc Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<s> Mpls LspG/<s> Lsp/n MplsServiceCategory*<br>The *MplsServiceCategory* subcomponent determines the emission priority that this LSP uses.<br><br>Only an LSP that has been provisioned to be a primary LSP by |

setting its *serviceCategory* attribute value to be a unique non-standby number between ***0*** and ***7*** may have a list of standby LSPs.

Each standby LSP instance value must be specified in exactly one *standbyLsp* attribute and only standby LSPs instance value may be specified in *standbyLsp* attribute. Any LSP appearing on a *standbyLsp* must be already provisioned.

Properties Provisioned

Description This group contains parameters for the LSP MPLS Service Category.

## ATTRIBUTE Vr Mpls LspG Lsp Msc serviceCategory (sC)

Access Read and write

Description This attribute specifies the MPLS Service Category of an LSP.

A value of ***pcElspSc***, or ***0*** to ***7***, or ***diffServDomainElsp*** indicates a primary LSP. A primary LSP that has a *serviceCategory* value from ***0*** to ***7*** can have up to seven standby LSPs.

A value of ***pcElspSc*** indicates this LSP can have multiple service category values as identified by the instance values of *PreconfigElspSc* subcomponents.

A value of ***diffServDomainElsp*** indicates this LSP can support multiple QoS as configured by the default *mplsServiceMap* instance under *differentiatedServiceDomain* subcomponent.

A value of ***standby*** indicates this LSP is acting as a standby LSP for a primary LSP.

Values: Decimal (0..7)
diffServDomainElsp
pcElspSc
standby

Default: standby

### ATTRIBUTE Vr Mpls LspG Lsp Msc standbyLsp (sLsp)

Access: Read and write

Description: This attribute specifies the ordered list of the *Lsp* component instance(s) assigned as standby to this primary LSP (with *serviceCategory* attribute value of ***0*** to ***7***). The first *Lsp* component instance in the list becomes operational if the primary LSP fails, the second *Lsp* component instance in the list becomes operational if the primary and first standby fails, and so on.

The *standbyLsp* of an *Lsp* component with *serviceCategory* attribute value of value of ***standBy,*** must not be set.

List of: Decimal (0..65535)

List Size: 7

Default: No default

### GROUP Vr Mpls LspG Lsp Msc Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *Msc*.

### ATTRIBUTE Vr Mpls LspG Lsp Msc activeLsp (aLsp)

Access: Read only

Description: This attribute indicates the active Lsp component instance value of a corresponding non standby MPLS service category. For an active primary and standby LSP, this attribute displays its own LSP instance. For an inactive LSP, this attribute displays its active LSP instance.

Values: Link (Service, inStaticPoint)

Default: No default

## COMPONENT Vr Mpls LspG Lsp RsvpQos (RsvpQ)

Scope: Application

Description: *Vr/<s> Mpls LspG/<s> Lsp/n RsvpQos*
This component represents the MPLS Quality of Service (QoS) for a Label Switched Path (LSP) using the RSVP-TE signaling protocol.

The *LdpQos*, *CrLdpQos* and *RsvpQos* components are mutually exclusive. Only one of the *LdpQos*, *CrLdpQos* or the *RsvpQos* component may be created under the *Vr/<s> Mpls LspG/<s>*

*Lsp/n* component.

## ATTRIBUTE Vr Mpls LspG Lsp RsvpQ Cls Def rsvpSenderTSpecRate (rate)

Access: Read and write

Criticality: Component

Description: This attribute specifies the average (sustained) rate of traffic. This is referred to in specifications (RFC 2215) as the average or token rate portion of the token bucket specification. It is set to reflect the sender's view of its generated traffic.

Values: Decimal (0..4294967295)

Units: kbit/s

Default: 0

## ATTRIBUTE Vr Mpls LspG Lsp RsvpQ Cls Def rsvpSenderTSpecPeakRate (pkRate)

Access: Read and write

Criticality: Component

Description: This attribute specifies the maximum rate at which traffic should be sent to the path. This is referred to in specifications (RFC 2210) as the peak rate portion of the RSVP Sender TSpec object.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Units | kbit/s |
| Default | 0 |

### ATTRIBUTE Vr Mpls LspG Lsp RsvpQ Cls Def rsvpSenderTSpecBurst (burst)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the length of traffic burst. This is referred to in specifications (RFC 2215) as the bucket depth portion of the token bucket specification (token bucket size). This attribute is set to reflect the sender's view of its traffic. |
| Values | Decimal (0..4294967295) |
| Units | octets |
| Default | 100000 |

### ATTRIBUTE Vr Mpls LspG Lsp RsvpQ Cls Def rsvpSenderTSpecMinTU (minTU)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the minimum policed unit parameter and should generally be set equal to the size of the smallest packet generated by the application. This is referred to in specifications (RFC 2210) as the minimum policed unit portion of the RSVP Sender TSpec object. This packet size includes the application data and all protocol headers at or above the IP level (IP, TCP, UDP, RTP, etc.). The size given does not include any link-level headers, because these headers will change as the packet crosses different portions of the internetwork.<br><br>Note that an *rsvpSenderTSpecMinTU* value of ***0*** is illegal. A value of ***0*** would indicate that no data or IP headers are present, and would give an infinite amount of link-level overhead. |
| Values | Decimal (1..4294967295) |
| Units | octets |

| | |
|---|---|
| Default | 40 |

### ATTRIBUTE Vr Mpls LspG Lsp RsvpQ Cls Def rsvpSenderTSpecMaxTU (maxTU)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum packet size parameter and should be set to the size of the largest packet the application might wish to generate. This is referred to in specifications (RFC 2210) as the maximum policed unit portion of the RSVP Sender TSpec object. This value must, by definition, be equal to or larger than the value of *rsvpSenderTSpecMinTU*. |
| Values | Decimal (1..4294967295) |
| Units | octets |
| Default | 64000 |

### COMPONENT Vr Mpls LspG Fec CosMscMapping (MscMap)

| | |
|---|---|
| Groups | "GROUP Vr Mpls LspG Fec MscMap MscMapProv (Prov)" |
| Scope | Application |

Description *Vr/<s> Mpls LspGroup/<s> Fec CosMscMapping*

This component specifies how to translate IP Quality Of Service into MPLS Quality Of Service when IP traffic is carried over MPLS.

IP QoS is represented by an IP COS value that is derived from an IP packet. MPLS QoS is implemented using MPLS MSC (MPLS Service Category) values that are related to different queueing, emission, discarding treatment on MPLS switches/routers.

The mapping data provisioned under this component determines how IP COS values are mapped into MPLS MSC values. Each IP COS must be mapped to a unique MPLS MSC value.

Description This group contains provisionable attribute(s) for the *CosMscMapping* component.

## ATTRIBUTE Vr Mpls LspG Fec MscMap cosToMsc

Access Read and write

Description This attribute specifies the MPLS MSC (MPLS Service Category) values that IP COS 0 to 3 map to.

Vector of Decimal (0..7)

Index Decimal (0; 1; 2; 3)

Default (0, 1, 2, 3)

## COMPONENT Vr Mpls LspG Fec Ipv4ReachableAddr (Ipv4RA)

Instance
ipv4Element (ipv4Elem) [IP address]
ipv4Prefix (ipv4Pref) [Decimal (1..32)]

Scope
Application

Description
*Vr/<s> Mpls LspG/<s> Fec Ipv4ReachableAddr/<IP address>, <IP address length>*

The *Ipv4ReachableAddr* component represents a destination (an IPv4 address) reachable beyond the *Ipv4EndPointAddr* for LSPs in this *LspGroup*. It may be provisioned or signalled. There may be multiple instances of the *Ipv4ReachableAddr* component per LSP group.

1) The *<IP address>* index indicates the destination address. It is a host address if the second index *<IP address length>* has the value 32; otherwise it is a network address.

2) The *<IP address length>* index represents the length of the IP address given in the first index *<IP address>*.

Instance
ipv4Element (ipv4Elem) [IP address]
ipv4Prefix (ipv4Pref) [Decimal (1..32)]

Groups
"GROUP Vr Mpls LspG Fec Ipv4Epa Ipv4Prov (Prov)"

Scope
Application

Description
*Vr/<s> Mpls LspGroup/<s> Fec Ipv4EndPointAddr/<IP address>, <IP address length>*
The *Ipv4Epa* component specifies a common endpoint for the data

flow of all LSPs in this *LspGroup* component. In case of LDP and RSVP-TE, the data flow endpoint is the same as the destination address of the LSP but that may or may not be the case for CRLDP. Only one of these is allowed per LSP group, and the actual address must be a valid, non-reserved Class A, B, or C address that is unique among the LSP groups on the node.

1) The *<IP address>* index indicates the destination address. It is a host address if the second index *<IP address length>* has the value 32; otherwise, the address is a network address.

2) The *<IP address length>* index represents the length of the IP address given in the first index *<IP address>*.

## GROUP Vr Mpls LspG Fec Ipv4Epa Ipv4Prov (Prov)

Properties: Provisioned

Description: This group contains provisionable attribute(s) for the *Ipv4EndPointAddr* component.

## ATTRIBUTE Vr Mpls LspG Fec Ipv4Epa bestMatchOverride

Access: Read and write

Description: This attribute specifies if an MPLS LSP in *LspGroup* component should subsume more specific routes to carry IP traffic.

What IP normally does when making next-hop route decision for incoming IP packets is to find the longest match on destination address in the routing table and use such a route. If multiple routes (from different protocols) are found to have same best destination address match, other criteria (such as route preference, metric) are used for further selection.

The best-match on destination address is the most important factor in traditional IP route selection. On Passport, the

"*bestMatchOverride*" attribute allows network operators to override this IP tradition by enabling MPLS forced subsume functionality. In many situations, using subsume can help to achieve better traffic engineering goals.

Setting this attribute to ***enabled*** instructs IP to select this MPLS LSP or LSP group to forward IP packets that matches the FEC of the LSP or LSP group, even though other routes have a better/ longer destination address match for these IP packets.

The value ***disabled*** is used when traditional IP route selection behavior (longest address match first) is chosen.

For example, say OSPF has different routes to 2 sets of destinations (100.200.100.0/24 and 100.200.200.0/24). Now We have setup an MPLS LSP and set the FEC to be 100.200.0.0/16. If we set this attribute to "disabled", IP traffic for destination 100.200.100.xxx and 100.200.200.xxx will take the corresponding OSPF routes due to better address match than the MPLS LSP. However, if the value of this attribute is "enabled", all IP traffic for destination 100.200.xxx.xxx (including 100.200.100.xxx and 100.200.200.xxx) will take the MPLS LSP. In such a situation, the two OSPF routes have been subsumed by the more generic route - MPLS LSP and the IP best-match rule has been overridden.

| | |
|---|---|

## GROUP Vr Mpls Rs SelectedRoute (SelectedRoute)

Properties: Operational

Description: This group contains selected route operational attributes for the MPLS Route Selector component.

## ATTRIBUTE Vr Mpls Rs routeMetric

Access: Read only

Description: This attribute indicates the metric of the last computed route. A lower values indicates a better route.

Values: Decimal (0..4294967295)

Default: No default

## ATTRIBUTE Vr Mpls Rs routeSelectionFailureReason

Access: Read only

Description: This attribute indicates the reason for the last computed route failure, if any.

***none*** indicates that the last route computation was successful in finding a route to the destination that matched the constraints.

***destinationNotFound*** indicates that the route computation failed because the destination of the route requrest was not found in the database.

***routeNotFound*** indicates that the route computation failed because a route to the desination could not be found because one or more link contraints could not be met.

| | |
|---|---|
| Values | none<br>destinationNotFound (destNotFound)<br>routeNotFound |
| Default | No default |

### ATTRIBUTE Vr Mpls Rs routeSelectionTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time at which the last route was computed. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Vr Mpls Rs routeDescription

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last computed route. The route is displayed as a list of pairs (router id, local interface IP address), one pair for each hop in the path. |
| List of | String (0..40, ASCII) |
| List Size | 20 |
| Default | No default |

### GROUP Vr Mpls Rs Constraints (Constraints)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains route constraint operational attributes for the MPLS Route Selector component. |

### ATTRIBUTE Vr Mpls Rs destinationAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the destination IP address of the last computed route. |
| Values | IP address |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Mpls Rs requiredBandwidth (reqBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the required bandwidth constraint of the last computed route. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Vr Mpls Rs includedColors

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the included colors constraint of the last computed route. |
| Values | String (0..200, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Mpls Rs excludedColors

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the excluded colors constraint of the last computed route. |
| Values | String (0..200, ASCII) |
| Default | No default |

### GROUP Vr Mpls Rs Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistic operational attributes for the MPLS Route Selector component. |

### ATTRIBUTE Vr Mpls Rs routeRequests (routeReq)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the route requests processed by the MPLS constraint based routing algorithm. This value includes the *failedRouteRequests*.<br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Mpls Rs failedRouteRequests (failedReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the failed route computations processed by the constraint-based routing algorithm.<br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr MemoryManagement (Mm)

| | |
|---|---|
| Groups | "GROUP Vr Mm Provisioned (Prov)"<br>"GROUP Vr Mm Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> MemoryManagement*<br>*Rtr/<string> MemoryManagement*<br>*Rtr/<string> Vrf/<string> MemoryManagement*<br><br>This component represents a mechanism to control and monitor dynamic memory usage within a *VirtualRouter*, *Router*, or *VpnRouteForwarder*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Mm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains all provisioned attributes for the *MemoryManagement* component. |

### ATTRIBUTE Vr Mm vrMaxHeapSpace (vrMax)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum percentage of the total system heap space that is allowed for use by this *VirtualRouter*, *Router*, or *VpnRouteForwarder*. Attempted memory allocation beyond this limit will cause a *VirtualRouter* or *VpnRouteForwarder* to automatically lock. If memory allocation for a *Router* exceeds this limit, an alarm is raised but the component is not locked. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 100 |

### GROUP Vr Mm Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all operational attributes for the *MemoryManagement* component. |

### ATTRIBUTE Vr Mm vrHeapSpaceBytesAllocated (vrBytesAlloc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of bytes of system dynamic memory which has been allocated to this *VirtualRouter*, *Router*, or *VpnRouteForwarder* component. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Mm vrHeapSpaceAllocated (vrAlloc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the percentage of the maximum permitted heap space for this *VirtualRouter*, *Router*, or *VpnRouteForwarder* |

| | |
|---|---|
| | component (as specified by *vrMaxHeapSpace* attribute) which is currently allocated. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

## COMPONENT Vr ProtocolPort (Pp)

| | |
|---|---|
| Instance | String (1..20, ASCII) |
| Groups | "GROUP Vr Pp AdministrativeControl (AdminControl)"<br>"GROUP Vr Pp Provisioned (Prov)"<br>"GROUP Vr Pp OperationalStatus (OperStatus)"<br>"GROUP Vr Pp OsiState (State)"<br>"GROUP Vr Pp Operational (Oper)"<br>"GROUP Vr Pp NbmaAddress"<br>"GROUP Vr Pp ProtocolPortAcct (PpAcct)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string>*<br>This component represents a logical interface to the network. Protocol Ports are associated with physical or logical media via a linkage attribute. Protocol Ports allow for individual upper layer protocols to be enabled or disabled. |

| | |
|---|---|

Subcomp. | "COMPONENT Vr Pp MplsPort"<br>"COMPONENT Vr Pp ClusterTbBridgePort (Tbcl)"<br>"COMPONENT Vr Pp FddiEncapTbPort (FddiETB)"<br>"COMPONENT Vr Pp TransparentBridgePort (Tbp)"<br>"COMPONENT Vr Pp IpPort"<br>"COMPONENT Vr Pp IpxPort (IpxP)"<br>"COMPONENT Vr Pp SourceRouteBridgePort (SrBp)"<br>"COMPONENT Vr Pp SourceRouteTransparentBridgePort (SrtBp)"<br>"COMPONENT Vr Pp SrseBridgePort (Srse)"<br>"COMPONENT Vr Pp TbseBridgePort (Tbse)"<br>"COMPONENT Vr Pp SrsgBridgePort (Srsg)"<br>"COMPONENT Vr Pp TbsgBridgePort (Tbsg)"<br>"COMPONENT Vr Pp ClusterSrBridgePort (Srcl)" |
| Dyn. Subcomp. | "COMPONENT Vr Pp ShortcutConnection (Sc)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Pp AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Pp snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet |

forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Vr Pp Provisioned (Prov)

Properties
Provisioned

Description
This group includes provisioned attributes specific to the ProtocolPort component.

### ATTRIBUTE Vr Pp linkToMedia (media)

Access
Read and write

Description
This attribute defines the Media Application which this Protocol Port is using as an interface to the network.

Values
Link (Service, linkToProtocolPort)

Default
No default

### GROUP Vr Pp OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Pp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Pp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Pp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Pp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes operational attributes specific to the ProtocolPort component. |

### ATTRIBUTE Vr Pp ifIndex

| | |
|---|---|
| Access | Read only |
| Description | This represents the SNMP ifIndex which is associated with this PP. This ifIndex can be used to extract detailed information about the PP from the ifTable. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Vr Pp NbmaAddress

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the ProtocolPort component specific to NHRP. |

### ATTRIBUTE Vr Pp atmAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM address which is associated with this protocol port. NHRP uses this address to establish shortcut connections. This attribute is not displayed if NHRP is not provisioned on this protocol port. |
| Values | String (0..20, Hex) |
| Default | No default |

### GROUP Vr Pp ProtocolPortAcct (PpAcct)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the protocol port Accounting options for the *ProtocolPort* component. |

## ATTRIBUTE Vr Pp accountingControl (acc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to control accounting for the protocol port. ***disable*** signifies that accounting is disabled unconditionally with this option for the *ProtocolPort*.<br><br>***sameAsProtocol*** signifies that accounting for the *ProtocolPort* is controlled by the attribute *accountCollection* in the *Vr Ip* component. |
| Values | sameAsProtocol<br>disabled |
| Default | sameAsProtocol |

## COMPONENT Vr Pp MplsPort

| | |
|---|---|
| Groups | "GROUP Vr Pp MplsPort OsiState (State)"<br>"GROUP Vr Pp MplsPort Operational (Oper)"<br>"GROUP Vr Pp MplsPort InStatistics (InStats)"<br>"GROUP Vr Pp MplsPort OutStatistics (OutStats)"<br>"GROUP Vr Pp MplsPort Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<s> Pp/<s> MplsPort*<br>This component represents a group of label switched path (LSP) MPLS traffic that use a specific *ProtocolPort*.<br><br>Each MPLS Port uses the media which is associated with its parent component *ProtocolPort*.<br><br>Each LSP corresponds to an *InSegment* (in the egress case), to an *OutSegment* (in the ingress case), or a combination of them (for example tandem or merge points). The statistics for individual LSPs are viewed through the *InSegment* and *OutSegment* subcomponents of the *MplsPort* component. Consolidated statistics for all LSPs on an MPLS Port are viewed through this *MplsPort* component. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Pp MplsPort LabelDistributionProtocolIf (LdpIf)"<br>"COMPONENT Vr Pp MplsPort RsvpTeIf" |
| Dyn. Subcomp. | "COMPONENT Vr Pp MplsPort InSegment (InSeg)" |
| Dyn. Subcomp. | "COMPONENT Vr Pp MplsPort OutSegment (OutSeg)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp MplsPort OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Pp MplsPort adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is |

administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Pp MplsPort operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp MplsPort usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

| | |
|---|---|
| | The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Pp MplsPort Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains summary information about the labels used in the media associated with this *MplsPort*. |

### ATTRIBUTE Vr Pp MplsPort inLabelsUsed (inUse)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of labels that are in use on the interface in the incoming direction (LSPs terminating on the LSR or tandeming LSPs arriving at the LSR). |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort outLabelsUsed (outUse)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of labels that are in use in the outgoing direction (LSPs originating on the LSR or tandeming LSPs exiting LSR). |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort mediaName (media)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the media component name for the MPLS Port which its traffic is running through. |
| Values | The name of the component |
| Default | No default |

### GROUP Vr Pp MplsPort InStatistics (InStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for incoming traffic of the *MplsPort* component on the ingress side of a tandem or destination switch. |

### ATTRIBUTE Vr Pp MplsPort inOctets

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the number of octets received from terminating or incoming tandem MPLS data traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort inDiscards

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the number of octets received but discarded from terminating or incoming tandem MPLS data traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort inFrames

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the number of frames received from terminating or incoming tandem MPLS data traffic. The counter wraps to zero when its maximum value is exceeded. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort inFramesDiscards

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the number of frames received but discarded from terminating or incoming tandem MPLS data traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### GROUP Vr Pp MplsPort OutStatistics (OutStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for outgoing traffic of *MplsPort* on the egress side of an originating or tandem switch. |

### ATTRIBUTE Vr Pp MplsPort outOctets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets transmitted for originating or outgoing transit MPLS data. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort outDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets transmitted that were discarded. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort outFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted for originating or outgoing transit MPLS data. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort outFramesDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted that were discarded. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### GROUP Vr Pp MplsPort Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for *InwMplsPort* subcomponent. |

### ATTRIBUTE Vr Pp MplsPort lspCacScalingFactor (sf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to calculate the portion of the requested bandwidth that will be reserved for the out segments of LSP connections. It provides a mean to overbook the link as the actual reserved bandwidth for the LSP connection is the multiplication of the scaling factor with the requested bandwidth.<br><br>For example: A value of 0% means that the out segments of LSP connections on this port are reserving 0% (none) of the requested bandwidth. A value of 100% (no overbooking) means that the out segments of LSP connections on this port are reserving 100% of the requested bandwidth. |

| | |
|---|---|
| Values | Decimal (0..100) |
| Units | % |
| Default | 100 |

## COMPONENT Vr Pp MplsPort LabelDistributionProtocolIf (LdpIf)

| | |
|---|---|
| Groups | "GROUP Vr Pp MplsPort LdpIf Provisioned (Prov)"<br>"GROUP Vr Pp MplsPort LdpIf OsiState (State)" |
| Scope | Application |
| Description | *Vr/<s> Pp/<s> MplsPort LdpIf*<br>*Rtr/<s> Pp/<s> MplsPort LdpIf*<br>This component represents the fact that the Label Distribution Protocol is to run over the interface associated with this protocol port.<br><br>An *IpPort* component must be provisioned under the same *ProtocolPort* component.<br><br>An *LdpIf* component may have an *AtmConnection* subcomponent provisioned. An *AtmConnection* subcomponent is required when the *LdpIf* component runs on top of ATM media<br><br>A provisioning check is made to ensure that an *MplsPort* component exists under the same *ProtocolPort* as this *LdpIf* component. |

### GROUP Vr Pp MplsPort LdpIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes for configuring LDP use over the interface. |

### ATTRIBUTE Vr Pp MplsPort LdpIf ldpInterworking (ldpInw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies if interworking between LDP and CR-LDP can occur over this interface. If ***True***, then a hop-by-hop LDP peer can interwork with this CR-LDP LSR. |
| Values | true<br>false |
| Default | false |

### ATTRIBUTE Vr Pp MplsPort LdpIf adminStatus (admin)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the administrative status of this LDP Interface. It is used to maintain “locks” and “unlocks” over FP and nodal restarts. |
| Values | null<br>enabled<br>disabled<br>testing |
| Default | enabled |

### GROUP Vr Pp MplsPort LdpIf OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp MplsPort LdpIf adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vr Pp MplsPort LdpIf operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp MplsPort LdpIf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### COMPONENT Vr Pp MplsPort LdpIf AtmConnection (AtmConn)

Groups

### GROUP Vr Pp MplsPort LdpIf AtmConn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes for configuring LDP over the ATM interface. |

### ATTRIBUTE Vr Pp MplsPort LdpIf AtmConn mediaName (mname)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the component name of the media over which LDP is run. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort LdpIf AtmConn atmLabelMin

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the minimum value of the MPLS ATM label that this LSR is willing to receive on this interface. |
| Values | Integer Sequence (0..254; 0..16127) |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort LdpIf AtmConn atmLabelMax

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum value of the MPLS ATM label that this LSR is willing to receive on this interface. |
| Values | Integer Sequence (0..254; 0..16127) |
| Default | No default |

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes specifies MPLS RSVP-TE optional capability on a per interface basis. |

## ATTRIBUTE Vr Pp MplsPort RsvpTeIf refreshInterval (refresh)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval between PATH or RESV refresh messages sent out this interface by this LSR.<br><br>Setting this attribute to a smaller value increases the control |

traffic overhead in the network. Setting this attribute to a larger number may increase the reaction time of the originating LER to apply a global fault recovery mechanism when control packets are repeatedly lost.

Values: Decimal (1..1800)

Units: seconds

Default: 30

### ATTRIBUTE Vr Pp MplsPort RsvpTelf refreshMultiple (rm)

Access: Read and write

Description: This attribute specifies the minimum number of refresh intervals that must elapse before a PATH or a RESV state which is not being refreshed is aged out. Refer to Resource Reservation Protocol Version 1 Functional Specification (RFC 2205) for detailed explanation of this value (referred to as K).

Setting this attribute to a smaller value might cause a premature loss of the related state block, especially in a lossy network. Setting this attribute to a higher value results in the similar effect as a high *refreshInterval* value in that it may increase the reaction time of the originating LER to apply a global fault recovery mechanism.

Values: Decimal (1..50)

Default: 3

### ATTRIBUTE Vr Pp MplsPort RsvpTelf slewMax (slewMax)

Access: Read and write

Description: This attribute specifies a limit on the rate of dynamic change S for *rsvpIfRefreshInterval* value, R.

When the *refreshInterval* value is set to a larger value on an enabled *RsvpTeIf*, the refresh interval is increased at *slewMax* percentage of the previous interval at each PATH/RESV cycle. In another words, the ratio of two successive values of R2/R1 does not exceed 1 + (*SlewMax*/100). Refer to Resource Reservation

Protocol Version 1 Functional Specification (RFC 2205) for a detailed explanation of this value.

Values: Decimal (1..200)

Units: %

Default: 30

### GROUP Vr Pp MplsPort RsvpTelf OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp MplsPort RsvpTelf adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE Vr Pp MplsPort RsvpTelf operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Pp MplsPort RsvpTelf usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Vr Pp MplsPort RsvpTeIf Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | These attributes comprise the control statistics collected by the *RsvpTeIf* component. |

## ATTRIBUTE Vr Pp MplsPort RsvpTeIf txPathErrors (txPErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts PATH ERROR messages sent out this interface since its creation. This value wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Vr Pp MplsPort RsvpTeIf lastTxPathErrorCode (lastTxPErrC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the error code of the last PATH ERROR message sent out this interface. Refer to “Resource Reservation Protocol Version 1 Functional Specification (RFC 2205)” and “RSVP-TE: Extensions to RSVP for LSP Tunnels (draft-ietf-mpls-lsp-tunnel-08.txt)” for the applicable PATH Error Codes.<br><br>A value of ***notApplicable*** indicates that the *RsvpTeIf* has not sent any PATH error messages since its creation. |
| Values | admissionControlFailure<br>policyControlFailure<br>conflictingDestPorts<br>conflictingSenderPorts<br>unknownObjectClass<br>unknownObjectCType<br>reservedForAPI<br>trafficControlError<br>trafficControlSystemError<br>rsvpSystemError<br>routingProblem<br>notifyError<br>notApplicable |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort RsvpTeIf lastTxPathErrorValue (lastTxPErrV)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the error value supplementing the error code of the last PATH ERROR message sent out this interface. Refer to “Resource Reservation Protocol Version 1 Functional Specification (RFC 2205)” and “RSVP-TE: Extensions to RSVP for LSP Tunnels (draft-ietf-mpls-lsp-tunnel-08.txt)” for the PATH error values and corresponding Error Codes.<br><br>If the *lastTxPathErrorCode* value is ***notApplicable*** then the value of this attribute is ***0***. |
| Values | Decimal (0..65536) |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort RsvpTeIf rxPathErrors (rxPErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts PATH ERROR messages received on this interface since its creation. This value wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort RsvpTeIf lastRxPathErrorCode (lastRxPErrC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the error code of the last PATH ERROR message received on this interface. Refer to “Resource Reservation Protocol Version 1 Functional Specification (RFC 2205)” and “RSVP-TE: Extensions to RSVP for LSP Tunnels (draft-ietf-mpls-lsp-tunnel-08.txt)” for the applicable PATH Error Codes.<br><br>A value of ***notApplicable*** indicates that the *RsvpTeIf* has not received any PATH error messages since its creation. |

| | |
|---|---|
| Values | admissionControlFailure<br>policyControlFailure<br>conflictingDestPorts<br>conflictingSenderPorts<br>unknownObjectClass<br>unknownObjectCType<br>reservedForAPI<br>trafficControlError<br>trafficControlSystemError<br>rsvpSystemError<br>routingProblem<br>notifyError<br>notApplicable |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort RsvpTelf lastRxPathErrorValue (lastRxPErrV)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the error value supplementing the error code of the last PATH ERROR message received on this interface. Refer to “Resource Reservation Protocol Version 1 Functional Specification (RFC 2205)” and “RSVP-TE: Extensions to RSVP for LSP Tunnels (draft-ietf-mpls-lsp-tunnel-08.txt)” for the PATH error values and corresponding Error Codes.<br><br>If the *lastRxPathErrorCode* value is ***notApplicable*** then the value of this attribute is ***0***. |
| Values | Decimal (0..65536) |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort RsvpTelf txResvErrors (txRErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts RESV ERROR messages sent on this interface since its creation. This value wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE Vr Pp MplsPort RsvpTeIf lastTxResvErrorCode (lastTtxRErrC)

Access Read only

Description This attribute indicates the error code of the last RESV ERROR message sent out this interface. Refer to “Resource Reservation Protocol Version 1 Functional Specification (RFC 2205)” and “RSVP-TE: Extensions to RSVP for LSP Tunnels (draft-ietf-mpls-lsp-tunnel-08.txt)” for the applicable RESV Error Codes.

A value of ***notApplicable*** indicates that the *RsvpTeIf* has not sent any RESV error messages since its creation.

Values
admissionControlFailure
policyControlFailure
noPathInfo
noSenderInfo
conflictingResvStyle
unknownResvStyle
conflictingDestPorts
conflictingSenderPorts
servicePreempted
unknownObjectClass
unknownObjectCType
reservedForAPI
trafficControlError
trafficControlSystemError
rsvpSystemError
routingProblem
notifyError
notApplicable

Default No default

### ATTRIBUTE Vr Pp MplsPort RsvpTeIf lastTxResvErrorValue (lastTxRErrV)

Access Read only

Description This attribute indicates the error value supplementing the error code of the last RESV ERROR message sent out this interface. Refer to “Resource Reservation Protocol Version 1 Functional Specification (RFC 2205)” and “RSVP-TE: Extensions to RSVP

for LSP Tunnels (draft-ietf-mpls-lsp-tunnel-08.txt)" for the RESV error values and corresponding Error Codes.

If the *lastTxResvErrorCode* value is ***notApplicable*** then the value of this attribute is ***0***.

Values: Decimal (0..65536)

Default: No default

### ATTRIBUTE Vr Pp MplsPort RsvpTeIf rxResvErrors (rxRErr)

Access: Read only

Description: This attribute counts RESV ERROR messages received on this interface since its creation. This value wraps to zero when the maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Vr Pp MplsPort RsvpTeIf lastRxResvErrorCode (rxRErrCode)

Access: Read only

Description: This attribute indicates the error code of the last RESV ERROR message received on this interface. Refer to "Resource Reservation Protocol Version 1 Functional Specification (RFC 2205)" and "RSVP-TE: Extensions to RSVP for LSP Tunnels (draft-ietf-mpls-lsp-tunnel-08.txt)" for the applicable RESV Error Codes.

A value of ***notApplicable*** indicates that the *RsvpTeIf* has not received any RESV error messages since its creation.

Values:
admissionControlFailure
policyControlFailure
noPathInfo
noSenderInfo
conflictingResvStyle
unknownResvStyle
conflictingDestPorts
conflictingSenderPorts
servicePreempted

unknownObjectClass
unknownObjectCType
reservedForAPI
trafficControlError
trafficControlSystemError
rsvpSystemError
routingProblem
notifyError
notApplicable

Default — No default

### ATTRIBUTE Vr Pp MplsPort RsvpTeIf lastRxResvErrorValue (lastRxRErrV)

Access — Read only

Description — This attribute indicates the error value supplementing the error code of the last RESV ERROR message received on this interface. Refer to “Resource Reservation Protocol Version 1 Functional Specification (RFC 2205)” and “RSVP-TE: Extensions to RSVP for LSP Tunnels (draft-ietf-mpls-lsp-tunnel-08.txt)” for the RESV error values and corresponding Error Codes.

If the *lastRxResvErrorCode* value is ***notApplicable*** then the value of this attribute is ***0***.

Values — Decimal (0..65536)

Default — No default

### COMPONENT Vr Pp MplsPort RsvpTeIf AtmConnection (AtmConn)

Groups — "GROUP Vr Pp MplsPort RsvpTeIf AtmConn Provisioned (Prov)"

Scope — Application

Description — *Vr/<string> Pp/<string> MplsPort RsvpTeIf AtmConnection*
This component represents the connection to an ATM VCC used by the RSVP-TE protocol on this *MplsPort*.

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Pp MplsPort RsvpTelf AtmConn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes for configuring RSVP-TE over the ATM interface. |

## ATTRIBUTE Vr Pp MplsPort RsvpTelf AtmConn minInLabel (minIn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum value of the ATM VPI/VCI field to encode the MPLS label that this LSR accepts for incoming LSP connections on this interface.<br><br>If not set, a default escape sets the VPI field of this label to ***0***, and the VCI field to the value specified in the *minAutoSelectedVciForVpiZero* attribute under the *AtmIf Ca* subcomponent.<br><br>If the value of the VPI field is set to ***0***, the VCI field must be in the range specified by the *minAutoSelectedVciForVpiZero* and *maxAutoSelectedVciForVpiZero* attributes under the *AtmIf Ca* subcomponent.<br><br>If the VPI field is set to a value that is not ***0***, the value of the VCI field must be in the range specified by the *minAutoSelectedVciForNonZeroVpi* and *maxAutoSelectedVciForNonZeroVpi* attributes under the *AtmIf Ca* subcomponent.<br><br>If set to a value that is not ***0***, the value of the VPI field should be in the range specified by the *minAutoSelectedVpi* and *maxAutoSelectedVpi* attributes under the *AtmIf Ca* subcomponent |

| | |
|---|---|
| Values | Integer Sequence (0..254; 0..65535) |

### ATTRIBUTE Vr Pp MplsPort RsvpTelf AtmConn maxInLabel (maxIn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum value of the ATM VPI/VCI field to encode the MPLS label that this LSR accepts for incoming LSP connections on this interface.<br><br>If not set, a default escape sets the VPI field of this label to ***0***, and the VCI field to the value specified in the *maxAutoSelectedVciForVpiZero* attribute under the *AtmIf Ca* subcomponent.<br><br>The value of this attribute must be greater than or equal to the *minInLabel* attribute.<br><br>If the value of the VPI field is set to ***0***, the VCI field must be in the range specified by the *minAutoSelectedVciForVpiZero* and *maxAutoSelectedVciForVpiZero* attributes under the *AtmIf Ca* subcomponent.<br><br>If the VPI field is set to a value that is not ***0***, the value of the VCI field must be in the range specified by the *minAutoSelectedVciForNonZeroVpi* and *maxAutoSelectedVciForNonZeroVpi* attributes under the *AtmIf Ca* subcomponent.<br><br>If set to a value that is not ***0***, the value of the VPI field should be in the range specified by the *minAutoSelectedVpi* and *maxAutoSelectedVpi* attributes under the *AtmIf Ca* subcomponent. |
| Values | Integer Sequence (0..254; 0..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort RsvpTelf AtmConn minOutLabel (minOut)

| | |
|---|---|
| Access | Read and write |

Description

This attribute specifies the minimum value of the ATM VPI/VCI field to encode the MPLS label that this LSR may select for outgoing LSP connections on this interface.

If not set, a default escape sets the VPI field of this label to ***0***, and the VCI field to the value specified in the *minAutoSelectedVciForVpiZero* attribute under the *AtmIf Ca* subcomponent.

If the value of the VPI field is set to ***0***, the VCI field must be in the range specified by the *minAutoSelectedVciForVpiZero* and *maxAutoSelectedVciForVpiZero* attributes under the *AtmIf Ca* subcomponent.

If the VPI field is set to a value that is not ***0***, the value of the VCI field must be in the range specified by the *minAutoSelectedVciForNonZeroVpi* and *maxAutoSelectedVciForNonZeroVpi* attributes under the *AtmIf Ca* subcomponent.

If set to a value that is not ***0***, the value of the VPI field should be in the range specified by the *minAutoSelectedVpi* and *maxAutoSelectedVpi* attributes under the *AtmIf Ca* subcomponent.

Values

Integer Sequence (0..254; 0..65535)

Default

No default

### ATTRIBUTE Vr Pp MplsPort RsvpTelf AtmConn maxOutLabel (maxOut)

Access

Read and write

Description

This attribute defines the maximum value of the ATM VPI/VCI field to encode the MPLS label that this LSR selects for outgoing LSP connections on this interface.

If not set, a default escape sets the VPI field of this label to ***0***, and the VCI field to the value specified in the *maxAutoSelectedVciForVpiZero* attribute under the *AtmIf Ca* subcomponent.

If the value of the VPI field is set to ***0***, the VCI field must be in

the range specified by the *minAutoSelectedVciForVpiZero* and *maxAutoSelectedVciForVpiZero* attributes under the *AtmIf Ca* subcomponent.

If the VPI field is set to a value that is not ***0***, the value of the VCI field must be in the range specified by the *minAutoSelectedVciForNonZeroVpi* and *maxAutoSelectedVciForNonZeroVpi* attributes under the *AtmIf Ca* subcomponent.

If set to a value that is not ***0***, the value of the VPI field should be in the range specified by the *minAutoSelectedVpi* and *maxAutoSelectedVpi* attributes under the *AtmIf Ca* subcomponent

## GROUP Vr Pp MplsPort InSeg OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Pp MplsPort InSeg adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Vr Pp MplsPort InSeg operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

## ATTRIBUTE Vr Pp MplsPort InSeg usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP Vr Pp MplsPort InSeg Operational (Oper)

Properties
Operational

Description
This group contains operational attributes of an *MplsPort InSegment* component.

### ATTRIBUTE Vr Pp MplsPort InSeg protocolType (prot)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the MPLS protocol using this segment. |
| Values | ldp<br>crLdp<br>rsvpTe<br>static |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg lspType (lsp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the level of diff-serv support provided by this segment. Value *regular-lsp* indicates a segment not providing diff-serv support |
| Values | eLsp<br>lLsp<br>regularLsp |
| Default | No default |

### GROUP Vr Pp MplsPort InSeg Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for each ingress connection on terminating or incoming tandem traffic. Each connection (*InSegment* instance) corresponds to an LSP. |

### ATTRIBUTE Vr Pp MplsPort InSeg inDe0Octets (de0Oct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the received and successfully passed through octets for the ingress traffic on this segment. The octets reflect the non discard-eligible traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg inDe1Octets (de1Oct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets that are received and successfully passed through for the ingress traffic on this segment. The octets reflect the discard-eligible traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg inDe0OctetsDiscarded (de0OctDsc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the received but discarded octets for the ingress traffic on this segment. The octets reflect the non discard-eligible traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg inDe1OctetsDiscarded (de1OctDsc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the received but discarded octets for the ingress traffic on this segment. The octets reflect the discard-eligible traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg inFrames

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the number of frames received from terminating or incoming tandem MPLS data traffic. The counter wraps to zero when its maximum value is exceeded. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg inFramesDiscards

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the number of frames received but discarded from terminating or incoming tandem MPLS data traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg inOctets

| | |
|---|---|
| Access | Read only |
| Description | The attribute counts the number of octets received from terminating or incoming tandem MPLS data traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Vr Pp MplsPort InSeg PathRroHop (PathRro)

| | |
|---|---|
| Instance | Decimal (1..255) |
| Groups | "GROUP Vr Pp MplsPort InSeg PathRro RsvpTeRro" |
| Scope | Application |
| Description | *Vr/<s> Pp/<s> MplsPort OutSeg/<s> PathRroHop*<br>This component represents a single hop of the Record Route Object (RRO) of the PATH message used to set up this LSP Tunnel Segment. The instance number specifies the relative position of the hop as it appears in the RRO of the PATH message. Displaying this component with a wildcard provides the information on all the upstream hops leading from the originating ingress LSR for the LSP to this interface. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp MplsPort InSeg PathRro RsvpTeRro

| | |
|---|---|
| Properties | Operational |
| Description | The group contains the hop information in the corresponding *RsvpTePathRroHop* component or *RsvpTeResvRroHop* component for this LSP tunnel segment. |

### ATTRIBUTE Vr Pp MplsPort InSeg PathRro hopAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IPv4 address of the RSVP-TE interface on which the corresponding PATH or RESV messages was sent. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg PathRro hopLabel

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the MPLS label associated with the IPv4 address of the RSVP-TE interface on which the corresponding PATH or RESV message was sent. |
| Values | Integer Sequence (0..254; 0..65535) |
| Default | No default |

### COMPONENT Vr Pp MplsPort InSeg ResvRroHop (ResvRro)

| | |
|---|---|
| Instance | Decimal (1..255) |
| Groups | "GROUP Vr Pp MplsPort InSeg ResvRro RsvpTeRro" |
| Scope | Application |

| | |
|---|---|
| Description | *Vr/<s> Pp/<s> MplsPort OutSeg/<s> ResvRroHop*<br>This component represents a single hop of the Record Route Object (RRO) of the RESV message used to set up this LSP Tunnel Segment. The instance number specifies the relative position of the hop as it appears in the RRO of the RESV message. Displaying this component with a wildcard provides the information on all the downstream hops leading from the destination egress LSR for the LSP to this interface. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp MplsPort InSeg ResvRro RsvpTeRro

| | |
|---|---|
| Properties | Operational |
| Description | The group contains the hop information in the corresponding *RsvpTePathRroHop* component or *RsvpTeResvRroHop* component for this LSP tunnel segment. |

### ATTRIBUTE Vr Pp MplsPort InSeg ResvRro hopAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IPv4 address of the RSVP-TE interface on which the corresponding PATH or RESV messages was sent. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort InSeg ResvRro hopLabel

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the MPLS label associated with the IPv4 address of the RSVP-TE interface on which the corresponding PATH or RESV message was sent. |
| Values | Integer Sequence (0..254; 0..65535) |
| Default | No default |

## COMPONENT Vr Pp MplsPort OutSegment (OutSeg)

| | |
|---|---|
| Instance | String (1..10, ASCII) |
| Groups | "GROUP Vr Pp MplsPort OutSeg OsiState (State)"<br>"GROUP Vr Pp MplsPort OutSeg Operational (Oper)"<br>"GROUP Vr Pp MplsPort OutSeg Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<s> Pp/<s> MplsPort OutSegment/<s>*<br>This component contains operational information related to a label switched paths (LSP) going out of the media associated with the *MplsPort*. The information applies if the LSP is either originating on the LSR or tandeming through the LSR in the outgoing direction. |
| Subcomponents | "COMPONENT Vr Pp MplsPort OutSeg StaticPoint (StPt)"<br>"COMPONENT Vr Pp MplsPort OutSeg StaticQos (StQos)" |

## GROUP Vr Pp MplsPort OutSeg OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Pp MplsPort OutSeg adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Pp MplsPort OutSeg operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Pp MplsPort OutSeg usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Pp MplsPort OutSeg Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of an *MplsPort OutSegment* component. |

### ATTRIBUTE Vr Pp MplsPort OutSeg protocolType (prot)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the MPLS protocol using this segment. |
| Values | ldp<br>crLdp<br>rsvpTe<br>static |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg lspType (lsp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the level of diff-serv support provided by this segment.<br><br>Value *eLsp* indicates a segment providing exp inferred diff-serv support.<br><br>Value *lLsp* indicates a segment providing label inferred diff-serv support.<br><br>Value *regularLsp* indicates a segment not providing diff-serv support. |
| Values | eLsp<br>lLsp<br>regularLsp |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg normalizedEffectiveBandwidth (nebw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the amount of bandwidth allocated for this segment from a media bandwidth pool. |
| Values | Decimal (0..4294967295) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg bandwidthPool (pool)

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the media bandwidth pool from which bandwidth is allocated for this segment. A value is displayed only when PPP media is in use. |
| Values | Decimal (1..4) |
| Default | No default |

## GROUP Vr Pp MplsPort OutSeg Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for each egress connection on originating or outgoing tandem traffic. Each connection (*OutSegment* instance) corresponds to an LSP. |

## ATTRIBUTE Vr Pp MplsPort OutSeg outFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted for originating or outgoing transit MPLS data. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Vr Pp MplsPort OutSeg outDe0Octets (de0Oct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the received traffic and successfully transmitted octets for the egress traffic on this segment. The octets reflect the non discard-eligible traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Vr Pp MplsPort OutSeg outDe1Octets (de1Oct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the received traffic and successfully transmitted octets for the egress traffic on this segment. The octets reflect the discard-eligible traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg outDe0OctetsDiscarded (de0OctDsc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the discarded octets before transmission for the egress traffic on this segment. The octets reflect the non discard-eligible traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg outDe1OctetsDiscarded (de1OctDsc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the discarded octets before transmission for the egress traffic on this segment. The octets reflect the discard-eligible traffic. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg outFramesDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted that were discarded. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg outOctets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets transmitted for originating or outgoing transit MPLS data. The counter wraps to zero when its maximum value is exceeded. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### COMPONENT Vr Pp MplsPort OutSeg PathRroHop (PathRro)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP Vr Pp MplsPort OutSeg PathRro RsvpTeRro" |
| Scope | Application |
| Description | *Vr/<s> Pp/<s> MplsPort OutSeg/<s> PathRroHop*<br>This component represents a single hop of the Record Route Object (RRO) of the PATH message used to set up this LSP Tunnel Segment. The instance number specifies the relative position of the hop as it appears in the RRO of the PATH message. Displaying this component with a wildcard provides the information on all the upstream hops leading from the originating ingress LSR for the LSP to this interface. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp MplsPort OutSeg PathRro RsvpTeRro

| | |
|---|---|
| Properties | Operational |
| Description | The group contains the hop information in the corresponding *RsvpTePathRroHop* component or *RsvpTeResvRroHop* component for this LSP tunnel segment. |

### ATTRIBUTE Vr Pp MplsPort OutSeg PathRro hopAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IPv4 address of the RSVP-TE interface on which the corresponding PATH or RESV messages was sent. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg PathRro hopLabel

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the MPLS label associated with the IPv4 address of the RSVP-TE interface on which the corresponding PATH or RESV message was sent. |
| Values | Integer Sequence (0..254; 0..65535) |
| Default | No default |

### COMPONENT Vr Pp MplsPort OutSeg ResvRroHop (ResvRro)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP Vr Pp MplsPort OutSeg ResvRro RsvpTeRro" |
| Scope | Application |
| Description | *Vr/<s> Pp/<s> MplsPort OutSeg/<s> ResvRroHop*<br>This component represents a single hop of the Record Route Object (RRO) of the RESV message used to set up this LSP Tunnel Segment. The instance number specifies the relative position of the hop as it appears in the RRO of the RESV message. Displaying this component with a wildcard provides the information on all the downstream hops leading from the destination egress LSR for the LSP to this interface. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp MplsPort OutSeg ResvRro RsvpTeRro

| | |
|---|---|
| Properties | Operational |
| Description | The group contains the hop information in the corresponding *RsvpTePathRroHop* component or *RsvpTeResvRroHop* component for this LSP tunnel segment. |

### ATTRIBUTE Vr Pp MplsPort OutSeg ResvRro hopAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IPv4 address of the RSVP-TE interface on which the corresponding PATH or RESV messages was sent. |

| | |
|---|---|
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Pp MplsPort OutSeg ResvRro hopLabel

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the MPLS label associated with the IPv4 address of the RSVP-TE interface on which the corresponding PATH or RESV message was sent. |
| Values | Integer Sequence (0..254; 0..65535) |
| Default | No default |

### COMPONENT Vr Pp MplsPort OutSeg StaticPoint (StPt)

| | |
|---|---|
| Groups | "GROUP Vr Pp MplsPort OutSeg StPt OutStaticPointProv (OutStPtProv)" |
| Scope | Application |
| Description | *Vr/<s> Pp/<s> MplsPort OutSeg/<s> OutStaticPoint*<br>This component provides a link to the ingress point of the LSP associated with a provisioned *OutSegment*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp MplsPort OutSeg StPt OutStaticPointProv (OutStPtProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute of the *OutStaticPoint* component. |

### ATTRIBUTE Vr Pp MplsPort OutSeg StPt inStaticPoint (isp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the ingress point of the LSP associated with a provisioned *OutSegment*.<br>The ingress point is a *Vr/<vr_name> LspGroup/ <lspgroup_name> Lsp/<lsp_name> StaticRoute*. |

| | |
|---|---|
| Values | Link (Service, outStaticPoint) |
| Default | No default |

### COMPONENT Vr Pp MplsPort OutSeg StaticQos (StQos)

| | |
|---|---|
| Groups | "GROUP Vr Pp MplsPort OutSeg StQos OutStaticBandwidth (OutStBw)" |
| Scope | Application |
| Description | *Vr/<s> Pp/<s> MplsPort OutSeg/<s> StaticQos*<br>This component represents the quality of service parameters associated with a provisioned *OutSegment*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp MplsPort OutSeg StQos OutStaticBandwidth (OutStBw)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable bandwidth requirement of the *StaticQos* component. |

### ATTRIBUTE Vr Pp MplsPort OutSeg StQos bandwidth (bw)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the amount of bandwidth requested for this segment. The *bandwidth* attribute is used to calculate the normalized effective bandwidth for this segment. |
| Values | Decimal (0..4294967295) |
| Units | kbit/s |
| Default | 64 |

### COMPONENT Vr Pp ClusterTbBridgePort (Tbcl)

| | |
|---|---|
| Groups | "GROUP Vr Pp Tbcl Provisioned (Prov)"<br>"GROUP Vr Pp Tbcl TbProvisioned (TbProv)"<br>"GROUP Vr Pp Tbcl StpProvisioned (StpProv)"<br>"GROUP Vr Pp Tbcl DomainInfoProvisioned (DIProv)" |

"GROUP Vr Pp Tbcl OsiState (State)"
"GROUP Vr Pp Tbcl OperationalStatus (OperStatus)"
"GROUP Vr Pp Tbcl Operational (Oper)"
"GROUP Vr Pp Tbcl TbOperational (TbOper)"
"GROUP Vr Pp Tbcl StpOperational (StpOper)"
"GROUP Vr Pp Tbcl Statistics (Stats)"

Scope: Application

Description: *Vr/<string> Pp/<string> ClusterTbBridgePort*
This component represents the functionality called Cluster Bridging. Cluster Bridging allows for MAC frames, carrying packets belonging a certain network protocol, to be bridged and routed at the same time. Also, it provides for a convenient way to manage the entire cluster of LANs, using a single attachment point to the cluster of LANs, the Cluster Bridge Port. To realize these features, the network protocol(s) should also be provisioned on same port as the Cluster Bridge Port. *ClusterTbBridgePort* represents a cluster of Tb LANs.

Opt. Subcomp.: "COMPONENT Vr Pp Tbcl NetSentry (Ns)"

Common Verbs:
Help
List
Display
Add
DELete
LOCK
Unlock

## GROUP Vr Pp Tbcl Provisioned (Prov)

Properties: Provisioned

Description: This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.

## ATTRIBUTE Vr Pp Tbcl fragmentIp (fIp)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Vr Pp Tbcl portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.<br>Notes:<br>Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.<br><br>The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute. |
| Values | Decimal (0..255) |
| Default | 0 |

### GROUP Vr Pp Tbcl TbProvisioned (TbProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode. |

### ATTRIBUTE Vr Pp Tbcl secureOption (sos)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen:<br>a) disallows dynamic learning,<br>b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame.<br>c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty.<br>This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit. |
| Values | disabled<br>enabled |
| Default | disabled |

### GROUP Vr Pp Tbcl StpProvisioned (StpProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp. |

### ATTRIBUTE Vr Pp Tbcl adminStatus (as)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation. |
| Values | up<br>down |
| Default | up |

### ATTRIBUTE Vr Pp Tbcl portStateStpControl (psstpc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.<br>***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.<br>A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE Vr Pp Tbcl stpTypeProv (stptProv)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of |

this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*.

Values: dec
ieee8021

Default: ieee8021

### ATTRIBUTE Vr Pp Tbcl portPriority (ppr)

Access: Read and write

Description: This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:
1) 0-255 for stp type DEC and
2) 0-65535 for stp type IEEE.

Values: Decimal (0..65535)

Default: 128

### ATTRIBUTE Vr Pp Tbcl pathCost (pc)

Access: Read and write

Description: This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.

Values: Decimal (1..65535)

Default: 10

### ATTRIBUTE Vr Pp Tbcl pathCostMethod (pcm)

Access: Read and write

Description: This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*.

| | |
|---|---|
| Values | off<br>dec<br>ieee8021 |
| Default | ieee8021 |

### GROUP Vr Pp Tbcl DomainInfoProvisioned (DIProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port. |

### ATTRIBUTE Vr Pp Tbcl domainNum (dn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.<br>This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation. |
| Values | Decimal (1..4294967293) |
| Default | 1 |

### ATTRIBUTE Vr Pp Tbcl preserveDomain (pds)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of |

the domains thus preventing domain breaches while tunnelling frames across backbone network.
If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.
Preserve domain is relevant only when used in conjunction with ATM MPE.

Values: off
on

Default: No default

### GROUP Vr Pp Tbcl OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp Tbcl adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Pp Tbcl operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp Tbcl usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Pp Tbcl OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp Tbcl snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Vr Pp Tbcl Operational (Oper)

Properties
Operational

Description
This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.

### ATTRIBUTE Vr Pp Tbcl portName (pn)

Access
Read only

Description
The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the

| | |
|---|---|
| | corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbcl upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |
| Values | unknown<br>tb<br>sr<br>srt |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Pp Tbcl bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame. |
| Values | access<br>backbone |
| Default | No default |

### ATTRIBUTE Vr Pp Tbcl bridgePortType (bpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port. |
| Values | ethernetBridgePort<br>tokenRingBridgePort<br>fddiBridgePort<br>tokenBusBridgePort<br>lanEmulationClientEthernet<br>fddiEncapsulatingBridgePort<br>vnsBridgePort<br>frameRelayBridgePort<br>pppBridgePort<br>smdsBridgePort<br>vcpBridgePort<br>x25BridgePort<br>atmMpeBridgePort |

srEncapTbBridgePort
sourceGateSrBridgePort
sourceGateTbBridgePort
srtbBridgePort
tbsrBridgePort
clusterSrBridgePort
clusterTbBridgePort
snaDlrBridgePort
unknown

Default: No default

### ATTRIBUTE Vr Pp Tbcl ifIndex (ifin)

Access: Read only

Description: This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Values: Decimal (1..65535)

Default: No default

### ATTRIBUTE Vr Pp Tbcl mtuExceededDiscards (med)

Access: Read only

Description: This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Values: Decimal (0..4294967295)

Default: 0

## GROUP Vr Pp Tbcl TbOperational (TbOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode |

## ATTRIBUTE Vr Pp Tbcl maxInfo (mi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Pp Tbcl badVerifyDiscards (bvd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and:<br>a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or<br>b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry.<br>Permission to receive frames from a MAC address is granted via the static table entries.<br>This attribute, *badVerifyDiscards*, is directly influenced by:<br>1. *secureOption* and<br>2. the static table entries.<br>This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Vr Pp Tbcl staticEntryDiscards (sed)

Access Read only

Description This attribute counts the number of frames that were discarded because of the following three reasons:
a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port.
b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state.
c) for spanning tree bpdus that are locally processed.
This counter wraps around its maximum value of 4294967295.
It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value.
Ideally this counter should be as low as possible.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Vr Pp Tbcl dynamicEntryDiscards (dend)

Access Read only

Description This attribute counts the number of incoming frames that:
a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or
b) if the stp port state of the out port is not ***forwarding***.
This counter wraps around its maximum value of 4294967295.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Vr Pp Tbcl learningDiscards (ld)

Access Read only

Description This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the

| | |
|---|---|
| | information from its header is learnt. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl inDiscards (id)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl inFrames (if)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl outFrames (of)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Tbcl StpOperational (StpOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp. |

### ATTRIBUTE Vr Pp Tbcl stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp Tbcl stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Tbcl designatedCost (dc)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbcl pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbcl designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbcl designatedPort (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbcl forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295.<br>A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp Tbcl Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp Tbcl badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbcl outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp Tbcl NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Pp Tbcl Ns Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> TransparentBridgePort NetSentry* This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp Tbcl Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames. |

### ATTRIBUTE Vr Pp Tbcl Ns incomingFilter (if)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the incoming filter point. |
| Values | String (0..32, ASCII) |

Default No default

### ATTRIBUTE Vr Pp Tbcl Ns outgoingFilter (of)

Access Read and write

Description This attribute specifies the name of the filter to be applied at the out going filter point.

Values String (0..32, ASCII)

Default No default

### COMPONENT Vr Pp FddiEncapTbPort (FddiETB)

"GROUP Vr Pp FddiETB Operational (Oper)"
"GROUP Vr Pp FddiETB TbOperational (TbOper)"
"GROUP Vr Pp FddiETB StpOperational (StpOper)"
"GROUP Vr Pp FddiETB Statistics (Stats)"

Scope Application

Description *Vr/<string> Pp/<string> FddiEncapTbPort*
This component represents a FDDI encapsulated port, working in the TB mode. It contains all the attribute groups (provisionable and operational) necessary for the working of this bridge port. In this mode the domain information can optionally be preserved in the frames.
This bridge port is characterized as a backbone port and can be used to tunnel TB frames, through the backbone. It participates in the transparent bridge (man) spanning tree protocol. Backbone ports are not associated with any domain as multiple domains should be able to multiplex traffic through them and thus share the backbone's bandwidth.
Please note that when this bridge port is provisioned multiple instances of the component *SpanningTreeProtocol* exist, there should exist exactly one instance of the *SpanningTreeProtocol* component with its attribute *stpMode* set to a value of ***backbone***.

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Pp FddiETB NetSentry (Ns)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp FddiETB Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port. |

## ATTRIBUTE Vr Pp FddiETB fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Vr Pp FddiETB portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. |

Notes:
Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.

The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

Values: Decimal (0..255)

Default: 0

### GROUP Vr Pp FddiETB TbProvisioned (TbProv)

Properties: Provisioned

Description: This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.

### ATTRIBUTE Vr Pp FddiETB secureOption (sos)

Access: Read and write

Description: This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen:
a) disallows dynamic learning,
b) disallows frames to be forwarded that do not satisfy the

following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame.
c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty.
This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.

Values: disabled
enabled

Default: disabled

## GROUP Vr Pp FddiETB StpProvisioned (StpProv)

Properties: Provisioned

Description: This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.

## ATTRIBUTE Vr Pp FddiETB adminStatus (as)

Access: Read and write

Description: This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.

Values: up
down

Default: up

## ATTRIBUTE Vr Pp FddiETB portStateStpControl (psstpc)

Access: Read and write

Description

This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.
***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.
A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.

Values

off
on

Default

on

### ATTRIBUTE Vr Pp FddiETB stpTypeProv (stptProv)

Access

Read and write

Description

This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*.

Values

dec
ieee8021

Default

ieee8021

### ATTRIBUTE Vr Pp FddiETB portPriority (ppr)

Access

Read and write

Description

This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:

| | |
|---|---|
| | 1) 0-255 for stp type DEC and<br>2) 0-65535 for stp type IEEE. |
| Values | Decimal (0..65535) |
| Default | 128 |

### ATTRIBUTE Vr Pp FddiETB pathCost (pc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise. |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Vr Pp FddiETB pathCostMethod (pcm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*. |
| Values | off<br>dec<br>ieee8021 |
| Default | ieee8021 |

### GROUP Vr Pp FddiETB DomainInfoProvisioned (DIProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port. |

### ATTRIBUTE Vr Pp FddiETB domainNum (dn)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.<br>This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation. |
| Values | Decimal (1..4294967293) |
| Default | 1 |

### ATTRIBUTE Vr Pp FddiETB preserveDomain (pds)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.<br>If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.<br>Preserve domain is relevant only when used in conjunction with ATM MPE. |
| Values | off<br>on |
| Default | No default |

## GROUP Vr Pp FddiETB OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Pp FddiETB adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Vr Pp FddiETB operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp FddiETB usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Pp FddiETB OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp FddiETB snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp FddiETB Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port. |

### ATTRIBUTE Vr Pp FddiETB portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |
| Values | unknown<br>tb<br>sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to |

| | |
|---|---|
| | another bridge unit for further processing/forwarding of the frame. |
| Values | access<br>backbone |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB bridgePortType (bpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port. |
| Values | ethernetBridgePort<br>tokenRingBridgePort<br>fddiBridgePort<br>tokenBusBridgePort<br>lanEmulationClientEthernet<br>fddiEncapsulatingBridgePort<br>vnsBridgePort<br>frameRelayBridgePort<br>pppBridgePort<br>smdsBridgePort<br>vcpBridgePort<br>x25BridgePort<br>atmMpeBridgePort<br>srEncapSrBridgePort<br>srEncapTbBridgePort<br>sourceGateSrBridgePort<br>sourceGateTbBridgePort<br>srtbBridgePort<br>tbsrBridgePort<br>clusterSrBridgePort<br>clusterTbBridgePort<br>snaDlrBridgePort<br>unknown |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB ifIndex (ifin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB mtuExceededDiscards (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.<br>This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp FddiETB TbOperational (TbOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode |

### ATTRIBUTE Vr Pp FddiETB maxInfo (mi)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB badVerifyDiscards (bvd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and:<br>a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or<br>b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry.<br>Permission to receive frames from a MAC address is granted via the static table entries.<br>This attribute, *badVerifyDiscards*, is directly influenced by:<br>1. *secureOption* and<br>2. the static table entries.<br>This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB staticEntryDiscards (sed)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because of the following three reasons:<br>a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port.<br>b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state. |

c) for spanning tree bpdus that are locally processed.
This counter wraps around its maximum value of 4294967295.
It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value.
Ideally this counter should be as low as possible.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Pp FddiETB dynamicEntryDiscards (dend)

Access: Read only

Description: This attribute counts the number of incoming frames that:
a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or
b) if the stp port state of the out port is not ***forwarding***.
This counter wraps around its maximum value of 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Pp FddiETB learningDiscards (ld)

Access: Read only

Description: This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Pp FddiETB inDiscards (id)

Access: Read only

Description: This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to

filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Pp FddiETB inFrames (if)

Access: Read only

Description: This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Pp FddiETB outFrames (of)

Access: Read only

Description: This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### GROUP Vr Pp FddiETB StpOperational (StpOper)

Properties: Operational

Description: This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.

### ATTRIBUTE Vr Pp FddiETB stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp FddiETB stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp FddiETB designatedCost (dc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute |

| | |
|---|---|
| | *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB designatedPort (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295.<br>A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp FddiETB Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp FddiETB badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp FddiETB outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp FddiETB NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Pp FddiETB Ns Provisioned (Prov)" |
| Scope | Application |

| | |
|---|---|
| Description | *Vr/<string> Pp/<string> TransparentBridgePort NetSentry*<br>This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp FddiETB Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames. |

### ATTRIBUTE Vr Pp FddiETB Ns incomingFilter (if)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the incoming filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp FddiETB Ns outgoingFilter (of)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the out going filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

## COMPONENT Vr Pp TransparentBridgePort (Tbp)

| | |
|---|---|
| Groups | "GROUP Vr Pp Tbp Provisioned (Prov)"<br>"GROUP Vr Pp Tbp TbProvisioned (TbProv)"<br>"GROUP Vr Pp Tbp StpProvisioned (StpProv)"<br>"GROUP Vr Pp Tbp DomainInfoProvisioned (DIProv)"<br>"GROUP Vr Pp Tbp OsiState (State)"<br>"GROUP Vr Pp Tbp OperationalStatus (OperStatus)"<br>"GROUP Vr Pp Tbp Operational (Oper)"<br>"GROUP Vr Pp Tbp TbOperational (TbOper)"<br>"GROUP Vr Pp Tbp StpOperational (StpOper)"<br>"GROUP Vr Pp Tbp Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> TransparentBridgePort*<br>This component represents a transparent bridge port. It contains all the attribute groups (provisionable and operational) that are required for the operation of such a port. Transparent bridge ports participate in the transparent bridging spanning tree protocol. They also have associated with them a domain number. Domains are logical partitions of an extended network and each partition is completely segregated in terms of traffic. Each domain has an identifier that identifies it uniquely, called the domain number. |
| Opt. Subcomp. | "COMPONENT Vr Pp Tbp NetSentry (Ns)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp Tbp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of |

bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.

### ATTRIBUTE Vr Pp Tbp fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Vr Pp Tbp portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.<br>Notes:<br>Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.<br><br>The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a |

port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

Values: Decimal (0..255)

Default: 0

### GROUP Vr Pp Tbp TbProvisioned (TbProv)

Properties: Provisioned

Description: This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.

### ATTRIBUTE Vr Pp Tbp secureOption (sos)

Access: Read and write

Description: This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen:
a) disallows dynamic learning,
b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame.
c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty.
This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.

Values: disabled
enabled

Default: disabled

### GROUP Vr Pp Tbp StpProvisioned (StpProv)

Properties: Provisioned

| | |
|---|---|
| Description | This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp. |

### ATTRIBUTE Vr Pp Tbp adminStatus (as)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation. |
| Values | up<br>down |
| Default | up |

### ATTRIBUTE Vr Pp Tbp portStateStpControl (psstpc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.<br>***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.<br>A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE Vr Pp Tbp stpTypeProv (stptProv)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*. |
| Values | dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Tbp portPriority (ppr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:<br>1) 0-255 for stp type DEC and<br>2) 0-65535 for stp type IEEE. |
| Values | Decimal (0..65535) |
| Default | 128 |

### ATTRIBUTE Vr Pp Tbp pathCost (pc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise. |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Vr Pp Tbp pathCostMethod (pcm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root |

bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*.

Values
off
dec
ieee8021

Default
ieee8021

### GROUP Vr Pp Tbp DomainInfoProvisioned (DIProv)

Properties
Provisioned

Description
This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.

### ATTRIBUTE Vr Pp Tbp domainNum (dn)

Access
Read and write

Description
This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.
This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.

Values
Decimal (1..4294967293)

Default
1

### ATTRIBUTE Vr Pp Tbp preserveDomain (pds)

Access
Read and write

Criticality
Component

Description
This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain

information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.
If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.
Preserve domain is relevant only when used in conjunction with ATM MPE.

Values: off
on

Default: No default

## GROUP Vr Pp Tbp OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Vr Pp Tbp adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Pp Tbp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp Tbp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Pp Tbp OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp Tbp snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Vr Pp Tbp Operational (Oper)

Properties
Operational

Description
This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.

### ATTRIBUTE Vr Pp Tbp portName (pn)

Access
Read only

| | |
|---|---|
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbp upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |
| Values | unknown<br>tb |

| | |
|---|---|
| | sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp Tbp bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame. |
| Values | access<br>backbone |
| Default | No default |

### ATTRIBUTE Vr Pp Tbp bridgePortType (bpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port. |
| Values | ethernetBridgePort<br>tokenRingBridgePort<br>fddiBridgePort<br>tokenBusBridgePort<br>lanEmulationClientEthernet<br>fddiEncapsulatingBridgePort<br>vnsBridgePort<br>frameRelayBridgePort<br>pppBridgePort<br>smdsBridgePort |

srEncapSrBridgePort
srEncapTbBridgePort
sourceGateSrBridgePort
sourceGateTbBridgePort
srtbBridgePort
tbsrBridgePort
clusterSrBridgePort
clusterTbBridgePort
snaDlrBridgePort
unknown

Default: No default

### ATTRIBUTE Vr Pp Tbp ifIndex (ifin)

Access: Read only

Description: This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Values: Decimal (1..65535)

Default: No default

### ATTRIBUTE Vr Pp Tbp mtuExceededDiscards (med)

Access: Read only

Description: This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Values: Decimal (0..4294967295)

| | |
|---|---|
| Default | 0 |

### GROUP Vr Pp Tbp TbOperational (TbOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode |

### ATTRIBUTE Vr Pp Tbp maxInfo (mi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp badVerifyDiscards (bvd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and:<br>a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or<br>b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry.<br>Permission to receive frames from a MAC address is granted via the static table entries.<br>This attribute, *badVerifyDiscards*, is directly influenced by:<br>1. *secureOption* and<br>2. the static table entries.<br>This counter wraps around its maximum value of 4294967295. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp staticEntryDiscards (sed)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because of the following three reasons:<br>a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port.<br>b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state.<br>c) for spanning tree bpdus that are locally processed.<br>This counter wraps around its maximum value of 4294967295.<br>It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value.<br>Ideally this counter should be as low as possible. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp dynamicEntryDiscards (dend)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming frames that:<br>a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or<br>b) if the stp port state of the out port is not ***forwarding***.<br>This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp learningDiscards (ld)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp inDiscards (id)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp inFrames (if)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp outFrames (of)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management |

| | |
|---|---|
| | frames.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Tbp StpOperational (StpOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp. |

### ATTRIBUTE Vr Pp Tbp stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp Tbp stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Tbp designatedCost (dc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbp pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbp designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbp designatedPort (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbp forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp Tbp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp Tbp badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbp outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp Tbp NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Pp Tbp Ns Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> TransparentBridgePort NetSentry* This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp Tbp Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames. |

### ATTRIBUTE Vr Pp Tbp Ns incomingFilter (if)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the name of the filter to be applied at the incoming filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbp Ns outgoingFilter (of)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the out going filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### COMPONENT Vr Pp IpPort

| | |
|---|---|
| Groups | "GROUP Vr Pp IpPort Provisioned (Prov)"<br>"GROUP Vr Pp IpPort SresProvisioned (SresProv)"<br>"GROUP Vr Pp IpPort AdministrativeControl (AdminControl)"<br>"GROUP Vr Pp IpPort Operational (Oper)"<br>"GROUP Vr Pp IpPort RelayBcOperational (RelayBcOper)"<br>"GROUP Vr Pp IpPort OsiState (State)"<br>"GROUP Vr Pp IpPort OperationalStatus (OperStatus)" |
| Scope | Application |

| | |
|---|---|
| Description | *Vr<string> Pp<string> IpPort*<br>The *IpPort* component contains IP attributes specific to this port. |
| Opt. Subcomp. | "COMPONENT Vr Pp IpPort IpLogicalInterface (LogicalIf)"<br>"COMPONENT Vr Pp IpPort NetSentry (Ns)"<br>"COMPONENT Vr Pp IpPort BootpPort (BootpP)"<br>"COMPONENT Vr Pp IpPort VrrpPort"<br>"COMPONENT Vr Pp IpPort CriticalIp" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Pp IpPort Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for IP ports. |

### ATTRIBUTE Vr Pp IpPort maxTxUnit (mtu)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP MTU (Maximum Transmission Unit) supported by this *IpPort*. The specified MTU must be within the valid range for the *IpPort* media type. |
| Values | Decimal (0..0; 80..18944) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort arpStatus

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether ARP is enabled or disabled on this *IpPort*. If ***auto*** is specified, an appropriate value will be selected based on the *IpPort* media type. |

| | |
|---|---|
| Values | enabled<br>disabled<br>auto |
| Default | auto |

### ATTRIBUTE Vr Pp IpPort proxyArpStatus

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether Proxy ARP is enabled or disabled for this *IpPort*. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Pp IpPort arpNoLearn

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not dynamic host entries will be installed in the ARP table when ARP packets are received on this *IpPort*. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Pp IpPort sendRedirect

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not ICMP host redirects will be sent out this *IpPort*. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Vr Pp IpPort multicastStatus

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies whether or not IP multicast packets can be sent out this *IpPort*. If ***auto*** is specified, an appropriate value will be selected based on the *IpPort* media type. |
| Values | enabled<br>disabled<br>auto |
| Default | auto |

### ATTRIBUTE Vr Pp IpPort relayAddress

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a relay broadcast address for this *IpPort*. Each packet, received on this *IpPort*, meeting the relay broadcast criteria will be forwarded to the specified relay broadcast address. An relay address of all zero's indicates no relay broadcast address. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Pp IpPort relayBroadcast

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how packets, received on other *IpPort*s, meeting the relay broadcast criteria, will be forwarded out this *IpPort*. The three options are described as follows:<br>***enabled***: packets will be forwarded out this *IpPort*.<br>***disabled***: packets will not be forwarded out this *IpPort*.<br>***auto***: packets will be forwarded out this *IpPort* only when the bridge state is forwarding. |
| Values | enabled<br>disabled<br>auto |
| Default | disabled |

## ATTRIBUTE Vr Pp IpPort linkModel

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the link model to use when the media type for this *IpPort* is ***PPP*** (Point to Point Protocol). A value of ***localAreaNetwork*** causes IP to treat this *IpPort* like a LAN. A value of ***pointToPoint*** causes IP to treat this *IpPort* like two directly connected IP hosts. |
| Values | localAreaNetwork (lan)<br>pointToPoint (ptop) |
| Default | localAreaNetwork |

## ATTRIBUTE Vr Pp IpPort lanModel

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the lan model to use for this *IpPort*. |
| Values | localAreaNetwork (lan)<br>nonBroadcastMultipleAccess (nbma) |
| Default | localAreaNetwork |

## ATTRIBUTE Vr Pp IpPort encap

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the encapsulation type to be used when sending packets out this *IpPort*. If ***auto*** is specified, an appropriate value is selected based on the *IpPort* media type. The values ***ieee8023*** and ***ethernet*** can only be specified if the media type is ethernet. Otherwise, ***auto*** must be specified. For ethernet media type, the default encapsulation is ***ethernet***. |
| Values | ieee8023<br>ethernet<br>auto |
| Default | auto |

### ATTRIBUTE Vr Pp IpPort icmpMaskReply

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not replies will be generated in response to ICMP Address Mask Requests received on this *IpPort.* |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Vr Pp IpPort directedBroadcast

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not directed broadcast to physical broadcast translation is enabled for incoming traffic on this *IpPort.* The IP router requirement (RFC1812) says this translation should be ***enabled***; however, in some network environments, setting this attribute to ***disabled*** may prevent operational problem such as broadcast storms. Note that in some configuration, setting this attribute to ***disabled*** may cause Bootp to fail. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Vr Pp IpPort allowMcastMacDest (ammd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether a multicast destination MAC address is valid on this *IpPort* or not. Setting this attribute to ***enabled*** results in non-standard behavior and is intended for applications such as transparent server backup. Multicast destination MAC address is only supported on LAN media. |
| Values | enabled<br>disabled |
| Default | disabled |

## ATTRIBUTE Vr Pp IpPort cosPolicyAssignment (policy)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *CosPolicyGroup* the *IpPort* is using.<br><br>If this attribute is not set, then the *cosPolicyAssignment* attribute of the *Ip* specifies the *CosPolicyGroup* in use.<br><br>The assigned *CosPolicyGroup* controls the forwarding behavior of IP packets recieved and transmitted at the *IpPort*. See the description of *Vr Ip CosPolicyGroup* for more information.<br><br>If the *VirtualRouter* has a *DifferentiatedServicesDomain* subcomponent, then this attribute cannot be set.<br><br>The assigned *CosPolicyGroup* must be a subcomponent of the same *VirtualRouter.* |
| Values | Link (Service, linkToPolicyUsers) |
| Default | No default |

## ATTRIBUTE Vr Pp IpPort filterAssignment (filtAss)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *Filter* the *IpPort* is using.<br><br>If this attribute is not set, then the *filterAssignment* attribute of the *Ip* specifies the *Filter* in use.<br><br>This attribute cannot be set if the *linkToMedia* attribute of the parent *ProtocolPort* is linked to *Vr Ip Tunnel Sep* or *Vr Ip Tunnel Msep*.<br><br>The assigned *Filter* must be a subcomponent of the same *Virtual Router.* |
| Values | Link (Service, linkToFilterUsers) |
| Default | No default |

## ATTRIBUTE Vr Pp IpPort ipCos

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP connection class value of the link layer connection used by the *IpPort* if the media linked to the *ProtocolPort* is not *AtmMpe*, *FrDte* or *IpDlciGroup*.<br><br>If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* specifies the initial Class of Service (CoS) value assigned to an IP packet received at the *IpPort* if the media linked to the *ProtocolPort* is not *AtmMpe*, *FrDte* or *IpDlciGroup*. See the description of *Vr Ip CosPolicyGroup* for more information. |
| Values | Decimal (0..3) |
| Default | 0 |

## ATTRIBUTE Vr Pp IpPort ipDscp (dscp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value marked into the Differentiated Services Code Point (DSCP) field of an IP packet received at an *IpPort* if the media linked to the *ProtocolPort* is not *AtmMpe*, *FrDte* or *IpDlciGroup*. and if one of the following conditions is true:<br><br>1) the *IpPort* is linked to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, or<br><br>2) the *Ip* is linked to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, and the *IpPort* does not have the *diffServAssignment* attribute set.<br><br>If one of these conditions is true, then the *ipDscp* value must match a *VirtualRouter DifferentiatedServicesDomain PerHopBehavior* subcomponent instance value. See the description of *Vr Ip DifferentiatedServices* interface configuration |

for more information.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipDscp* must be set to ***na***.

## ATTRIBUTE Vr Pp IpPort diffServAssignment (ds)

Access

Read and write

Description

This attribute specifies the *DifferentiatedServices* interface configuration the *IpPort* is using.

If this attribute is not set, then the *diffServAssignment* attribute of

the *Ip* specifies the *DifferentiatedServices* interface configuration in use.

The assigned *DifferentiatedServices* interface configuration controls the forwarding behavior of IP packets recieved and transmitted at the *IpPort*. See the description of of *Vr Ip DifferentiatedServices* interface configuration for more information.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then this attribute cannot be set.

The assigned *DifferentiatedServices* interface configuration must be a subcomponent of the same *Virtual Router.*

| | |
|---|---|
| Values | Link (Service, linkToDiffServUsers) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort mcastDomain (mDomain)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the multicast domain index which all traffic coming in from this *IpPort* use. The numerical value of this attribute selects *Vr/<string> Ip Mcast Domain/n*. |
| Values | Decimal (0..3) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort mcastPolicyAssignment (mPolicy)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the policyGroup component that this IpPort component is using. |
| Values | Link (Service, linkToPolicyUser) |
| Default | No default |

## GROUP Vr Pp IpPort SresProvisioned (SresProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for *SourceRouteEndStation* support. |

## ATTRIBUTE Vr Pp IpPort sourceRouteEndStationSupport (sresSupport)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to ***enable*** or ***disable*** support for *SourceRouteEndStation (Sres)*. If set to ***enable***, *Sres* will be supported on this protocol on this *ProtocolPort (Pp)*. If set to ***disable***, it will not be supported. An *Sres* component must be provisioned under the VirtualRouter if this attribute is set to ***enable***. If this attribute is set to ***enable*** and this *Pp* has its *linkToMedia* attribute set, it must be linked to a *LanApplication* (*La*) that has its *Framer interfaceName* linked to a *Fddi* or *TokenRing* component. |
| Values | enable<br>disable |
| Default | disable |

## GROUP Vr Pp IpPort AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

## ATTRIBUTE Vr Pp IpPort snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp IpPort Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for an *IpPort*. |

### ATTRIBUTE Vr Pp IpPort mediaType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the media type of this *IpPort*. |
| Values | ethernet<br>fddi<br>tokenRing<br>ppp<br>bnx<br>vcpEther<br>vcpToken<br>x25<br>frameRelay<br>clusterBridge<br>smds<br>atmMpeVcEncap<br>atmMpeLlcEncap<br>lecEther<br>lecToken<br>tunnel<br>virtual<br>locaMedia<br>invalid |
| Default | invalid |

### ATTRIBUTE Vr Pp IpPort operMtu

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the current operational IP MTU for this *IpPort*. Note that this value may be different than the provisioned *maxTxUnit*. |
| Values | Decimal (0..0; 80..18944) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort operArpStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current operational ARP status. If the provisioned *arpStatus* is set to ***auto***, then the IP application automatically determines the *operArpStatus* based on the *IpPort* media type. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Pp IpPort operMulticastStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current operational Multicast status. If the provisioned *multicastStatus* is set to ***auto***, then the IP application automatically determines the *operMulticastStatus* based on the *IpPort* media type. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Pp IpPort operEncap

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current operational encapsulation type. If the provisioned *encap* is set to auto, then the IP application automatically determines the *operEncap* based on the *IpPort* media type. |

| | |
|---|---|
| Values | ieee8023<br>ethernet<br>notApplicable |
| Default | notApplicable |

### ATTRIBUTE Vr Pp IpPort operCosPolicyAssignment

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *CosPolicyGroup* the *IpPort* is using. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort operDiffServAssignment

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *DifferentiatedServices* interface configuration the *IpPort* is using. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort operFilterAssignment

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *Filter* the *IpPort* is using. |
| Values | The name of the component |
| Default | No default |

### GROUP Vr Pp IpPort RelayBcOperational (RelayBcOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for an *Interface*'s or *IpPort*'s RelayBc counters. |

### ATTRIBUTE Vr Pp IpPort relayAddressCount

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the number of frames received on this *Interface* or *IpPort* which were forwarded to the provisioned *relayAddress* for this port. This counter wraps to zero when it reaches it's maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort relayBcCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of frames received on this port which were forwarded to the *broadcastAddress* on other *IpPorts* or *Interfaces*. This counter is incremented once for every frame received on this port regardless of how many other ports it was sent on. This counter wraps to zero when it reaches it's maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp IpPort OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Pp IpPort adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vr Pp IpPort operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Vr Pp IpPort usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Pp IpPort OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp IpPort snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### COMPONENT Vr Pp IpPort IpLogicalInterface (LogicalIf)

Instance
IP address

Groups
"GROUP Vr Pp IpPort LogicalIf Provisioned (Prov)"
"GROUP Vr Pp IpPort LogicalIf ConnLink"

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> PP/<string> IpPort IpLogicalInterface/<IP address>*<br>The *IpLogicalInterface* component defines a single *IpPort* address on a logical IP network. In general, *IpPort*'s can have multiple *IpLogicalInterface*'s. However, if the media type is ***PPP*** (Point to Point Protocol), then only one *IpLogicalInterface* is allowed for that *IpPort*. |

## GROUP Vr Pp IpPort LogicalIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes required to define an *IpLogicalInterface*. |

## ATTRIBUTE Vr Pp IpPort LogicalIf netMask

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the subnet mask for this *IpLogicalInterface*. This attribute must be specified because the IP application will not automatically provide a default value.<br><br>The value must be ***255.255.255.255*** if *linkModel* attribute of *IpPort* component is set to ***pointToPoint***. For example, when |

*linkToMedia* attribute is set to ***alwaysUpInterface*** *mode VirtualMedia Interface* or *PPP* (Point to Point Protocol), *linkModel* attribute of *IpPort* component will be ***pointToPoint***.

The value must be one of classA, classB or classC if the *linkModel* attribute of *ipPort* component is set to ***localAreaNetwork***.

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Pp IpPort LogicalIf broadcastAddress

Access: Read and write

Description: This attribute specifies the broadcast address for this *IpLogicalInterface*. This attribute is ignored if the *IpPort mediaType* is ***ppp*** (Point to Point Protocol). If the value is 0.0.0.0, the actual broadcast address will be derived from the IP address of this *LogicalIf* and the *netmask* attribute.

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Pp IpPort LogicalIf linkDestinationAddress

Access: Read and write

Description: This attribute specifies the address for the link destination for this *IpLogicalInterface*. This attribute is only required if the *IpPort* media type is ***PPP*** (Point to Point Protocol).

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Pp IpPort LogicalIf linkToPimSmCandidateRp

Access: Read and write

Description: This attribute specifies a link to the *CandidateRendezvousPoint* component which uses this logicalIf as it's RendezvousPoint (*CRp*).

Values: Link (Service, address)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf linkToPimSmCandidateBsr

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a link to the *CandidateBootstrapRouter* component which uses this logicalIf as it's BootstrapRouter Interface. |
| Values | Link (Service, address) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf linkToMulticastStaticGroup

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a link to the component *RouteEntry* which uses this *LogicalIf* as its *outInterface*. There is a limit of up to 1000 *RouteEntry's* that could reference this *LogicalIf* as its *outInterface*. |
| List of | Link (Service, outInterfaces) |
| List Size | 1000 |
| Default | No default |

### GROUP Vr Pp IpPort LogicalIf ConnLink

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the links between this component and the associated media connections. |

### ATTRIBUTE Vr Pp IpPort LogicalIf linkToMediaConnection (conn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the media connections, *AtmMpe/m Ac/n* or *FrDte/m staticDlci/n*, that are associated with this component. |
| List of | Link (Service, linkToIpLogicalInterface) |
| Default | No default |

## COMPONENT Vr Pp IpPort LogicalIf IsisInterface (IsisIf)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpPort LogicalIf IsisIf Provisioned (Prov)"<br>"GROUP Vr Pp IpPort LogicalIf IsisIf Operational (Oper)"<br>"GROUP Vr Pp IpPort LogicalIf IsisIf Statistics (Stats)"<br>"GROUP Vr Pp IpPort LogicalIf IsisIf ErrorStatistics (Errors)" |
| Scope | Application |
| Description | *Rtr/<string> Interface/<Ip Address> IsisInterface*<br>An *IsisIf* component can be created under each *Interface* component to run the ISIS protocol.<br><br>This component requires an associated *Isis* component to be provisioned.<br><br>This component requires at least one *Level* subcomponent to be provisioned.<br><br>If the underlying media is ATM based, this component requires an *AtmConn* subcomponent to be provisioned. |

## GROUP Vr Pp IpPort LogicalIf IsisIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the set of attributes used to configure an ISIS Interface. |

## ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf snmpAdminStatus

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the administrative status of this *IsisInterface* component on this *Router.* |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf passive

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether the *IsisInterface* should be passive. A passive interface is one whose IP address is advertised in the LSP, but is not involved in ISIS protocol activities (for example, transmitting LSPs and establishing adjacencies). |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf lspInterval

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies, in milliseconds, the minimum time between transmission of successive LSPs on this interface. This minimum time applies to any LSP, whether it is the LSP of this *Router*, or another router's LSP that is being retransmitted. |
| Values | Decimal (33..65535) |
| Units | msec |
| Default | 100 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf lspRetransmitInterval

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies, in seconds, the minimum time to wait before retransmitting this *Router's* LSP on this interface. An LSP retransmission occurs if a previously transmitted LSP is not acknowledged. Retransmissions only occur on point-to-point links. |

| | |
|---|---|
| Values | Decimal (1..300) |
| Units | seconds |
| Default | 5 |

### GROUP Vr Pp IpPort LogicalIf IsisIf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes associated with the ISIS protocol running on this interface. |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf upTime

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the time, in seconds, that the ISIS protocol has been operational on this interface. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf adjacencyChanges (adjChanges)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times that an adjacency on this interface has changed state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Vr Pp IpPort LogicalIf IsisIf Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | The attributes in this group are statistics associated with the normal operation of this *IsisInterface* component. |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf txLsps

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of LSPs transmitted on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf rxLsps

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of LSPs received on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf txPtpHellos

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of point-to-point hellos transmitted on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf rxPtpHellos

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of point-to-point hellos received on this interface since the last time this *IsisIf* component became enabled. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf txBroadcastHellos

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of broadcast hellos transmitted on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf rxBroadcastHellos

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of broadcast hellos received on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf txCsnps

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of Complete Sequence Number PDUs (CSNPs) transmitted on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf rxCsnps

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the number of Complete Sequence Number PDUs (CSNPs) received on this interface since the last time this *Isis*If component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf txPsnps

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of Partial Sequence Number PDUs (PSNPs) transmitted on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf rxPsnps

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of Partial Sequence Number PDUs (PSNPs) received on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf totalPacketsTxd

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the total number of packets transmitted on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf totalPacketsRxd

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the total number of packets received on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Vr Pp IpPort LogicalIf IsisIf ErrorStatistics (Errors)

| | |
|---|---|
| Properties | Operational |
| Description | The attributes in this group are statistics associated with the operation of this *IsisInterface* component. Each attribute counts a specific abnormal event that has occurred since this component was last enabled. |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf initFails

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times that initialization of this ISIS interface has failed. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf adjRejects

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times that an attempt to form an adjacency on this interface has failed. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf rxUnknownPacketTypes

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of packets of unknown type that were received on this interface since the last time this *IsisIf* component became enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Pp IpPort LogicalIf IsisIf IsisIfLevel (Level)

| | |
|---|---|
| Instance | Decimal (1..1) |
| Groups | "GROUP Vr Pp IpPort LogicalIf IsisIf Level Provisioned (Prov)"<br>"GROUP Vr Pp IpPort LogicalIf IsisIf Level Operational (Oper)" |
| Scope | Application |
| Description | *Rtr/<string> Interface/<Ip Address> IsisIf Level/<1..2>*<br>The ISIS routing protocol supports a two-level routing hierarchy. This component represents ISIS routing aspects that are specific to each routing level for this ISIS interface. In the current release, only *Level/1* is supported. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp IpPort LogicalIf IsisIf Level Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes used to independently configure each ISIS interface routing level. |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level metric

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the cost of this interface, which is used by the SPF algorithm in this and other routers. This value is advertised in the LSP. |
| Values | Decimal (0..63) |
| Default | 10 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level helloInterval

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time, in seconds, between transmission of successive hello messages (IIH PDU). |
| Values | Decimal (1..20000) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level helloMultiplier

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the factor by which the *helloInterval* attribute is multiplied in order to create the hold time value transmitted in the hello packets (IIH PDU). The hold time value is used by the receiving router to determine how long it should maintain the adjacency if a subsequent hello packet is not received. |
| Values | Decimal (2..100) |
| Default | 3 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level csnpInterval

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time interval, in seconds, between successive transmissions of the CSNP PDUs. |
| Values | Decimal (1..600) |

| | |
|---|---|
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level priority

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the DIS priority for this router. On a multi-access LAN, the router with the highest DIS priority is elected to represent the LAN. The elected router transmits an LSP for the pseudonode representing the LAN. |
| Values | Decimal (0..127) |
| Default | 64 |

### GROUP Vr Pp IpPort LogicalIf IsisIf Level Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes representing the operational state of this *IsisIf Level* component. |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level disId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the system ID of the ISIS router acting as DIS for the LAN to which this interface is attached. For non-LAN interfaces, the value of this attribute is ***N/A***. |
| Values | String (1..14, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level disChanges

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of DIS changes that have occurred on this interface for this level. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level adjacencies

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of active adjacencies that exist on this interface for this level. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level timeToNextTxHello

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the time, in seconds, until the next Hello message is to be transmitted on this interface for this level. |
| Values | Decimal (0..600) |
| Units | seconds |
| Default | No default |

### COMPONENT Vr Pp IpPort LogicalIf OspfInterface (OspfIf)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpPort LogicalIf OspfIf Provisioned (Prov)"<br>"GROUP Vr Pp IpPort LogicalIf OspfIf Operational (Oper)"<br>"GROUP Vr Pp IpPort LogicalIf OspfIf Metric" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> IpPort logicalIf/<Ip Address> ospfIf*<br>*Rtr/<string> Interface/<Ip Address> OspfIf*<br>*Rtr/<string> Vrf/<string> Interface/<Ip Address> OspfIf*<br>An OspfIf component can be created under each *logicalIf* or *Interface* to run OSPF protocol. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Pp IpPort LogicalIf OspfIf TypeOfService (TOS)"<br>"COMPONENT Vr Pp IpPort LogicalIf OspfIf Neighbor (Nbr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp IpPort LogicalIf OspfIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes identifies a provisionable set of attributes. |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf areaId

| | |
|---|---|
| Access | Read and write |
| Description | The area Id this Ospf interface belongs to. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf ifType

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of this *OspfInterface*. Neighbors are dynamically discovered using the Hello protocol for an *ifType* of ***broadcast***, ***pointToPoint***, or ***pointToMultipoint*** when *pointToMultiPointMode* is set to ***broadcast***. A *Neighbor* component must be configured for an *ifType of* ***nbma*** or ***pointToMultiPoint***, when *pointToMultiPointMode* is set to ***nonBroadcast***. When *ifType* is set to ***passive***, neighbors are not required. |
| Values | broadcast<br>nbma<br>pointToPoint |

| | |
|---|---|
| | passive<br>pointToMultiPoint (ptmp) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The administrative status of this Ospf interface. |
| Values | up<br>down |
| Default | up |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf rtrPriority (rtrPri)

| | |
|---|---|
| Access | Read and write |
| Description | The priority of this interface. Used in multi-access networks, this field is used in the designated router election algorithm. The value 0 signifies that the router is not eligible to become the designated router on this particular protocol port. In the event of a tie in this value, routers will use their *routerId* as a tie breaker. |
| Values | Decimal (0..255) |
| Default | 1 |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf transitDelay

| | |
|---|---|
| Access | Read and write |
| Description | The estimated number of seconds it takes to transmit a link-state update packet over this interface. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 1 |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf retransInterval (retransInt)

| | |
|---|---|
| Access | Read and write |
| Description | The number of seconds between link-state advertisements retransmissions, for adjacencies belonging to this interface. This |

| | |
|---|---|
| | value is also used when retransmitting database description and link-state request packets. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf helloInterval (helloInt)

| | |
|---|---|
| Access | Read and write |
| Description | The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for all routers attached to a common network. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf rtrDeadInterval (rtrDeadInt)

| | |
|---|---|
| Access | Read and write |
| Description | The number of seconds that a router's hello packets have not been seen before it's neighbors declare the router down. This should be some multiple of the *helloIntereval*. This value must be the same for all routers attached to a common network. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 40 |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf pollInterval (pollInt)

| | |
|---|---|
| Access | Read and write |
| Description | The largest time interval, in seconds, between the hello packets sent to an inactive non-broadcast multi-access neighbor. |
| Values | Decimal (1..3600) |
| Units | seconds |

| | |
|---|---|
| Default | 120 |

### ATTRIBUTE Vr Pp IpPort LogicalIf Ospfif authKey

| | |
|---|---|
| Access | Write only |
| Description | The Authentication Key. If the value of the attribute *authType* of an *AreaEntry* is ***simplePassword***, and the *authKey* length is shorter than 8 octets, then the value of *authKey* will be left adjusted zero-filled to 8 octets. |
| Values | String (1..8, Hex) |
| Default | 0000000000000000 |

### ATTRIBUTE Vr Pp IpPort LogicalIf Ospfif multicastForwarding (multicastFwd)

| | |
|---|---|
| Access | Read and write |
| Description | The way multicasts should be forwarded on this interface; non forwarded, forwarded as data-link multicasts, or forwarded as data-link unicasts. Data-link multicasting is not meaningful on point-to-point and NBMA(No Broadcast Multi Access) interfaces, and setting this attribute to blocked effectively disables all multicast forwarding. |
| Values | blocked |
| Default | blocked |

### ATTRIBUTE Vr Pp IpPort LogicalIf Ospfif pointToMultiPointMode (ptmpmode)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Point-to-Multipoint mode to use when the *ifType* of this *OspfInterface* is ***pointToMultipoint***. A value of ***nonBroadcast*** restricts this interface to only send unicast packets, Hence, a *Neighbor* component must be configured. A value of ***broadcast*** enables sending multicast OSPF Hello packets to dynamically discover neighbors. |
| Values | nonBroadcast (nbc)<br>broadcast (bc) |
| Default | nonBroadcast |

## GROUP Vr Pp IpPort LogicalIf OspfIf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes identifies operational state that this interface is performing. |

## ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf state

| | |
|---|---|
| Access | Read only |
| Description | The state of the OSPF interface. |
| Values | down<br>loopback<br>waiting<br>pointToPoint<br>designatedRouter<br>backupDesignatedRouter<br>otherDesignatedRouter |
| Default | designatedRouter |

## ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf designatedRouter

| | |
|---|---|
| Access | Read only |
| Description | The Ip address of the designated router. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf backupDesignatedRouter

| | |
|---|---|
| Access | Read only |
| Description | The Ip address of the backup designated router |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf events

| | |
|---|---|
| Access | Read only |
| Description | The number of times this OSPF interface has changed its state or an error has occurred. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Vr Pp IpPort LogicalIf OspfIf Metric

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational metric attribute of this interface. |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf metric

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the metric being used by this *OspfIf*. The metric is derived in one of two ways:<br>1. If there is a *TypeOfService* component provisioned under this *OspfIf* component, then the value of the *metric* attribute is copied from the provisionable attribute *tosMetric*.<br>2. Otherwise, the metric is computed based on the interface speed. If the interface speed is greater than 100 Mbit/s, then the *metric* is 1. If the interface speed is less than 100 Mbit/s, then the metric is 100 Mbit/s divided by the interface speed. If the interface speed is unknown, then it is treated as 1.54 Mbit/s during the calculation.<br>The value of interface speed is available by displaying the *ifSpeed* attribute of the corresponding *IfTableEntry* component. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Pp IpPort LogicalIf OspfIf TypeOfService (TOS)

| | |
|---|---|
| Instance | Decimal (0..0) |
| Groups | "GROUP Vr Pp IpPort LogicalIf OspfIf TOS Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> IpPort logicalIf/<Ip Address> ospfIf OspfIfTypeOfService/<Decimal>*<br>*Rtr/<string> If/<Ip Address> ospfIf OspfIfTypeOfService/ <Decimal>*<br>*Rtr/<string> Vrf/<string> If/<Ip Address> ospfIf* |

*OspfIfTypeOfService/<Decimal>*
This component describes the metrics to be advertised for a specified interface at various types-of-service.

*Rtr/<string> If/<Ip Address> ospfIf OspfIfNeighbor/<Ip Address>*
*Rtr/<string> Vrf/<string> If/<Ip Address> ospfIf OspfIfNeighbor/<Ip Address>*
This component represents a neighbor on a multi-access non-broadcast *OspfInterface* configured with its *ifType* attribute set to one of the following:
- ***nbma*** and the *rtrPriority* attribute is set to non-zero or

- ***pointToMultiPoint*** and *pointToMultiPointMode* is set to ***nonBroadcast***.

The operational attributes for this component can also be viewed from:
*Vr/<string> Ip Ospf NbrEntry/<Ip Address>,<Decimal>* or
*Rtr/<string> Ospf NbrEntry/<Ip Address>,<Decimal>* or
*Rtr/<string> Vrf/<string> Ospf NbrEntry/<Ip Address>,<Decimal>*

## GROUP Vr Pp IpPort LogicalIf OspfIf Nbr Provisioned (Prov)

Properties: Provisioned

Description: Identifies a group of Provisionable attributes.

## ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr priority

Access: Read and write

Description: The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network. The higher the number, the better are the chances of being a designated router.

Values: Decimal (0..255)

Default: 1

## GROUP Vr Pp IpPort LogicalIf OspfIf Nbr Operational (Oper)

Properties: Operational

Description: Contains the Operational set of attributes for the Neighbor.

## ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr rtrId

Access: Read only

| | |
|---|---|
| Description | An Ip Address uniquely identifying the neighboring router in the Autonomous System. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr options

| | |
|---|---|
| Access | Read only |
| Description | A bit mask corresponding to the neighbor's options field. Bit 0, if set, indicates that the area accepts and operates on external information, if zero, it is a stub area. Bit 1, if set, indicates that the system will operate on Type of Service metrics other than TOS 0. If zero, the neighbor will ignore all metrics except the TOS 0 metric. Bit 2, if set, indicates that the system is Network Multicast capable; i.e., that it implements OSPF Multicast Routing. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr state

| | |
|---|---|
| Access | Read only |
| Description | The state of the relationship with this neighbor. |
| Values | down<br>attempt<br>init<br>twoWay<br>exchangeStart<br>exchange<br>loading<br>full |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr events

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of times this neighbor relationship has changed state, or an error has occurred. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr lsRetransQlen

| | |
|---|---|
| Access | Read only |
| Description | The current length of the Retransmission queue. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr exchangeStatus

| | |
|---|---|
| Access | Read only |
| Description | Indicates the exchange status for a neighbor Entry. |
| Values | master<br>slave |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr permanance

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays how the neighbor became an entry. |
| Values | permanent<br>dynamic |
| Default | permanent |

### COMPONENT Vr Pp IpPort LogicalIf RipInterface (RipIf)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpPort LogicalIf RipIf Provisioned (Prov)"<br>"GROUP Vr Pp IpPort LogicalIf RipIf Operational (Stat)" |
| Scope | Application |
| Description | *Vr/<X> Pp/<X> IpPort LogicalIf/<Ip Address> RipInterface*<br>*Rtr/<X> Interface/<X> RipInterface* |

*Rtr/<X> Vrf/<X> Interface/<X> RipInterface*
This component is used to configure a *LogicalIf* or an *Interface* to run RIP protocol.

Opt. Subcomp. "COMPONENT Vr Pp IpPort LogicalIf RipIf Neighbor (Nbr)"

Common Verbs

### GROUP Vr Pp IpPort LogicalIf RipIf Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes of the *RipIf* component.

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf snmpAdminStatus

Access Read and write

Description Identifies the administrative status of this *RipInterface*. Setting this value to ***disabled*** will have the effect of rendering it inactive.

Values
up
down

Default up

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf metric

Access Read and write

Description This attribute is the RIP metric for this logical interface.

Values Decimal (1..16)

Default 1

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf poisonReverseFlag (poison)

Access Read and write

| | |
|---|---|
| Description | If the value of this attribute is set to ***true***, then poison reverse algorithm is used when sending out the updates otherwise use split horizon only. |
| Values | true<br>false |
| Default | false |

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf flashUpdateFlag

| | |
|---|---|
| Access | Read and write |
| Description | This attribute when set to ***true*** will send updates when updates are received; otherwise RIP will wait till the next update period. |
| Values | true<br>false |
| Default | true |

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf networkRouteStatus

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines what type of network routes will be sent and whether a default route will be generated for this *RipInterface*. Generated default routes will not go into the routing table, but are sent in the updates going out on the interface. The possible values for this<br>attribute are:<br><br>***naturalNetWithOutDefaultRoute*** - This value will cause normal RIP network routes to be put in the update. This means that the address of *logicalIf* or *Interface* pertaining to this *RipInterface* knowledge is taken into account in determining if the subnetted network or the natural network is sent for any route going into this update.<br><br>***naturalNetWithDefaultRoute*** - Selecting this value will cause a default route to be generated with the value of the metric selected for the attribute *defaultRouteMetric*.<br><br>***defaultRouteOnly*** - Selection of this value causes the default route to be generated with the value of the metric selected for the |

attribute *defaultRouteMetric*.
NOTE: No other routes will go in the update.

***subnetsOnly*** - selection of this value will cause only subnet information to be put in the update. No default routes will be generated or passed on. Only subnetted routes that are part of the same subnetted network that this *logicalInterface* or *Interface* is on will be put in the update.
NOTE: this also effects receiving of updates on this interface. Only subnetted routes that are part of the same subnetted network that this *logicalInterface* or *Interface* is on will be accepted on a received RIP update on this *RipInterface*.

Values: naturalNetWithOutDefaultRoute (noDefault)
naturalNetWithDefaultRoute (withDefault)
defaultRouteOnly (defaultOnly)
subnetsOnly (subnets)

Default: naturalNetWithOutDefaultRoute

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf defaultRouteMetric

Access: Read and write

Description: This attribute identifies the metric value for the default route. This value is only used if the attribute *networkRouteStatus* is configured with a value of either ***naturalNetWithDefaultRoute*** or ***defaultRouteOnly***

Values: Decimal (1..16)

Default: 1

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf acceptDefault

Access: Read and write

Description: If this attribute is set to true, then accept the default route from this interface.

Values: true
false

Default: true

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf ifConfSend

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies what the router sends on this *RipIf*. ***ripVersion1*** implies sending RIP updates compliant with RFC 1058. ***rip1Compatible*** implies broadcasting RIP-2 updates according to RFC 1058. ***ripVersion2*** implies multicasting RIP-2 updates. |
| Values | doNotSend (silent)<br>ripVersion1 (v1)<br>rip1Compatible (v2b)<br>ripVersion2 (v2) |
| Default | rip1Compatible |

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf ifConfReceive

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies which version of RIP updates are to be accepted on this *RipIf*. Note that ***rip2*** and ***rip1OrRip2*** implies reception of multicast packets. |
| Values | rip1 (v1)<br>rip2 (v2)<br>rip1OrRip2 (both)<br>doNotReceive (reject) |
| Default | rip1OrRip2 |

### GROUP Vr Pp IpPort LogicalIf RipIf Operational (Stat)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes of the *RipIf* component. These attributes are statistical data corresponding to the RIP-2 standard MIB (rfc 1724) rip2Status table. |

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf ifBadPacketRcv

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of RIP response packets recieved by the RIP process which were subsequently discarded for any reason. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf ifBadRouteRcv

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many routes, in valid RIP packets, were ignored for any reason. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort LogicalIf RipIf ifTriggeredUpdates

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of triggered updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp IpPort LogicalIf RipIf Neighbor (Nbr)

| | |
|---|---|
| Instance | IP address |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> IpPort logicalIf/<Ip Address> RipIf Neighbor/<Ip address>*<br>*Rtr/<string> Interface/<Ip Address> RipIf Neighbor/<Ip address>*<br>*Rtr/<string> Vrf/<string> Interface/<Ip Address> RipIf Neighbor/<Ip address>*<br><br>This component is used to configure the Ip Address of the non broadcast multi access (NBMA) neighbor. |

|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## COMPONENT Vr Pp IpPort LogicalIf NhrpInterface (NhrpIf)

| | |
|---|---|
| Scope | Application |
| Description | *Vr/x Pp/x IpPort LogicalIf/<ipAddress> NhrpInterface*<br>This component is used to configure a *LogicalIf* to run NHRP protocol. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## COMPONENT Vr Pp IpPort LogicalIf LocalHost (Host)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP Vr Pp IpPort LogicalIf Host Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<n> Pp/<n> IpPort LogicalIf/<addr> LocalHost/<addr>*<br><br>This component represents an instance of *LocalHost* functionality, which is used by an application to access the IP forwarding capability of this *VirtualRouter.*<br><br>The instance value is the IP address used by the application, and is a member of the local subnet represented by the parent *LogicalIf* component. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp IpPort LogicalIf Host Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status information for this *LocalHost* component. |

### ATTRIBUTE Vr Pp IpPort LogicalIf Host hostName

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the component name representing the application which is registered as this *LocalHost*. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort LogicalIf Host hostStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the activity status of the application which is registered as this *LocalHost*.<br><br>A value of ***up*** means that the application is ready to accept IP traffic from and supply IP traffic to the *VirtualRouter*.<br><br>A value of ***down*** means that the application is not ready to accept IP traffic from the *VirtualRouter*, and is not supplying IP traffic to the *VirtualRouter*. |
| Values | up<br>down |
| Default | No default |

## COMPONENT Vr Pp IpPort LogicalIf IgmpInterface (IgmpIf)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpPort LogicalIf IgmpIf Provisioned (Prov)"<br>"GROUP Vr Pp IpPort LogicalIf IgmpIf Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> IpPort LogicalIf/<Ip Address> IgmpIf*<br>This component is used to configure a *logicalIf* to run the Igmp protocol. The *Igmp* component must be added under multicast. Only 1 *logicalIf* that can have a *IgmpIf* under the same port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Pp IpPort LogicalIf IgmpIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *IpIgmpIf* component. |

## ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf version (ver)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IGMP protocol version running on this interface. v2 is the only supported version at this time. |
| Values | v2 |
| Default | v2 |

## ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf queryInterval

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the frequency at which IGMP Host-Query packets are transmitted on this interface. |
| Values | Decimal (1..3600) |
| Units | seconds |

| | |
|---|---|
| Default | 125 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf queryMaxRespTime

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum query response time advertised in IGMPv2 queries on this interface. The number of seconds represented by the *queryMaxRespTime* must be less than the Query Interval. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 10 |

### GROUP Vr Pp IpPort LogicalIf IgmpIf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of *IpIgmpIf* component. |

### ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf querier

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the address of the IGMP Querier on the IP subnet to which this interface is attached. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf wrongVersionQuery (wvq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of queries received whose IGMP version does not match that configured for this interface. IGMP requires that all routers on a LAN be configured to run the same version of IGMP. |
| Values | Decimal (0..4292967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf joins

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of times a group membership has been added on this interface. |
| Values | Decimal (0..4292967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf groups

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of entries for this interface in the cache table. |
| Values | Decimal (0..4292967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf querierExpiryTime (qet)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the amount of time remaining before the other querier present timer expires. If the local system is the querier, the value of this attribute is zero. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 0 |

### COMPONENT Vr Pp IpPort LogicalIf PimSparseModeInterface (PimSmIf)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpPort LogicalIf PimSmIf Porvisioned (Prov)"<br>"GROUP Vr Pp IpPort LogicalIf PimSmIf Operational (Oper)" |
| Scope | Application |
| Description | Vr/<string> Pp/<string> Ipport Logical/<addr> PimSmIf. This component is used to configure a logicalIf to run PIM-SM protocol. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp IpPort LogicalIf PimSmIf Porvisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *PimSmIf* component. |

### ATTRIBUTE Vr Pp IpPort LogicalIf PimSmIf helloInterval (hello)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the frequency at which PIM-SM hello messages are transmitted on this interface. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 30 |

### GROUP Vr Pp IpPort LogicalIf PimSmIf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *PimSmIf* component. |

### ATTRIBUTE Vr Pp IpPort LogicalIf PimSmIf designatedRouter (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Designated Router on this PIM-SM interface. For non-broadcast media such as AtmMpe and FrDte, this attribute has the value 0.0.0.0. |
| Values | IP address |
| Default | No default |

## COMPONENT Vr Pp IpPort NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpPort Ns Provisioned (Prov)" |
| Scope | Application |
| Description | This component allows the configuration of *NetSentry* filters for this *IpPort*. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp IpPort Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes required by *NetSentry* to be applied to all IP packets going through this *IpPort*. |

## ATTRIBUTE Vr Pp IpPort Ns incomingFilter

| | |
|---|---|
| Access | Read and write |
| Description | An ASCII string which provides the name of the *NetSentry* filter which will be applied to all IP datagrams arriving from this *IpPort*. |
| Values | String (0..32, ASCII) |
| Default | "" |

## ATTRIBUTE Vr Pp IpPort Ns outgoingFilter

| | |
|---|---|
| Access | Read and write |
| Description | An ASCII string which provides the name of *NetSentry* filter which will be applied to all IP datagrams sent to this *IpPort*. |
| Values | String (0..32, ASCII) |
| Default | "" |

## COMPONENT Vr Pp IpPort BootpPort (BootpP)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpPort BootpP Provisioned (Prov)"<br>"GROUP Vr Pp IpPort BootpP AdministrativeControl (AdminControl)"<br>"GROUP Vr Pp IpPort BootpP OperationalStatus (OperStatus)"<br>"GROUP Vr Pp IpPort BootpP OsiState (State)"<br>"GROUP Vr Pp IpPort BootpP Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> IpPort BootpPort*<br>*Rtr/<string> Interface/<string> BootpPort*<br>*Rtr/<string> Vrf/<string> Interface/<string> BootpPort*<br>An *BootpPort* component must be provisioned for each *IpPort* or *Interface* where BOOTP request messages will be received. Each *BootpPort* component can be provisioned with a set of relay addresses. Each BOOTP request message received on this port will be sent to the provisioned set of relay addresses. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp IpPort BootpP Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *BootpPort* component. |

## ATTRIBUTE Vr Pp IpPort BootpP relayForwardStatus (status)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute controls how BOOTP request packets, received on another port, will be flooded out this port. If *relayForwardStatus* is ***enabled***, BOOTP requests received on another port will be broadcast out this port. When *relayForwardStatus* is ***disabled***, |

BOOTP requests will not be broadcast out this port. If ***auto*** is used, the bridge spanning tree database is used to determine if BOOTP requests should be broadcast out this port.

Note that when using ***enabled***, it is possible to create misconfigurations which will result in broadcast storms. When using this feature with multiple routers, make sure there are no broadcast forwarding loops. Using ***auto*** with bridge spanning tree is safer to use if the network is running bridge spanning tree.

Note that for ***auto*** to have effect, bridge spanning tree must be running on the corresponding *VirtualRouter ProtocolPort* or *Rtr Interface* or *Rtr Vrf Interface*.

Values: enabled
disabled
auto

Default: disabled

### ATTRIBUTE Vr Pp IpPort BootpP bootpLogicalInterface (portIf)

Access: Read and write

Description: This attribute identifies the logical interface whose address is to be the GIADDR of this BOOTP port. If not set, the address of the first logical port or Interface is chosen.

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Pp IpPort BootpP relayAddress (addr)

Access: Read and write

Description: This attribute identifies a list of relay addresses. When a BOOTP request message is received on this port, the request will be forwarded to the IP addresses provisioned in *relayAddress*. Note that BOOTP requests are also broadcast out all other *BootpPort*'s according to the *relayForwardStatus* of the outgoing port.

List of: IP address

List Size: 3

| | |
|---|---|
| Default | No default |

### GROUP Vr Pp IpPort BootpP AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Pp IpPort BootpP snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp IpPort BootpP OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Pp IpPort BootpP snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

Default up

### GROUP Vr Pp IpPort BootpP OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp IpPort BootpP adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

### ATTRIBUTE Vr Pp IpPort BootpP operationalState (osiOper)

Access Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Pp IpPort BootpP usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Pp IpPort BootpP Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains *BootpPortEntry* component statistics. |

### ATTRIBUTE Vr Pp IpPort BootpP inRequests

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BOOTP Request messages received on this port. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort BootpP inReplies

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BOOTP Reply messages received on this port. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort BootpP outRequests

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts total the number of BOOTP Request messages broadcast out on this port. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort BootpP outReplies

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BOOTP Reply messages sent out on this port. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort BootpP inRequestErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of BOOTP Request messages received on this port but not forwarded due to an error. An error occurs if the BOOTP hop limit has been exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpPort BootpP inReplyErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BOOTP Reply messages received on this port but not forwarded due to an error. An error occurs if the giaddr field in the BOOTP reply does not match an IP address assigned to this *VirtualRouter* or *Rtr* or *Rtr Vrf*, or if the output *IpPort* or *Interface* for the BOOTP reply is not provisioned for BOOTP. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp IpPort VrrpPort

| | |
|---|---|
| Instance | Decimal (1..255) |
| Groups | "GROUP Vr Pp IpPort VrrpPort Provisioned (Prov)"<br>"GROUP Vr Pp IpPort VrrpPort Operational (Oper)"<br>"GROUP Vr Pp IpPort VrrpPort AdministrativeControl (AdminControl)"<br>"GROUP Vr Pp IpPort VrrpPort OperationalStatus (OperStatus)"<br>"GROUP Vr Pp IpPort VrrpPort OsiState (State)" |
| Scope | Application |
| Description | Vr/<string> Pp/<string> IpPort VrrpPort/n<br>This component contains attributes that define a VRRP virtual router instance associated with this *IpPort*. The component instance (n) is the VRRP virtual router VRID. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Pp IpPort VrrpPort Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the VrrpPort component. |

### ATTRIBUTE Vr Pp IpPort VrrpPort priority

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the priority of *VrrpPort* during election of a master VRRP virtual router. A priority of 0 (zero) is reserved for the master to indicate it is releasing responsibility for the VRRP virtual router. A priority of 255 is reserved for the VRRP virtual router that owns (has as real interfaces) the IP addresses associated with this *VrrpPort*. |
| Values | Decimal (1..255) |
| Default | 100 |

### ATTRIBUTE Vr Pp IpPort VrrpPort advertisementInterval

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval between VRRP advertisements which will be sent by the master VRRP virtual router. |
| Values | Decimal (1..255) |
| Units | seconds |

| | |
|---|---|
| Default | 1 |

### ATTRIBUTE Vr Pp IpPort VrrpPort linkToCriticalIp (linkToCIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *CriticalIp* instance to which this *VrrpPort* instance is linked. If the *IpPort* associated with this *CriticalIp* instance becomes disabled, the *VrrpPort* will transition to “backup” state. |
| Values | Link (Service, linkToVrrp) |
| Default | No default |

### ATTRIBUTE Vr Pp IpPort VrrpPort ipAddresses

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies one or more IP addresses associated with this *VrrpPort* instance (VRID). All VRRP virtual routers with this VRID must have the same set of IP addresses configured. Each of the IP addresses in the list must be on the same subnet as an *IpLogicalInterface* for the *IpPort*. All the IP addresses in the list must be owned by this VRRP virtual router or by other VRRP virtual routers but not a combination. |
| List of | IP address |
| Default | No default |

### GROUP Vr Pp IpPort VrrpPort Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *VrrpPort* component. |

### ATTRIBUTE Vr Pp IpPort VrrpPort virtualRouterState

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of this *VrrpPort* instance. It will be one of three states: initialize, backup and master. |

| | |
|---|---|
| Values | initialize<br>backup<br>master |
| Default | initialize |

### ATTRIBUTE Vr Pp IpPort VrrpPort virtualRouterPhysicalAddress

| | |
|---|---|
| Access | Read only |
| Description | This attributes indicates the physcial address of the *VrrpPort*. The address is a virtual physical address of the form “00-00-5e-00-01-VRID” where the VRID is the instance value of the *VrrpPort*. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp IpPort VrrpPort AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Pp IpPort VrrpPort snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp IpPort VrrpPort OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |

Description — This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp IpPort VrrpPort snmpOperStatus

Access — Read only

Description — The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values — up
down
testing

Default — up

### GROUP Vr Pp IpPort VrrpPort OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp IpPort VrrpPort adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it

is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Pp IpPort VrrpPort operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp IpPort VrrpPort usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## COMPONENT Vr Pp IpPort CriticalIp

Instance
Decimal (1..255)

Groups
"GROUP Vr Pp IpPort CriticalIp Provisioned (Prov)"

Scope
Application

Description
*Vr/<string> Pp/<string> IpPort CriticalIp/n*
The *CriticalIp* component defines a critical *IpPort* for use by the VRRP virtual router with the same instance (VRID) as the *CriticalIp* instance. If the *IpPort* associated with this *CriticalIp* instance becomes disabled the *VrrpPort* linked to this *CriticalIp* will transition to “backup” state.

Common Verbs

## GROUP Vr Pp IpPort CriticalIp Provisioned (Prov)

Properties
Provisioned

Description
This group contains the provisionable attributes for the *CriticalIp* component.

## ATTRIBUTE Vr Pp IpPort CriticalIp linkToVrrp

Access
Read and write

| | |
|---|---|
| Description | This attribute defines the *VrrpPort* to which this *CriticalIp* has been linked. When the *IpPort* associated with this *CriticalIp* becomes disabled, the linked *VrrpPort* will transition to “backup” state. |
| Values | Link (Service, linkToCriticalIp) |
| Default | No default |

## COMPONENT Vr Pp IpxPort (IpxP)

| | |
|---|---|
| Instance | link<br>ethernet<br>novell<br>sap<br>snap<br>vns<br>tunnel |

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Pp IpxP AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Pp IpxP snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp IpxP Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | The Provisionable group for the *IpxPort* component. |

### ATTRIBUTE Vr Pp IpxP networkNumberProv (netP)

| | |
|---|---|
| Access | Read and write |
| Description | The Ipx network number of the network directly connected to this port. |
| Values | String (0..4, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp IpxP defaultType (defType)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates which protocol is to run on a protocol port.<br>In the case of a lan media it is to be set to broadcast.<br>In the case of WAN media the following choices are to be exercised:<br>For running Pre-IPXWAN RIP set value to *other*.<br>For running numbered RIP set value to *wanRip*.<br>For running un-numbered RIP set value to *unnumberedRip*.<br>Setting this value to *ppp* will signify unnumbered Rip running on a ppp port. |
| Values | other<br>broadcast<br>ppp<br>wanRip<br>unnumberedRip |
| Default | No default |

### ATTRIBUTE Vr Pp IpxP broadcastInhibit (bInh)

| | |
|---|---|
| Access | Read and write |
| Description | If this attribute is set, all outgoing periodic and triggered updates for RIP and SAP will be inhibited for the port. However the port |

will still accept incoming RIP and SAP packets on the port. This may be useful for ports with only a bank of servers on its network in order to limit the routing traffic, assuming that servers don't require routing information or other server information.

Values
enabled
disabled

Default
disabled

### GROUP Vr Pp IpxP SresProvisioned (SresProv)

Properties
Provisioned

Description
This group contains the provisioned attributes for *SourceRouteEndStation* support.

### ATTRIBUTE Vr Pp IpxP sourceRouteEndStationSupport (sresSupport)

Access
Read and write

Description
This attribute is used to ***enable*** or ***disable*** support for *SourceRouteEndStation (Sres)*. If set to ***enable***, *Sres* will be supported on this protocol on this *ProtocolPort (Pp)*. If set to ***disable***, it will not be supported. An *Sres* component must be provisioned under the VirtualRouter if this attribute is set to ***enable***. If this attribute is set to ***enable*** and this *Pp* has its *linkToMedia* attribute set, it must be linked to a *LanApplication* (*La*) that has its *Framer interfaceName* linked to a *Fddi* or *TokenRing* component.

Values
enable
disable

Default
disable

### GROUP Vr Pp IpxP OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp IpxP adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vr Pp IpxP operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp IpxP usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Pp IpxP OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp IpxP snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp IpxP Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | The *IpxPort* Operational Attributes. |

### ATTRIBUTE Vr Pp IpxP type

| | |
|---|---|
| Access | Read only |
| Description | The type of the circuit. This would differ from the provisioned type when a different routing protocol is negotiated with the peer. |
| Values | other<br>broadcast<br>ppp<br>wanRip<br>unnumberedRip |
| Default | No default |

### ATTRIBUTE Vr Pp IpxP encapsulation (encapO)

| | |
|---|---|
| Access | Read only |
| Description | Packet encapsulation type that the router has determined to use on the port. There are seven encapsulation types used to identify IPX datagram as listed below.<br><br>1. ***link***: IPX encapsulation type for PPP, ATM MPE, and X25DTE media types.<br><br>2. ***ethernet*:** IPX encapsulation type for Ethernet and FrDte media types.<br><br>3. ***novell*:** IPX encapsulation type for Ethernet and FrDte media types.<br><br>4. ***sap*:** IPX encapsulation type for FDDI, Token Ring, |

Ethernet and FrDte media types.

5. ***snap*:** IPX encapsulation type for FDDI, Token Ring, Ethernet, and FrDte media types.

6. ***vns*:** IPX encapsulation type for VNS media type.

7. ***tunnel***: IPX encapsulation type for Tunnel media type.

| | |
|---|---|
| Values | link<br>ethernet<br>novell<br>sap<br>snap<br>vns<br>tunnel |
| Default | No default |

### ATTRIBUTE Vr Pp IpxP networkNumber (netO)

| | |
|---|---|
| Access | Read only |
| Description | The Ipx network number from the provisioned *networkNumberProv* value. |
| Values | String (0..4, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp IpxP node

| | |
|---|---|
| Access | Read only |
| Description | The Ipx node address of this *IpxPort*. |
| Values | String (1..6, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp IpxP Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | The *IpxPort* Statistics group. |

### ATTRIBUTE Vr Pp IpxP stateChanges

| | |
|---|---|
| Access | Read only |
| Description | Number of times the port has changed state. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP inReceives

| | |
|---|---|
| Access | Read only |
| Description | Total number of packets received. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP forwarded

| | |
|---|---|
| Access | Read only |
| Description | Number of packets forwarded. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp IpxP RipPort (RipP)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpxP RipP Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> PP/<string> IpxP RipP*<br>The RIP specific information pertaining to this *IpxPort* component. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Pp IpxP RipP Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | RIP specific statistics for this *IpxPort*. |

## ATTRIBUTE Vr Pp IpxP RipP inPackets (inPkts)

| | |
|---|---|
| Access | Read only |
| Description | The number of RIP packets received on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Pp IpxP RipP inRequests

| | |
|---|---|
| Access | Read only |
| Description | The number of RIP request packets received on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Pp IpxP RipP inResponses

| | |
|---|---|
| Access | Read only |
| Description | The number of RIP response packets received on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Pp IpxP RipP outPackets (outPkts)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of RIP packets sent out on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP RipP outRequests

| | |
|---|---|
| Access | Read only |
| Description | The number of RIP request packets sent out on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP RipP outResponses

| | |
|---|---|
| Access | Read only |
| Description | The number of RIP response packets sent out on this *IpxPort*. This includes RIP periodic update packets. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP RipP incorrectPackets

| | |
|---|---|
| Access | Read only |
| Description | Number of times that an incorrectly formatted RIP packet was received on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp IpxP SapPort (SapP)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpxP SapP Statistics (Stats)" |

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> PP/<string> IpxP SapP*<br>The SAP specific information pertaining to this *IpxPort* component. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp IpxP SapP Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | SAP specific statistics for this *IpxPort*. |

### ATTRIBUTE Vr Pp IpxP SapP inPackets (inPkts)

| | |
|---|---|
| Access | Read only |
| Description | The total number of SAP packets received on this *IpxPort*. Includes SAP requests and responses. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP SapP inRequests

| | |
|---|---|
| Access | Read only |
| Description | The number of SAP Request packets received on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP SapP inResponses

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of SAP response packets received on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP SapP outPackets (outPkts)

| | |
|---|---|
| Access | Read only |
| Description | The total number of SAP packets sent out this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP SapP outRequests

| | |
|---|---|
| Access | Read only |
| Description | The number of SAP request packets sent out on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP SapP outResponses

| | |
|---|---|
| Access | Read only |
| Description | The number of SAP response packets sent out this *IpxPort*. This includes periodic SAP update packets. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp IpxP SapP incorrectPackets

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | Number of times an incorrectly formatted SAP packet was received on this *IpxPort*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp IpxP IpxWanPort (IWP)

| | |
|---|---|
| Instance | String (1..8, Dashed Hex) |
| Groups | "GROUP Vr Pp IpxP IWP Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> PP/<string> IpxP IWP*<br>This component contains information for this *IpxPort* that are specific to the IPXWAN protocol. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp IpxP IWP Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that are specific for the IPXWAN protocol. |

### ATTRIBUTE Vr Pp IpxP IWP neighbourRouterName (neiName)

| | |
|---|---|
| Access | Read only |
| Description | The name of the neighboring router on a WAN circuit. |
| Values | String (0..48, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp IpxP IWP neighbourInternalNetworkNumber (neiNet)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The internal network number of the neighboring router on a WAN circuit. |
| Values | String (1..4, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp IpxP IWP initFails

| | |
|---|---|
| Access | Read only |
| Description | The number of times initialization has failed on this circuit. This counter wraps around to zero after reaching the maximum value of 4294967295 |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Pp IpxP NetSentryPort (NetSentryP)

| | |
|---|---|
| Groups | "GROUP Vr Pp IpxP NetSentryP Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> IpxP NetSentryPort*<br>This component contains the NetSentry attributes that specify the names of the NetSentry filters which will be applied to IPX packets as incoming and outgoing filters. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Pp IpxP NetSentryP Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the NetSentry attributes that specify the names of the NetSentry filters which will be applied to IPX packets as incoming and outgoing filters. |

### ATTRIBUTE Vr Pp IpxP NetSentryP inComingFilter (inFilt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the NetSentry filter applied to incoming IPX packets on this port. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp IpxP NetSentryP outGoingFilter (outFilt)

| | |
|---|---|
| Access | Read and write |
| Description | The name of the filter applied to outgoing IPX packets on this port. |
| Values | String (0..32, ASCII) |
| Default | No default |

### COMPONENT Vr Pp SourceRouteBridgePort (SrBp)

| | |
|---|---|
| Groups | "GROUP Vr Pp SrBp Provisioned (Prov)"<br>"GROUP Vr Pp SrBp StpProvisioned (StpProv)"<br>"GROUP Vr Pp SrBp DomainInfoProvisioned (DIProv)"<br>"GROUP Vr Pp SrBp OsiState (State)"<br>"GROUP Vr Pp SrBp OperationalStatus (OperStatus)"<br>"GROUP Vr Pp SrBp Operational (Oper)"<br>"GROUP Vr Pp SrBp StpOperational (StpOper)"<br>"GROUP Vr Pp SrBp Statistics (Stats)"<br>"GROUP Vr Pp SrBp SrProvisioned (SrProv)"<br>"GROUP Vr Pp SrBp SrStatistics (SrStats)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> SourceRouteBridgePort*<br>This component represents a source route bridge port. It contains all the attributes (provisionable and operational attributes) necessary for the operation of this bridge port. The source route bridge port provides a way to facilitate source route bridging on a media interface. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Pp SrBp NetSentry (Ns)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp SrBp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port. |

## ATTRIBUTE Vr Pp SrBp fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Vr Pp SrBp portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. |

Notes:
Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.

The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

| | |
|---|---|
| Values | Decimal (0..255) |
| Default | 0 |

### GROUP Vr Pp SrBp StpProvisioned (StpProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp. |

### ATTRIBUTE Vr Pp SrBp adminStatus (as)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation. |

Values
up
down

Default
up

### ATTRIBUTE Vr Pp SrBp portStateStpControl (psstpc)

Access
Read and write

Description
This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.
***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.
A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.

Values
off
on

Default
on

### ATTRIBUTE Vr Pp SrBp stpTypeProv (stptProv)

Access
Read and write

Description
This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*.

Values
dec
ieee8021

Default
ieee8021

### ATTRIBUTE Vr Pp SrBp portPriority (ppr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:<br>1) 0-255 for stp type DEC and<br>2) 0-65535 for stp type IEEE. |
| Values | Decimal (0..65535) |
| Default | 128 |

### ATTRIBUTE Vr Pp SrBp pathCost (pc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise. |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Vr Pp SrBp pathCostMethod (pcm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*. |
| Values | off<br>dec<br>ieee8021 |
| Default | ieee8021 |

### GROUP Vr Pp SrBp DomainInfoProvisioned (DIProv)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port. |

### ATTRIBUTE Vr Pp SrBp domainNum (dn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.<br>This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation. |
| Values | Decimal (1..4294967293) |
| Default | 1 |

### ATTRIBUTE Vr Pp SrBp preserveDomain (pds)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.<br>If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.<br>Preserve domain is relevant only when used in conjunction with ATM MPE. |

| | |
|---|---|
| Values | off<br>on |
| Default | No default |

### GROUP Vr Pp SrBp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Pp SrBp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Pp SrBp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Pp SrBp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Pp SrBp OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Pp SrBp snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp SrBp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port. |

### ATTRIBUTE Vr Pp SrBp portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |
| Values | unknown<br>tb<br>sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a |

MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.

Values
access
backbone

Default
No default

### ATTRIBUTE Vr Pp SrBp bridgePortType (bpt)

Access
Read only

Description
This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.

Values
ethernetBridgePort
tokenRingBridgePort
fddiBridgePort
tokenBusBridgePort
lanEmulationClientEthernet
fddiEncapsulatingBridgePort
vnsBridgePort
frameRelayBridgePort
pppBridgePort
smdsBridgePort
vcpBridgePort
x25BridgePort
atmMpeBridgePort
srEncapSrBridgePort
srEncapTbBridgePort
sourceGateSrBridgePort
sourceGateTbBridgePort
srtbBridgePort
tbsrBridgePort
clusterSrBridgePort
clusterTbBridgePort

| | |
|---|---|
| | snaDlrBridgePort<br>unknown |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp ifIndex (ifin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp mtuExceededDiscards (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.<br>This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp SrBp StpOperational (StpOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp. |

### ATTRIBUTE Vr Pp SrBp stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp SrBp stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp SrBp designatedCost (dc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute |

| | |
|---|---|
| | *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp designatedPort (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295.<br>A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp SrBp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp SrBp badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp SrBp SrProvisioned (SrProv)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp SrBp hopCount (hc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame |
| Values | Decimal (1..7) |
| Default | 7 |

### ATTRIBUTE Vr Pp SrBp exploreFrameTreatment (eft)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled.<br>A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic. |
| Values | encap<br>xlate |
| Default | encap |

### ATTRIBUTE Vr Pp SrBp lanId (lid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |

| | |
|---|---|
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp internalLanId (ilid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp bridgeNum (bid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments. |
| Values | Decimal (0..15) |
| Default | 7 |

### ATTRIBUTE Vr Pp SrBp largestFrame (lf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted. |
| Values | Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp steSpanMode (steSm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame.<br>If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState*.<br>If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState*.<br>***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded. |
| Values | autoSpan<br>disabled<br>forced |
| Default | autoSpan |

### ATTRIBUTE Vr Pp SrBp areRdLimit (arl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### ATTRIBUTE Vr Pp SrBp steRdLimit (srl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8. |

| | |
|---|---|
| Values | Decimal (0..8) |
| Default | 8 |

### GROUP Vr Pp SrBp SrStatistics (SrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp SrBp specInFrames (sif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp specOutFrames (srfof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp apeInFrames (apeif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp apeOutFrames (apeof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp steInFrames (steif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp steOutFrames (steof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp segmentMismatchDiscards (lidmd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp dupSegmentDiscards (dsd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp hopCountExceededDiscards (hced)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp dupLanIdOrTreeErrors (dlte)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp lanIdMismatches

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp staticDiscards (sd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrBp dynamicDiscards (dd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp SrBp NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Pp SrBp Ns Provisioned (Prov)" |

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> Pp/<string> TransparentBridgePort NetSentry*<br>This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp SrBp Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames. |

### ATTRIBUTE Vr Pp SrBp Ns incomingFilter (if)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the incoming filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp SrBp Ns outgoingFilter (of)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the out going filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

## COMPONENT Vr Pp SourceRouteTransparentBridgePort (SrtBp)

| | |
|---|---|
| Groups | "GROUP Vr Pp SrtBp Provisioned (Prov)"<br>"GROUP Vr Pp SrtBp TbProvisioned (TbProv)"<br>"GROUP Vr Pp SrtBp StpProvisioned (StpProv)"<br>"GROUP Vr Pp SrtBp DomainInfoProvisioned (DIProv)"<br>"GROUP Vr Pp SrtBp OsiState (State)"<br>"GROUP Vr Pp SrtBp OperationalStatus (OperStatus)"<br>"GROUP Vr Pp SrtBp Operational (Oper)"<br>"GROUP Vr Pp SrtBp TbOperational (TbOper)"<br>"GROUP Vr Pp SrtBp StpOperational (StpOper)"<br>"GROUP Vr Pp SrtBp Statistics (Stats)"<br>"GROUP Vr Pp SrtBp SrProvisioned (SrProv)"<br>"GROUP Vr Pp SrtBp SrStatistics (SrStats)" |
| Scope | Application |
| Description | Vr/*<string>* *Pp/<string>* *SourceRouteTransparentBridgePort*<br>This component represents a Source Route Transparent (SRT) bridge port. It contains all the attributes (provisionable and operational attributes) necessary for the operation of the bridge port. The SRT bridge port provides a mechanism to transmit and receive both source route and transparent bridge frames. In essence, the SRT bridging scheme defines a method for TB bridges to handle SR frames. SRT bridge ports participate in the transparent bridging spanning tree protocol. |
| Opt. Subcomp. | "COMPONENT Vr Pp SrtBp NetSentry (Ns)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp SrtBp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port. |

### ATTRIBUTE Vr Pp SrtBp fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Vr Pp SrtBp portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.<br>Notes:<br>Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.<br><br>The portNum is set as component critical since bridging also uses |

the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

Values: Decimal (0..255)

Default: 0

### GROUP Vr Pp SrtBp TbProvisioned (TbProv)

Properties: Provisioned

Description: This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.

### ATTRIBUTE Vr Pp SrtBp secureOption (sos)

Access: Read and write

Description: This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen:
a) disallows dynamic learning,
b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame.
c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty.
This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.

Values: disabled
enabled

Default: disabled

## GROUP Vr Pp SrtBp StpProvisioned (StpProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp. |

## ATTRIBUTE Vr Pp SrtBp adminStatus (as)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation. |
| Values | up<br>down |
| Default | up |

## ATTRIBUTE Vr Pp SrtBp portStateStpControl (psstpc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.<br>***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.<br>A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE Vr Pp SrtBp stpTypeProv (stptProv)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*. |
| Values | dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp SrtBp portPriority (ppr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:<br>1) 0-255 for stp type DEC and<br>2) 0-65535 for stp type IEEE. |
| Values | Decimal (0..65535) |
| Default | 128 |

### ATTRIBUTE Vr Pp SrtBp pathCost (pc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise. |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Vr Pp SrtBp pathCostMethod (pcm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*. |
| Values | off<br>dec<br>ieee8021 |
| Default | ieee8021 |

### GROUP Vr Pp SrtBp DomainInfoProvisioned (DIProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port. |

### ATTRIBUTE Vr Pp SrtBp domainNum (dn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.<br>This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation. |
| Values | Decimal (1..4294967293) |
| Default | 1 |

### ATTRIBUTE Vr Pp SrtBp preserveDomain (pds)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.<br>If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.<br>Preserve domain is relevant only when used in conjunction with ATM MPE. |
| Values | off<br>on |
| Default | No default |

### GROUP Vr Pp SrtBp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Pp SrtBp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Pp SrtBp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp SrtBp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Pp SrtBp OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp SrtBp snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Vr Pp SrtBp Operational (Oper)

Properties
Operational

Description
This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.

### ATTRIBUTE Vr Pp SrtBp portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |

| | |
|---|---|
| Values | unknown<br>tb<br>sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame. |
| Values | access<br>backbone |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp bridgePortType (bpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port. |
| Values | ethernetBridgePort<br>tokenRingBridgePort<br>fddiBridgePort<br>tokenBusBridgePort<br>lanEmulationClientEthernet<br>fddiEncapsulatingBridgePort<br>vnsBridgePort<br>frameRelayBridgePort |

pppBridgePort
smdsBridgePort
vcpBridgePort
x25BridgePort
atmMpeBridgePort
srEncapSrBridgePort
srEncapTbBridgePort
sourceGateSrBridgePort
sourceGateTbBridgePort
srtbBridgePort
tbsrBridgePort
clusterSrBridgePort
clusterTbBridgePort
snaDlrBridgePort
unknown

Default: No default

### ATTRIBUTE Vr Pp SrtBp ifIndex (ifin)

Access: Read only

Description: This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Values: Decimal (1..65535)

Default: No default

### ATTRIBUTE Vr Pp SrtBp mtuExceededDiscards (med)

Access: Read only

Description: This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp SrtBp TbOperational (TbOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode |

### ATTRIBUTE Vr Pp SrtBp maxInfo (mi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp badVerifyDiscards (bvd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and:<br>a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or<br>b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry.<br>Permission to receive frames from a MAC address is granted via the static table entries.<br>This attribute, *badVerifyDiscards*, is directly influenced by:<br>1. *secureOption* and<br>2. the static table entries. |

This counter wraps around its maximum value of 4294967295.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Vr Pp SrtBp staticEntryDiscards (sed)

Access Read only

Description This attribute counts the number of frames that were discarded because of the following three reasons:
a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port.
b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state.
c) for spanning tree bpdus that are locally processed.
This counter wraps around its maximum value of 4294967295.
It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value.
Ideally this counter should be as low as possible.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Vr Pp SrtBp dynamicEntryDiscards (dend)

Access Read only

Description This attribute counts the number of incoming frames that:
a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or
b) if the stp port state of the out port is not ***forwarding***.
This counter wraps around its maximum value of 4294967295.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Vr Pp SrtBp learningDiscards (ld)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp inDiscards (id)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp inFrames (if)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp outFrames (of)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp SrtBp StpOperational (StpOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp. |

### ATTRIBUTE Vr Pp SrtBp stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp SrtBp stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |

| | |
|---|---|
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp SrtBp designatedCost (dc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp designatedPort (dp)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295.<br>A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp SrtBp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp SrtBp badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp SrtBp SrProvisioned (SrProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp SrtBp hopCount (hc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame |
| Values | Decimal (1..7) |
| Default | 7 |

### ATTRIBUTE Vr Pp SrtBp exploreFrameTreatment (eft)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This |

| | |
|---|---|
| | option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled.<br>A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic. |
| Values | encap<br>xlate |
| Default | encap |

### ATTRIBUTE Vr Pp SrtBp lanId (lid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp internalLanId (ilid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp bridgeNum (bid)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments. |
| Values | Decimal (0..15) |
| Default | 7 |

### ATTRIBUTE Vr Pp SrtBp largestFrame (lf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted. |
| Values | Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp steSpanMode (steSm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame.<br>If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState*.<br>If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState*.<br>***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded. |
| Values | autoSpan<br>disabled<br>forced |
| Default | autoSpan |

### ATTRIBUTE Vr Pp SrtBp areRdLimit (arl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### ATTRIBUTE Vr Pp SrtBp steRdLimit (srl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### GROUP Vr Pp SrtBp SrStatistics (SrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp SrtBp specInFrames (sif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp specOutFrames (srfof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp apeInFrames (apeif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp apeOutFrames (apeof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp steInFrames (steif)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp steOutFrames (steof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp segmentMismatchDiscards (lidmd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp dupSegmentDiscards (dsd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp hopCountExceededDiscards (hced)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp dupLanIdOrTreeErrors (dlte)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp lanIdMismatches

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp staticDiscards (sd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp SrtBp dynamicDiscards (dd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp SrtBp NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Pp SrtBp Ns Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> TransparentBridgePort NetSentry* This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp SrtBp Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames. |

### ATTRIBUTE Vr Pp SrtBp Ns incomingFilter (if)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the incoming filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp SrtBp Ns outgoingFilter (of)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the out going filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### COMPONENT Vr Pp SrseBridgePort (Srse)

| | |
|---|---|
| Groups | "GROUP Vr Pp Srse Provisioned (Prov)"<br>"GROUP Vr Pp Srse StpProvisioned (StpProv)"<br>"GROUP Vr Pp Srse DomainInfoProvisioned (DIProv)"<br>"GROUP Vr Pp Srse OsiState (State)" |

"GROUP Vr Pp Srse OperationalStatus (OperStatus)"
"GROUP Vr Pp Srse Operational (Oper)"
"GROUP Vr Pp Srse StpOperational (StpOper)"
"GROUP Vr Pp Srse Statistics (Stats)"
"GROUP Vr Pp Srse SrProvisioned (SrProv)"
"GROUP Vr Pp Srse SrStatistics (SrStats)"

Scope: Application

Description: Vr/*<string> Pp/<string> SrseBridgePort*
This component represents the access point for source route frames destined for the source route encapsulating logic. Source route encapsulated bridging enables source routed frames to be tunneled through a transparent bridge/source route transparent cloud in order to reach a remote source route network. This mechanism provides for virtual connectivity of source route networks across non source route networks. The *SrseBridgePort* essentially provides an access point for source route frames into this virtual connectivity. Note that the *SrseBridgePort* and the *TbseBridgePort* must be provisioned in the same provisioning session. Enabling/disabling the *SrseBridgePort* automatically enables/disables the *TbseBridgePort*.

## GROUP Vr Pp Srse Provisioned (Prov)

Properties: Provisioned

Description: This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.

## ATTRIBUTE Vr Pp Srse fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Vr Pp Srse portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.<br>Notes:<br>Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.<br><br>The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute. |
| Values | Decimal (0..255) |

| | |
|---|---|
| Default | 0 |

### GROUP Vr Pp Srse StpProvisioned (StpProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp. |

### ATTRIBUTE Vr Pp Srse adminStatus (as)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation. |
| Values | up<br>down |
| Default | up |

### ATTRIBUTE Vr Pp Srse portStateStpControl (psstpc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.<br>***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.<br>A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology. |
| Values | off<br>on |

| | |
|---|---|
| Default | on |

### ATTRIBUTE Vr Pp Srse stpTypeProv (stptProv)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*. |
| Values | dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Srse portPriority (ppr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:<br>1) 0-255 for stp type DEC and<br>2) 0-65535 for stp type IEEE. |
| Values | Decimal (0..65535) |
| Default | 128 |

### ATTRIBUTE Vr Pp Srse pathCost (pc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise. |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Vr Pp Srse pathCostMethod (pcm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*. |
| Values | off<br>dec<br>ieee8021 |
| Default | ieee8021 |

### GROUP Vr Pp Srse DomainInfoProvisioned (DIProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port. |

### ATTRIBUTE Vr Pp Srse domainNum (dn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.<br>This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation. |
| Values | Decimal (1..4294967293) |
| Default | 1 |

### ATTRIBUTE Vr Pp Srse preserveDomain (pds)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.<br>If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.<br>Preserve domain is relevant only when used in conjunction with ATM MPE. |
| Values | off<br>on |
| Default | No default |

### GROUP Vr Pp Srse OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Pp Srse adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Pp Srse operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp Srse usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Pp Srse OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp Srse snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Vr Pp Srse Operational (Oper)

Properties
Operational

Description
This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.

### ATTRIBUTE Vr Pp Srse portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Srse upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |

| | |
|---|---|
| Values | unknown<br>tb<br>sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp Srse bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame. |
| Values | access<br>backbone |
| Default | No default |

### ATTRIBUTE Vr Pp Srse bridgePortType (bpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port. |
| Values | ethernetBridgePort<br>tokenRingBridgePort<br>fddiBridgePort<br>tokenBusBridgePort<br>lanEmulationClientEthernet<br>fddiEncapsulatingBridgePort<br>vnsBridgePort<br>frameRelayBridgePort |

unknown

Default — No default

### ATTRIBUTE Vr Pp Srse ifIndex (ifin)

Access — Read only

Description — This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Values — Decimal (1..65535)

Default — No default

### ATTRIBUTE Vr Pp Srse mtuExceededDiscards (med)

Access — Read only

Description — This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Srse StpOperational (StpOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp. |

### ATTRIBUTE Vr Pp Srse stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp Srse stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Srse designatedCost (dc)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp Srse pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Srse designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp Srse designatedPort (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp Srse forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp Srse Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp Srse badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Srse SrProvisioned (SrProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp Srse hopCount (hc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame |
| Values | Decimal (1..7) |
| Default | 7 |

### ATTRIBUTE Vr Pp Srse exploreFrameTreatment (eft)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled.<br>A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic. |
| Values | encap<br>xlate |
| Default | encap |

### ATTRIBUTE Vr Pp Srse lanId (lid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse internalLanId (ilid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse bridgeNum (bid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments. |
| Values | Decimal (0..15) |
| Default | 7 |

### ATTRIBUTE Vr Pp Srse largestFrame (lf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is |

| | |
|---|---|
| | used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted. |
| Values | Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Vr Pp Srse steSpanMode (steSm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame.<br>If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState*.<br>If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState*.<br>***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded. |
| Values | autoSpan<br>disabled<br>forced |
| Default | autoSpan |

### ATTRIBUTE Vr Pp Srse areRdLimit (arl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### ATTRIBUTE Vr Pp Srse steRdLimit (srl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### GROUP Vr Pp Srse SrStatistics (SrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp Srse specInFrames (sif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse specOutFrames (srfof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse apeInFrames (apeif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse apeOutFrames (apeof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse steInFrames (steif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse steOutFrames (steof)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse segmentMismatchDiscards (lidmd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse dupSegmentDiscards (dsd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse hopCountExceededDiscards (hced)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Pp Srse dupLanIdOrTreeErrors (dlte)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse lanIdMismatches

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse staticDiscards (sd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srse dynamicDiscards (dd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT Vr Pp TbseBridgePort (Tbse)

| | |
|---|---|
| Groups | "GROUP Vr Pp Tbse Provisioned (Prov)"<br>"GROUP Vr Pp Tbse TbProvisioned (TbProv)"<br>"GROUP Vr Pp Tbse StpProvisioned (StpProv)"<br>"GROUP Vr Pp Tbse DomainInfoProvisioned (DIProv)"<br>"GROUP Vr Pp Tbse OsiState (State)"<br>"GROUP Vr Pp Tbse OperationalStatus (OperStatus)"<br>"GROUP Vr Pp Tbse Operational (Oper)"<br>"GROUP Vr Pp Tbse TbOperational (TbOper)"<br>"GROUP Vr Pp Tbse StpOperational (StpOper)"<br>"GROUP Vr Pp Tbse Statistics (Stats)" |
| Scope | Application |
| Description | Vr/*<string> Pp/<string> TbseBridgePort*<br>This component represents the access point or TB/SRT frames carrying a payload of a SR frame, into the SR encapsulation logic. After the encapsulated frame is stripped and the SR frame extracted, the extracted frame is handed down to regular SR bridging logic for further forwarding. The *TbseBridgePort* is the end point in the remote bridge unit with a MAC address, the TB/SRT encapsulated SR frames are directed to. This MAC address of a *TbseBridgePort* in the remote bridge unit, is learned and stored in the Lan Id Table (*peerMACAddress)* of the local bridge unit. Please note that the *SrseBridgePort* and the *TbseBridgePort* are always to be provisioned together. Enabling/disabling the *SrseBridgePort* automatically enables/disables the *TbseBridgePort*. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Pp Tbse Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port. |

### ATTRIBUTE Vr Pp Tbse fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Vr Pp Tbse portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.<br>Notes:<br>Escape routines exist for initializing, copying, and deleting port |

numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.

The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

| | |
|---|---|
| Values | Decimal (0..255) |
| Default | 0 |

### GROUP Vr Pp Tbse TbProvisioned (TbProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode. |

### ATTRIBUTE Vr Pp Tbse secureOption (sos)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen:<br>a) disallows dynamic learning,<br>b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of |

the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame.
c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty.
This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.

Values
disabled
enabled

Default
disabled

### GROUP Vr Pp Tbse StpProvisioned (StpProv)

Properties
Provisioned

Description
This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.

### ATTRIBUTE Vr Pp Tbse adminStatus (as)

Access
Read and write

Description
This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.

Values
up
down

Default
up

### ATTRIBUTE Vr Pp Tbse portStateStpControl (psstpc)

Access
Read and write

Description
This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received

bridge protocol data units and by sending out the same.
***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.
A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.

Values
off
on

Default
on

### ATTRIBUTE Vr Pp Tbse stpTypeProv (stptProv)

Access
Read and write

Description
This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*.

Values
dec
ieee8021

Default
ieee8021

### ATTRIBUTE Vr Pp Tbse portPriority (ppr)

Access
Read and write

Description
This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:
1) 0-255 for stp type DEC and
2) 0-65535 for stp type IEEE.

Values
Decimal (0..65535)

| | |
|---|---|
| Default | 128 |

### ATTRIBUTE Vr Pp Tbse pathCost (pc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise. |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Vr Pp Tbse pathCostMethod (pcm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*. |
| Values | off<br>dec<br>ieee8021 |
| Default | ieee8021 |

### GROUP Vr Pp Tbse DomainInfoProvisioned (DIProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port. |

### ATTRIBUTE Vr Pp Tbse domainNum (dn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired |

specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.
This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.

Values: Decimal (1..4294967293)

Default: 1

### ATTRIBUTE Vr Pp Tbse preserveDomain (pds)

Access: Read and write

Criticality: Component

Description: This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.
If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.
Preserve domain is relevant only when used in conjunction with ATM MPE.

Values: off
on

Default: No default

### GROUP Vr Pp Tbse OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies

about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp Tbse adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Pp Tbse operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Vr Pp Tbse usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP Vr Pp Tbse OperationalStatus (OperStatus)

Properties: Operational

Description: This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp Tbse snmpOperStatus

Access: Read only

Description: The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable

| | |
|---|---|
| | to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp Tbse Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port. |

### ATTRIBUTE Vr Pp Tbse portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbse upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |
| Values | unknown<br>tb<br>sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp Tbse bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame. |
| Values | access<br>backbone |
| Default | No default |

## ATTRIBUTE Vr Pp Tbse bridgePortType (bpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port. |
| Values | ethernetBridgePort<br>tokenRingBridgePort<br>fddiBridgePort<br>tokenBusBridgePort<br>lanEmulationClientEthernet<br>fddiEncapsulatingBridgePort<br>vnsBridgePort<br>frameRelayBridgePort<br>pppBridgePort<br>smdsBridgePort<br>vcpBridgePort<br>x25BridgePort<br>atmMpeBridgePort<br>srEncapSrBridgePort<br>srEncapTbBridgePort<br>sourceGateSrBridgePort<br>sourceGateTbBridgePort<br>srtbBridgePort<br>tbsrBridgePort<br>clusterSrBridgePort<br>clusterTbBridgePort<br>snaDlrBridgePort<br>unknown |
| Default | No default |

## ATTRIBUTE Vr Pp Tbse ifIndex (ifin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained. |

| | |
|---|---|
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbse mtuExceededDiscards (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.<br>This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Tbse TbOperational (TbOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode |

### ATTRIBUTE Vr Pp Tbse maxInfo (mi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse badVerifyDiscards (bvd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and:<br>a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or<br>b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry.<br>Permission to receive frames from a MAC address is granted via the static table entries.<br>This attribute, *badVerifyDiscards*, is directly influenced by:<br>1. *secureOption* and<br>2. the static table entries.<br>This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse staticEntryDiscards (sed)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because of the following three reasons:<br>a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port.<br>b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state.<br>c) for spanning tree bpdus that are locally processed.<br>This counter wraps around its maximum value of 4294967295.<br>It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value.<br>Ideally this counter should be as low as possible. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse dynamicEntryDiscards (dend)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming frames that:<br>a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or<br>b) if the stp port state of the out port is not ***forwarding***.<br>This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse learningDiscards (ld)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse inDiscards (id)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse inFrames (if)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse outFrames (of)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Tbse StpOperational (StpOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp. |

### ATTRIBUTE Vr Pp Tbse stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking |

| | |
|---|---|
| | listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp Tbse stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Tbse designatedCost (dc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbse pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbse designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbse designatedPort (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbse forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295.<br>A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp Tbse Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp Tbse badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbse outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp SrsgBridgePort (Srsg)

| | |
|---|---|
| Groups | "GROUP Vr Pp Srsg Provisioned (Prov)"<br>"GROUP Vr Pp Srsg StpProvisioned (StpProv)"<br>"GROUP Vr Pp Srsg DomainInfoProvisioned (DIProv)"<br>"GROUP Vr Pp Srsg OsiState (State)"<br>"GROUP Vr Pp Srsg OperationalStatus (OperStatus)"<br>"GROUP Vr Pp Srsg Operational (Oper)"<br>"GROUP Vr Pp Srsg StpOperational (StpOper)"<br>"GROUP Vr Pp Srsg Statistics (Stats)" |

"GROUP Vr Pp Srsg SrProvisioned (SrProv)"
"GROUP Vr Pp Srsg SrStatistics (SrStats)"

Scope

Application

Description

Vr/*<string> Pp/<string> SrsgBridgePort*
This component represents a controlled method to allow exchange of explorer frames between source route (SR) and source route transparent (SRT) networks.The *SrsgBridgePort* provides a cross over point for explorer frames from the source route network into the source route gating logic and vice-versa. The source route gating performs required verification before forwarding the frames into the source route transparent network. The *SrsgBridgePort* participates in the source route spanning tree to eliminate possible loops caused by multiple active cross over points on multiple bridges and to provide for fault tolerance of these cross over points. While enabled, source route spanning tree BPDUs are sent across the source route transparent network, through this cross over point and the gating logic. Note that these explorer frames cross over based on the port's *stpPortState.*
All route explorer frames (ARE) are exchanged regardless of the *stpPortState*.
Spanning tree explorer frames (STE) are exchanged only if *stpPortState* has a value of ***Forwarding.***
If *stpPortState* has a value of ***Blocking*** STE frames will be sent out on bridge ports that are operating in the same mode, i.e. no exchange across SR and SRT networks takes place. Nevertheless, SR spanning tree BPDUs are still sent across the SRT network. Note that the *SrsgBridgePort* and the *TbsgBridgePort* must be provisioned during the same provisioning session as one cannot function without the other.

## GROUP Vr Pp Srsg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port. |

## ATTRIBUTE Vr Pp Srsg fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Vr Pp Srsg portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.<br>Notes:<br>Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending |

deletion state, the same port number could be temporarily assigned to two ports for a short period of time.

The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

Values: Decimal (0..255)

Default: 0

### GROUP Vr Pp Srsg StpProvisioned (StpProv)

Properties: Provisioned

Description: This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.

### ATTRIBUTE Vr Pp Srsg adminStatus (as)

Access: Read and write

Description: This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.

Values: up
down

Default: up

### ATTRIBUTE Vr Pp Srsg portStateStpControl (psstpc)

Access: Read and write

Description: This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.
***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.

A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.

Values
off
on

Default
on

### ATTRIBUTE Vr Pp Srsg stpTypeProv (stptProv)

Access
Read and write

Description
This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*.

Values
dec
ieee8021

Default
ieee8021

### ATTRIBUTE Vr Pp Srsg portPriority (ppr)

Access
Read and write

Description
This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:
1) 0-255 for stp type DEC and
2) 0-65535 for stp type IEEE.

Values
Decimal (0..65535)

Default
128

### ATTRIBUTE Vr Pp Srsg pathCost (pc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise. |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Vr Pp Srsg pathCostMethod (pcm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*. |
| Values | off<br>dec<br>ieee8021 |
| Default | ieee8021 |

### GROUP Vr Pp Srsg DomainInfoProvisioned (DIProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port. |

### ATTRIBUTE Vr Pp Srsg domainNum (dn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains |

possible are 4294967293.
This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.

Values: Decimal (1..4294967293)

Default: 1

### ATTRIBUTE Vr Pp Srsg preserveDomain (pds)

Access: Read and write

Criticality: Component

Description: This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.
If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.
Preserve domain is relevant only when used in conjunction with ATM MPE.

Values: off
on

Default: No default

### GROUP Vr Pp Srsg OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp Srsg adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vr Pp Srsg operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Pp Srsg usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Pp Srsg OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Pp Srsg snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp Srsg Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port. |

### ATTRIBUTE Vr Pp Srsg portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg downTime (dt)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |
| Values | unknown<br>tb<br>sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame. |
| Values | access<br>backbone |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg bridgePortType (bpt)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port. |
| Values | ethernetBridgePort<br>tokenRingBridgePort<br>fddiBridgePort<br>tokenBusBridgePort<br>lanEmulationClientEthernet<br>fddiEncapsulatingBridgePort<br>vnsBridgePort<br>frameRelayBridgePort<br>pppBridgePort<br>smdsBridgePort<br>vcpBridgePort<br>x25BridgePort<br>atmMpeBridgePort<br>srEncapSrBridgePort<br>srEncapTbBridgePort<br>sourceGateSrBridgePort<br>sourceGateTbBridgePort<br>srtbBridgePort<br>tbsrBridgePort<br>clusterSrBridgePort<br>clusterTbBridgePort<br>snaDlrBridgePort<br>unknown |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg ifIndex (ifin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg mtuExceededDiscards (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.<br>This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Srsg StpOperational (StpOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp. |

### ATTRIBUTE Vr Pp Srsg stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp Srsg stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Srsg designatedCost (dc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Pp Srsg designatedPort (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295.<br>A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |

| | |
|---|---|
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp Srsg Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp Srsg badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Srsg SrProvisioned (SrProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp Srsg hopCount (hc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame |
| Values | Decimal (1..7) |
| Default | 7 |

### ATTRIBUTE Vr Pp Srsg exploreFrameTreatment (eft)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled.<br>A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic. |
| Values | encap<br>xlate |
| Default | encap |

### ATTRIBUTE Vr Pp Srsg lanId (lid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg internalLanId (ilid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg bridgeNum (bid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments. |
| Values | Decimal (0..15) |
| Default | 7 |

### ATTRIBUTE Vr Pp Srsg largestFrame (lf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted. |
| Values | Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Vr Pp Srsg steSpanMode (steSm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame.<br>If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState*.<br>If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState*.<br>***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded. |

| | |
|---|---|
| Values | autoSpan<br>disabled<br>forced |
| Default | autoSpan |

### ATTRIBUTE Vr Pp Srsg areRdLimit (arl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### ATTRIBUTE Vr Pp Srsg steRdLimit (srl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### GROUP Vr Pp Srsg SrStatistics (SrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp Srsg specInFrames (sif)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg specOutFrames (srfof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg apeInFrames (apeif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg apeOutFrames (apeof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg steInFrames (steif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg steOutFrames (steof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg segmentMismatchDiscards (lidmd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg dupSegmentDiscards (dsd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg hopCountExceededDiscards (hced)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg dupLanIdOrTreeErrors (dlte)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg lanIdMismatches

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg staticDiscards (sd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srsg dynamicDiscards (dd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp TbsgBridgePort (Tbsg)

| | |
|---|---|
| Groups | "GROUP Vr Pp Tbsg Provisioned (Prov)"<br>"GROUP Vr Pp Tbsg TbProvisioned (TbProv)"<br>"GROUP Vr Pp Tbsg StpProvisioned (StpProv)"<br>"GROUP Vr Pp Tbsg DomainInfoProvisioned (DIProv)"<br>"GROUP Vr Pp Tbsg OsiState (State)"<br>"GROUP Vr Pp Tbsg OperationalStatus (OperStatus)"<br>"GROUP Vr Pp Tbsg Operational (Oper)"<br>"GROUP Vr Pp Tbsg TbOperational (TbOper)"<br>"GROUP Vr Pp Tbsg StpOperational (StpOper)"<br>"GROUP Vr Pp Tbsg Statistics (Stats)" |
| Scope | Application |

| | |
|---|---|
| Description | Vr/*<string>* *Pp/<string>* *TbsgBridgePort*<br>This component represents a controlled way to allow exchange of explorer frames between SR and SRT networks.The *TbsgBridgePort* provides a cross over point for explorer frames from the source route gating logic into a SRT network and vice-versa. This port can and should be enabled / disabled through the *SrsgBridgePort*. This bridge port does not participate in the SR spanning tree protocol. Nevertheless, SR spanning tree BPDUs are still sent out across into the SRT network. Note that the *SrsgBridgePort* and the *TbsgBridgePort* should always be provisioned together, as one of these bridge ports cannot function without the other. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp Tbsg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port. |

## ATTRIBUTE Vr Pp Tbsg fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Vr Pp Tbsg portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.<br>Notes:<br>Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.<br><br>The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute. |
| Values | Decimal (0..255) |
| Default | 0 |

## GROUP Vr Pp Tbsg TbProvisioned (TbProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode. |

### ATTRIBUTE Vr Pp Tbsg secureOption (sos)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen:<br>a) disallows dynamic learning,<br>b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame.<br>c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty.<br>This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit. |
| Values | disabled<br>enabled |
| Default | disabled |

### GROUP Vr Pp Tbsg StpProvisioned (StpProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp. |

### ATTRIBUTE Vr Pp Tbsg adminStatus (as)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation. |

| | |
|---|---|
| Values | up<br>down |
| Default | up |

### ATTRIBUTE Vr Pp Tbsg portStateStpControl (psstpc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.<br>***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.<br>A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE Vr Pp Tbsg stpTypeProv (stptProv)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*. |
| Values | dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Tbsg portPriority (ppr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:<br>1) 0-255 for stp type DEC and<br>2) 0-65535 for stp type IEEE. |
| Values | Decimal (0..65535) |
| Default | 128 |

### ATTRIBUTE Vr Pp Tbsg pathCost (pc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise. |
| Values | Decimal (1..65535) |
| Default | 10 |

### ATTRIBUTE Vr Pp Tbsg pathCostMethod (pcm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*. |
| Values | off<br>dec<br>ieee8021 |
| Default | ieee8021 |

### GROUP Vr Pp Tbsg DomainInfoProvisioned (DIProv)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port. |

### ATTRIBUTE Vr Pp Tbsg domainNum (dn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.<br>This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation. |
| Values | Decimal (1..4294967293) |
| Default | 1 |

### ATTRIBUTE Vr Pp Tbsg preserveDomain (pds)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.<br>If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.<br>Preserve domain is relevant only when used in conjunction with ATM MPE. |

| | |
|---|---|
| Values | off<br>on |
| Default | No default |

### GROUP Vr Pp Tbsg OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Pp Tbsg adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Pp Tbsg operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Pp Tbsg usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Pp Tbsg OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Pp Tbsg snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp Tbsg Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port. |

### ATTRIBUTE Vr Pp Tbsg portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbsg upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |
| Values | unknown<br>tb<br>sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp Tbsg bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a |

MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.

Values
access
backbone

Default
No default

### ATTRIBUTE Vr Pp Tbsg bridgePortType (bpt)

Access
Read only

Description
This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.

Values
ethernetBridgePort
tokenRingBridgePort
fddiBridgePort
tokenBusBridgePort
lanEmulationClientEthernet
fddiEncapsulatingBridgePort
vnsBridgePort
frameRelayBridgePort
pppBridgePort
smdsBridgePort
vcpBridgePort
x25BridgePort
atmMpeBridgePort
srEncapSrBridgePort
srEncapTbBridgePort
sourceGateSrBridgePort
sourceGateTbBridgePort
srtbBridgePort
tbsrBridgePort
clusterSrBridgePort
clusterTbBridgePort

| | |
|---|---|
| | snaDlrBridgePort<br>unknown |
| Default | No default |

### ATTRIBUTE Vr Pp Tbsg ifIndex (ifin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbsg mtuExceededDiscards (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.<br>This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Tbsg TbOperational (TbOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode |

### ATTRIBUTE Vr Pp Tbsg maxInfo (mi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg badVerifyDiscards (bvd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and:<br>a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or<br>b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry.<br>Permission to receive frames from a MAC address is granted via the static table entries.<br>This attribute, *badVerifyDiscards*, is directly influenced by:<br>1. *secureOption* and<br>2. the static table entries.<br>This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg staticEntryDiscards (sed)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because of the following three reasons:<br>a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port. |

b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state.
c) for spanning tree bpdus that are locally processed.
This counter wraps around its maximum value of 4294967295.
It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value.
Ideally this counter should be as low as possible.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Pp Tbsg dynamicEntryDiscards (dend)

Access: Read only

Description: This attribute counts the number of incoming frames that:
a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or
b) if the stp port state of the out port is not ***forwarding***.
This counter wraps around its maximum value of 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Pp Tbsg learningDiscards (ld)

Access: Read only

Description: This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Pp Tbsg inDiscards (id)

Access: Read only

| | |
|---|---|
| Description | This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg inFrames (if)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg outFrames (of)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Tbsg StpOperational (StpOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge |

ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.

### ATTRIBUTE Vr Pp Tbsg stpPortState (sps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Pp Tbsg stpTypeOper (stptOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. |
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Tbsg designatedCost (dc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbsg pathCostOper (pco)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbsg designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbsg designatedPort (dp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp Tbsg forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295.<br>A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp Tbsg Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp Tbsg badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Tbsg outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT Vr Pp ClusterSrBridgePort (Srcl)

| | |
|---|---|
| Groups | "GROUP Vr Pp Srcl Provisioned (Prov)"<br>"GROUP Vr Pp Srcl StpProvisioned (StpProv)"<br>"GROUP Vr Pp Srcl DomainInfoProvisioned (DIProv)"<br>"GROUP Vr Pp Srcl OsiState (State)"<br>"GROUP Vr Pp Srcl OperationalStatus (OperStatus)"<br>"GROUP Vr Pp Srcl Operational (Oper)"<br>"GROUP Vr Pp Srcl StpOperational (StpOper)"<br>"GROUP Vr Pp Srcl Statistics (Stats)"<br>"GROUP Vr Pp Srcl SrProvisioned (SrProv)"<br>"GROUP Vr Pp Srcl SrStatistics (SrStats)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> ClusterSrBridgePort*<br>This component represents the functionality called Cluster Bridging. Cluster Bridging allows for MAC frames, carrying packets belonging a certain network protocol, to be bridged and routed at the same time. Also, it provides for a convenient way to manage the entire cluster of LANs, using a single attachment point to the cluster of LANs, the Cluster Bridge Port. To realize these features, the network protocol(s) should also be provisioned on same port as the Cluster Bridge Port. *ClusterSrBridgePort* represents a cluster of Sr LANs. |
| Opt. Subcomp. | "COMPONENT Vr Pp Srcl NetSentry (Ns)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Pp Srcl Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of |

bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.

### ATTRIBUTE Vr Pp Srcl fragmentIp (fIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Vr Pp Srcl portNum (pNum)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.<br>Notes:<br>Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.<br><br>The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a |

port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

Values: Decimal (0..255)

Default: 0

### GROUP Vr Pp Srcl StpProvisioned (StpProv)

Properties: Provisioned

Description: This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.

### ATTRIBUTE Vr Pp Srcl adminStatus (as)

Access: Read and write

Description: This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.

Values:
up
down

Default: up

### ATTRIBUTE Vr Pp Srcl portStateStpControl (psstpc)

Access: Read and write

Description: This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same.
***on*** signifies that this bridge port's spanning tree port state is controlled by the stp.
A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not

set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.

Values
off
on

Default
on

### ATTRIBUTE Vr Pp Srcl stpTypeProv (stptProv)

Access
Read and write

Description
This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper*.

Values
dec
ieee8021

Default
ieee8021

### ATTRIBUTE Vr Pp Srcl portPriority (ppr)

Access
Read and write

Description
This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows:
1) 0-255 for stp type DEC and
2) 0-65535 for stp type IEEE.

Values
Decimal (0..65535)

Default
128

### ATTRIBUTE Vr Pp Srcl pathCost (pc)

Access
Read and write

Description
This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value

of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.

Values: Decimal (1..65535)

Default: 10

### ATTRIBUTE Vr Pp Srcl pathCostMethod (pcm)

Access: Read and write

Description: This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost*.

Values:
off
dec
ieee8021

Default: ieee8021

### GROUP Vr Pp Srcl DomainInfoProvisioned (DIProv)

Properties: Provisioned

Description: This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.

### ATTRIBUTE Vr Pp Srcl domainNum (dn)

Access: Read and write

Description: This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293.
This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.

Values: Decimal (1..4294967293)

Default 1

### ATTRIBUTE Vr Pp Srcl preserveDomain (pds)

Access Read and write

Criticality Component

Description This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.
If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.
Preserve domain is relevant only when used in conjunction with ATM MPE.

Values off
on

Default No default

### GROUP Vr Pp Srcl OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Pp Srcl adminState (osiAdmin)

Access Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Vr Pp Srcl operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Vr Pp Srcl usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Pp Srcl OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Pp Srcl snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Pp Srcl Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port. |

### ATTRIBUTE Vr Pp Srcl portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Srcl upTime (ut)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated up time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl downTime (dt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the accumulated down time of this bridge port since the last reset occurred. |
| Values | Decimal (0..4294967295) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Pp SrcI bridgingMode (bm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported. |
| Values | unknown<br>tb<br>sr<br>srt |
| Default | No default |

### ATTRIBUTE Vr Pp SrcI bridgePortConfig (bpc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame. |
| Values | access<br>backbone |
| Default | No default |

### ATTRIBUTE Vr Pp SrcI bridgePortType (bpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port. |

| | |
|---|---|
| Values | ethernetBridgePort<br>tokenRingBridgePort<br>fddiBridgePort<br>tokenBusBridgePort<br>lanEmulationClientEthernet<br>fddiEncapsulatingBridgePort<br>vnsBridgePort<br>frameRelayBridgePort<br>pppBridgePort<br>smdsBridgePort<br>vcpBridgePort<br>x25BridgePort<br>atmMpeBridgePort<br>srEncapSrBridgePort<br>srEncapTbBridgePort<br>sourceGateSrBridgePort<br>sourceGateTbBridgePort<br>srtbBridgePort<br>tbsrBridgePort<br>clusterSrBridgePort<br>clusterTbBridgePort<br>snaDlrBridgePort<br>unknown |
| Default | No default |

### ATTRIBUTE Vr Pp SrcI ifIndex (ifin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp SrcI mtuExceededDiscards (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit |

(mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp*. This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Values: Decimal (0..4294967295)

Default: 0

### GROUP Vr Pp Srcl StpOperational (StpOper)

Properties: Operational

Description: This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.

### ATTRIBUTE Vr Pp Srcl stpPortState (sps)

Access: Read only

Description: This attribute indicates the stp state of the bridge port.

Values:
disabled
blocking
listening
learning
forwarding
broken

Default: disabled

### ATTRIBUTE Vr Pp Srcl stpTypeOper (stptOper)

Access: Read only

Description: This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp.

| | |
|---|---|
| Values | none<br>dec<br>ieee8021 |
| Default | ieee8021 |

### ATTRIBUTE Vr Pp Srcl designatedCost (dc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Pp Srcl pathCostOper (pco)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Pp Srcl designatedBridge (db)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this port considers to be the designated bridge. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp Srcl designatedPort (dp)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to. |
| Values | Hex (H.0..H.ffff) |
| Default | No default |

### ATTRIBUTE Vr Pp Srcl forwardTransitions (ft)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295.<br>A rapidly increasing value might be indicative of an unstable spanning tree topology. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl blockingDiscards (bd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### GROUP Vr Pp Srcl Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port. |

### ATTRIBUTE Vr Pp Srcl badAbstractDiscards (bad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl tinygramFramesIn (tfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl tinygramFramesOut (tfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl inFilterDiscards (ifd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl outFilterDiscards (ofd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Pp Srcl SrProvisioned (SrProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp Srcl hopCount (hc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame |
| Values | Decimal (1..7) |
| Default | 7 |

### ATTRIBUTE Vr Pp Srcl exploreFrameTreatment (eft)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This |

| | |
|---|---|
| | option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled.<br>A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic. |
| Values | encap<br>xlate |
| Default | encap |

### ATTRIBUTE Vr Pp Srcl lanId (lid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl internalLanId (ilid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.<br>Current source route bridge implementations limit the lanId to a value in the range 0 to 4095. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl bridgeNum (bid)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments. |
| Values | Decimal (0..15) |
| Default | 7 |

### ATTRIBUTE Vr Pp SrcI largestFrame (lf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted. |
| Values | Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Vr Pp SrcI steSpanMode (steSm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame.<br>If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState*.<br>If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState*.<br>***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded. |
| Values | autoSpan<br>disabled<br>forced |
| Default | autoSpan |

### ATTRIBUTE Vr Pp Srcl areRdLimit (arl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### ATTRIBUTE Vr Pp Srcl steRdLimit (srl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8. |
| Values | Decimal (0..8) |
| Default | 8 |

### GROUP Vr Pp Srcl SrStatistics (SrStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports. |

### ATTRIBUTE Vr Pp Srcl specInFrames (sif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl specOutFrames (srfof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl apeInFrames (apeif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl apeOutFrames (apeof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl steInFrames (steif)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl steOutFrames (steof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl segmentMismatchDiscards (lidmd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl dupSegmentDiscards (dsd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl hopCountExceededDiscards (hced)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl dupLanIdOrTreeErrors (dlte)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl lanIdMismatches

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl staticDiscards (sd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Pp Srcl dynamicDiscards (dd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Pp Srcl NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Pp Srcl Ns Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Pp/<string> TransparentBridgePort NetSentry*<br>This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Pp Srcl Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames. |

### ATTRIBUTE Vr Pp Srcl Ns incomingFilter (if)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the incoming filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Pp Srcl Ns outgoingFilter (of)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the out going filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### COMPONENT Vr Pp ShortcutConnection (Sc)

| | |
|---|---|
| Instance | Decimal (0..1023) |
| Groups | "GROUP Vr Pp Sc Operational (Oper)"<br>"GROUP Vr Pp Sc Statistics (Stats)" |

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> Pp/<string> ShortcutConnection/n*<br>This component represents a shortcut connection (SVC) for use by NHRP. |
| Dyn. Subcomp. | "COMPONENT Vr Pp Sc AtmConnection (AtmCon)" |
| Common Verbs | Help<br>List<br>Display |

### VERB Clear Vr Pp Sc

| | |
|---|---|
| Impact | Service |
| Description | Clear Vr/<string> Pp/<string> ShortcutConnection/n<br>This command clears the specified *ShortcutConnection*. The connection associated with this component is released. |

### GROUP Vr Pp Sc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status attributes of the *ShortcutConnection* component. |

### ATTRIBUTE Vr Pp Sc remoteNbmaAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the NBMA address of the far (remote) end. |
| Values | String (0..20, Hex) |
| Default | No default |

### ATTRIBUTE Vr Pp Sc age

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates how long the connection has been up. |
| Values | Decimal (0..4292967295) |

| | |
|---|---|
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Pp Sc mtu

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Layer 2 MTU (that is, CPCS-SDU for ATM) of this connection. |
| Values | Decimal (0..0; 576..18944) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Vr Pp Sc connSource

| | |
|---|---|
| Access | Read only |
| Description | This attributes indicates which end originated the connect request for this connection. |
| Values | local<br>remote |
| Default | No default |

### ATTRIBUTE Vr Pp Sc type

| | |
|---|---|
| Access | Read only |
| Description | This attributes indicates the type of this connection. |
| Values | unidirectional<br>bidirectional |
| Default | No default |

### GROUP Vr Pp Sc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of the *ShortcutConnection* component. |

### ATTRIBUTE Vr Pp Sc txFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames transmitted over this connection. This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Pp Sc rxFrames

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the frames received over this connection. This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### COMPONENT Vr Pp Sc AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Vr Pp Sc AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Pp Sc AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE Vr Pp Sc AtmCon nextHop

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

## COMPONENT Vr NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Ns Provisioned (Prov)"<br>"GROUP Vr Ns Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> NetSentry*<br>This is the top-level component for NetSentry. It exists to hold global NetSentry data, and the subcomponents. |
| Opt. Subcomp. | "COMPONENT Vr Ns File"<br>"COMPONENT Vr Ns Engine"<br>"COMPONENT Vr Ns IPStatistics (IPStats)"<br>"COMPONENT Vr Ns IPXStatistics (IPXStats)"<br>"COMPONENT Vr Ns AppletalkStatistics (ATStats)"<br>"COMPONENT Vr Ns DECnetStatistics (DNStats)"<br>"COMPONENT Vr Ns BridgingStatistics (BrStats)" |
| Dyn. Subcomp. | "COMPONENT Vr Ns Filter" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This contains the global *NetSentry* control flags. |

## ATTRIBUTE Vr Ns dropConditions

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute controls under what circumstances *NetSentry* drops packets. It is possible for *NetSentry* to drop packets when: There is no memory to contain statistics for this packet (statsNoMem), it is for whatever reason impossible to clone, copy, or log a copy of the packet via the clone_to copy_to or log_to actions respectively (cantCloneTo, cantCopyTo and cantLogTo), and if the packet encounters a filter which is provisioned at a filter point within a protocol component, but not defined in any of the files defined by *File* components within *NetSentry* (this is a Null filter). |
| Set of | statsNoMem<br>cantCloneTo<br>cantLogTo<br>cantCopyTo<br>cantMacCloneTo<br>nullFilter |
| Default | No default |

### GROUP Vr Ns Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This contains the global *NetSentry* (in particular, non-protocol specific) statistics. |

### ATTRIBUTE Vr Ns packetsProcessed (packets)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets processed through *NetSentry*. This counter will wrap around to zero when it exceeds its maximum value, 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns packetsFailed (failed)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of packets processed through *NetSentry* which ended with a fail disposition. This |

counter will wrap around to zero when it exceeds its maximum value, 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Ns statsNoMem (mem)

Access: Read only

Description: This attribute counts the total number of packets processed through *NetSentry* for which statistic should have been gathered, but for which statistics were not gathered due to a failure to allocate memory. Such packets may or may not be dropped according to the values provisioned in *dropConditions* under the *NetSentry* component. If this attribute is being incremented, the system is suffering from memory shortfalls, and some operator action is advised. Perhaps memory allocations should be re-provisioned, *NetSentry* statistics gathering should be reduced, or *NetSentry* statistics tables should be cleared to temporarily free memory. This counter will wrap around to zero when it exceeds its maximum value, 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Ns hsaOkayFailed (hsaokfailed)

Access: Read only

Description: This attribute counts the total number of packets processed through *NetSentry* which encountered, and did not match, an hsa_okay pattern. Such packets are likely to be generated from misconfigured hosts. Some operator action to track down these hosts is advised. This counter will wrap around to zero should it ever exceed its maximum value, 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Ns depthExceeded (depth)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of times a *NetSentry* filter was executed which referenced too many layers of indirect filters. If this count is non-zero, the filter definitions the unit is using are incorrect, and some operator action to track down the erroneous filter definitions is advised. Filters will not be behaving correctly if this counter is increasing, and security could be compromised. This count should always be zero, and it will wrap around to zero should it ever exceed its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns droppedStatsNoMem (dropSNM)

| | |
|---|---|
| Access | Read only |
| Description | This counts the total number of packets that were actually dropped due to an inability to allocate memory to hold statistics for the packet. Such a packet must have had a *NetSentry* statistics gathering action applied to it, in order for the attempt to gather statistics to be made, and the *dropConditions* attribute must include the ***statsNoMem*** value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns droppedCantCloneTo (dropCCloneT)

| | |
|---|---|
| Access | Read only |
| Description | This counts the total number of packets that were dropped due to the failure of a clone_to action applied to the packet. This counter will only increment if the *dropConditions* attribute includes the ***cantCloneTo*** value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns droppedCantLogTo (dropCLogT)

| | |
|---|---|
| Access | Read only |
| Description | This counts the total number of packets that were dropped due to the failure of a log_to action applied to the packet. This counter will only increment if the *dropConditions* attribute includes the ***cantLogTo*** value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns droppedCantCopyTo (dropCCopyT)

| | |
|---|---|
| Access | Read only |
| Description | This counts the total number of packets that were dropped due to the failure of a copy_to action applied to the packet. This counter will only increment if the *dropConditions* attribute includes the ***cantCopyTo*** value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns droppedNullFilter (dropNF)

| | |
|---|---|
| Access | Read only |
| Description | This counts the total number of packets that were dropped because the packet passed through a filter point into which was provisioned a filter which was never defined in a file loaded into *NetSentry.* Such filter points have atached to the the so-call Null Filter, which will either succeed or fail all packets passing through it, depending on whether or not the *dropConditions* attribute includes the ***nullFilter*** value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT Vr Ns File

| | |
|---|---|
| Instance | String (1..64, ASCII) |
| Groups | "GROUP Vr Ns File Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> NetSentry File/<filename>*<br>This component's instance value is a single filename to be compiled. The file must reside in<br>/provisioning/netsentry/prov<br>in order to be compiled at provisioning activate time, but in<br>/provisioning/netsentry/oper<br>to be recompiled with the *ReLoad* verb. This is to provide the same sort of protections that the provisioning system gives with its activate-confirm-commit sequence. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## VERB RELoad Vr Ns File

| | |
|---|---|
| Impact | Configuration |
| Description | *RELoad VR/<string> NS File/<filename>*<br>This verb compiles the file to which the *File* component the verb applies to refers, searching for the named file in the /provisioning /netsentry/oper subdirectory. This is in contrast to the provisioning-time load, which searches the /provisioning/netsentry/prov subdirectory. This provides some measure of safety in the event of misconfigured filters, since rebooting the unit will cause *NetSentry* to fall back to the filters defined in files in the prov subdirectory. Presently, the operator must manually 'commit' a file of filter definitions by moving or copying it from the oper subdirectory to the prov subdirectory. This verb will return either success or failure, with a detailed error message both returned in the failure, and set in the *File* component itself. |

### GROUP Vr Ns File Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This holds hold a single compiler error message. |

### ATTRIBUTE Vr Ns File compilerErrorMsg

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains a single string holding the compiler error which caused the compile to fail. In the event that the file is recompiled (using the *RELoad* verb), the value of this will change, to reflect the new error, if any was encountered, or no error, if the compile was successful. |
| Values | String (1..80, ASCII) |
| Default | "No Error" |

### COMPONENT Vr Ns Engine

| | |
|---|---|
| Instance | Decimal (0..15) |
| Scope | Application |
| Description | *Vr/<string> NetSentry Engine/n*<br>The existence of this component represents the presence of NetSentry on a particular Logical Processor. Each *Engine* component must correspond to a matching *Lp* component. If *NetSentry* filtering is needed on some *Lp*, a corresponding *Engine* must be provisioned. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### COMPONENT Vr Ns IPStatistics (IPStats)

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> NetSentry IPStats*<br>This component holds all the statistics gathered for the IP |

protocol. If *IPStatistics* is provisioned, *NetSentry* statistics gathering actions will gather statistics for all IP packets to which they apply.

## VERB CLEAR Vr Ns IPStats

Impact System_admin

Description *CLEAR Vr/<string> Ns IPStats*
This clears statistics gathered for IP, deleting all the allocated resources, and discarding gathered data.

## COMPONENT Vr Ns IPStats AddressStatistic (AddrStat)

Instance sourceAddress (sa) [String (1..32, ASCII)]
destinationAddress (da) [String (1..32, ASCII)]

Groups "GROUP Vr Ns IPStats AddrStat Statistics (Stats)"

Scope Application

Description *Vr/<string> NetSentry IPStats AddrStat/128.12.3.7,-*
This component holds statistics for a source address, a destination address, or a source address/destination address pair. This component may reside in one of a variety of by-protocol tables, each with a double index for rows. One index is the source address, one is the destination address. One of the indices may be a “-”, which indicates that the other index is the relevent one. That is, a statistic referred to with source address “128.12.3.7” and destination address “-” is a statistic for packets originating from 128.12.3.7 alone.

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ns IPStats AddrStat Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This is the basic statistic used throughout *NetSentry* by-protocol statistics gathering. It contains counters for total packets, total octets in packets, and two user counters, counter_1 and counter_2. |

### ATTRIBUTE Vr Ns IPStats AddrStat packetCount

| | |
|---|---|
| Access | Read only |
| Description | This is the number of packets which caused the enclosing *Statistics* group to to be incremented. This counter will wrap around to zero when it exceeds its maximum value, 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns IPStats AddrStat byteCount

| | |
|---|---|

| Groups | "GROUP Vr Ns Filter Statistics (Stats)" |
| Scope | Application |

| | |
|---|---|
| Description | *Vr/<string> NetSentry Filter/not_tcp,Filter*<br>Each instance of this component names a single *NetSentry* Filter or other *NetSentry* data object. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ns Filter Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the various counters associated with a particular filter definition. A packet being processed through a *NetSentry* filter will encounter zero or more dispositions according to which elements of the filter have patterns which match the packet. This group counts, for the enclosing *Filter*, how many packets encountered each sort of disposition while being processed through the filter. |

### ATTRIBUTE Vr Ns Filter packetsSucceeded

| | |
|---|---|
| Access | Read only |
| Description | This counter contains the number of packets which passed through *NetSentry*, which happen to have been matched against an element of the enclosing *Filter* component which had a succeed disposition. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns Filter bytesSucceeded

| | |
|---|---|
| Access | Read only |
| Description | This counter counts the number of bytes in the packets counted in the *packetsSucceeded*. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns Filter packetsFailed

| | |
|---|---|
| Access | Read only |
| Description | This counter contains the number of packets which passed through *NetSentry*, which happen to have been matched against an element of the enclosing *Filter* which had a fail disposition. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns Filter bytesFailed

| | |
|---|---|
| Access | Read only |
| Description | This counter counts the number of bytes in the packets counted in the *packetsFailed* counter. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns Filter packetsBreaked

| | |
|---|---|
| Access | Read only |
| Description | This counter contains the number of packets which passed through *NetSentry*, which happen to have been matched against an element of the enclosing *Filter* which had a break disposition. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns Filter bytesBreaked

| | |
|---|---|
| Access | Read only |
| Description | This counter counts the number of bytes in the packets counted in the *packetsBreaked* counter. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns Filter packetsContinued

| | |
|---|---|
| Access | Read only |
| Description | This counter contains the number of packets which passed through *NetSentry*, which happen to have been matched against at least one element of the enclosing *Filter* which had a continue disposition. Such a packet may also have been counted in one of the *packetsSucceeded packetsFailed* or *packetsBreaked* counters, since a continue disposition does not exit a *NetSentry* filter unless it is the disposition in the last element of the filter. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ns Filter bytesContinued

| | |
|---|---|
| Access | Read only |
| Description | This counter counts the number of bytes in the packets counted in the *packetsContinued* counter. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Bridge (Br)

| | |
|---|---|
| Groups | "GROUP Vr Br AdministrativeControl (AdminControl)"<br>"GROUP Vr Br OsiState (State)"<br>"GROUP Vr Br OperationalStatus (OperStatus)"<br>"GROUP Vr Br Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Bridge*<br>This component represents the bridge logic, and all the associated attribute groups. All the various functions provided by bridging are encompassed by this component. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Br NetSentry (Ns)"<br>"COMPONENT Vr Br TransparentBridge (Tb)"<br>"COMPONENT Vr Br SourceRouteBridge (Srb)" |
| Dyn. Subcomp. | "COMPONENT Vr Br PortTableEntry (Pte)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Br AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

## ATTRIBUTE Vr Br adminStatus (as)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the current administrative status for this component.<br>***enabled*** indicates that the component is available for operation.<br>***disabled*** indicates the component is unavailable for operation. The application preserves all previously received provisioning data, all writable operational data and all counters. Please note that all learnt data are lost. The bridge application is not available for operation while in this state. |
| Values | up<br>down |
| Default | up |

### GROUP Vr Br OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Br adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Br operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Br usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Br OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Br snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Br Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational attributes applicable to bridging, those components that are global in nature and are not port specific. |

### ATTRIBUTE Vr Br bridgeAddress (ba)

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the Mac address for the bridge. This address is used when this bridge must be referred to in a unique manner. It is used to form the bridge identifier, used by the spanning tree protocol, by concatenating it with the attribute bridgePriority under the component *SpanningTreeProtocol*. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Br numPorts (np)

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the number of the ports this bridge controls. In other words, it is a count of the number of bridge ports provisioned. |

| | |
|---|---|
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vr Br type

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the capability of this bridge unit in terms of types of bridging it can handle. |
| Values | unknown<br>transparentOnly<br>sourceRouteOnly<br>srt |
| Default | No default |

### COMPONENT Vr Br PortTableEntry (Pte)

| | |
|---|---|
| Instance | domainNum [Decimal (1..4294967293)]<br>portName [String (0..29, ASCII)]<br>mode [tb<br>sr<br>srt] |
| Groups | "GROUP Vr Br Pte Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Bridge PortTableEntry/<Decimal>,<string>,mode*<br>This component is one of a group of similar components that forms a table. This table contains all the bridge ports provisioned and the corresponding domains they belong to. This table can be used as a central place to access all the information about bridge ports and the domains associated with these bridge ports. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Br Pte Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational attributes belonging to the *PortTableEntry* component. |

## ATTRIBUTE Vr Br Pte macType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Mac type of the bridge port is associated with. |
| Values | ethernet<br>tokenRing<br>fddiBridgePort<br>tokenBus<br>lecEthernet<br>fddiEncapsulating<br>vns<br>frameRelay<br>ppp<br>smds<br>vcp<br>x25<br>atmMpe<br>srEncapSr<br>srEncapTb<br>sourceGateSr<br>sourceGateTb<br>srtb<br>tbsr<br>clusterSr<br>clusterTb<br>snaDlr<br>unknown |
| Default | No default |

## ATTRIBUTE Vr Br Pte stpState

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the stp state of the bridge port. |
| Values | disabled<br>blocking<br>listening<br>learning<br>forwarding<br>broken |
| Default | disabled |

### ATTRIBUTE Vr Br Pte stpType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the spanning tree protocol this bridge port is participating in. |
| Values | unknown<br>dec<br>ieee_8021 |
| Default | ieee_8021 |

### ATTRIBUTE Vr Br Pte portPointsTo

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the fact if this bridge port leads to the root bridge of the spanning tree topology or if it leads to the designated bridge of the lan segment the bridge port is attached to. |
| Values | none<br>rootBridge<br>designatedBridge |
| Default | none |

### COMPONENT Vr Br NetSentry (Ns)

| | |
|---|---|
| Groups | "GROUP Vr Br Ns Provisioned (Prov)" |
| Scope | Application |

| | |
|---|---|
| Description | *Vr/<string> Bridge NetSentry*<br>This component represents the net sentry facility as applicable to bridging. It serves to allow the user to provision filter names that are applicable at the first, the last filter, the localIn and the localOut points and also the filter apply table. |
| Opt. Subcomp. | "COMPONENT Vr Br Ns ApplyTableEntry (Ate)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Br Ns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group houses all the provisionable attributes applicable to the packet control facility. These attributes are global attributes and are not port specific. |

### ATTRIBUTE Vr Br Ns firstFilter (ff)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter to be applied at the first filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Br Ns lastFilter (lf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the name of the filter that is to be applied at the last filter point. |
| Values | String (0..32, ASCII) |
| Default | No default |

## COMPONENT Vr Br Ns ApplyTableEntry (Ate)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP Vr Br Ns Ate Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Bridge NetSentry ApplyTableEntry/<Decimal>*<br>This component, represents an entry in the filter apply table. The filter apply table is used to specifically filter frames, based on a frame's origin, its destination, and the domain associated with the frame. A filter name is specified in the entry, which is applied to a frame if the match criteria is satisfied.<br>When the attribute *direction* has the value ***to***, a match in the filter table requires the *firstMACAddress* anded with the *firstMACAddressMask* to match the source MAC address in the frame, the *secondMACAddress* anded with the *secondMACAddressMask to* match the destination MAC address in the frame, and the *domainNum* to match the domain number associated with the frame.<br>When the *direction* has the value ***from***, a match in the filter table requires the *firstMACAddress* anded with the *firstMACAddressMask* to match the destination MAC address in the frame, the *secondMACAddress* anded with the *secondMACAddressMask to* match the source MAC address in the frame, and the *domainNum* to match the domain number associated with the frame.<br>When the *direction* has the value ***toFrom***, a match in the filter table requires the *firstMACAddress* anded with the *firstMACAddressMask* to match the source/destination MAC address in the frame, the *secondMACAddress* anded with the *secondMACAddressMask to* match the destination/source MAC address in the frame, and the *domainNum* to match the domain number associated with the frame. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Br Ns Ate Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group houses all the attributes that together form an apply table entry. These fields of an apply table entry are used as match criteria, which when satisfied results in the application of the named filter to the frame. |

### ATTRIBUTE Vr Br Ns Ate domainNum (dn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the domain number associated with a frame, that would qualify it partly, for a match in the apply table. The domain number provisioned will form a part of the match criteria only if it is not provisioned with a wild card value of ***0.*** If the wild card character is specified, any domain number will satisfy the match criteria, in effect loosing domain number as a qualifier in the match criteria. |
| Values | Decimal (0..4294967293) |
| Default | 0 |

### ATTRIBUTE Vr Br Ns Ate firstMacAddress (fma)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the MAC address to be anded with the *firstMACAddressMask*, and the result compared with-<br>a) The source MAC address in a frame when the attribute *direction* has a value of ***to***,<br>b) The destination MAC address in a frame when the attribute *direction* has a value of ***from***,<br>c) Source / Destination address in a frame when the attribute *direction* has a value of ***toFrom***, as a part of finding a match in the bridge filter apply table. |
| Values | String (6, Dashed Hex) |
| Default | 00-00-00-00-00-00 |

### ATTRIBUTE Vr Br Ns Ate firstMacAddressMask (fmam)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the mask which is anded with the attribute *firstMACAddress*. The result is then compared with-<br>a) The source MAC address in a frame when the attribute *direction* has a value of ***to***,<br>b) The destination MAC address in a frame when the attribute *direction* has a value of ***from***,<br>c) Source / Destination address in a frame when the attribute *direction* has a value of ***toFrom***, as a part of finding a match in the bridge filter apply table. |
| Values | String (6, Dashed Hex) |
| Default | ff-ff-ff-ff-ff-ff |

### ATTRIBUTE Vr Br Ns Ate secondMacAddress (sma)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the MAC address to be anded with the *secondMACAddressMask*, and the result compared with-<br>a) The destination MAC address in a frame when the attribute *direction* has a value of ***to***,<br>b) The source MAC address in a frame when the attribute *direction* has a value of ***from***,<br>c) Destination/Source address in a frame when the attribute *direction* has a value of ***toFrom***, as a part of finding a match in the bridge filter apply table. |
| Values | String (6, Dashed Hex) |
| Default | 00-00-00-00-00-00 |

### ATTRIBUTE Vr Br Ns Ate secondMacAddressMask (smam)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the mask which is anded with the attribute *secondMACAddress*. The result is then compared with-<br>a) The destination MAC address in a frame when the attribute *direction* has a value of ***to***,<br>b) The source MAC address in a frame when the attribute *direction* has a value of ***from***,<br>c) Destination/Source address in a frame when the attribute |

*direction* has a value of ***toFrom***, as a part of finding a match in the bridge filter apply table.

Values: String (6, Dashed Hex)

Default: ff-ff-ff-ff-ff-ff

### ATTRIBUTE Vr Br Ns Ate direction (dir)

Access: Read and write

Description: This attribute specifies the direction of frame flow. It is used to appropriately compare the result of logically anding MAC address, MACAddressMask pairs, with the source /destination MAC address fields in a frame, as a part of the match finding process.
When this attribute has value of ***to***, the *firstMACAddress* is logically anded with the *firstMACAddressMask* and the result compared with the source MAC address in a frame and the *secondMACAddress* logically anded with the *secondMACAddressMask* and compared with the destination MAC address.
When this attribute has a value of ***from***, the *firstMACAddress* is logically anded with the *firstMACAddressMask* and the result compared with the destinationMAC address in a frame and the *secondMACAddress* logically anded with the *secondMACAddressMask* and compared with the sourceMAC addressin the frame, as a part of finding a match in the bridge filter apply table entry.

Values:
to
from
toFrom

Default: toFrom

### ATTRIBUTE Vr Br Ns Ate filterName (fn)

Access: Read and write

Description: This attribute specifies the name of the filter to be applied to the frame, if it satisfies the match criteria mentioned in the bridge filter apply table entry.

Values: String (0..32, ASCII)

| | |
|---|---|
| Default | No default |

## COMPONENT Vr Br TransparentBridge (Tb)

| | |
|---|---|
| Groups | "GROUP Vr Br Tb Provisioned (Prov)"<br>"GROUP Vr Br Tb Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Bridge TransparentBridge*<br>This component contains all the global bridge attribute groups necessary for the operation of a transparent bridge. |
| Opt. Subcomp. | "COMPONENT Vr Br Tb SpanningTreeProtocol (Stp)"<br>"COMPONENT Vr Br Tb StaticTableEntry (Ste)" |
| Dyn. Subcomp. | "COMPONENT Vr Br Tb ForwardTableEntry (Fte)"<br>"COMPONENT Vr Br Tb NcForwardTableEntry (NcFte)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Br Tb Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes applicable to a transparent bridge, those attributes that are global and are not port specific. |

## ATTRIBUTE Vr Br Tb fwdTableNumEntries (ftNe)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of entries that can exist in the transparent bridge forwarding table. This attribute provides a way to control the resources allocated to forwarding table. This attribute will prove to be very useful while attempting to fine tune the resource allocated to suit the network configuration.<br>Please understand that this attribute *tbFwdTableNumEntries* is influenced by the memory management scheme provided by the |

| | |
|---|---|
| | *VirtualRouter* and is by no means independent of the same. It is important to understand the network configuration in terms of number and types of bridge ports provisioned before attempting to fine tune this attribute.The following attributes can be used as feedback to fine tune this attribute:<br>a) attribute *totalForwardingTableEntries* under the *TransparentBridge component,*<br>*b) attribute numFtEntriesFree under the TransparentBridge component,*<br>*c) attribute numFtEntriesDenied under the TransparentBridge component* |
| Values | Decimal (0..65535) |
| Default | 500 |

### ATTRIBUTE Vr Br Tb agingTime (at)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time period used in seconds, to age out dynamically learned entries in the forwarding table. The aging time can change, triggered by a spanning tree topology change. The operational value of the aging time is reflected in the attribute *agingTimeOper* under the *SpanningTreeProtocol* component. |
| Values | Decimal (10..1000000) |
| Units | seconds |
| Default | 300 |

### GROUP Vr Br Tb Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistical attributes for a transparent bridge, those attributes that are global in nature and are not port specific. |

### ATTRIBUTE Vr Br Tb learnedEntryDiscards (led)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute represents the number of dynamic entries that might have been learned but have been discarded due to a static entry already installed by provisioning in the forwarding table. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Br Tb totalForwardingTableEntries (tFtE)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of transparent bridge forwarding table entries. This includes static forwarding table entries and dynamic forwarding table entries.<br>This attribute is influenced by the attribute *tbFwdTableNumEntries*, which is a provisionable attribute.<br>If the value is consistently approaching the value of the attribute *tbFwdTableNumEntries*, it is advisable to increase the value provisioned for *tbFwdTableNumEntries*. It indicates a potential shortage of forwarding table entries in the future.<br>This attribute is inversely proportional in value to the attribute *numFtEntriesFree.*<br>This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Br Tb numFtEntriesFree (nFteF)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of free transparent bridge forwarding table entries. These entries could be used by static entries or by dynamic entries. This counter wraps around its maximum value of 4294967295.<br>A consistently high value for this attribute indicates that there is a resource surplus here, in terms of the memory requirements of the forwarding table. This surplus could be utilized elsewhere if need be. The value of this attributes directly influenced by the value of the attribute *tbFwdTableNumEntries.* |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Br Tb numFtEntriesDenied (nFteD)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of instances wherein transparent bridge table entry was unavailable. These entries could have been denied for static entries or for dynamic entries. This counter wraps around its maximum value of 4294967295. If this counter consistently shows a high value, it is indicative of a resource shortage in terms of memory required to support the increase in the number of forwarding table entries. To rectify this resource shortage, increase the number of forwarding table entries through the provisioned attribute *tbFwdTableEntries* under the *Bridge* component. This counter should ideally be as low as possible. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Br Tb SpanningTreeProtocol (Stp)

| | |
|---|---|
| Instance | Decimal (1..4294967293) |
| Groups | "GROUP Vr Br Tb Stp Provisioned (Prov)"<br>"GROUP Vr Br Tb Stp Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Br Tb Stp/<Decimal>*<br>This component represents the Spanning Tree Protocol for the bridge. Bridges use the Spanning Tree Protocol to provide a loop free, fault tolerant network topology.<br>Individual spanning tree instances are indexed using the domain number.<br>Only 16 instances of this component are allowed including the backbone spanning tree instance.<br>The instance identifier of the *SpanningTreeProtocol* component |

is significant as it indicates the domain that the spanning tree instance governs.

DELete

## GROUP Vr Br Tb Stp Provisioned (Prov)

Properties: Provisioned

Description: This group contains all the provisionable attributes that are applicable to the spanning tree protocol. These are global attributes and not port specific attributes. These attributes have a direct impact on the way this bridge participates in the stp.

## ATTRIBUTE Vr Br Tb Stp stpMode

Access: Read and write

Description: This attribute determines if this stp instance is to act as the stp instance for the backbone or an stp instance for a non-backbone media configuration. There can exist only one Backbone stp instance per virtual router. Please note that it is not permissible to assign the instance identifier of this stp instance as domain number of any access bridge port. In case of stp instances that are non-Backbone, the instance identifier is indicating the domain number the stp is operational in.

Values: access
backbone

Default: access

## ATTRIBUTE Vr Br Tb Stp protocolSpec (pS)

Access: Read and write

Description: This attribute specifies the type of the spanning tree protocols that are in operation in the bridge. This means that this bridge participates in the types of stp indicated by this attribute.

| | |
|---|---|
| Values | both<br>dec<br>ieee8021d |
| Default | ieee8021d |

### ATTRIBUTE Vr Br Tb Stp priority

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to construct the *bridgeId*. It forms the first two octets of the *bridgeId* and the remaining 6 octets are made up of the *bridgeMACAddress*. The *priority* also determines the root bridge of the spanning tree topology. Manipulating this attribute might lead to a change in the spanning tree topology. |
| Values | Decimal (0..65535) |
| Default | 32768 |

### ATTRIBUTE Vr Br Tb Stp bridgeMaxAge (bma)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum age of the stp information learned from the network on any bridge port before it is discarded. This value is used by this bridge and all the other bridges when this bridge is the root bridge of the spanning tree topology. The following relationships are enforced as required by the IEEE 802.1d standards document.<br>2 *(*bridgeForwardDelay* -1.0seconds) >= *bridgeMaxAge*,<br>*bridgeMaxAge* >= 2 * *bridgeHelloTime* + 1.0 seconds. |
| Values | Decimal (600..4000) |
| Units | centiseconds |
| Default | 2000 |

### ATTRIBUTE Vr Br Tb Stp bridgeHelloTime (bht)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval between the transmission of configuration BPDUs on any bridge port when this bridge becomes the root bridge. This attribute value is also used by all |

| | |
|---|---|
| | the other bridges in the Spanning Tree while this bridge is the root.<br>The following relationship is enforced as required by the IEEE 802.1d standards document.<br>*bridgeMaxAge* >= 2 * *bridgeHelloTime* + 1.0 seconds. |
| Values | Decimal (100..1000) |
| Units | centiseconds |
| Default | 200 |

### ATTRIBUTE Vr Br Tb Stp bridgeForwardDelay (bfd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how fast a bridge port changes its STP state while progressing towards the forwarding state. It is also used as *agingTime* to age dynamic entries in the forwarding table once a topology change is detected. This attribute is used by all the bridges participating in the stp when this bridge is the root bridge.<br>The following relationship is enforced as required by the IEEE 802.1d standards document.<br>2 *(*bridgeForwardDelay* -1.0sconds) >= *bridgeMaxAge*. |
| Values | Decimal (400..3000) |
| Units | centiseconds |
| Default | 1500 |

### GROUP Vr Br Tb Stp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational, stp attributes. These attributes are applicable in a global manner and are not specific to a bridge port. |

### ATTRIBUTE Vr Br Tb Stp bridgeId (bid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier value of this bridge, which serves to uniquely represent this bridge in the spanning tree |

topology. Thus, a *bridgeId* is unique only in the spanning tree instance the bridge is participating in. If multiple domain spanning trees exist then the same *bridgeId* can be re-used across these spanning tree instances.

Values: String (8, Dashed Hex)

Default: No default

### ATTRIBUTE Vr Br Tb Stp rootPortName (rpn)

Access: Read only

Description: This attribute indicates the name of the bridge port that offers the lowest cost route to the root bridge of the spanning tree topology.The attribute *rootPortName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***TBP-MyPort.***
If multiple instances of spanning tree are operational then there will exist a *rootPortName* value for each instance of the running stp and is applicable to that instance alone.

Values: String (4..29, ASCII)

Default: No default

### ATTRIBUTE Vr Br Tb Stp timeSinceTopologyChange (tstc)

Access: Read only

Description: This attribute indicates the time since a spanning tree topology change was detected by this bridge.

Values: Decimal (0..4294967295)

Units: centiseconds

Default: 0

### ATTRIBUTE Vr Br Tb Stp topologyChangeDetect (tcd)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates whether or not a topology change was detected. This flag is set when a bpdu with the topology detect flag set is received from the root bridge. If this bridge is the root bridge this flag is set on receipt of a topology change notification bpdu. It is reset after a fixed length of time. |
| Values | false<br>true |
| Default | false |

### ATTRIBUTE Vr Br Tb Stp topologyChanges (tc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of the topology change events detected by this bridge since the last bridge reset. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Br Tb Stp designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this bridge treats as the root of the spanning tree topology. The root of the spanning tree topology is chosen through exchange. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Br Tb Stp rootCost (rc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cost of the path to the root as seen by this bridge. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Br Tb Stp maxAge (mAg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum age of the stp info learnt from a port before it is discarded. |
| Values | Decimal (600..4000) |
| Units | centiseconds |
| Default | 2000 |

### ATTRIBUTE Vr Br Tb Stp agingTimeOper (ato)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time period in seconds used to age out dynamically learned entries in the forwarding table. The aging time is specific to a running stp instance. A value for the aging time of the current instance of the stp can be provisioned through the attribute *agingTime* under the *InwBrTb* component. The *agingTimeOper* attribute assumes the value of the *bridgeForwardDelay* while a topology change is in progress. This is done to facilitate a quick aging out of the learned entries that might have become obsolete due to a spanning tree topology change. |
| Values | Decimal (10..1000000) |
| Units | seconds |
| Default | 300 |

### ATTRIBUTE Vr Br Tb Stp helloTime (heT)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time interval between the transmission of the configuration BPDUs. This value is obtained from the root bridge of the spanning tree topology through bridge protocol data units. This value should be the value assigned to the attribute *bridgeHelloTime* of the root bridge. |
| Values | Decimal (100..1000) |
| Units | centiseconds |

| | |
|---|---|
| Default | 200 |

### ATTRIBUTE Vr Br Tb Stp holdTime (hoT)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum interval of time between the transmission of two BPDUs. |
| Values | Decimal (100) |
| Units | centiseconds |
| Default | 100 |

### ATTRIBUTE Vr Br Tb Stp fwdDelay (fd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates how much time a port spends in any state while progressing towards the ***forwarding*** state. It is also used to age out learned entries while a topology change is in progress.This value should be the value assigned to the attribute *bridgeFwdDelay* of the root bridge. |
| Values | Decimal (400..3000) |
| Units | centiseconds |
| Default | 1500 |

### COMPONENT Vr Br Tb StaticTableEntry (Ste)

| | |
|---|---|
| Instance | address [String (6, Dashed Hex)]<br>receivePort [String (1..29, ASCII)] |
| Groups | "GROUP Vr Br Tb Ste Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Br Tb StaticTableEntry/address, receivePort*<br>This component represents an entry in the transparent bridge forwarding table. A collection of such entries form the static forwarding table. Entries in the static table indicate the output ports a frame is allowed to go out of if it was received on *receivePort* and if its destination MAC address field matched *address.* |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Br Tb Ste Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the fields of a static table entry. All these attributes can be provisioned by the user. Multiple such static table entries together form the static forwarding table. |

### ATTRIBUTE Vr Br Tb Ste status

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the longevity of an entry in the static table. Please note that currently only a value of ***permanent*** is supported. |
| Values | permanent |
| Default | permanent |

### ATTRIBUTE Vr Br Tb Ste allowedToGoTo (atgt)

| | |
|---|---|
| Access | Read and write |
| Description | This port map specifies the out bridge ports a MAC frame with *address* in its destination MAC address field, originating from *receivePort*, can go out of.<br>The *allowedToGoTo* attribute is a set of strings. Each string is of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding transparent bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. Multiple strings can be specified on the same *set* command. Each string in the list is space separated. An ***"*"*** in place of the ***i*** indicates that regardless of the protocol port instance, all bridge ports with name ***BridgePortName*** should be included in the *allowedToGoTo*. |

| | |
|---|---|
| List of | String (4..29, ASCII) |
| List Size | 255 |
| Default | No default |

## COMPONENT Vr Br Tb ForwardTableEntry (Fte)

| | |
|---|---|
| Instance | address [String (6, Dashed Hex)]<br>domainNum [Decimal (1..4294967293)] |
| Groups | "GROUP Vr Br Tb Fte Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Br Tb FowardTableEntry/address, domainNum*<br>This component represents an entry in the transparent bridge forwarding table. Entries in this table serve to map a destination MAC address to a port in the bridge. Essentially, entries are learned and aged in this table. This means that entries that are not frequently used, are purged. The *agingTime* is a provisionable attribute under the *TransparentBridge* component. Other fields in this table are informative in nature. A collection of such entries constitutes a transparent bridge forwarding table. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Br Tb Fte Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the attributes that form the fields of a forwarding table entry. These attributes reflect the state of the transparent bridge forwarding table. |

## ATTRIBUTE Vr Br Tb Fte port

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the port name through which the *address* was learned. This implies that the frames that are destined for a station whose MAC address is the same as the *address*, will be forwarded through the bridge port indicated by the attribute *port*. The attribute *port* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort*, the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***TBP-MyPort.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Br Tb Fte ageOfEntry (aoe)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the age of the forwarding table entry. This is used to purge entries that have not been used for a certain period of time. This feature is to ensure that only the recently used entries are kept in the forwarding table. The time period for aging entries can be provisioned through the attribute *agingTime* under the component *TransparentBridge*. |
| Values | Decimal (0..1000000) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Br Tb Fte peerAddressInfo (pai)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the learned peer address information. This address is used to essentially tunnel frames to a peer bridge unit across a network or a backbone. The tunneled frame is then appropriately processed by the peer bridge unit. Encapsulated bridging using a backbone bridge port is an example where this attribute *peerAddressInfo* is used. |
| Values | String (8, Dashed Hex) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Br Tb Fte status

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the forwarding table entry. A value of ***learned*** indicates that the entry was learned and cached from the network. Please note that only a value of ***learned*** is currently supported. |
| Values | learned |
| Default | learned |

### COMPONENT Vr Br Tb NcForwardTableEntry (NcFte)

| | |
|---|---|
| Instance | address [String (6, Dashed Hex)]<br>domainNum [Decimal (1..4294967293)] |
| Groups | "GROUP Vr Br Tb NcFte Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Br Tb NcFowardTableEntry/address, domainNum*<br>This component represents an entry in the transparent bridge forwarding table. This component is identical to *ForwardTableEntry* except the MAC address portion of the index of this component is in non-canonical form. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Br Tb NcFte Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the attributes that form the fields of a forwarding table entry. These attributes reflect the state of the transparent bridge forwarding table. |

### ATTRIBUTE Vr Br Tb NcFte port

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the port name through which the *address* was learned. This implies that the frames that are destined for a station whose MAC address is the same as the *address*, will be forwarded through the bridge port indicated by the attribute *port*. The attribute *port* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort*, the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***TBP-MyPort.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Br Tb NcFte ageOfEntry (aoe)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the age of the forwarding table entry. This is used to purge entries that have not been used for a certain period of time. This feature is to ensure that only the recently used entries are kept in the forwarding table. The time period for aging entries can be provisioned through the attribute *agingTime* under the component *TransparentBridge*. |

|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the forwarding table entry. A value of ***learned*** indicates that the entry was learned and cached from the network. Please note that only a value of ***learned*** is currently supported. |
| Values | learned |
| Default | learned |

### COMPONENT Vr Br SourceRouteBridge (Srb)

| | |
|---|---|
| Groups | "GROUP Vr Br Srb Provisioned (Prov)"<br>"GROUP Vr Br Srb Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Br SourceRouteBridge*<br>This component represents the source route bridging scheme described in various IEEE documents. Source routing is a scheme whereby most of the routing decisions are made by the originating host. The bridge merely forwards frames based upon the route descriptor fields found in the individual frames. Source route bridges also process explorer frames traversing the network. The spanning tree protocol is (optionally) used to prevent loops and the duplication of explorer frames. |
| Opt. Subcomp. | "COMPONENT Vr Br Srb SpanningTreeProtocol (Stp)" |
| Dyn. Subcomp. | "COMPONENT Vr Br Srb LanIdTableEntry (Lte)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Br Srb Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains all provisionable attributes associated with source route bridging. These attributes are global in nature as opposed to port specific. |

### ATTRIBUTE Vr Br Srb lanIdTableNumEntries (lanIdtNe)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of entries in the LAN ID table. This attribute provides a way to control the resources allocated to the LAN ID table. The *lanIdTableNumEntries* value depends upon the *VirtualRouter* attribute *bridgingMaxHeapSpace* and the number of source route bridge ports provisioned for this *SourceRouteBridge*.<br><br>Consider the following attributes of the *SourceRouteBridge* component when adjusting this number:<br>- *totalLanIdTableEntries*<br>- *numLanIdTEntriesFree*<br>- *numLanIdTEntriesDenied* |
| Values | Decimal (500..65535) |
| Default | 500 |

### ATTRIBUTE Vr Br Srb agingTime (at)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time period used in seconds, to age out dynamically learned entries in the forwarding table. The aging time can change, triggered by a spanning tree topology change. The operational value of the aging time is reflected in the attribute *agingTimeOper* under the *SpanningTreeProtocol* component. |
| Values | Decimal (10..1000000) |
| Units | seconds |
| Default | 300 |

### ATTRIBUTE Vr Br Srb bridgeLfMode (blfMode)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates whether the bridge operates using the older 3-bit length negotiation field or the newer 6-bit length field in the routing information field. Only the 3-bit field is supported at this time. |
| Values | mode3<br>mode6 |
| Default | mode3 |

### GROUP Vr Br Srb Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all statistical attributes associated with the *SourceRouteBridge*. These attributes are global in nature as opposed to port specific. |

### ATTRIBUTE Vr Br Srb totalLanIdTableEntries (tLIdTe)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the total number of LAN ID Table entries. The total includes both static and dynamic entries. The value is limited by the attribute *lanIdTableNumEntries*, a provisionable attribute. If the value is consistently approaching the value of *lanIdTableNumEntries* it is advisable to increase the value provisioned for *lanIdTableNumEntries*. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Br Srb numLanIdtEntriesFree (nLIdTeF)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of *LanIdTable* entries that are available for use. A consistently high value indicates a resource surplus in terms of memory requirements for the bridge. This surplus could be utilized elsewhere if need be. The value of this attribute is directly influenced by the value of the *lanIdTableNumEntries*. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Vr Br Srb numLanIdtEntriesDenied (nLIdTeD)

Access Read only

Description This attribute indicates the number of instances where an entry was not placed in the *LanIdTable* due to the lack of free entries. A rapid increase indicates a shortage of free entries. To reduce the shortage increase the provisioned *lanIdTableNumEntries* value.

Values Decimal (0..4294967295)

Default 0

### COMPONENT Vr Br Srb SpanningTreeProtocol (Stp)

Instance Decimal (1..4294967295)

Groups "GROUP Vr Br Srb Stp Provisioned (Prov)"
"GROUP Vr Br Srb Stp Operational (Oper)"

Scope Application

Description *Vr/<string> Br Tb Stp/<Decimal>*
This component represents the Spanning Tree Protocol for the bridge. Bridges use the Spanning Tree Protocol to provide a loop free, fault tolerant network topology.
Individual spanning tree instances are indexed using the domain number.
Only 16 instances of this component are allowed including the backbone spanning tree instance.
The instance identifier of the *SpanningTreeProtocol* component is significant as it indicates the domain that the spanning tree instance governs.

## GROUP Vr Br Srb Stp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes that are applicable to the spanning tree protocol. These are global attributes and not port specific attributes. These attributes have a direct impact on the way this bridge participates in the stp. |

## ATTRIBUTE Vr Br Srb Stp stpMode

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines if this stp instance is to act as the stp instance for the backbone or an stp instance for a non-backbone media configuration. There can exist only one Backbone stp instance per virtual router. Please note that it is not permissible to assign the instance identifier of this stp instance as domain number of any access bridge port. In case of stp instances that are non-Backbone, the instance identifier is indicating the domain number the stp is operational in. |
| Values | access<br>backbone |
| Default | access |

## ATTRIBUTE Vr Br Srb Stp protocolSpec (pS)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of the spanning tree protocols that are in operation in the bridge. This means that this bridge participates in the types of stp indicated by this attribute. |
| Values | both<br>dec<br>ieee8021d |
| Default | ieee8021d |

## ATTRIBUTE Vr Br Srb Stp priority

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute is used to construct the *bridgeId*. It forms the first two octets of the *bridgeId* and the remaining 6 octets are made up of the *bridgeMACAddress*. The *priority* also determines the root bridge of the spanning tree topology. Manipulating this attribute might lead to a change in the spanning tree topology. |
| Values | Decimal (0..65535) |
| Default | 32768 |

### ATTRIBUTE Vr Br Srb Stp bridgeMaxAge (bma)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum age of the stp information learned from the network on any bridge port before it is discarded. This value is used by this bridge and all the other bridges when this bridge is the root bridge of the spanning tree topology. The following relationships are enforced as required by the IEEE 802.1d standards document.<br>2 *(*bridgeForwardDelay* -1.0seconds) >= *bridgeMaxAge*,<br>*bridgeMaxAge* >= 2 * *bridgeHelloTime* + 1.0 seconds. |
| Values | Decimal (600..4000) |
| Units | centiseconds |
| Default | 2000 |

### ATTRIBUTE Vr Br Srb Stp bridgeHelloTime (bht)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval between the transmission of configuration BPDUs on any bridge port when this bridge becomes the root bridge. This attribute value is also used by all the other bridges in the Spanning Tree while this bridge is the root.<br>The following relationship is enforced as required by the IEEE 802.1d standards document.<br>*bridgeMaxAge* >= 2 * *bridgeHelloTime* + 1.0 seconds. |
| Values | Decimal (100..1000) |
| Units | centiseconds |

| | |
|---|---|
| Default | 200 |

### ATTRIBUTE Vr Br Srb Stp bridgeForwardDelay (bfd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how fast a bridge port changes its STP state while progressing towards the forwarding state. It is also used as *agingTime* to age dynamic entries in the forwarding table once a topology change is detected. This attribute is used by all the bridges participating in the stp when this bridge is the root bridge.<br>The following relationship is enforced as required by the IEEE 802.1d standards document.<br>2 *(*bridgeForwardDelay* -1.0sconds) >= *bridgeMaxAge*. |
| Values | Decimal (400..3000) |
| Units | centiseconds |
| Default | 1500 |

### GROUP Vr Br Srb Stp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the operational, stp attributes. These attributes are applicable in a global manner and are not specific to a bridge port. |

### ATTRIBUTE Vr Br Srb Stp bridgeId (bid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier value of this bridge, which serves to uniquely represent this bridge in the spanning tree topology. Thus, a *bridgeId* is unique only in the spanning tree instance the bridge is participating in. If multiple domain spanning trees exist then the same *bridgeId* can be re-used across these spanning tree instances. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Br Srb Stp rootPortName (rpn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the name of the bridge port that offers the lowest cost route to the root bridge of the spanning tree topology.The attribute *rootPortName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***TBP-MyPort.***<br>If multiple instances of spanning tree are operational then there will exist a *rootPortName* value for each instance of the running stp and is applicable to that instance alone. |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Br Srb Stp timeSinceTopologyChange (tstc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time since a spanning tree topology change was detected by this bridge. |
| Values | Decimal (0..4294967295) |
| Units | centiseconds |
| Default | 0 |

### ATTRIBUTE Vr Br Srb Stp topologyChangeDetect (tcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not a topology change was detected. This flag is set when a bpdu with the topology detect flag set is received from the root bridge. If this bridge is the root bridge this flag is set on receipt of a topology change notification bpdu. It is reset after a fixed length of time. |
| Values | false<br>true |

| | |
|---|---|
| Default | false |

### ATTRIBUTE Vr Br Srb Stp topologyChanges (tc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of the topology change events detected by this bridge since the last bridge reset. This counter wraps around its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Br Srb Stp designatedRoot (dr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the identifier of the bridge that this bridge treats as the root of the spanning tree topology. The root of the spanning tree topology is chosen through exchange. |
| Values | String (8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Br Srb Stp rootCost (rc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cost of the path to the root as seen by this bridge. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Br Srb Stp maxAge (mAg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum age of the stp info learnt from a port before it is discarded. |
| Values | Decimal (600..4000) |
| Units | centiseconds |

| | |
|---|---|
| Default | 2000 |

### ATTRIBUTE Vr Br Srb Stp agingTimeOper (ato)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time period in seconds used to age out dynamically learned entries in the forwarding table. The aging time is specific to a running stp instance. A value for the aging time of the current instance of the stp can be provisioned through the attribute *agingTime* under the *InwBrTb* component. The *agingTimeOper* attribute assumes the value of the *bridgeForwardDelay* while a topology change is in progress. This is done to facilitate a quick aging out of the learned entries that might have become obsolete due to a spanning tree topology change. |
| Values | Decimal (10..1000000) |
| Units | seconds |
| Default | 300 |

### ATTRIBUTE Vr Br Srb Stp helloTime (heT)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time interval between the transmission of the configuration BPDUs. This value is obtained from the root bridge of the spanning tree topology through bridge protocol data units. This value should be the value assigned to the attribute *bridgeHelloTime* of the root bridge. |
| Values | Decimal (100..1000) |
| Units | centiseconds |
| Default | 200 |

### ATTRIBUTE Vr Br Srb Stp holdTime (hoT)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum interval of time between the transmission of two BPDUs. |
| Values | Decimal (100) |

| | |
|---|---|
| Units | centiseconds |
| Default | 100 |

### ATTRIBUTE Vr Br Srb Stp fwdDelay (fd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates how much time a port spends in any state while progressing towards the ***forwarding*** state. It is also used to age out learned entries while a topology change is in progress.This value should be the value assigned to the attribute *bridgeFwdDelay* of the root bridge. |
| Values | Decimal (400..3000) |
| Units | centiseconds |
| Default | 1500 |

### COMPONENT Vr Br Srb LanIdTableEntry (Lte)

| | |
|---|---|
| Instance | lanId [Decimal (0..4095; 65535)]<br>domainNum (dn) [Decimal (1..4294967295)] |
| Groups | "GROUP Vr Br Srb Lte Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Br Srb LanIdTableEntry/lanId, domainNum*<br>This component represents an entry in the LAN ID Table. The LAN ID Table is used by the *SourceRouteBridge* logic to associate a particular bridge port with a LAN ID found in the route descriptor field of a source route frame. Static entries reference bridge ports local to the bridge. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Br Srb Lte Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the fields of a LAN ID Table entry. |

### ATTRIBUTE Vr Br Srb Lte portName (pn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the name of the bridge port the frame should be forwarded through to reach the desired Lan. In the case where the desired Lan is across a TB/SRT cloud, this entry would have the name of the *SrSeBridgePort.*<br>The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *SourceRouteBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***SrBP-MyPort.*** Please note that the attribute *portName* cannot have a value of ***TBP, FddiETb, Tbse, Tbcl, Tbsr, Srsg, Tbsg.*** |
| Values | String (4..29, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Br Srb Lte ageOfEntry (aoe)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the age of this entry in seconds. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Br Srb Lte peerMACAddress (pma)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the MAC address of a bridge unit found across an transparent bridge/source route transparent network whose LAN ID is referenced by the attribute *lanId.* The *peerMACAddress* for static entries will be all zeroes. |
| Values | String (6, Dashed Hex) |
| Default | No default |

## ATTRIBUTE Vr Br Srb Lte typeOfEntry (toe)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the type of the LAN ID table entry. LAN ID table entries may be either static or dynamic. Dynamic entries imply that to reach the desired LAN source route frames need to be tunneled through a TB/SRT network, to another bridge unit which is attached to the LAN. These entries have a *peerMACAddress* associated with them and may be removed through the aging mechanism of the LAN ID table. Static entries on the other hand contain information about LANs that may be reached directly through bridge ports attached to the bridge. They are not aged and do not have a *peerMACAddress* associated with them. |
| Values | static<br>dynamic |
| Default | No default |

## COMPONENT Vr Ip

| | |
|---|---|

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Ip Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains global attributes for IP. |

## ATTRIBUTE Vr Ip forwarding

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates whether this VR is acting as an IP gateway in respect to the forwarding of datagrams received by, but not addressed to, this VR. |
| Values | gateway |
| Default | gateway |

## ATTRIBUTE Vr Ip defaultTtl

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the default value inserted into the Time-To-Live field of the IP header of datagrams originated at this entity, whenever a Time-To-Live value is not supplied by the transport layer protocol.<br><br>The value of this attribute deviates from the MIB requirement that it will always have a value of 255. |
| Values | Decimal (255..255) |
| Default | 255 |

## ATTRIBUTE Vr Ip cosPolicyAssignment (cospolicy)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *CosPolicyGroup* that each *IpPort* on the *VirtualRouter* uses if the *cosPolicyAssignment* attribute of the *IpPort* is not set.<br><br>The assigned *CosPolicyGroup* controls the forwarding behavior of IP packets recieved and transmitted at each *IpPort* that use it. See the description of *Vr Ip CosPolicyGroup* for more information. |

If the *VirtualRouter* has a *DifferentiatedServicesDomain* subcomponent, then this attribute cannot be set.

The assigned *CosPolicyGroup* must be a subcomponent of the same *Virtual Router.*

Values: Link (Service, linkToPolicyUsers)

Default: No default

### ATTRIBUTE Vr Ip sourceRoute

Access: Read and write

Description: This attribute indicates whether or not this VR allows processing of datagrams which have a source route IP option.

Values: enabled
disabled

Default: disabled

### ATTRIBUTE Vr Ip filterAssignment (filtAss)

Access: Read and write

Description: This attribute specifies the *Filter* that each *IpPort* on the *VirtualRouter* uses if the *filterAssignment* attribute of the *IpPort* is not set.

The filtering of IP packets is controlled by the *filterAssignment* attribute of the *Ip* and *IpPort*. If no *Filter* is used, then all packets are permitted.

If the *linkToMedia* attribute of the parent *ProtocolPort* of an *IpPort* is linked to *Vr Ip Tunnel Sep* or *Vr Ip Tunnel Msep*, then the *IpPort* operates as if no *Filter* is used. All packets are permitted.

The assigned *Filter* must be a subcomponent of the same *Virtual Router.*

Values: Link (Service, linkToFilterUsers)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip diffServAssignment (ds)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *DifferentiatedServices* that each *IpPort* on the *VirtualRouter* uses if the *diffServAssignment* attribute of the *IpPort* is not set.<br><br>The assigned *DifferentiatedServices* interface configuration controls the forwarding behavior of IP packets recieved and transmitted at each *IpPort* that uses it. See the description of of *Vr Ip DifferentiatedServices* interface configuration for more information.<br><br>If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then this attribute cannot be set.<br><br>The assigned *DifferentiatedServices* must be a subcomponent of the same *Virtual Router.* |
| Values | Link (Service, linkToDiffServUsers) |
| Default | No default |

### ATTRIBUTE Vr Ip cacheTableSize (cts)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of entries that can exist in the IP local cache table on each LP. This attribute provides a way to control the resources allocated to the IP cache tables.<br>The default cache table size is *3000* for an FP and *100* for a CP, is used if this attribute is not specified explicitly. The attribute value must be multiple of 100. |
| Vector of | Decimal (100..8000) |
| Index | Decimal (0..15) |
| Default | ([1] 100, [15] 3000) |

## GROUP Vr Ip Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This is the GROUP holding the struct which contains statistical attributes for IP. |

## ATTRIBUTE Vr Ip inReceives

| | |
|---|---|
| Access | Read only |
| Description | This is the number of input datagrams received from the interfaces, including those received in error. *inReceives* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Ip inHdrErrors

| | |
|---|---|
| Access | Read only |
| Description | The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc. *inHdrErrors* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Ip inAddrErrors

| | |
|---|---|
| Access | Read only |
| Description | The number of input datagrams discarded due to errors such as invalid address, unsupported address class. *inAddrErrors* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip forwDatagrams

| | |
|---|---|
| Access | Read only |
| Description | The number of input datagrams for which this router was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. *forwDatagrams* wraps to zero if reaches it's maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip inUnknownProtos

| | |
|---|---|
| Access | Read only |
| Description | The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol *inUnknownProtos* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip inDiscards

| | |
|---|---|
| Access | Read only |
| Description | The number of input datagrams for which no problems were encountered to prevent their continued processing, but which were discarded due to the lack of buffers. This does not include any datagram discarded while awaiting for re-assembly. *inDiscards* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip inDelivers

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of input datagrams successfully delivered to IP user-protocols (including ICMP). *inDelivers* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip outRequests

| | |
|---|---|
| Access | Read only |
| Description | The number of datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. This sum does not include datagrams counted in *ForwDatagrams*. *outRequests* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip outDiscards

| | |
|---|---|
| Access | Read only |
| Description | The number of outbound datagrams that were discarded due to the lack of buffers. This sum also includes datagrams counted in *forwDatagrams* if any such packets met the discard criterion. *outDiscards* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip outNoRoutes

| | |
|---|---|
| Access | Read only |
| Description | The number of outbound datagrams discarded because no route could be found to transmit them to their destination. This counter includes any datagrams counted in *forwDatagrams*. *outNoRoutes* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Ip reasmTimeOut

| | |
|---|---|
| Access | Read only |
| Description | The maximum number of seconds, which received fragments are held while they are awaiting reassembly at this gateway. |
| Values | Decimal (0..5) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Vr Ip reasmReqds

| | |
|---|---|
| Access | Read only |
| Description | The number of the IP fragments received by this gateway which needed to be reassembled. *reasmReqds* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip reasmOks

| | |
|---|---|
| Access | Read only |
| Description | The number of IP fragments successfully reassembled by this gateway. *reasmOks* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip reasmFails

| | |
|---|---|
| Access | Read only |
| Description | The number of times this gateway is unabled to assemble IP-fragments for whatever reasons. *reasmFails* wraps to zero if reaches its maximum defined value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip fragOks

| | |
|---|---|
| Access | Read only |
| Description | The number of IP datagrams that have been successfully fragmented by this gateway. *fragOks* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip fragFails

| | |
|---|---|
| Access | Read only |
| Description | The number of IP-fragments that have been discarded because they needed to be fragmented but could not be. For example, their Don't Fragment flag was set. *fragFails* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip fragCreates

| | |
|---|---|
| Access | Read only |
| Description | This number of IP fragments that have been generated as a result of fragmentation by this gateway. *fragCreates* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip routingDiscards

| | |
|---|---|
| Access | Read only |
| Description | The number of routing entries which were chosen to be discarded even though they are valid. One possible reason for discarding |

| | |
|---|---|
| | such an entry could be to free -up buffer space for other routing entries. In this implementation, this number is always zero because IP never deletes a valid routing entry. |
| Values | Decimal (0..0) |
| Default | 0 |

### ATTRIBUTE Vr Ip inSrcRouteDiscards

| | |
|---|---|
| Access | Read only |
| Description | The number of input datagrams which had a source route IP option and were discarded because this functionality is not allowed for this Routing Component. *srcRouteDiscards* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Ip AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Ip snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ip OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Ip adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Ip operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Ip OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Ip snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ip AcctProvisioned (AcctProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for IP accounting. |

### ATTRIBUTE Vr Ip accountCollection (acl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit*** or ***force***.<br><br>If the set of reasons is not empty then accounting records will be generated by this interface in the following situations:<br>- on a TODA (time of day accounting) changeover, if TODA is enabled<br>- every 12 hours per *ProtocolPort* if TODA is disabled<br><br>If none of the above reasons are present IP accounting will be disabled on the VR. Accounting can be disabled on individual *ProtocolPort*s by disabling the attribute *accountingControl* in *Vr ProtocolPort*. |

The reason for collection is recorded in the accounting records, in the attribute *collectReason*.

Set of
bill
test
study
audit
force

Default
No default

## COMPONENT Vr Ip Isis (Isis)

Groups
"GROUP Vr Ip Isis Provisioned (Prov)"
"GROUP Vr Ip Isis OsiState (State)"
"GROUP Vr Ip Isis ErrorStatistics (Errors)"

Scope
Application

Description
*Router/<id> Isis*
This component is configured to control the Intermediate System to Intermediate System (ISIS) routing protocol.

This component requires at least one *Net* subcomponent and no more than 3 *Net* subcomponents to be provisioned.

This component requires at least one *Level* subcomponent to be provisioned.

For ISIS routes to be entered into the routing table, at least one active *IsisIf* component must be provisioned.

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Ip Isis NetworkEntityTitle (Net)"<br>"COMPONENT Vr Ip Isis IsisLevel (Level)" |
| Dyn. Subcomp. | "COMPONENT Vr Ip Isis NeighborEntry (Nbr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Ip Isis Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes is used to configure the *Isis* component. |

### ATTRIBUTE Vr Ip Isis snmpAdminStatus (admin)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the administrative status of the *Isis* component in this *Router.* |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Vr Ip Isis intermediateSystemType (isType)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the ISIS level functionality of this *Router* as defined in ISO specification 10589. In this release only level1 ISIS support exists and therefore the value ***level1*** is the only |

value supported by this attribute.

| | |
|---|---|
| Values | level1 |
| Default | level1 |

### ATTRIBUTE Vr Ip Isis overloadBitControl

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how the value of the overload bit in the *Router's* Link State PDU (LSP) should be derived.<br><br>A value of ***on*** specifies that the overload bit is forced on in the LSP.<br><br>A value of ***auto*** specifies that the overload bit value is fully controlled by system software. This means that system software, based on current operating conditions, may choose to set the overload bit as appropriate.<br><br>Any other value specifies, in seconds, the time period after a software restart that the overload bit will be forced on. |
| Values | Decimal (60..1800)<br>on<br>auto |
| Default | auto |

### ATTRIBUTE Vr Ip Isis ignoreLspErrors

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how the system behaves on receipt of a corrupted Link State PDU (LSP).<br><br>If the attribute value is ***ignore***, the system will discard a corrupted LSP.<br><br>If the attribute value is ***purge***, the system will purge the LSP. |

| | |
|---|---|
| Values | purge<br>ignore |
| Default | purge |

### ATTRIBUTE Vr Ip Isis lspMaxLifetime

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time, in seconds, that an LSP generated by this *Router* may exist before being considered to be stale and therefore should be purged by other nodes in the network.<br><br>A *Check Prov* error occurs if this attribute specifies a value less than or equeal to the value specified for the *lspRefreshInterval* attribute. A *Check Prov* warning is produced if the value of this attribute is not at least 300 seconds greater than the value of the *lspRefreshInterval* attribute. |
| Values | Decimal (350..65535) |
| Units | seconds |
| Default | 1200 |

### ATTRIBUTE Vr Ip Isis lspRefreshInterval

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time, in seconds, between successive retransmissions of this *Router's* LSP.<br><br>A *Check Prov* error occurs if this attribute specifies a value greater than the value specified for the *lspMaxLifetime* attribute. A *Check Prov* warning is produced if the value of this attribute is not at least 300 seconds less than the value of the *lspMaxLifetime* attribute. |
| Values | Decimal (1..65535) |
| Units | seconds |

| | |
|---|---|
| Default | 900 |

### ATTRIBUTE Vr Ip Isis spfDelay

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies, in milliseconds, the delay between the detection of a network topology change and the execution of the ISIS Shortest Path First (SPF) route calculation algorithm. |
| Values | Decimal (1..10000) |
| Units | msec |
| Default | 2000 |

### GROUP Vr Ip Isis OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Ip Isis adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Ip Isis operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Isis usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

| | |
|---|---|
| | The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Isis ErrorStatistics (Errors)

| | |
|---|---|
| Properties | Operational |
| Description | The attributes in this group are essentially statistics or counters. Each attribute counts each particular, abnormal event that has occurred since the *Isis* component was last enabled or unlocked. |

### ATTRIBUTE Vr Ip Isis rxCorruptedLsps

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of corrupted LSPs received on all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis lsdbOverloads

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of occurrences of link state database overloads for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis attemptsToExceedMaxSeqNum

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times that the maximum LSP sequence number has be reached for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis seqNumSkips

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times that LSPs have been received where sequence numbers are nonsequential with respect to the previously received LSP. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis ownLspPurges

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times that this *Router* has purged its own LSP. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis idFieldLenMismatches

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times that this *Router* has received PDUs with ID Field lengths that do not match those used by this *Router*. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis maxAreaAddrMismatches

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of times that this *Router* has received a PDU with the “maximum number of supported area addresses” field set to a value greater than the maximum number of area addresses supported by this *Router*. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Ip Isis NetworkEntityTitle (Net)

| | |
|---|---|
| Instance | String (1..46, ASCII) |
| Scope | Application |
| Description | *Rtr/id Isis NetworkEntityTitle/<net>*<br>This component represents the *Router’s* Network Entity Title (NET). A NET is an ISO address that uniquely identifies an ISIS router. The NET format is specified in ISO 8348.<br><br>The *Net* instance ID must be formatted as follows:<br><br>AA.aaaa.SSSS.SSSS.SSSS.NN where; |

"AA" represents the ISIS area number and is a two hex digit string.

"aaaa" represents the ISIS area number and is a string of 0 to 24 hex digits and there must be an even number of digits in this field.

"SSSS.SSSS.SSSS" represents this *Router's* ISIS system ID. The system ID is made up of 12 hex digits, grouped in 3 groups of 4 hex digits, separated by the "." character. Note that when more than one *Net* component is provisioned, all *Net* components must have the same system ID portion of the *Net* instance ID.

"NN" represents the NSEL portion of the *Net* instance ID. This must always be "00" (zero zero).

The sections of the *Net* instance ID are separated by the "." character.

### GROUP Vr Ip Isis Level Lsdb Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the set of operational attributes of the *LsDbEntry* component. |

### ATTRIBUTE Vr Ip Isis Level Lsdb seqNumber

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the sequence number of the LSP. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Level Lsdb remainingLifetime

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates, in seconds, the remaining lifetime of the LSP. |
| Values | Decimal (0..65535) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Level Lsdb attachment (att)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the default attachment bit is set in this LSP. |

| | |
|---|---|
| Values | notAttached<br>attached |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Level Lsdb partitionRepair

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the partition repair bit is set in this LSP. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Level Lsdb overloadBit

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the overload bit is set in this LSP. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Level Lsdb isType

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates which system type bits are set in this LSP. |
| Values | none<br>level1<br>level2<br>both |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Level Lsdb lspBody

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the content of this LSP's body. |
| Values | String (1..1500, Hex) |
| Default | No default |

### COMPONENT Vr Ip Isis NeighborEntry (Nbr)

| | |
|---|---|
| Instance | sysId [String (1..14, ASCII)]<br>level [Decimal (1..2)] |
| Groups | "GROUP Vr Ip Isis Nbr Operational (Oper)" |
| Scope | Application |
| Description | *Rtr/<id> Isis Nbr/SysId,Level*<br>This component represents the list of ISIS adjacencies formed with the specified ISIS router at the specified level. |
| Dyn. Subcomp. | "COMPONENT Vr Ip Isis Nbr Adjacency (Adj)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ip Isis Nbr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains only one operational attribute, which represents the number of adjacencies formed with the router identified by the instance ID of the parent *NeighborEntry* component. This instance ID specifies the System ID of the neighbor router. |

### ATTRIBUTE Vr Ip Isis Nbr adjacencies

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of adjacencies between this *Router* and the specified neighbor router at the specified ISIS level. The neighbor's system ID and the level at which the adjacency was formed is specified by the instance ID of the *NeighborEntry* component. |

| | |
|---|---|
| Values | Decimal (0..65535) |
| Default | No default |

### COMPONENT Vr Ip Isis Nbr Adjacency (Adj)

| | |
|---|---|
| Instance | Decimal (1..65535) |
| Groups | "GROUP Vr Ip Isis Nbr Adj Operational (Oper)" |
| Scope | Application |
| Description | *Rtr/<id> Isis Nbr/SysId,Level Adjacency/n*<br>This component represents the collection information available regarding an adjacency formed with another ISIS router. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ip Isis Nbr Adj Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains a set of attributes that indicate the characteristics of the adjacency. |

### ATTRIBUTE Vr Ip Isis Nbr Adj neighborLinkLayerAddress (nbrLLAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the neighbor's link layer address for the link on which the adjacency was formed. In ISO ISIS terminology, this is referred to as the subnetwork point of attachment (SNPA). |
| Values | String (0..11, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Nbr Adj interface

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the *Interface* component on which this adjacency was formed. The format will be:<br><br>*Rtr/<s> Interface/<IP Address>* |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Nbr Adj state

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the operating state of the *adjacency.* |
| Values | null<br>initializing<br>up<br>fail |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Nbr Adj holdTime

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates, in seconds, the maximum time that may elapse without receiving a hello message before the adjacency is considered down. |
| Values | Decimal (1..600) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Nbr Adj priority

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the DIS priority of the neighbor associated with this *adjacency.* |
| Values | Decimal (0..127) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Isis Nbr Adj protocols

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the list of protocols supported by the neighbor on this *adjacency.* |
| Values | none<br>osi_only<br>ip_only<br>osi_and_ip |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Nbr Adj areaAddresses

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the list of area addresses used by the neighbor associated with this *adjacency.* |
| Values | String (0..85, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Isis Nbr Adj age

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the elapsed time, in seconds, since this *adjacency* was established. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### COMPONENT Vr Ip DifferentiatedServices (DiffServ)

| | |
|---|---|
| Instance | String (1..20, ASCII) |
| Groups | "GROUP Vr Ip DiffServ Provisioned (Prov)" |

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> Ip DifferentiatedServices/<string>* |

This component and its subcomponents specify the Differentiated Services capabilities of an *IpPort*.

A *DifferentiatedServices* component is used by all *IpPort* subcomponents of a *VirtualRouter* by setting the *diffServAssignment* attribute of the *Ip* component. It is used by one or more *IpPort* components directly by setting the *diffServAssignment* attribute of the *IpPort*. The direct assignment to the *IpPort* completely overrides the assignment to the *Ip*.

Differentiated Services processing of IP packets is based on the value of the Differentiated Services Code Point (DSCP) field in each IP packet header.

At any time the total number of interface profiles (*CosPolicyGroup*, *DifferentiatedServices*, and *Filter* components) in the current view plus the total number of newly created interface profiles in the edit view must be less than the system limit, regardless how many interface profiles have been deleted in the edit view. Any interface profile created in the edit view that results in a total count greater than the system limit is identified as invalid and must be deleted; otherwise a *Check Prov* command will produce an error. If invalid interface profiles exist after a software migration prior to a *Check Prov* command, then those interface profiles are ignored and have no impact on IP forwarding. Any subsequent *Check Prov* command fails until the invalid interface profiles are deleted. It is recommended that all interface profile deletions be activated using the *Activate Prov* command before any new interface profiles are created.

There are seven logical stages for processing IP Differentiated Services on the *VirtualRouter* component. These seven stages are presented below, along with the behavior of locally generated packets, and the behavior of any *IpPort* component that does not use a *DifferentiatedServices* component.

1. INGRESS CLASSIFICATION AND MARKING

If the *baMode* attribute of the *IngressServices* subcomponent of the *DifferentiatedServices* used by the *IpPort* where the packet was received is set to ***preserve***, then the DSCP field of the packet header is not modified.

If the *baMode* attribute is set to ***translate***, then the DSCP field is marked according to the *BehaviorAggregate* subcomponents of the *IngressServices* component, if they exist and if there is a match; otherwise, the DSCP field is marked to 0. A match occurs if the DSCP of the packet is equal to one of the values specified by the *dscpToMatch* attribute on a *BehaviorAggregate* subcomponent. If a match occurs, then the DSCP of the packet is set equal to the value of the *dscpToMark* attribute of the *BehaviorAggregate* subcomponent where the match occurred.

If the *baMode* attribute is set to ***link***, then the DSCP field is marked according to the DSCP configured for the link where the packet arrived. For *AtmMpe*, the DSCP of a link is specified by the *ipDscp* attribute of the *AtmConnection* subcomponent. For *FrDte*, the DSCP of a link is specified by the *ipDscp* attribute of the *StaticDlci* or *DynamicDlciDef* subcomponent. For *IpDlciGroup*, the DSCP of a link is specified by the *ipDscp* attribute of the *FrConnection* subcomponent. For PPP and Ethernet, the DSCP of the link is specified by the *ipDscp* attribute of the *IpPort*.

2. DROP PRECEDENCE ASSIGNMENT

If the *dpMode* attribute of the *IngressServices* subcomponent of the *DifferentiatedServices* used by the *IpPort* where the packet was received is set to ***mapDscpToDp***, then the packet is assigned a drop precedence value (***low***, ***medium***, ***high***) according to the *Vr DifferentiatedServicesDomain PerHopBehavior* component whose instance value is equal to the DSCP of the packet header. If there is no *PerHopBehavior* component whose instance value is equal to the DSCP of the packet, then the drop precedence for DSCP 0 is used.

If the *dpMode* attribute is set to ***retainLinkDp***, then the drop precedence assigned to the packet is not modified. It remains at the value provided by the ingress link. If this attribute value is used, then the *IpPort* is not operating in a mode that is compliant with Differentiated Services standards.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue, as explained in Step 7.

Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The ***high*** value indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the discarding mechanism at the queue.

3. SCHEDULING CLASS ASSIGNMENT

The packet is assigned an logical scheduling class value for eight, four, three, and two queues in the range from ***0*** to ***7***, ***0*** to ***3***, ***0*** to ***2***, and ***0*** to ***1***, respectively. The scheduling class values are selected according to the *Vr DifferentiatedServicesDomain PerHopBehavior* component whose instance value is equal the DSCP of the packet header. If there is no *PerHopBehavior* component whose instance value is equal to the DSCP of the packet, then the scheduling classes for DSCP 0 are used.

Scheduling classes are assigned to a packet to control its scheduling behavior relative to other packets at the egress interface where the packets are transmitted, as explained in Step 7.

Generally, a numerically lower value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically higher value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism and number of

queues at the egress interface.

4. CONNECTION CLASS ASSIGNMENT

The packet is assigned aconnection class value in the range from ***0*** to ***3*** according to the *Vr DifferentiatedServicesDomain PerHopBehavior* component whose instance value is equal the DSCP of the packet header. If there is no *PerHopBehavior* component whose instance value is equal to the DSCP of the packet, then the connection class for DSCP 0 is used.

A connection class is assigned to a packet to select one of up to four egress link layer connections for transmitting the packet as described in Step 6.

5. EGRESS CLASSIFICATION AND MARKING

If the *baMode* attribute of the *EgressServices* subcomponent of the *DifferentiatedServices* used by the *IpPort* where the packet is transmitted is set to ***preserve***, then the DSCP field in the packet header is not modified.

If the *baMode* attribute is set to ***translate***, then the DSCP field is marked according the *BehaviorAggregate* subcomponents of the *EgressServices* component, if they exist and there is a match; otherwise, the DSCP field is marked to 0. A match occurs if the DSCP of the packet is equal to one of the values specified by the *dscpToMatch* attribute of a *BehaviorAggregate* subcomponent. If a match occurs, then the DSCP of the packet is set equal to the value of the *dscpToMark* attribute of the *BehaviorAggregate* subcomponent where the match occurred.

The new value of the DSCP field does not influence the forwarding behavior of the packet as it continues to be processed by the *VirtualRouter*, but it may have significance at the next hop.

6. MULTI-LINK CONGESTION CONTROL

The connection class assigned to the packet is used to select one of up to four link layer connections at the *IpPort* where the packet is transmitted. Per-packet selection of egress connections is supported only if these conditions are all true:

i) the egress media is *FrDte*, *AtmMpe*, *IpDlciGroup* or *IpoDlci*, and
ii) more than one link layer connection is configured to the next hop IP router, and
iii) each connection is provisioned with a different connection class.

Normally the packet is transmitted on the connection whose connection class is equal to the connection class assigned to the packet. If that connection does not exist, then the connection having the next lower connection class is used. If that connection does not exist also, then the connection having the next higher connection class is used.

For *AtmMpe* the connection class is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte* the connection class is specified by the *ipCoS* attribute of the *StaticDlci* and *DynamicDlciDef* subcomponents. For *IpDlciGroup* and *IpoDlci* the connection class is specified by the *ipCos* attribute of the *FrConnection* subcomponent.

If each link layer connection is configured to provide different policing and scheduling characteristics, then the forwarding behaviors of IP packets are differentiated as they transit through the link layer network. In general, the scheduling characteristics of the connections should be configured to be better for numerically greater conection class values. For example, if four *AtmConnection* components are associated with *AtmIf* components configured for ATM service classes ***UBR***, ***nrtVBR***, ***rtVBR***, and ***CBR***, then the *ipCos* attributes of the *AtmConnection* components should be either ***0***, ***1***, ***2*** and ***3***, respectively, or ***0***, ***1***, ***3*** and ***2*** respectively.

7. PER-LINK CONGESTION CONTROL

The drop precedence and scheduling classes assigned to the packet are used by the egress interface where the packet is transmitted, but only if the egress interface supports these parameters on a per-link basis.

Multiple drop precedences are supported on MS3-based FPs at Gigabit Ethernet interfaces. On PQC-based FPs they are supported at *AtmMpe*, *FrDte*, *IpDlciGroup*, *IpoDlci* , and Ethernet interfaces. On SBIC-based FPs they are supported at PPP interfaces and *FrDte* interfaces.

Eight queues per link are supported on MS3-based FPs at Gigabit Ethernet interfaces. Four queues per link are supported on PQC-based FPs at PPP interfaces, at *FrDte* interfaces provisioned with *DirectConnection*, and at *IpDlciGroup* and *IpoDlci* interfaces where FRF.12 is disabled on the DLCI.

## LOCALLY GENERATED PACKETS

Ingress classification and marking is not performed on packets generated locally at the *VirtualRouter*. For a locally generated packet used for network routing control, the DSCP field is initialized to the value of the *phbRoutingSource* (*phbR*) attribute of the *DifferentiatedServicesDomain* component. For any other locally generated packet, the DSCP field is initialized to the value of the *phbGeneralSource* (*phbG*) attribute of the *DifferentiatedServicesDomain* component.

For a locally generated ICMP echo request packet, the initial value of the DSCP field is overridden by the *-tos* or *-dscp* option of the *Ping* command. For a locally generated ICMP echo reply packet, the DSCP field is set to the value contained in the IP header of the received request packet.

Locally generated IP multicast and IP broadcast packets are not subject to Multi-Link Congestion Control as described above. Each of these packets is copied and transmitted individually on each of the available connections.

DEFAULT BEHAVIOR

If the *VirtualRouter* has a *DifferentiatedServicesDomain* subcomponent, then the IP Differentiated Services behavior of any *IpPort* that does not use a *DifferentiatedServices* component (by setting the *diffServAssignment* attribute of the *Ip* or *IpPort* as explained above) is identical to an *IpPort* that uses the *DifferentiatedServices* component described here: The *IngressServices* subcomponent has no subcomponents and the *baMode*, and *dpMode* attributes are set to ***preserve*** and ***mapDscpToDp***, respectively. The *EgressServices sub*component has no subcomponents and the *baMode* attribute is set to ***preserve***.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then the IP Differentiated Services behavior of the *IpPort* components are controlled by *Vr Ip CosPolicyGroup* components. See the description of the *CosPolicyGroup* component for more information.

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of seconds since this route was last updated or otherwise determined to be correct. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Fwd protocolPortName (pPName)

| | |
|---|---|
| Access | Read only |
| Description | For a *Vr*, this attribute indicates the name of the protocol port by which the next hop of this route should be reached. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Ip Fwd nextHopAs

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the Autonomous System number of the Next Hop. If unknown or not relevant to the protocol indicated by the attribute *protocol*, the value should be zero. |

| | |
|---|---|
| Values | Decimal (0..429467295) |
| Default | No default |

### ATTRIBUTE Vr Ip Fwd metric

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the primary routing metric for this route. The semantics of this metric are determined by the routing protocol specified by the value of the attribute *protocol*. If this metric is not used, its value should be set to -1. |
| Values | Signed (-1..65535) |
| Default | -1 |

### ATTRIBUTE Vr Ip Fwd interfaceName

| | |
|---|---|
| Access | Read only |
| Description | For a *Rtr* or *Rtr Vrf*, this attribute indicates the name of the interface by which the next hop of this route should be reached. |
| Values | The name of the component |
| Default | No default |

| | |
|---|---|
| Properties | Operational |
| Description | Identifies a group of operational attributes associated with each entry in the Ip interface table. |

### ATTRIBUTE Vr Ip If interfaceMask (mask)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mask for this interface entry. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip If status

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute specifies the status of the provisioned Ip logicalInterface entry. A value of ***disabled*** is used when the parent components *Vr*, *Ip* or *ipPort* is in a disabled state. A value of ***up*** is used when the interface is in an operational state. A state of ***down*** is used if the media associated with this interface is not ready or disabled. |
| Values | up<br>down<br>disabled |
| Default | No default |

### ATTRIBUTE Vr Ip If pPName

| | |
|---|---|
| Access | Read only |
| Description | Indicates the name of the protocol port this logicalIfEntry belongs to. |
| Values | String (1..23, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip If mediaType (type)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the media type of interface. When the interface is down, a value of none indicates the media stays down from the beginning. When the interface is down, a value of some valid media type indicates the media is brought down after it was up. Otherwise, when the interface is up or disabled, this attribute should reflect the proper media type of the interface. |

|---|---|
| Access | Read and write |
| Description | The autonomous system identifier for this EGP entity. The value of this *asId* can not be equal to the value of *EgpNeighborEntry asId.* |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp defaultHelloInterval (hello)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to configure the default hello interval for each neighbor. This attribute's value is used by the application for each *EgpNeighbor* whose *helloInterval* has not been set. |
| Values | Decimal (30..900) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Vr Ip Egp defaultPollInterval (poll)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to configure the default polling interval for the EGP Neighbor. This attribute's value is used by the application for each *EgpNeighbor* whose *pollInterval* has not been set. |
| Values | Decimal (120..3600) |
| Units | seconds |
| Default | 120 |

### ATTRIBUTE Vr Ip Egp maxNatNets (maxNets)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to configure the maximum number of external natural networks this virtual router will be advertising via EGP. |
| Values | Decimal (1..65535) |
| Default | 500 |

### ATTRIBUTE Vr Ip Egp maxBufferSize (maxBuf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum buffer size (in 1024 byte memory blocks) to be used for an EGP update to be sent. |
| Values | Decimal (2..16) |
| Units | Kbyte |
| Default | 4 |

### GROUP Vr Ip Egp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | These set of attributes identifies the statistics for the EGP component. |

### ATTRIBUTE Vr Ip Egp inMsgs

| | |
|---|---|
| Access | Read only |
| Description | Identifies the number of EGP messages received without error. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp inErrorMsgs

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | Identifies the sum of EGP error messages from all the neighbors. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp outErrorMsgs

| | |
|---|---|
| Access | Read only |
| Description | Indicates the sum of Egp error messages sent to all the neighbors. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp inErrors

| | |
|---|---|
| Access | Read only |
| Description | Identifies the number of EGP messages that proved to be in error. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp outMsgs

| | |
|---|---|
| Access | Read only |
| Description | The total number of locally generated EGP messages. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp outErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of EGP messages that were locally generated but were not sent out due to resource limitations within an EGP entity.This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Vr Ip Egp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Ip Egp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE Vr Ip Egp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Ip Egp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Egp AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Ip Egp snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ip Egp OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Ip Egp snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## COMPONENT Vr Ip Egp NeighborEntry (Nbr)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP Vr Ip Egp Nbr Provisioned (Prov)"<br>"GROUP Vr Ip Egp Nbr Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Egp NeighborEntry/<Ip Address>*<br>This component identifies the properties of each EGP neighbor. The index value of this entry should belong to one of the subnets provisioned as *logicalIfEntry* under one of the *IpPort*. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Egp Nbr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes identify the provisionable attributes for this EGP neighbor. |

## ATTRIBUTE Vr Ip Egp Nbr asId (as)

| | |
|---|---|
| Access | Read and write |
| Description | The autonomous system identifier of this EGP peer.<br>The value of this neighbor's *asId* should not be equal to the *asId* value of *Egp* entity |
| Values | Decimal (1..65535) |
| Default | No default |

## ATTRIBUTE Vr Ip Egp Nbr mode

| | |
|---|---|
| Access | Read and write |
| Description | This attribute will indicate whether this neighbor is being configured as an active or passive neighbor. |

| | |
|---|---|
| Values | active<br>passive |
| Default | active |

### ATTRIBUTE Vr Ip Egp Nbr generateDefaultRoute (default)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute distinguishes whether or not the default route should be generated. This route is put in the EGP update along with the normal EGP update routes when updates are sent to this EGP neighbor |
| Values | yes<br>no |
| Default | no |

### ATTRIBUTE Vr Ip Egp Nbr defaultRouteMetric

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the Metric to be used for propagating the “Default Route”. The value of *defaultRouteMetric* is used only in the case where the value of the attribute *generateDefaultRoute* is set to ***yes***. |
| Values | Decimal (0..255) |
| Default | 128 |

### ATTRIBUTE Vr Ip Egp Nbr defaultMetric (metric)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the default metric value for routes that are exported to this *EgpNeighbor*. This value is used when exporting routes to this neighbor and no *Export* policy applies a different metric. |
| Values | Decimal (0..255) |
| Default | 128 |

### ATTRIBUTE Vr Ip Egp Nbr helloInterval (helloInt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the interval in seconds, between EGP hello command retransmissions. This is the P1 timer in the RFC904. This value may change in operation due to negotiations. |
| Values | Decimal (30..120) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Vr Ip Egp Nbr pollInterval (pollInt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the interval in seconds, between EGP poll command retransmissions. This is the P2 timer in the RFC904. This value may change in operation due to negotiations. |
| Values | Decimal (120..480) |
| Units | seconds |
| Default | 120 |

### GROUP Vr Ip Egp Nbr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes identifies the operational set of attributes for the *NeighborEntry* component. |

### ATTRIBUTE Vr Ip Egp Nbr state

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the state of the local system with respect to this entry's EGP Neighbor. |
| Values | idle<br>acquisition<br>down<br>up<br>cease |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr inMsgs

| | |
|---|---|
| Access | Read only |
| Description | The number of EGP messages received without error from the EGP peer. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr inErrors

| | |
|---|---|
| Access | Read only |
| Description | The number of messages received from this EGP peer that proved to be in error. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr outMsgs

| | |
|---|---|
| Access | Read only |
| Description | The number of locally generated EGP messages for this EGP peer. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr outErrors

| | |
|---|---|
| Access | Read only |
| Description | The number of locally generated EGP messages not sent to this EGP peer due to resource limitations within an EGP entity.This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr inErrorMsgs

| | |
|---|---|
| Access | Read only |
| Description | The number of EGP-defined error messages received from this EGP peer.This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr outErrorMsgs

| | |
|---|---|
| Access | Read only |
| Description | The number of EGP-defined error messages sent to this EGP peer.This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr stateUps

| | |
|---|---|
| Access | Read only |
| Description | The number of EGP state transitions to the UP state with this EGP peer. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr stateDowns

| | |
|---|---|
| Access | Read only |
| Description | The number of EGP state transitions from the UP state to any other state with this EGP peer. This counter will wraparound once the value reaches the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Egp Nbr eventTrigger

| | |
|---|---|
| Access | Read only |
| Description | This attribute is used to control the state of the Neighbor. It is not allowed to change.<br>This attribute from SNMP perspective deviates from MIB that it is made READONLY. |
| Values | start<br>stop |
| Default | start |

### COMPONENT Vr Ip Egp Import

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Egp Import Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Egp Import/n*<br>This component controls the functionality of route leaking. In other words, this component will determine what routes are used by EGP. |
| Opt. Subcomp. | "COMPONENT Vr Ip Egp Import Network (Net)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Egp Import Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | These set of attributes describe the provisionable attributes for the import component. |

## ATTRIBUTE Vr Ip Egp Import usageFlag (usage)

| | |
|---|---|
| Access | Read and write |
| Description | This flag will determine whether or not EGP will use or ignore information in updates received. If the attribute *nbrAsId* is not specified or any of the *NetworkList* components are not added, then this attribute when set to ***ignore*** will ignore all incoming information. |
| Values | use<br>ignore |
| Default | use |

## ATTRIBUTE Vr Ip Egp Import importMetric (metric)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to set the metric value to be included in the routing table for any routes sent because this particular import instance was it's "best match" policy.<br>However this attribute is not a selection key. It should not ***use*** or ***ignore*** a particular metric value. If the value for this attribute is not specified, then the metric value received in an Egp update will be used.<br><br>Note:<br><br>When setting this value, caution should be taken to set the metric value in all relevant *Import* components to make sure that all matching policies for a given route have the same metric set. This will insure that there are no situations where a specific metric was desired, but doesn't get used in the update because the "best match" policy for that situation did not set the metric parameter.<br><br>If the attribute *usageFlag* for this import policy is set to ***ignore***, then the *importMetric* value will be ignored by the application. The *importMetric* value is not used to select which routes to use or ignore but is used to set the metric value for the routes being imported. A value of zero indicates that the metric received in the update will be used. |
| Values | Decimal (0..255) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Ip Egp Import nbrAsId (nbrAs)

| | |
|---|---|
| Access | Read and write |
| Description | The autonomous system Id this import policy will apply to.<br>Note: The Valid value of an *asId* is from 1 to 65,535.<br>This attribute's value when set to 0 will be ignored. |
| Values | Decimal (0..65535) |
| Default | No default |

### COMPONENT Vr Ip Egp Import Network (Net)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Egp Import Net Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Egp Import/<Decimal> NetworkList/<Decimal>*<br>This is an optional subcomponent of Import and identifies a set of networks that this import policy will apply to. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Egp Import Net Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group identifies attributes for the NetworkList component for which the import policy will be applied to |

### ATTRIBUTE Vr Ip Egp Import Net ipAddress (addr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the IP address that needs to be matched against in this network list for the Import policy to be applied to. |

| | |
|---|---|
| Values | IP address |
| Default | No default |

### COMPONENT Vr Ip Egp Export

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Egp Export Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Egp Export/n*<br>Each instance of this component specifies an EGP export policy. An EGP export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as EGP routes onto one or all attached EGP autonomous systems of the virtual router.<br>Passport IP EGP by default advertises all local routes to all attached EGP autonomous systems using the metric 128. |
| Opt. Subcomp. | "COMPONENT Vr Ip Egp Export Network (Net)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Egp Export Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisioned attributes for the *Export* component. |

### ATTRIBUTE Vr Ip Egp Export advertiseStatus (advertise)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***). |
| Values | send<br>block |

Default send

### ATTRIBUTE Vr Ip Egp Export exportMetric (metric)

Access Read and write

Description This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy.
If the attribute *advertiseStatus* is set to ***block***, then the value of *exportMetric* is ignored. The *exportMetric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes.
A value of 0 indicates that the metric associated with the route in the forwarding table is used.

Values Decimal (0..255)

Default 0

### ATTRIBUTE Vr Ip Egp Export protocol

Access Read and write

Description This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If it is set to ***all***, this export policy applies to all routes in the forwarding table.

Values all
egp
rip
ospfInternal
ospfExternal
staticLocal
staticRemote

Default all

### ATTRIBUTE Vr Ip Egp Export ripInterface (ripIf)

Access Read and write

Description This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned.
This attribute can only be non zero when the *protocol* is set to

***rip***. The value of 0.0.0.0 implies any RIP interface on the same virtual router; otherwise the value of this attribute must match the interface address of a *LogicalIf* that has a *RipIf* on the same virtual router.

Values — IP address

Default — 0.0.0.0

### ATTRIBUTE Vr Ip Egp Export ripNeighbor (ripNbr)

Access — Read and write

Description — This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP neighbor of which the routes are learned from.
This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP neighbor.

Values — IP address

Default — 0.0.0.0

### ATTRIBUTE Vr Ip Egp Export inEgpAsId (inAs)

Access — Read and write

Description — This attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from.
This attribute can only be non zero when *protocol* is set to ***egp***. The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.

Values — Decimal (0..65535)

Default — 0

### ATTRIBUTE Vr Ip Egp Export ospfTag (tag)

Access — Read and write

Description — This attribute specifies the OSPF learned external routes to which this export policy applies, based on the learned OSPF tag of the routes.

This attribute can only be set to a non default value when *protocol* is set to ***ospfExternal***. The value of 4294967295 implies any tag.

Values: Decimal (0..4294967295)

Default: 4294967295

## ATTRIBUTE Vr Ip Egp Export outAutonomousSystem (outAs)

Access: Read and write

Description: This attribute specifies the EGP autonomous system to which routes are exported to as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *outAutonomousSystem* is ignored. The *outAutonomousSystem* value is not used to select which routes to block or send but where to export the routes.
A value of 0 indicates that the routes are exported to all EGP autonomous systems of which the virtual router is a neighbor. Otherwise, the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.

Values: Decimal (0..65535)

Default: 0

## COMPONENT Vr Ip Egp Export Network (Net)

Instance: Decimal (0..65535)

Groups: "GROUP Vr Ip Egp Export Net Provisioned (Prov)"

Scope: Application

Description: *Vr/<string> Ip Egp Export/<Decimal> NetworkList/<Decimal>*
This component identifies a set of attributes when matched determines the export policy applied.

Common Verbs:
- Help
- List
- Display
- Add
- DELete

## GROUP Vr Ip Egp Export Net Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group identifies the set of provisionable attributes for the *ExportNetworkList* component. |

## ATTRIBUTE Vr Ip Egp Export Net ipAddress (addr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the 32 bit IP address to match against. |
| Values | IP address |
| Default | No default |

## COMPONENT Vr Ip Ospf (Ospf)

| | |
|---|---|
| Groups | "GROUP Vr Ip Ospf Provisioned (Prov)"<br>"GROUP Vr Ip Ospf Operational (Oper)"<br>"GROUP Vr Ip Ospf OsiState (State)"<br>"GROUP Vr Ip Ospf OperationalStatus (OperStatus)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf*<br>*Rtr/<string> Ospf*<br>*Rtr/<string> Vrf/<string> Ospf*<br>This component is configured to control the Open Shortest Path First IP routing protocol. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Ip Ospf AreaEntry (Area)"<br>"COMPONENT Vr Ip Ospf StubAreaEntry (Stub)"<br>"COMPONENT Vr Ip Ospf AreaAggregateEntry (Aggregate)"<br>"COMPONENT Vr Ip Ospf HostEntry (Host)"<br>"COMPONENT Vr Ip Ospf VirtIfEntry (VirtIf)"<br>"COMPONENT Vr Ip Ospf Export" |
| Dyn. Subcomp. | "COMPONENT Vr Ip Ospf VirtNbrEntry (VirtNbr)"<br>"COMPONENT Vr Ip Ospf NeighborEntry (Nbr)"<br>"COMPONENT Vr Ip Ospf LsdbEntry (Lsdb)"<br>"COMPONENT Vr Ip Ospf ExtLsdbEntry (ExtLsdb)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Ip Ospf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes are used to configure the OSPF component. |

## ATTRIBUTE Vr Ip Ospf routerId (id)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is an Ip Address that uniquely identifies the router in the autonomous system. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vr Ip Ospf snmpAdminStatus

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The administrative status of the OSPF Component in this routing component (*Vr*, *Rtr* or *Vrf*). |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Vr Ip Ospf asBdrRtrStatus (asBr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is a flag to note whether this router is an autonomous system border router. If this router is configured to export any routes learned from other than OSPF-internal protocol, this attribute should be configured as autonomous system border router. |
| Values | true<br>false |
| Default | false |

### ATTRIBUTE Vr Ip Ospf tosSupport

| | |
|---|---|
| Access | Read and write |
| Description | The router's support for type-of-service routing. Only one value will be allowed. This is a deviation from supporting the MIB. |
| Values | false |
| Default | false |

### ATTRIBUTE Vr Ip Ospf extLsdbLimit

| | |
|---|---|
| Access | Read and write |
| Description | The maximum number of external link-state entries that can be stored in the link-state database. If the value is -1, then there is no limit,<br>that is the maximum number of external OSPF routes that this autonomous system border router will originate.<br>It will begin to flush LSA(Link State Advertisement)s, if an ASBR might receive bursts of external routes (for example, a |

regional network), then the parameter should be configured to a reasonable level. If there are less than two thousand routes and large bursts are unlikely, then the default should be adequate. This parameter will not affect the number of external OSPF routes a router will store in it's database.

Values: Signed (-1..2147483647)

Default: -1

### ATTRIBUTE Vr Ip Ospf multicastForward

Access: Read and write

Description: A bit mask indicating the limits on Network Layer Multicast(class D) forwarding. It is represented as a sum of the following:
if intra-Area forwarding is permitted, 1; else 0
if inter-Area forwarding is permitted 2; else 0
if inter-AS forwarding is permitted, 4; else 0
Only the value of 0 is being supported and this is a MIB deviation.

Values: Decimal (0..0)

Default: 0

### ATTRIBUTE Vr Ip Ospf migrateRip

Access: Read and write

Description: This Attribute sets the preference level of OSPF-internal routes to be less preferred than RIP.
This Parameter should only be used when starting migration of network from RIP to OSPF. When ready to cutover to OSPF, set this attribute disabled and run under normal preferences. All OSPF routers in the Autonomous System should be running with *migraterip* ***enabled*** or with *migraterip* ***disabled*** to prevent routing loops. It is important that the changeover period from RIP to OSPF be performed quickly on all OSPF routers so that no routing loops are formed. These routing loops could be caused by conflicts in the internal RIP and OSPF databases.

| | |
|---|---|
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Ip Ospf generateDefaultRouteMetric (genDefaultMetric)

| | |
|---|---|
| Access | Read and write |
| Description | If this router is configured as an autonomous system border router, then this attribute causes the default route to be generated with a metric value equal to *generateDefaultRouteMetric* value. This route is put in the OSPF update along with the normal update routes when updates are sent to the neighbors. No default route will be generated if the value is 0. |
| Values | Signed (-1..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Ospf redistributeIbgp (ribgp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the export policies of this *Ospf* instance can match routes learned from internal BGP (IBGP) peers when their *protocol* attribute value is ***all***. If *redistributeIbgp* is ***true***, a *protocol* value of ***all*** allows routes learned from IBGP peers to be included in the matching routes. If *redistributeIbgp* is ***false***, routes learned from IBGP peers are excluded when the *protocol* value is ***all***. To cause IBGP routes to be considered in this case, the *protocol* value must be set to ***bgpInternal***. |
| Values | true<br>false |
| Default | false |

### ATTRIBUTE Vr Ip Ospf estimatedNumberOfInternalOSPFRoutes

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the average estimated number of routes in the autonomous system that this OSPF instance will have to keep track of. If this value is provisioned too low it will cause |

| | |
|---|---|
| | increased CPU utilization due to dynamic memory allocation. If this value is provisioned too high the result is wasted memory. |
| Values | Decimal (0..65535) |
| Default | 500 |

### ATTRIBUTE Vr Ip Ospf estimatedNumberOfExternalOSPFRoutes

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the average estimated number of routes external to the autonomous system that this OSPF instance will have to keep track of. If this value is provisioned too low it will cause increased CPU utilization due to dynamic memory allocation. If this value is provisioned too high the result is wasted memory. |
| Values | Decimal (0..65535) |
| Default | 500 |

### ATTRIBUTE Vr Ip Ospf estimatedNumberOfAreas

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the average estimated number of areas in the autonomous system that this OSPF instance will have to keep track of. |
| Values | Decimal (0..65535) |
| Default | 2 |

### ATTRIBUTE Vr Ip Ospf estimatedNumberOfInterfacesPerArea

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the average estimated number of interfaces in a given area that this OSPF instance will have to keep track of. |
| Values | Decimal (0..65535) |
| Default | 10 |

### ATTRIBUTE Vr Ip Ospf estimatedNumberOfNeighborsPerInterface

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the average estimated number of neighbors that a given interface will have on it in this OSPF interface. |
| Values | Decimal (0..65535) |
| Default | 3 |

### ATTRIBUTE Vr Ip Ospf defaultOspfIntRtePreference (ospfIntPref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF internal routes. A lower value indicates a more preferred route. |
| Values | Decimal (1..254) |
| Default | 30 |

### ATTRIBUTE Vr Ip Ospf defaultOspfExt1RtePreference (ospfExt1Pref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF external type 1 routes. A lower value indicates a more preferred route. |
| Values | Decimal (1..254) |
| Default | 80 |

### ATTRIBUTE Vr Ip Ospf defaultOspfExt2RtePreference (ospfExt2Pref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF external type 2 routes. A lower value indicates a more preferred route. |
| Values | Decimal (1..254) |
| Default | 120 |

## ATTRIBUTE Vr Ip Ospf opaqueCapability (opcap)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the OSPF instance is allowed to participate in flooding Opaque LSAs. Such LSAs are also stored in the InwOspfLsdbEntry. Applications, such as MPLS Traffic Engineering, use this mechanism to flood their information throughout a network. Of the three Opaque LSA types (9,10,11), only type 10 LSAs (area scope) are supported.The OSPF instance remains fully inter-operable with non-opaque-capable neighbors. Opaque capability is not fully supported. When the ***mplsTeEmulation*** feature is provisioned, setting this attribute to ***true*** activates hooks to emulate TE capability by flooding hardcoded type 10 TE LSAs to opaque-capable neighbors. This emulated TE functionality is not standards compliant and is strictly provided for MPLS RSVP-TE interoperability with vendors that are dependent on MPLS TE to establish LSPs. |
| Values | true<br>false |
| Default | false |

## ATTRIBUTE Vr Ip Ospf spareInstance (spInst)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether to maintain a copy of the link state database on the standby card. When this attribute is set to ***disable***, OSPF does not maintain a copy of the link state database.<br><br>If the *virtualRouterProcessor* attribute of this *VirtualRouter* is set to ***Lp/0***, then the following conditions must both be true for a copy of the link-state database to be maintained on the standby CP:<br><br>- This attribute must be set to ***enable***, and<br><br>- The *Shelf cpEquipmentProtection* attribute must be set to ***hot***. |

| | |
|---|---|
| Values | enable<br>disable |
| Default | disable |

### ATTRIBUTE Vr Ip Ospf spfHoldTime (spfTime)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum time interval between spf calculations. If a link state change in the autonomous system is detected, and the time since the last spf calculation is greater than *spfHoldTime*, then the spf calculation starts immediately. Otherwise, the spf calculation waits until a time of at least *spfHoldTime* has elapsed since the previous spf calculation.<br><br>Setting this attribute to a lower value decreases convergence time in the OSPF autonomous system, but uses more CPU resource more frequently. Setting this attribute to a higher value increases convergence time but provides for a more scalable node configuration, especially if there are many *Ospf* components configured on the node. |
| Values | Decimal (1..60) |
| Units | seconds |
| Default | 1 |

### ATTRIBUTE Vr Ip Ospf alarmGeneration (alarms)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the level of alarm generation for this *Ospf* instance.<br><br>A value of ***all*** specifies that all OSPF alarms are made visible.<br><br>A value of ***normal*** specifies that all existing OSPF alarms are made visible, except *Ospf NeighborEntry* state change alarms.<br><br>A value of ***none*** specifies that no OSPF alarms are made visible.<br><br>It is recommended that *VirtualRouter* components with the |

*vpnMode* attribute set to ***carrier*** should have the *alarmGeneration* attribute set to ***all***. *VirtualRouter* components with the *vpnMode* attribute set to ***customer*** should have the *alarmGeneration* attribute set to either ***normal*** or ***none***, for scalability reasons. Similarly, the *alarmGeneration* attribute should be set to ***all*** for *Router*. The *alarmGeneration* attribute should be set to either ***normal*** or ***none*** for *Vrf* for scalability reasons.

Values
none
normal
all

Default
all

### ATTRIBUTE Vr Ip Ospf ecmpStatus

Access
Read and write

Description
This attribute specifies whether the Equal Cost Multi-Path (ECMP) functionality is enabled or not in the network meaning that the number of next hops for one route learned through OSPF depend on the value of *ecmpStatus*. If *ecmpStatus* is ***enabled,*** a maximum of three next hops are kept for one route. If it is ***disabled***, one next hop is kept for that route.

Values
enabled
disabled

Default
enabled

### GROUP Vr Ip Ospf Operational (Oper)

Properties
Operational

Description
These group of attributes identifies the operational attributes for this OSPF Component.

### ATTRIBUTE Vr Ip Ospf versionNumber (ver)

Access
Read only

Description
The Current Version number of the OSPF Protocol. (2).

Values
Decimal (2..2)

| | |
|---|---|
| Default | 2 |

### ATTRIBUTE Vr Ip Ospf areaBdrRtrStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute is used to specify whether this router is configured as an area border router. |
| Values | true<br>false |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf externLsaCount

| | |
|---|---|
| Access | Read only |
| Description | The number of external (LS type 5) link-state advertisements in the link-state database. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Ospf externLsaChecksumSum

| | |
|---|---|
| Access | Read only |
| Description | The 32-bit unsigned sum of the LS checksums of the external link-state database. This sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf originateNewLsas

| | |
|---|---|
| Access | Read only |
| Description | The number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Ospf rxNewLsas

| | |
|---|---|
| Access | Read only |
| Description | The number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Vr Ip Ospf OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Ip Ospf adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Ip Ospf operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Ospf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Ospf OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Ip Ospf snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### COMPONENT Vr Ip Ospf AreaEntry (Area)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP Vr Ip Ospf Area Provisioned (Prov)"<br>"GROUP Vr Ip Ospf Area Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf AreaEntry/<Ip Address>*<br>*Rtr/<string> Ospf AreaEntry/<Ip Address>*<br>*Rtr/<string> Vrf/<string> Ospf AreaEntry/<Ip Address>*<br>This component contains the information about various areas that the router is connected to. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Ospf Area Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group describes the set of provisionable attributes for the AreaEntry Component. |

### ATTRIBUTE Vr Ip Ospf Area authType

| | |
|---|---|
| Access | Read and write |
| Description | The authentication type specified for this area. |
| Values | none<br>simplePassword |
| Default | none |

### ATTRIBUTE Vr Ip Ospf Area importAsExtern

| | |
|---|---|
| Access | Read and write |
| Description | The area's support for importing AS external link-state advertisements. For backbone area (that is, areaId 0.0.0.0), this attribute must be set to ***importExternal***. |
| Values | importExternal (external)<br>importNoExternal (noExternal)<br>importNssa (nssa) |
| Default | importExternal |

### ATTRIBUTE Vr Ip Ospf Area areaSummary

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This variable controls the import of summary LSAs into stub areas. If it is ***noAreaSummary***, the router will neither originate nor propagate summary LSAs into the stub areas. It will rely entirely on its default route. If it is ***sendAreaSummary***, the router will both summarize and propagate summary LSAs. |
| Values | noAreaSummary<br>sendAreaSummary |
| Default | noAreaSummary |

### GROUP Vr Ip Ospf Area Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes describes the Operational set of attributes for the AreaEntry component. |

### ATTRIBUTE Vr Ip Ospf Area spfRuns

| | |
|---|---|
| Access | Read only |
| Description | The number of times that the intra-area route table has been calculated using this area's link-state database since the protocol became operational. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Area areaBdrRtrCount

| | |
|---|---|
| Access | Read only |
| Description | The total number of area border routers reachable within this area. This is initially zero, and is calculated in each Shortest Path First Pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Area asBdrRtrCount

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The total number of Autonomous System border routers reachable within this area. This is initially zero, and is calculated in each Shortest Path First Pass. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Area lsaCount

| | |
|---|---|
| Access | Read only |
| Description | The total number of link-state advertisements in this area's link-state database, excluding AS External LSA's. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Area areaLsaCksumSum

| | |
|---|---|
| Access | Read only |
| Description | The 32-bit unsigned sum of the link-state advertisement's LS checksums contained in this area's link-state database. This sum excludes external (LS type 5) link-state advertisements. The sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Ip Ospf StubAreaEntry (Stub)

| | |
|---|---|
| Instance | areaId [IP address]<br>tos [Decimal (0..0)] |
| Groups | "GROUP Vr Ip Ospf Stub Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf StubAreaEntry/<Ip Address>,<Decimal>*<br>*Rtr/<string> Ospf StubAreaEntry/<Ip Address>,<Decimal>*<br>*Rtr/<string> Vrf/<string> Ospf StubAreaEntry/<Ip Address>,<Decimal>* |

This component describes metrics that a default area border router will advertise into a stub area.

## GROUP Vr Ip Ospf Stub Provisioned (Prov)

Properties: Provisioned

Description: These set of attributes explain the provisionable group for the *StubAreaEntry.*

## ATTRIBUTE Vr Ip Ospf Stub metric (metric)

Access: Read and write

Description: The metric value applied at the indicated type of service.

Values: Decimal (1..4294967295)

Default: 1

## ATTRIBUTE Vr Ip Ospf Stub metricType

Access: Read and write

Description: This type of the metric advertised as a default route.

Values:
ospfMetric
comparableCost
nonComparable

Default: ospfMetric

## ATTRIBUTE Vr Ip Ospf Stub advertiseDefault

Access: Read and write

Description: This attribute determines whether or not the default routing information will be advertised, depending on other criterion. Setting this value to ***no*** can prevent advertising default routing information.

If the value of the attribute is set to ***yes***, then the value of the attribute *importAsExtern* for that particular *AreaEntry* should be set to ***importNssa***.

Values
yes
no

Default
yes

## COMPONENT Vr Ip Ospf AreaAggregateEntry (Aggregate)

Instance
areaId [IP address]
lsdbType [summaryLink
nssaExternalLink]
aggregateNet [IP address]
aggregateMask [IP address]

Groups
"GROUP Vr Ip Ospf Aggregate Provisioned (Prov)"

Scope
Application

Description
*Vr/<string> Ip Ospf AreaAggregateEntry/<Ip Address>,<enum>,*
*<Ip Address>,<Ip Address>*
*Rtr/<string> Ospf AreaAggregateEntry/<Ip Address>,<enum>,*
*<Ip Address>,<Ip Address>*
*Rtr/<string> Vrf/<string> Ospf AreaAggregateEntry/<Ip Address>,<enum>,<Ip Address>,<Ip Address>*
This table entry replaces the Area Summary table from RFC1253 and is used as an extension for CIDR support.

## GROUP Vr Ip Ospf Aggregate Provisioned (Prov)

Properties
Provisioned

Description
Identifies a group of provisionable attributes.

## ATTRIBUTE Vr Ip Ospf Aggregate effect

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines whether or not the routing information will be advertised, depending on other criterion. Setting this value to ***doNotAdvertiseMatching*** can prevent advertising routing information for the address and mask values specified as the indices for this entry. |
| Values | advertiseMatching<br>doNotAdvertiseMatching<br>invalid |
| Default | advertiseMatching |

## COMPONENT Vr Ip Ospf HostEntry (Host)

| | |
|---|---|
| Instance | address [IP address]<br>tos [Decimal (0..0)] |
| Groups | "GROUP Vr Ip Ospf Host Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf HostEntry/<Ip Address>,<Decimal>*<br>*Rtr/<string> Ospf HostEntry/<Ip Address>,<Decimal>*<br>*Rtr/<string> Vrf/<string> Ospf HostEntry/<Ip Address>,<Decimal>*<br>This component indicates what hosts are directly attached to the router, and what metrics and types of service should be advertised for them. This component is an optional subcomponent of Ospf. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Ospf Host Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | Provisionable set of attributes for the Host entry. |

### ATTRIBUTE Vr Ip Ospf Host areaId

| | |
|---|---|
| Access | Read and write |
| Description | This is an Ip address for the Host Entry that indicates the area it belongs to. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Host metric

| | |
|---|---|
| Access | Read and write |
| Description | The metric to be advertised. |
| Values | Decimal (1..65535) |
| Default | 1 |

### COMPONENT Vr Ip Ospf VirtIfEntry (VirtIf)

| | |
|---|---|
| Instance | areaId [IP address]<br>nbrRouterId [IP address] |
| Groups | "GROUP Vr Ip Ospf VirtIf Provisioned (Prov)"<br>"GROUP Vr Ip Ospf VirtIf Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf VirtIfEntry/<Ip Address>,<Ip Address>*<br>*Rtr/<string> Ospf VirtIfEntry/<Ip Address>,<Ip Address>*<br>*Rtr/<string> Vrf/<string> Ospf VirtIfEntry/<Ip Address>,<Ip Address>*<br>This component describes all the virtual links configured for this OSPF Router. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Ospf VirtIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes provide provisioning data for the *VirtIfEntry.* |

## ATTRIBUTE Vr Ip Ospf VirtIf transitDelay (transDelay)

| | |
|---|---|
| Access | Read and write |
| Description | The estimated number of seconds it takes to transmit a link-state update packet over this interface. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 1 |

## ATTRIBUTE Vr Ip Ospf VirtIf retransInterval (retransInt)

| | |
|---|---|
| Access | Read and write |
| Description | The number of seconds between link-state advertisement retransmissions, for adjacencies belonging to this interface. This value is also used when retransmitting database description and link-state request packets. This value would be well over the expected round-trip time. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 5 |

## ATTRIBUTE Vr Ip Ospf VirtIf helloInterval (helloInt)

| | |
|---|---|
| Access | Read and write |
| Description | The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for the virtual neighbor. |
| Values | Decimal (1..3600) |
| Units | seconds |

| | |
|---|---|
| Default | 10 |

### ATTRIBUTE Vr Ip Ospf VirtIf rtrDeadInterval (rtrDeadInt)

| | |
|---|---|
| Access | Read and write |
| Description | The number of seconds that a router's Hello packets have not been seen before its neighbors declare the router down. This should be some multiple of the Hello interval. This value must be the same for the virtual neighbor. |
| Values | Decimal (1..3600) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE Vr Ip Ospf VirtIf authKey

| | |
|---|---|
| Access | Write only |
| Description | If authentication type is simple password, the password for this virtual circuit. If the value of the attribute is not set, then this attribute is ignored by the application.<br>If the value of this attribute is set, then the value of the attribute *authType* under this particular *Area* should be set to ***simplePassword***, otherwise the application will ignore this authentication key. |
| Values | String (1..8, Hex) |
| Default | 0000000000000000 |

### GROUP Vr Ip Ospf VirtIf Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | Represents a group of operational attributes for the *VirtIfEntry* component. |

### ATTRIBUTE Vr Ip Ospf VirtIf state (state)

| | |
|---|---|
| Access | Read only |
| Description | The state of the OSPF virtual interface. |

| | |
|---|---|
| Values | down<br>pointToPoint |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf VirtIf events (events)

| | |
|---|---|
| Access | Read only |
| Description | The number of state changes or error events on the virtual link. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Ip Ospf Export

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Ospf Export Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf Export/n*<br>*Rtr/<string> Ospf Export/n*<br>*Rtr/<string> Vrf/<string> Ospf Export/n*<br>Each instance of this component specifies an OSPF export policy. An OSPF export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as OSPF external routes onto attached OSPF areas of the routing component (*Vr*, *Rtr* or *Vrf*).<br>Passport IP OSPF by default advertises all OSPF external routes based on the metric and tag in the IP forwarding table. |
| Opt. Subcomp. | "COMPONENT Vr Ip Ospf Export NetworkList (NetList)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Ospf Export Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This Group contains all the Provisioned attributes for the Export Component. |

### ATTRIBUTE Vr Ip Ospf Export advertiseStatus (advertise)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***). |
| Values | send<br>block |
| Default | send |

### ATTRIBUTE Vr Ip Ospf Export metric (metric)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy.<br>If the attribute *advertiseStatus* is set to ***block***, then the value of *metric* is ignored. The *metric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes.<br>A value of -1 indicates that the metric associated with the route in the forwarding table is used. |
| Values | Signed (-1..16777215) |
| Default | -1 |

### ATTRIBUTE Vr Ip Ospf Export protocol

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If the value is ***all***, the policy applies to all routes in the forwarding table, with the following exceptions: external BGP routes are always excluded and internal BGP routes are excluded if the parent *Ospf* component's *reDistributeIBGP* attribute has the value ***false***. |
| Values | all<br>egp |

rip
staticLocal
staticRemote
bgpInternal
bgpExternal
mbgp
bgpMplsInternal

Default: all

### ATTRIBUTE Vr Ip Ospf Export ripInterface (ripIf)

Access: Read and write

Description: This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned.
This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of an *Interface* or a *LogicalIf* that has a *RipIf* on the same routing component.

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Ip Ospf Export ripNeighbor (ripNbr)

Access: Read and write

Description: This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP neighbor of which the routes are learned from.
This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP neighbor.

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Ip Ospf Export egpAsId (egpAs)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from.<br>This attribute can only be non zero when *protocol* is set to ***egp***.<br>The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Ospf Export tag

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the OSPF tag to be used on the routes being exported as a result of matching this export policy.<br>If the attribute *advertiseStatus* is set to ***block***, then the value of *tag* is ignored. The *tag* value is not used to select which routes to block or send, but rather the tag value advertised for the routes.<br>A value of 4294967295 indicates that the tag associated with the route in the forwarding table is used. |
| Values | Decimal (0..4294967295) |
| Default | 4294967295 |

### ATTRIBUTE Vr Ip Ospf Export extLsaMetricType

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the metric type in the OSPF external link state advertisement of the routes being exported as a result of matching this export policy.<br>If the attribute *advertiseStatus* is set to ***block***, then the value of *extLsaMetricType* is ignored. The *extLsaMetricType* value is not used to select which routes to block or send, but rather the metric value advertised for the routes.<br>The value ***useProtocolDefault*** indicates the metric type is automatically chosen based on the routing protocol which the route was learned from. |

| | |
|---|---|
| Values | useProtocolDefault<br>type1<br>type2 |
| Default | useProtocolDefault |

### ATTRIBUTE Vr Ip Ospf Export bgpAsId (bgpAs)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the bgp AS from which a bgp route is learned from. This key is used only if the *protocol* is ***bgpExternal***. *bgpAsId* of value ***0*** mathces all ASs. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Ospf Export bgpPeerIp (peerIp)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the bgp peer where the routes were learned from. *bgpPeerIp* of ***0*** matches all bgp peers. This attribute is used as a key when *protocol* is set to ***bgpInternal*** or ***bgpExternal***. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Ospf Export description (desc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute describes the policy. For example, ‘to export OSPF routes to MCI’. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Vr Ip Ospf Export NetworkList (NetList)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Ospf Export NetList Provisioned (Prov)" |

| | |
|---|---|
| Scope | Application |
| Description | This component identifies a set of attributes when matched determines the export policy applied. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Ospf Export NetList Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group identifies the set of provisionable attributes for the *ExportNetworkList* component. |

### ATTRIBUTE Vr Ip Ospf Export NetList ipAddress

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the 32 bit IP address to match against. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Export NetList ipMask (mask)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the IP Mask to be used with the IP Address to match against. |
| Values | IP address |
| Default | No default |

### COMPONENT Vr Ip Ospf VirtNbrEntry (VirtNbr)

| | |
|---|---|
| Instance | areaId [IP address]<br>nbrRouterId [IP address] |
| Groups | "GROUP Vr Ip Ospf VirtNbr Operational (Oper)" |
| Scope | Application |

| | |
|---|---|
| Description | *Vr/<string> Ip Ospf VirtNbrEntry/<Ip Address>,<Ip Address> Rtr/<string> Ospf VirtNbrEntry/<Ip Address>,<Ip Address> Rtr/<string> Vrf/<string> Ospf VirtNbrEntry/<Ip Address>,<Ip Address>*<br>This component describes all of OSPF's Virtual Neighbors. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Ospf VirtNbr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group identifies a set of operational attributes. |

## ATTRIBUTE Vr Ip Ospf VirtNbr nbrIpAddress (addr)

| | |
|---|---|
| Access | Read only |
| Description | Indicates the Ip address this interface this virtual neighbor is using. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vr Ip Ospf VirtNbr options

| | |
|---|---|
| Access | Read only |
| Description | A bit mask corresponding to the neighbor's options field. Bit 1, if set indicates that the system will operate on Type of Service metrics other than TOS 0. If zero, the neighbor will ignore all metrics except the TOS 0 metric. Bit 2, if set, indicates that the system is Network Multicast capable; i.e., that it implements OSPF Multicast Routing. |
| Values | Decimal (0..7) |
| Default | No default |

## ATTRIBUTE Vr Ip Ospf VirtNbr state

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The state of the virtual neighbor relationship. |
| Values | down<br>attempt<br>init<br>twoWay<br>exchange<br>exchangeStatrt<br>loading<br>full |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf VirtNbr events

| | |
|---|---|
| Access | Read only |
| Description | The number of times this virtual link has changed its state, or an error has occurred. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf VirtNbr lsRetransQlen

| | |
|---|---|
| Access | Read only |
| Description | The current length of the Retransmission queue. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf VirtNbr exchangeStatus

| | |
|---|---|
| Access | Read only |
| Description | Indicates the exchange status of the entry in this table. |
| Values | master<br>slave |
| Default | No default |

## COMPONENT Vr Ip Ospf NeighborEntry (Nbr)

| | |
|---|---|
| Instance | address [IP address]<br>addressLessIndex [Decimal (0)] |
| Groups | "GROUP Vr Ip Ospf Nbr Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf NbrEntry/<Ip Address>,<Decimal>*<br>*Rtr/<string> Ospf NbrEntry/<Ip Address>,<Decimal>*<br>*Rtr/<string> Vrf/<string> Ospf NbrEntry/<Ip Address>,<Decimal>*<br>This component is a dynamic subcomponent of OSPF that describes all the OSPF Neighbors. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Ospf Nbr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group identifies the operational set of attributes for the *NeighborEntry.* |

## ATTRIBUTE Vr Ip Ospf Nbr rtrId

| | |
|---|---|
| Access | Read only |
| Description | An Ip Address that uniquely identifies the neighboring router in the autonomous system. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vr Ip Ospf Nbr options

| | |
|---|---|
| Access | Read only |
| Description | A bit mask corresponding to the neighbor’s options field. Bit 0, if set, indicates that the area accepts and operates on external information, if zero, it is a stub area. Bit 1, if set, indicates that |

| | |
|---|---|
| | the system will operate on Type of Service metrics other than TOS 0. If zero, the neighbor will ignore all metrics except the TOS 0 metric. Bit 2, if set, indicates that the system is Network Multicast capable; i.e., that it implements OSPF Multicast Routing. |
| Values | Decimal (0..7) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Nbr priority

| | |
|---|---|
| Access | Read only |
| Description | The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Nbr state

| | |
|---|---|
| Access | Read only |
| Description | The state of the relationship with this neighbor. |
| Values | down<br>attempt<br>init<br>twoWay<br>exchangeStart<br>exchange<br>loading<br>full |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Nbr events

| | |
|---|---|
| Access | Read only |
| Description | The number of times this neighbor relationship has changed state, or an error has occurred. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Nbr lsRetransQlen

| | |
|---|---|
| Access | Read only |
| Description | The current length of the Retransmission queue. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Nbr nbmaNbrStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the status of the entry. |
| Values | valid<br>invalid |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Nbr exchangeStatus

| | |
|---|---|
| Access | Read only |
| Description | Indicates the exchange status for a neighbor entry. |
| Values | master<br>slave |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Nbr permanence

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays how the neighbor became an entry. |
| Values | dynamic<br>permanent |
| Default | dynamic |

### ATTRIBUTE Vr Ip Ospf Nbr opaqueCapability (opcap)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the Opaque capabilty of this neighbor. |
| Values | true<br>false |
| Default | No default |

## COMPONENT Vr Ip Ospf LsdbEntry (Lsdb)

| | |
|---|---|
| Instance | areaId [IP address]<br>lsdbType [Decimal (1..10)]<br>lsId [IP address]<br>routerId [IP address] |
| Groups | "GROUP Vr Ip Ospf Lsdb Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf LsdbEntry/<Ip Address>,<Decimal>, <Ip Address>, <Ip Address>*<br>*Rtr/<string> Ospf LsdbEntry/<Ip Address>,<Decimal>, <Ip Address>, <Ip Address>*<br>*Rtr/<string> Vrf/<string> Ospf LsdbEntry/<Ip Address>,<Decimal>, <Ip Address>, <Ip Address>*<br>This dynamic component contains the Link State Advertiements (LSA) from all areas the device is connected to. The supported types are: router-LSA (1), network-LSA (2), network-summary-LSA (3), ASBR-summary-LSA (4), AS-external-LSA (5) Group-membership-LSA (6) NSSA-LSA (7) and opaqueArea-LSA (10). |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Ospf Lsdb Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group describes the Operational set of attributes for the *LsdbEntry.* |

### ATTRIBUTE Vr Ip Ospf Lsdb sequence

| | |
|---|---|
| Access | Read only |
| Description | A signed 32-bit integer, used to detect old and duplicate LSAs. The space of sequence numbers is linearly ordered. The larger the sequence number, the more recent the advertisement. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Lsdb age

| | |
|---|---|
| Access | Read only |
| Description | The age of the Link State Advertisement in seconds. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Lsdb checksum

| | |
|---|---|
| Access | Read only |
| Description | The checksum of the complete contents of the advertisement, excepting the age field. The checksum used is the Fletcher checksum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf Lsdb advertisement

| | |
|---|---|
| Access | Read only |
| Description | The entire LSA including its header. |
| Values | String (1..65535, Hex) |
| Default | No default |

## COMPONENT Vr Ip Ospf ExtLsdbEntry (ExtLsdb)

| | |
|---|---|
| Instance | lsdbType [Decimal (1..7)]<br>lsId [IP address]<br>routerId [IP address] |
| Groups | "GROUP Vr Ip Ospf ExtLsdb Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Ospf ExtLsdbEntry/<Decimal>, <Ip Address>, <Ip Address>*<br>*Rtr/<string> Ospf ExtLsdbEntry/<Decimal>, <Ip Address>, <Ip Address>*<br>*Rtr/<string> Vrf/<string> Ospf ExtLsdbEntry/<Decimal>, <Ip Address>, <Ip Address>*<br>This dynamic component contains the Link State Advertiements(LSA) from other Autonomous systems. It is identical in format to the *Lsdb*. The purpose is to allow all external LSAs to be displayed together rather than distributed over the different non-stub areas. These types are: AS-external-LSA (5) and NSSA-LSA (7). |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Ospf ExtLsdb Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group describes the operational set of attributes for the *ExtLsdbEntry.* |

## ATTRIBUTE Vr Ip Ospf ExtLsdb sequence

| | |
|---|---|
| Access | Read only |
| Description | A signed 32-bit integer, used to detect old and duplicate LSAs. The space of sequence numbers is linearly ordered. The larger the sequence number, the more recent the advertisement. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Ospf ExtLsdb age

| | |
|---|---|
| Access | Read only |
| Description | The age of the Link State Advertisement in seconds. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf ExtLsdb checksum

| | |
|---|---|
| Access | Read only |
| Description | The checksum of the complete contents of the advertisement, excepting the age field. The checksum used is the Fletcher checksum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Ospf ExtLsdb advertisement

| | |
|---|---|
| Access | Read only |
| Description | The entire LSA including its header. |
| Values | String (1..36, Hex) |
| Default | No default |

## COMPONENT Vr Ip RoutingInformationProtocol (Rip)

| | |
|---|---|
| Groups | "GROUP Vr Ip Rip Provisioned (Prov)"<br>"GROUP Vr Ip Rip OsiState (State)"<br>"GROUP Vr Ip Rip AdministrativeControl (AdminControl)"<br>"GROUP Vr Ip Rip OperationalStatus (OperStatus)"<br>"GROUP Vr Ip Rip Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Rip*<br>*Rtr/<string> Rip* |

*Rtr/<string> Vrf/<string> Rip*
This component represents the Routing Information Protocol for the IP.
There should be at least one *RipInterface* provisioned below an *Interface* or below a *LogicalIf* under an *IpPort*.

Opt. Subcomp. "COMPONENT Vr Ip Rip Import (Import)"
"COMPONENT Vr Ip Rip Export"

## GROUP Vr Ip Rip Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes for the RIP component

## ATTRIBUTE Vr Ip Rip migrateRip

Access Read and write

Description This attribute sets the preference level of OSPF-internal routes to be less preferred than RIP.
Note:
This parameter should only be used when starting migration of network from RIP to OSPF. When ready to cutover to OSPF, set this attribute value to ***disabled*** and run under normal preferences. All OSPF routers in the Autonomous System should be running with *migrateRip* ***enabled*** or with *migrateRip* ***disabled*** to prevent routing loops. It is important that the changeover period from RIP to OSPF be performed quickly on all OSPF routers so that no routing loops are formed. These routing loops could be caused by conflicts in the internal RIP and OSPF databases.

Values
enabled
disabled

Default disabled

### ATTRIBUTE Vr Ip Rip rfc1058MetricUsage (rfc1058)

Access Read and write

Description This attribute determines the metric usage for this RIP instance. This flag is used to determine the way metrics are incremented.
RFC1058 way :
Sending Update: This is to use the metric for the route from the routing table as the advertised metric to be sent for that route. Nothing is ever added to this value from the sending side. The only special case handling is that if the route being advertised is the network route of a directly connectednetwork, the metric in the routing table will be zero. Then the RipIf interface metric for the interface being advertised is used as the advertise metric. If the interface being advertised is not a Rip interface, then metric value of 1 is used.
Receiving Update: Add receiving interface's RIP metric to the metric for the route in the received advertisement and install the result in the receiver's routing table as the metric for that route.
Older way:
Sending Updates: Add the out going interfaces rip metric to the metric for a route in the routing table to form the metric to be advertised for that route.
Receiving Updates: The metric received in the advertisement for a route is put directly in the routing table as the metric for that route.

Note: It is recommended that, all the routers in this autonomous system should be following the rfc1058 metric system.
Setting this flag to ***disabled*** will have the effect of running the RIP with old metric incrementing system.

Values enabled
disabled

Default enabled

### ATTRIBUTE Vr Ip Rip generateDiscardRoute (discard)

Access Read and write

| | |
|---|---|
| Description | This attribute when set to ***yes*** will add network disacrd routes to the routing and forwarding table for the subnetted interfaces that are running RIP. |
| Values | yes<br>no |
| Default | yes |

### ATTRIBUTE Vr Ip Rip redistributeIbgp (ribgp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the export policies of this *Rip* instance can match routes learned from internal BGP (IBGP) peers when their *protocol* attribute value is ***all.*** If *redistributeIbgp* is ***true***, a *protocol* value of ***all*** allows routes learned from IBGP peers to be included in the matching routes. If *redistributeIbgp* is ***false,*** routes learned from IBGP peers are excluded when the *protocol* value is ***all***. To cause IBGP routes to be considered in this case, the *protocol* value must be set to ***bgpInternal***. |
| Values | true<br>false |
| Default | false |

### ATTRIBUTE Vr Ip Rip defaultRipRtePreference (ripPref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this RIP component instance's default routing preference assigned to the RIP routes. A lower value indicates a more preferred route. |
| Values | Decimal (1..254) |
| Default | 82 |

### GROUP Vr Ip Rip OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state |

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Ip Rip adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vr Ip Rip operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available

for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Rip usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Ip Rip AdministrativeControl (AdminControl)

Properties
Provisioned

Description
This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.

### ATTRIBUTE Vr Ip Rip snmpAdminStatus

Access
Read and write

Description
The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet

forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Vr Ip Rip OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Ip Rip snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Vr Ip Rip Operational (Oper)

Properties
Operational

Description
This group defines a set of operational attributes belonging to the *RIP* component. It corresponds to the rip2Globals table in the RIP-2 standard MIB.

### ATTRIBUTE Vr Ip Rip routeChangesMade

Access
Read only

| | |
|---|---|
| Description | This attribute counts the route changes made to the IP Route Database by Rip. This does not include the refresh of the route's age. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Rip queryResponses

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the responses sent to RIP queries from other systems. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Ip Rip Import (Import)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Rip Import Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Rip Import/<Decimal>*<br>*Rtr/<string> Rip Import/<Decimal>*<br>*Rtr/<string> Vrf/<string> Rip Import/<Decimal>*<br>This component controls the functionality of Route Leaking. In other words, this component will determine what routes are used by RIP. |
| Opt. Subcomp. | "COMPONENT Vr Ip Rip Import Network (Net)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Rip Import Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This is the group of provisionable attributes for the *Import* Subcomponent. |

### ATTRIBUTE Vr Ip Rip Import usageFlag (usage)

| | |
|---|---|
| Access | Read and write |
| Description | This flag when set to ***ignore*** indicates the routes that are not used and if set to ***use***, indicates the routes which are used. |
| Values | use<br>ignore |
| Default | use |

### ATTRIBUTE Vr Ip Rip Import importMetric (metric)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to override the default import metric for the RIP protocol. This value is not used to select which routes to use or ignore, rather it is the metric to be used in the routing table for the routes imported for this import policy. A value of zero indicates that the metric received in the update will be used. |
| Values | Decimal (0..16) |
| Default | 0 |

### ATTRIBUTE Vr Ip Rip Import neighbor (nbr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the IP Address of the neighbor this policy will apply to. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Rip Import interface (if)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the RIP interface to which this import policy applies.<br>The value of 0.0.0.0 implies any RIP interface on the routing |

component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.

| | |
|---|---|
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Rip Import description (desc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute describes the policy. For example, ‘to import RIP routes from MCI’. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Vr Ip Rip Import Network (Net)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Rip Import Net Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Rip Import/<Decimal> NetworkList/<Decimal> Rtr/<string> Rip Import/<Decimal> NetworkList/<Decimal> Rtr/<string> Vrf/<string> Rip Import/<Decimal> NetworkList/ <Decimal>*<br>This component identifies a set of networks that this Import policy will apply to. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Rip Import Net Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains attributes for the *Import NetworkList* component for the Import Policy to be applied to. |

### ATTRIBUTE Vr Ip Rip Import Net ipAddress (addr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address that needs to be matched against in this network list for the Import Policy to be applied to. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Rip Import Net ipMask (mask)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP mask for the attribute *ipAddress*. |
| Values | IP address |
| Default | No default |

### COMPONENT Vr Ip Rip Export

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Rip Export Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Rip Export/<Decimal>*<br>*Rtr/<string> Rip Export/<Decimal>*<br>*Rtr/<string> Vrf/<string> Rip Export/<Decimal>*<br>Each instance of this component specifies a RIP export policy. A RIP export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as a RIP route on one or all RIP interfaces of the routing component (*Vr*, *Rtr* or *Vrf*).<br>Passport IP RIP by default advertises all local routes and all RIP learned routes to all RIP interfaces based on the metric in the IP forwarding table. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Ip Rip Export Network (Net)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Rip Export Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisioned attributes for the *Export* component. |

### ATTRIBUTE Vr Ip Rip Export advertiseStatus (advertise)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***). |
| Values | send<br>block |
| Default | send |

### ATTRIBUTE Vr Ip Rip Export exportMetric (metric)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy.<br>If the attribute *advertiseStatus* is set to ***block***, then the value of *exportMetric* is ignored. The *exportMetric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes.<br>A value of 0 indicates that the exported routes will be advertised with their original metric. When exporting routes from other protocols into RIP, an *exportMetric* value of 0 will distribute these routes with the metric of the original protocol. If the metric |

of the original protocol exceeds 15, the exported routes will be considered as unreachable by RIP. If an *exportMetric* value of 16 is specified, the exported routes will be advertised into RIP as unreachable.

Values: Decimal (0..16)

Default: 0

### ATTRIBUTE Vr Ip Rip Export protocol

Access: Read and write

Description: This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If the value is ***all***, the policy applies to all routes in the forwarding table, with the following exceptions: external BGP routes are always excluded and internal BGP routes are excluded if the parent *Rip* component's *reDistributeIBGP* attribute has the value ***false***.

Values:
all
egp
rip
ospfInternal
ospfExternal
staticLocal
staticRemote
bgpInternal
bgpExternal
mbgp
bgpMplsInternal

Default: all

### ATTRIBUTE Vr Ip Rip Export ripInterface (ripIf)

Access: Read and write

Description: This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned.
This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same

routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Ip Rip Export egpAsId (egpAs)

Access: Read and write

Description: Under the *Rtr* and *Rtr Vrf*, this attribute has no effect.

Under the *Vr*, this attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from.
This attribute can only be non zero when *protocol* is set to ***egp***.
The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.

Values: Decimal (0..65536)

Default: 0

### ATTRIBUTE Vr Ip Rip Export ospfTag (tag)

Access: Read and write

Description: This attribute specifies the OSPF learned external routes to which this export policy applies, based on the learned OSPF tag of the routes.
This attribute can only be set to a non default value when *protocol* is set to ***ospfExternal***. The default value of 4294967295 implies any tag.

Values: Decimal (0..4294967295)

Default: 4294967295

### ATTRIBUTE Vr Ip Rip Export outInterface (outIf)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the RIP interface on the virtual router which routes are exported onto as a result of matching this export policy.<br>If the attribute *advertiseStatus* is set to ***block***, then the value of *outInterface* is ignored. The *outInterface* value is not used to select which routes to block or send, but rather where to export the routes.<br>A value of 0.0.0.0 indicates that the routes are exported to all RIP interfaces on the routing component (*Vr*, *Rtr* or *Vrf*). Otherwise, the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Rip Export bgpAsId (bgpAs)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the BGP AS from which the routes are learned. This key will be used only when the *protocol* is set to ***bgpExternal***. *bgpAsId* of ***0*** matches all BGP ASs. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Rip Export description (desc)

| | |
|---|---|
| Access | Read and write |
| Description | The attribute describes the policy. For example, ‘to export RIP routes to AS 1’. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Vr Ip Rip Export Network (Net)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Rip Export Net Provisioned (Prov)" |

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> Ip Rip Export/<Decimal> NetworkList/<Decimal> Rtr/<string> Rip Export/<Decimal> NetworkList/<Decimal> Rtr/<string> Vrf/<string> Rip Export/<Decimal> NetworkList/ <Decimal>*<br>This component identifies a set of attributes when matched determines the export policy applied. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Rip Export Net Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group identifies the set of Provisionable attributes for the *ExportNetworkList* component. |

### ATTRIBUTE Vr Ip Rip Export Net ipAddress (addr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the 32 bit IP address to match against. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Rip Export Net ipMask (mask)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the IP Mask to be used with the IP Address to match against. |
| Values | IP address |
| Default | No default |

## COMPONENT Vr Ip Static

| | |
|---|---|
| Groups | "GROUP Vr Ip Static OsiState (State)"<br>"GROUP Vr Ip Static Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Static*<br>*Rtr/<string> Static*<br>*Rtr/<string> Vrf/<string> Static*<br>The *Static* component is used to configure addition, deletion and modification of static routing information. |
| Opt. Subcomp. | "COMPONENT Vr Ip Static RouteEntry (Route)"<br>"COMPONENT Vr Ip Static DiscardRouteEntry (Discard)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Ip Static OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Ip Static adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively |

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vr Ip Static operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Vr Ip Static usageState (osiUsage)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Static Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group of attributes are used to configure the Static component. |

### ATTRIBUTE Vr Ip Static defaultStaticRemoteRtePreference (pref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this *Static* component instance's default routing preference assigned to the remote routes. A lower value indicates a more preferred route. Assigning a non-zero value to the staticRemoteRtePreference attribute in RouteEntry will overrides this default. |
| Values | Decimal (1..253) |
| Default | 72 |

### ATTRIBUTE Vr Ip Static defaultStaticDiscardRtePreference (discpref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this Static component instance's default routing preference assigned to the discard routes. A lower value indicates a more preferred route. Assigning a non-zero value to |

| | |
|---|---|
| | the staticDiscardRtePreference attribute in DiscardRouteEntry will overrides this default. |
| Values | Decimal (0..253) |
| Default | 0 |

## COMPONENT Vr Ip Static RouteEntry (Route)

| | |
|---|---|
| Instance | destAddress (addr) [IP address]<br>destMask (mask) [IP address]<br>typeOfService (tos) [Decimal (0..0)] |
| Groups | "GROUP Vr Ip Static Route Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Static RouteEntry*/<Ip Address>, <Ip Address>, <Decimal><br>*Rtr/<string> Static RouteEntry*/<Ip Address>, <Ip Address>, <Decimal><br>*Rtr/<string> Vrf/<string> Static RouteEntry*/<Ip Address>, <Ip Address>, <Decimal><br>This component describes the IP static routes.<br><br>For a *RouteEntry* to be valid, there should be at least one *NextHop* provisioned. Up to three *NextHops* can be provisioned for each instance of a *RouteEntry.*<br><br>The value of index *destMask* should be contiguous.<br><br>Only the value zero is supported. Zero will be substituted for any value that is entered. |
| Opt. Subcomp. | "COMPONENT Vr Ip Static Route NextHop (Nh)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Static Route Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains a provisionable set of attributes for the static route entry component. |

## ATTRIBUTE Vr Ip Static Route staticRemoteRtePreference (pref)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the route preference of the static remote route. A lower preference value means the route is more preferred. If ***sameAsStatic*** is specified, the value of *defaultStaticRemoteRtePreference* in the *StaticProv* component is used. |
| Values | Decimal (1..253)<br>sameAsStatic |
| Default | sameAsStatic |

## COMPONENT Vr Ip Static Route NextHop (Nh)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP Vr Ip Static Route Nh Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Static Route/<Ip Address>,<Ip Address>,<Decimal> NextHop/<Ip Address>*<br>*Rtr/<string> Static Route/<Ip Address>,<Ip Address>,<Decimal> NextHop/<Ip Address>*<br>*Rtr/<string> Vrf/<string> Static Route/<Ip Address>,<Ip Address>,<Decimal> NextHop/<Ip Address>*<br>This component provides the destination Ip address of the *NextHop* (some times referred to as the Gateway).<br><br>For a *RouteEntry* to be valid, there should be at least one *NextHop* provisioned. Up to three *NextHops* can be provisioned for each instance of a *RouteEntry.* |

Each provisioned *NextHop* address should belong to a valid subnet.
A valid subnet for this IP entity can be provisioned as a *logicalIf* Entry under an *IpPort*.

## GROUP Vr Ip Static Route Nh Provisioned (Prov)

Properties: Provisioned

Description: This group contains a provisionable set of attributes for the *Static RouteEntry NextHop* component.

## ATTRIBUTE Vr Ip Static Route Nh metric (metric)

Access: Read and write

Description: This attribute specifies the primary routing metric for this *NextHop*.

Values: Signed (-1..65535)

Default: 1

## COMPONENT Vr Ip Static DiscardRouteEntry (Discard)

Instance: destAddress (addr) [IP address]
destMask [IP address]

Scope: Application

Description: *Vr/<string> Ip Static DiscardRouteEntry/<Ip Address>,<Ip Address>*
*Router/<string> Static DiscardRouteEntry/<Ip Address>,<Ip Address>*
*Router/<string> Vrf/<string> Static DiscardRouteEntry/<Ip Address>,<Ip Address>*
This table identifies invalid martian networks. Forwarding of

packets to the network address indicated by this entry will be discarded.

## GROUP Vr Ip Ns Provisioned (Prov)

Properties Provisioned

Description This group contains provisionable attributes for the *NetSentry* component.

## ATTRIBUTE Vr Ip Ns firstFilter

Access Read and write

Description The *firstFilter* is the first filter point which affects all IP packets before they have been examined in any way for their origin and destination. The most common use of a *firstFilter* point is to

| | |
|---|---|
| | collect statistis for all packets arriving at the route on any interface, before any subsequent filter processing changes their direction or disposition. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Ns localInFilter

| | |
|---|---|
| Access | Read and write |
| Description | The *localInFilter* is the second filter point which uses by network administrator to perform a common action on all IP packets that physically arrive over a specific logical interface, regardless of the packet's stated source or destination. Typical uses for a *localInFilter* include verifying that known Ethernet media source addresses match known IP addresses, or confirming that the IP packet source addresses of received IP packet fall within a narrow range. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Ns localOutFilter

| | |
|---|---|
| Access | Read and write |
| Description | The *localOutFilter* is the third filter point which applies to any IP packet that will be transmitted from the router to the medium associated with the interface, regardless of its source, destination, or what type of decision was made to cause the datagram to be transmitted on this interface. *localOutFilter* generally used to ensure that certain paterns of traffic do not enter the network or reach a second IP router on that network. For example, *localOutFilter* can be used as the exclusion of all IP packets above a certain security classification, or collecting statistics on the amount of IP fragments performed on an outgoing interface. |
| Values | String (0..32, ASCII) |
| Default | No default |

## ATTRIBUTE Vr Ip Ns lastFilter

| | |
|---|---|
| Access | Read and write |
| Description | *lastFilter* is the fourth and last filter point to be excecuted after all other routing and filtering decisions have been made on the IP packet, and transmission of the information is imminent. *lastFilter* is generally used to collect statistics on traffic after all previous control and routing decisions have been made. |
| Values | String (0..32, ASCII) |
| Default | No default |

## COMPONENT Vr Ip Ns ApplyEntry (Apply)

| | |
|---|---|
| Instance | Decimal (1..65535) |
| Groups | "GROUP Vr Ip Ns Apply Provisioned (NetSentryEntry)" |
| Scope | Application |
| Description | *Vr/<string> Ip NetSentry ApplyEntry/<Decimal>*<br>This component contains a list of *NetSentry* filters that can be applied to IP packets and information pertaining to each application of such *NetSentry* filters. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Ns Apply Provisioned (NetSentryEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | The instance of provisioned information relating to a filter application to IP packet. |

## ATTRIBUTE Vr Ip Ns Apply filter

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The name of the *filter* to be applied to packet matching the conditions in this entry. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Ns Apply ipAddress1

| | |
|---|---|
| Access | Read and write |
| Description | The first IP address used to compare. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Ns Apply ipMask1

| | |
|---|---|
| Access | Read and write |
| Description | The first netmask associated with *ipAddress1* used to compare. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Ns Apply ipAddress2

| | |
|---|---|
| Access | Read and write |
| Description | This second IP address used to compare. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Ns Apply ipMask2

| | |
|---|---|
| Access | Read and write |
| Description | This second netmask associated with *ipAddress2* used to compare. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vr Ip Ns Apply direction

| | |
|---|---|
| Access | Read and write |
| Description | Indicates the direction a packet must be moving between the first and second apply list entries in order for the entries to match. First “to” second, first “from” second, or first “tofrom” second (either direction). |
| Values | to<br>from<br>tofrom |
| Default | tofrom |

## COMPONENT Vr Ip Arp

| | |
|---|---|
| Groups | "GROUP Vr Ip Arp Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Arp*<br>*Rtr/<string> Arp*<br>*Rtr/<string> Vrf/<string> Arp*<br>The component specifies the Address Resolution Protocol. |

| Common Verbs | Help<br>List<br>Display |

## VERB Clear Vr Ip Arp

| | |
|---|---|
| Impact | Passive |
| Description | *Clear [-logicalIf(Ip Address)] [-includeInverse] Vr/<string> Ip Arp*<br>*Clear [-logicalIf(Ip Address)] [-includeInverse] Rtr/<string> Arp*<br><br>The *Clear* verb is intended for manually flushing dynamically learned ARP entries. Without any options, *Clear* will flush all non-inverse dynamic ARP entries. The *Clear* verb does not affect static ARP host entries, that is, entries which correspond to *HostEntry* subcomponents of this component. These entries can be removed by deleting the corresponding provisioned *HostEntry* component.<br><br>The *-logicalIf* or *-interface* option is used to flush dynamic ARP entries which were learned on a particular *IpPort LogicalInterface* or *Interface*. The option must specify the IP address of an existing *IpPort LogicalInterface* (which may be under any *ProtocolPort) or Interface*.<br><br>The *-includeInverse* option is used to force the deletion of inverse ARP entries. Inverse ARP entries which are learned through inverse ARP (*FrDte*) and inverse ATM ARP (*AtmMpe*) are important and should not be cleared by the users accidentally. If the option is not present, inverse ARP entries are not cleared. |

## GROUP Vr Ip Arp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | The ARP refresh feature allows the router to periodically verify ARP table entries. Whenever the router updates an ARP entry, or creates a new entry, a timeout value is assigned to the entry. When the timeout for an entry expires, the router will send a unicast ARP request to the currently-known physical address. If an ARP response comes back, the entry will be assigned a new timeout. If, however, the host has gone away or been assigned a new physical address, the host will not respond to the unicast ARP, and the entry will be removed from the ARP table. The new |

physical address will be discovered through the normal ARP mechanism when the next communication is attempted to the host.

### ATTRIBUTE Vr Ip Arp autoRefresh

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to enable or disable the ARP refresh feature. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Ip Arp autoRefreshTimeout

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the timeout value, in minutes, which is assigned to updated ARP entries, or newly created ARP entries. The range for the timeout is 1 minute to 1440 minutes (24 hours). |
| Values | Decimal (1..1440) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Vr Ip Arp retryTimes

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the number of times that an ARP request will be sent to a remote host if there is no reply received. This value is assigned when ARP entries are updated or created. The range of the value can be from 0 to 127. |
| Values | Decimal (0..127) |
| Units | times |
| Default | 127 |

## COMPONENT Vr Ip Arp DynHostEntry (DynHost)

| | |
|---|---|
| Instance | hostAddress (addr) [IP address]<br>cos [0<br>1<br>2<br>3<br>notApplicable (na)] |
| Groups | "GROUP Vr Ip Arp DynHost Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Arp DynHostEntry/<Ip Address>*<br>*Router/<string> Arp DynHostEntry/<Ip Address>*<br>*Router/<string> Vrf/<string> DynHostEntry/<Ip Address>*<br>This component is a table that contains all Arp host entries (both static and dynamic). Each IP ARP entry in the table is uniquely defined by its IP address and Class of Service (CoS) index.<br><br>When the associated media type is one where the CoS can be specified on a per virtual circuit basis (e.g. frameRelayDte or atmMpe) the CoS index of the arp entry may be *0*, *1*, *2*, or *3*; otherwise, the CoS index is *na* (not VC dependent).<br><br>An IP packet that has been assigned a particular CoS will be forwarded using the arp entry where the IP address matches the packet's destination IP address and where the CoS index matches the packet's CoS. When there are arp entries that match the packet's destination IP address, but not the packet's CoS, the packet will be forwarded using the arp entry that has the next lowest CoS index; failing this, the packet will be forwarded using the arp entry that has the next highest CoS index. |
| Common Verbs | Help<br>List<br>Display |

## VERB Clear Vr Ip Arp DynHost

| | |
|---|---|
| Impact | Passive |
| Description | *Clear [-inverse] Vr/<string> Ip Arp DynHostEntry/<Ip Address>*<br>*Clear [-inverse] Router/<string> Arp DynHostEntry/<Ip Address>*<br>*Clear [-inverse] Router/<string> Vrf/<string> Arp DynHostEntry/<Ip Address>*<br><br>The *Clear* verb is used to delete the single dynamically learned ARP entry that is represented by this component.<br><br>The *Clear* command does not affect static ARP host entries, that is, entries whose *type* attribute has the value ***static***. These entries can be removed by deleting the corresponding provisioned *HostEntry* component under *Arp*.<br><br>The *-inverse* option deletes the ARP entry even if it was an inverse ARP entry. Inverse ARP entries are learned through inverse ARP (*FrDte* or *IpoDlci*) and inverse ATM ARP (*AtmMpe*), and should not be removed by the users accidentally. If the option is not present, an inverse ARP entry is not cleared. |

## GROUP Vr Ip Arp DynHost Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *DynHostEntry* component. |

## ATTRIBUTE Vr Ip Arp DynHost physAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the physical address of the host in canonical form. |
| Values | String (0..8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Ip Arp DynHost maxTxUnit (mtu)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum MTU size that can be accepted by the host. |
| Values | Decimal (0..0; 80..18944) |
| Default | 0 |

### ATTRIBUTE Vr Ip Arp DynHost encapsulationType (encap)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the encapsulation type of the host. |
| Values | ieee8023<br>ethernet<br>notApplicable |
| Default | No default |

### ATTRIBUTE Vr Ip Arp DynHost permanentVirtualCircuitNumber (pvcNo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the permanent virtual circuit number to the remote host. |
| Values | Decimal (0..4095) |
| Default | No default |

### ATTRIBUTE Vr Ip Arp DynHost ifIndex

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *ifIndex* of the protocol port that is associated with this entry. |
| Values | Decimal (1..65535) |
| Default | 1 |

### ATTRIBUTE Vr Ip Arp DynHost type

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates how this entry was learned. |
| Values | pending<br>invalid<br>dynamic<br>static |
| Default | No default |

### ATTRIBUTE Vr Ip Arp DynHost ncPhysAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the physical address of the host in non-canonical form. This attribute is not displayed for hosts on non-LAN media. |
| Values | String (0..8, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Ip Arp DynHost tunnelDestinationAddress (tda)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of a remote IP tunnel endpoint in the shared domain.<br><br>A value of 0.0.0.0 is used when the entry is not referring to an IP tunnel. |
| Values | IP address |
| Default | 0.0.0.0 |

### COMPONENT Vr Ip Arp HostEntry (Host)

| | |
|---|---|
| Instance | hostAddress (addr) [IP address]<br>cos [0<br>1<br>2<br>3<br>notApplicable (na)] |
| Groups | "GROUP Vr Ip Arp Host Provisioned (Prov)"<br>"GROUP Vr Ip Arp Host Operational (Oper)" |

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> Ip Arp HostEntry/<Ip Address>,<Cos>*<br>*Rtr/<string> Arp HostEntry/<Ip Address>,<Cos>*<br>*Rtr/<string> Vrf/<string> Arp HostEntry/<Ip Address>,<Cos>*<br>This component defines a static host entry in the ARP table.<br><br>For *Vr*, a Class of Service (CoS) of ***0, 1, 2,*** or ***3*** should be used when the associated *mediaType* under *IpPort* is one where CoS can be specified on a per virtual circuit basis (for example: ***frameRelay***, ***atmMpeLlcEncap***, and ***atmMpeVcEncap***). For other media types, the CoS value ***notApplicable*** (not VC dependent) should be used.<br><br>For *Router* and *Vrf*, a Class of Service (CoS) of ***0, 1, 2,*** or ***3*** should be used when the associated media is one of *AtmMpe* or *IpoDlci*. For other media types, the CoS value ***notApplicable*** should be used. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Arp Host Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *HostEntry* component. |

## ATTRIBUTE Vr Ip Arp Host physAddress

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the physical address of the host being defined.<br>The value for this attribute should only be specified for media types supporting physical addresses (e.g. ethernet, fddi, tokenRing etc.) |
| Values | String (0..8, Dashed Hex) |

| | |
|---|---|
| Default | 00-00-00-00-00-00 |

### ATTRIBUTE Vr Ip Arp Host maxTxUnit (mtu)

| | |
|---|---|
| Access | Read and write |
| Description | Specify the maximum transmit unit (MTU) size that can be accepted by the host. If this value is not specified, the value for the media interface is used. The specified MTU must be less than or equal to the interface's MTU size. |
| Values | Decimal (0..0; 80..18944) |
| Default | 0 |

### ATTRIBUTE Vr Ip Arp Host permanentVirtualCircuitNumber (pvcNo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of the PVC for the static host entry. It is the instance number of the X.25 media, Frame Relay media, and of the *AtmConnection* component on the ATM MPE interface.. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE Vr Ip Arp Host tunnelDestinationAddress (tda)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address of a remote IP tunnel endpoint in the shared domain.<br><br>A value of 0.0.0.0 is used when the entry is not referring to an IP tunnel. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Arp Host encap

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the encapsulation type for the host. The value for this attribute should only be specified for the hosts on the ethernet media. If a value of ***auto*** is specified, the application based on the media will determine the proper applicable encapsulation type. |
| Values | ieee8023<br>ethernet<br>auto |
| Default | auto |

### GROUP Vr Ip Arp Host Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *HostEntry* component. |

### ATTRIBUTE Vr Ip Arp Host operMaxTxUnit (operMtu)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the operational value of the maximum transmission unit. |
| Values | Decimal (0..0; 80..18944) |
| Default | No default |

### ATTRIBUTE Vr Ip Arp Host operEncap

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the operational encapsulation type. if the value of the attribute *encap* is set to ***auto***, then the application will determine the encapsulation type based on the media being used and assigns the appropriate value. |
| Values | ieee8023<br>ethernet<br>notApplicable |
| Default | No default |

## COMPONENT Vr Ip Icmp

| | |
|---|---|
| Groups | "GROUP Vr Ip Icmp Statistics (Stats)" |
| Scope | Application |
| Description | Vr/<string> Ip Icmp<br>Rtr/<string> Icmp<br>Rtr/<string> Vrf/<string> Icmp<br>The Icmp component controls all ICMP related attributes available to this router. |
| Common Verbs | Help<br>List<br>Display |

## VERB Ping Vr Ip Icmp

| | |
|---|---|
| Impact | Passive |
| Description | *Ping -ipAddr(Ip Address) [-srcAddr(Ip Address)] [-netmask(Ip Address)] [-size(30..20000)] [-retry(0..9)] [-traceRoute] [-continuous] [-dontFragment] [-cos(0..3)][-tos(0..FF)][-stop] Vr/<string> Ip Icmp*<br><br>The *Ping* verb is intended for testing network connections at the IP level. The verb invokes ICMP to issue an echo request to the host specified by the *ipAddr* option and waits for its echo response.<br><br>If the *Ping* is successful, it outputs the following information:<br>- number of bytes received<br>- IP address of the responding host<br>- ICMP sequence number of the received packet<br>- elaspsed time from sending of the *Ping* to receiving of the response<br><br>The following options are supported:<br><br>-*srcAddr* is used to define the source IP address of the IP ICMP echo request packet. When not specified or specified as 0.0.0.0, the outgoing IP *Interface* or *LogicalIf* address is used as the |

source address.

-*netmask* when specified is used to define a range of IP host addresses to which echo requests are sent to (ping sweep). The netmask given must be contiguous. The -*retry* option is ignored if used together with this option. By default, the value is set to 255.255.255.255.

-*size* is used to define the size of the IP packet to be echoed including the IP and ICMP header. The default is 64 bytes. The maximum size is 4096.

-*retry* is used to define the number of times an echo request is resent if no echo reply is received. Default is 0.

-*traceRoute* is used to find the route the Passport would use to reach a particular destination IP address at the moment when the *Ping* command is executed with this option. The -*netmask*, -*size*, -*retry* and -*continuous* option are ignored if used together with this option. By default, the *traceRoute* option is not used.

-*continuous* causes ICMP to issue echo requests once per second to the host or hosts specified by the -*ipAddr* and the -*netmask* option. For every echo response ICMP receives, one line of output is printed. No output is produced if there is no response. The -*stop* option is used to stop ICMP from sending the echo requests. By default, the -*continuous* option is not used.

-*dontFragment* causes ICMP to set the Don’t Fragment flag of the IP packet that carries the echo request. This is useful in determining path MTU. By default, the *dontFragment* option is not used.

-*cos* causes the echo request packet to be forwarded with the given Class Of Service. Default is 0.

-*tos* causes the Type Of Service (TOS) byte of the echo request packet to be set to the given value. Default is 0.

-*stop* is used to stop ICMP from sending echo requests due to a previously issued *Ping* command with the -*continuous* and/or -*netmask* option. Under any other situation, the *Ping* command with the -*stop* option has no effect.

Note: Only one *Ping* command per *VirtualRouter* or *Router* or *Router Vrf* is allowed to be in progress at any one time. Any in progress *Ping* command must be stopped before a new *Ping* command can be issued.

## GROUP Vr Ip Icmp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group holds statistics for ICMP. |

## ATTRIBUTE Vr Ip Icmp inMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP messages received by this gateway. This number includes *inErrors*. *inMsgs* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Ip Icmp inErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP messages received by this gateway but determined as having ICMP specific errors such as bad ICMP checksums or bad length. *inErrors* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inDestUnreachs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP destination unreachable messages received by this gateway. *inDestUnreachs* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inTimeExcds

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP time exceeded messages received by this gateway. *inTimeExcds* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inParmProbs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP parameter problem messages received by this gateway. *inParmProbs* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inSrcQuenchs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP source quench messages received by this gateway. *inSrcQuenchs* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Icmp inRedirects

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP redirect messages received by this gateway. *inRedirects* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inEchos

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP echo request messages received by this gateway. *inEchos* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inEchoReps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP echo reply messages received by this gateway. *inEchoReps* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inTimestamps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP timestamp request messages received by this gateway. *inTimeStamps* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inTimestampReps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP timestamp reply messages received by this gateway. *inTimeStampReps* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inAddrMasks

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP address mask request messages received by this gateway. *inAddrMasks* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inAddrMaskReps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP address mask reply messages received by this gateway. *inAddrMaskReps* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP messages which this gateway attempted to send. This number includes *outErrors*. *outMsgs* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP messages which this gateway did not send due to problems discovered within ICMP such as a lack of buffers. *outErrors* does not included errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. *outErrors* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outDestUnreachs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP destination unreachable messages sent by this gateway. *outDestUnreachs* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outTimeExcds

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP time exceeded messages sent by this gateway. *outTimeExcds* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outParmProbs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP parameter problem messages sent by this gateway. *outParmProbs* wraps to zero if it reaches its maximum defined value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outSrcQuenchs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP source quench messages sent by this gateway. *ourSrcQuench* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outRedirects

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP redirect messages sent by this gateway. *outRedirects* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outEchos

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP echo request messages sent by this gateway. *outEchos* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outEchoReps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP echo reply messages sent by this gateway. *outEchoReps* wraps to zero if it reaches its maximum defined value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outTimestamps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP timestamp request messages sent by this gateway. *outTimeStamps* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outTimestampReps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP timestamp reply messages sent by this gateway. *outTimeStampReps* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outAddrMasks

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP address mask request messages sent by this gateway. *outAddrMasks* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outAddrMaskReps

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP address mask reply message sent by this gateway. *outAddrMaskReps* wraps to zero if it reaches its maximum defined value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inRtrAdvs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP router advertisement messages received by this gateway. *inRtrAdvs* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp inRtrSolicits

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP router solicitation messages received by this gateway. *inRtrSolicits* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outRtrAdvs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP router advertisement messages sent by this gateway. *outRtrAdvs* wraps to zero if it reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Icmp outRtrSolicits

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of ICMP router solicitation messages sent by this gateway. *outRtrSolicits* wraps to zero if it reaches its maximum defined value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Ip RelayBC

| | |

### GROUP Vr Ip RelayBC Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains global configuration attributes for the Relay Broadcast component. |

### ATTRIBUTE Vr Ip RelayBC relayStatus

| | |
|---|---|
| Access | Read and write |
| Description | Specifies whether or not IP will forward IP broadcast packets that were received as Link-Layer broadcasts. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Ip RelayBC relayNdStatus

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | Specifies whether or not IP will forward broadcast packets whose protocol is Sun ND. |
| Values | enabled<br>disabled |
| Default | disabled |

### GROUP Vr Ip RelayBC Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains RelayBroadcast component statistics. |

### ATTRIBUTE Vr Ip RelayBC relayNdCount

| | |
|---|---|
| Access | Read only |
| Description | Indicates the number of Sun ND packets received by this router which were forwarded. *relayNdCount* wraps to zero if reached its maximum. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Ip RelayBC PortEntry (Port)

| | |
|---|---|
| Instance | Decimal (0..4294967295) |
| Groups | "GROUP Vr Ip RelayBC Port Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip RelayBC PortEntry/<Decimal>*<br>*Rtr/<string> RelayBC PortEntry/<Decimal>*<br>This component is a table of destination UDP port numbers. In order for a packet to be forwarded by Relay Broadcast, the packet's destination UDP port number must be listed in this table. |

## GROUP Vr Ip Udp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group holds statictics for UDP. |

## ATTRIBUTE Vr Ip Udp inDatagrams

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of UDP datagrams delivered to UDP users. *inDatagrams* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Udp noPorts

| | |
|---|---|
| Access | Read only |
| Description | The number of UDP datagrams received for which there was no application at the destination port. *noPorts* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Udp inErrors

| | |
|---|---|
| Access | Read only |
| Description | The number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port. *inErrors* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Udp outDatagrams

| | |
|---|---|
| Access | Read only |
| Description | The number of UDP datagrams sent from this gateway. *outDatagrams* wraps to zero if reaches its maximum defined value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Vr Ip Udp ListenEntry

| | |
|---|---|
| Instance | localAddress [IP address]<br>localPort [Decimal (0..65535)] |
| Scope | Application |
| Description | The table contains UDP listener information. |

## GROUP Vr Ip Tcp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics for TCP. |

## ATTRIBUTE Vr Ip Tcp rToAlgorithm

| | |
|---|---|
| Access | Read only |
| Description | Indicate which algorithm was used to calculate the timeout value used for retransmitting unackowledged octet. |
| Values | other<br>constant |

| | |
|---|---|
| | rsre<br>vanJacobson |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp rToMin

| | |
|---|---|
| Access | Read only |
| Description | Indicate the minimum value, measured in milliseconds, allowed for retransmission timeout. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE Vr Ip Tcp rToMax

| | |
|---|---|
| Access | Read only |
| Description | Indicates the maximun value, measured in milliseconds, allowed for retransmission timeout. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp maxConn

| | |
|---|---|
| Access | Read only |
| Description | Limit on number of connections the TCP can support. The value is always -1 which indicates that the number of connections supported is dynamic (limited by memory in the system). |
| Values | Signed (-1) |
| Default | -1 |

### ATTRIBUTE Vr Ip Tcp activeOpens

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of times TCP connections have made a direct transition to the ***synSent*** state from the ***closed*** state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp passiveOpens

| | |
|---|---|
| Access | Read only |
| Description | The number of times TCP connections have made a direct transition to the ***synRcvd*** state from the ***listen*** state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp attemptFails

| | |
|---|---|
| Access | Read only |
| Description | The number of times TCP connections have made a direct transition to the ***closed*** state from either the ***synSent*** state or the ***synRcvd*** state, plus the number of times TCP connections have made a direct transition to the ***listen*** state from the ***synRcvd*** state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp estabResets

| | |
|---|---|
| Access | Read only |
| Description | The number of times TCP connections have made a direct transition to the ***closed*** state from either the ***established*** state or the ***closedWait*** state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp currEstab

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of TCP connections for which the current state is either ***established*** or ***closedWait***. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp inSegs

| | |
|---|---|
| Access | Read only |
| Description | The number of segments received, including those received in error. This count includes segments received on currently established connections. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp outSegs

| | |
|---|---|
| Access | Read only |
| Description | The number of segments sent, including those on current connections but excluding those containing only retransmitted octets. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp retransSegs

| | |
|---|---|
| Access | Read only |
| Description | The number of segments retransmitted that is, the number of TCP segments transmitted containing one or more previously transmitted octets. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp inErrs

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | Total number of segments received in error, for example bad TCP checksum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Tcp outRsts

| | |
|---|---|
| Access | Read only |
| Description | Number of TCP segments sent containing the RST flag. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Ip Tcp TcpEntry (TcpEntry)

| | |
|---|---|
| Instance | localAddress [IP address]<br>localPort [Decimal (0..65535)]<br>remoteAddress [IP address]<br>remotePort [Decimal (0..65535)] |
| Groups | "GROUP Vr Ip Tcp TcpEntry Operational (Oper)" |
| Scope | Application |
| Description | The component defines an entry in the TCP connection table. Each entry corresponds to TCP end-point identified by 4-tuples, *LocalAddress*, *LocalPort*, *RemoteAddress*, and *RemotePort*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ip Tcp TcpEntry Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains columnar entries for each end-point on the TCP. |

### ATTRIBUTE Vr Ip Tcp TcpEntry state

| | |
|---|---|
| Access | Read and write |

Description This attribute reflects the current state of this Tcp connection.

Values
closed
listen
synSent
synReceived
established
closeWait
finWait1
closing
lastAck
finWait2
timeWait
delete

Default No default

## COMPONENT Vr Ip BootpRelayAgent (Bootp)

Groups
"GROUP Vr Ip Bootp AdministrativeControl (AdminControl)"
"GROUP Vr Ip Bootp Provisioned (Prov)"
"GROUP Vr Ip Bootp OsiState (State)"
"GROUP Vr Ip Bootp OperationalStatus (OperStatus)"

Scope Application

Description
*Vr/<string> Ip BootpRelayAgent*
*Rtr/<string> BootpRelayAgent*
*Rtr/<string> Vrf<string> BootpRelayAgent*
The *BootpRelayAgent* component contains all the necessary attributes and components to provision a BOOTP relay agent. The BOOTP relay agent functionality conforms to that described in RFCs 951 and 1542.

The purpose of the BOOTP relay agent is to forward BOOTP request packets from a client to a server, and also to deliver server BOOTP replies back to the client. When a BOOTP request is received on a port, the request will be sent to a provisioned list of

IP addresses for that port. In addition, the request will be broadcast out all other BOOTP ports which allow it.

## GROUP Vr Ip Bootp AdministrativeControl (AdminControl)

Properties Provisioned

Description This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.

## ATTRIBUTE Vr Ip Bootp snmpAdminStatus

Access Read and write

Description The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default up

## GROUP Vr Ip Bootp Provisioned (Prov)

Properties Provisioned

Description This group contains provisionable attributes for the *BootpRelayAgent* component.

### ATTRIBUTE Vr Ip Bootp hopDiscardThreshold (hops)

| | |
|---|---|
| Access | Read and write |
| Description | BOOTP packets contain a ‘hops’ field which is used to limit the number of relay agents that can process the packet (each relay agent increments the ‘hops’ field by one). This attribute is used by the relay agent to determine when to discard a BOOTP packet. If the ‘hops’ field exceeds the *hopDiscardThreshold* the BOOTP packet will be discarded. |
| Values | Decimal (2..16) |
| Default | 4 |

### GROUP Vr Ip Bootp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Ip Bootp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Ip Bootp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Bootp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Bootp OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Ip Bootp snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### COMPONENT Vr Ip Bootp BootpPortEntry (PpE)

| | |
|---|---|
| Instance | String (1..20, ASCII) |
| Groups | "GROUP Vr Ip Bootp PpE Operational (Oper)"<br>"GROUP Vr Ip Bootp PpE Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Ip BootpRelayAgent BootpPortEntry/<string> Rtr/<string> BootpRelayAgent BootpPortEntry/<string> Rtr/<string> Vrf/<string> BootpRelayAgent BootpPortEntry/ <string>*<br>The *BootpPortEntry* component contains information about the provisioned *BootpPort*. This component is indexed by a string |

which represents a *VirtualRouter ProtocolPort* or *Rtr Interface* or *Rtr Vrf Interface* component name.

## GROUP Vr Ip Bootp PpE Operational (Oper)

Properties: Operational

Description: This group contains *BootpPortEntry* component operational data.

## ATTRIBUTE Vr Ip Bootp PpE status

Access: Read only

Description: This attribute indicates the status of the provisioned *BootpPortEntry* component. A value of ***disabled*** is used when the parent components is in a disabled state. A value of ***up*** is used when the *BootpPortEntry* is in an operational state. A state of ***down*** is used if the media associated with the *BootpPortEntry* is not ready or disabled.

Values:
up
down
disabled

Default: No default

## GROUP Vr Ip Bootp PpE Statistics (Stats)

Properties: Operational

Description: This group contains *BootpPortEntry* component statistics.

## ATTRIBUTE Vr Ip Bootp PpE inRequests

Access: Read only

| | |
|---|---|
| Description | This attribute counts the total number of BOOTP Request messages received on this port. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bootp PpE inReplies

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BOOTP Reply messages received on this port. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bootp PpE outRequests

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts total the number of BOOTP Request messages broadcast out on this port. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bootp PpE outReplies

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BOOTP Reply messages sent out on this port. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bootp PpE inRequestErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BOOTP Request messages received on this port but not forwarded due to an error. An error occurs if the BOOTP hop limit has been exceeded. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bootp PpE inReplyErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BOOTP Reply messages received on this port but not forwarded due to an error. An error occurs if the giaddr field in the BOOTP reply does not match an IP address assigned to this *VirtualRouter* or *Rtr* or *Rtr Vrf*, or if the output *IpPort* or *Interface* for the BOOTP reply is not provisioned for BOOTP. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Ip Cache

| | |
|---|---|
| Instance | Decimal (0..15) |

### ATTRIBUTE Vr Ip Cache usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Cache Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group houses all the operational attributes of an *Ip* cache table. |

### ATTRIBUTE Vr Ip Cache entriesFree (ef)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is indicative of the number of free *Ip* cache table entries.<br>A consistently high value for this attribute indicates that there is a resource surplus of the memory requirements for cache table. This surplus could be utilized elsewhere if needed by adjusting the appropriate *cacheTableMaxEntries* attribute. For *Vr*, *cacheTableMaxEntries* is under the *Ip* component; for *Rtr* and *Vrf*, it is under the respective components. |
| Values | Decimal (0..8000) |
| Default | No default |

### ATTRIBUTE Vr Ip Cache totalLookups (tl)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of local cache lookups. It wraps around to zero when it exceeds its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Cache lookupMisses (lm)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total number of local cache lookup misses. It wraps around to zero when it exceeds its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Cache cacheTableMaxEntries (ctme)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current maximum number of entries that can exist in the IP local cache table on each LP. |
| Values | Decimal (0..8000) |
| Default | No default |

### COMPONENT Vr Ip Tunnel

| | |
|---|---|
| Groups | "GROUP Vr Ip Tunnel OsiState (State)"<br>"GROUP Vr Ip Tunnel Operational (Oper)"<br>"GROUP Vr Ip Tunnel Provisioned (Prov)" |

### GROUP Vr Ip Tunnel OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Vr Ip Tunnel adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Vr Ip Tunnel operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Tunnel usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Ip Tunnel Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes for the *Tunnel* component.

### ATTRIBUTE Vr Ip Tunnel optimizationStatus (opts)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the tunnel optimization status of this *Tunnel* instance.<br><br>***optimized***: The IP tunnels represented by the *Msep* subcomponents of this *Tunnel* instance have been optimized.<br><br>***ineligible***: The conditions necessary for tunnel optimization are not met. None of the IP tunnels represented by the *Msep* subcomponents of this *Tunnel* instance have been optimized.<br><br>***eligible***: All of the conditions necessary for tunnel optimization are met, but the *optimization* attribute has been set to ***disabled***. None of the IP tunnels represented by the *Msep* subcomponents of this *Tunnel* instance have been optimized.<br><br>***optimizationOnHold***: All of the conditions necessary for tunnel optimization are met, but since the tunnel was in the ineligible state with the *optimization* attribute set to ***enabled***, it does not go into the ***optimized*** state. Instead, the tunnel goes into the ***optimizationOnHold*** state. To proceed with optimization, disable and reenable optimization. |
| Values | optimized<br>ineligible<br>eligible<br>optimizationOnHold |
| Default | No default |

### GROUP Vr Ip Tunnel Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Tunnel* component. |

### ATTRIBUTE Vr Ip Tunnel optimization (opt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether tunnel optimization is enabled for the *Msep* subcomponents of this *Tunnel* instance. Tunnel optimization is not performed for any of the *Msep* |

subcomponents if either of the following is true:

- The *VirtualRouter* has *ProtocolPort* components that are linked to components representing physical media on more than one access card. This includes the case when one of the cards is a standby card, or when the physical media is linked to a SONET or SDH port which is protected by inter-card APS. This also includes if *AtmMultiprotocolEncapsulation SpvcTerminationPoint* is used and the *AtmConnection* components resides on more than one access card.

- The *VirtualMedia Interface* component corresponding to any of the *Msep* subcomponent of this *Tunnel* instance has its *mode* attribute set to a value other than ***alwaysUpSummaryInterface***.

This attribute must be set to ***disabled*** if the *VirtualRouter* has a *ProtocolPort* which is linked to an *AtmMpe* component whose *encapType* attribute is set to ***llcBridgeEncap***.

Values: disabled
enabled

Default: disabled

## COMPONENT Vr Ip Tunnel StaticEndPoint (Sep)

Instance: Decimal (0..63)

Groups: "GROUP Vr Ip Tunnel Sep IfEntryProv (IfEntry)"
"GROUP Vr Ip Tunnel Sep MediaProv (Mp)"
"GROUP Vr Ip Tunnel Sep Provisioned (Prov)"
"GROUP Vr Ip Tunnel Sep Operational (Oper)"

Scope: Application

Description: *Vr/<string> Ip Tunnel StaticEndPoint/n*
An IP tunnel allows two geographically separated networks to be connected over a shared IP network (for example the Internet), either because the networks at the end points are using private IP address or they are not running IP as the network protocol.

This component represents a static IP Tunnel End Point. It is static in the sense that both the tunnel source and destination IP

addresses are static configured. For proper operation of the tunnel, the exact source and destination IP addresses (in reverse order) must be used to provision the Tunnel End Point on the far end router.

Two types of IP tunnel encapsulation are supported: IP in IP as specified in RFC 2003 and Generic Routing Encapsulation as specified in RFC 1701. Note: IP in IP tunnel encapsulation is not compliant with RFC 2003 when using an ATM IP FP as a backbone FP.

## GROUP Vr Ip Tunnel Sep IfEntryProv (IfEntry)

Properties: Provisioned

Description: This group contains the provisionable attributes for the ifEntry.

## ATTRIBUTE Vr Ip Tunnel Sep ifAdminStatus (ifState)

Access: Read and write

Description: The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.

Values:
up
down
testing

Default: up

### ATTRIBUTE Vr Ip Tunnel Sep ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Vr Ip Tunnel Sep MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the media base component. |

### ATTRIBUTE Vr Ip Tunnel Sep linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP Vr Ip Tunnel Sep Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *StaticEndPoint* component. |

### ATTRIBUTE Vr Ip Tunnel Sep encapType

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | There are two types of encapsulation techniques for IP tunnel, IP in IP (RFC 2003) and GRE over IP (RFC 1701). This attributes specifies the encapsulation type of the IP tunnel.<br><br>***ipInIp***: As defined in RFC 2003, it can be used to encapsulated IP and IP payload only. If IP is the only type of payload to be encapsulated by the tunnel, this type of encapsulation is recommended as it requires less processing and uses less bandwidth. Note: IP in IP tunnel encapsulation is not compliant with RFC 2003 when using an ATM IP FP as a backbone FP.<br><br>***greIp***: As defined in RFC 1701, it can be used to encapsulate IP or IPX payload. To encapsulate IPX payload, this encapsulation type must be used. |
| Values | ipInIp<br>greIp |
| Default | ipInIp |

## ATTRIBUTE Vr Ip Tunnel Sep sourceAddress (src)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP address of the local end of the tunnel. The source address must be an address in the shared domain, and it must equal to an interface address on its own Virtual Router (under *Vr/<string> Pp/<string> IpPort LogicalIf/ <IpAddress>*). However, it must not be the interface address of the linked protocol port's *IpPort* component.<br><br>The *sourceAddress* of *StaticEndPoint* or *MultipointStaticEndPoint* components within the same *sharedDomainVirtualRouter* must be unique. |
| Values | IP address |
| Default | 0.0.0.0 |

## ATTRIBUTE Vr Ip Tunnel Sep destinationAddress (dst)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP address of the far end of the tunnel. It must not match any of the IP interface addresses on this Virtual Router. |
| Values | IP address |
| Default | 0.0.0.0 |

## GROUP Vr Ip Tunnel Sep Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status attributes of the *StaticEndPoint* component. |

## ATTRIBUTE Vr Ip Tunnel Sep discoveredPathMtu (dmtu)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the latest learned Path MTU of the tunnel.<br><br>An MTU is the maximum transmission unit of an arbitrary internet path. When a large amount of IP datagrams are to be transmitted, it is usually preferable that the datagrams be of the largest size that does not require fragmentation anywhere along the path from the source to the destination. This datagram size is referred to as the Path MTU (PMTU). It is equal to the minimum of the MTUs of each hop in the path. |
| Values | Decimal (0; 100..18944) |
| Default | 0 |

## COMPONENT Vr Ip Tunnel MultipointStaticEndPoint (Msep)

| | |
|---|---|
| Instance | Decimal (0..1) |
| Groups | "GROUP Vr Ip Tunnel Msep IfEntryProv (IfEntry)"<br>"GROUP Vr Ip Tunnel Msep MediaProv (Mp)"<br>"GROUP Vr Ip Tunnel Msep Provisioned (Prov)" |

"GROUP Vr Ip Tunnel Msep Operational (Oper)"
"GROUP Vr Ip Tunnel Msep DestinationDiscovery (DstDisovery)"

Scope: Application

Description: *Vr/<string> Ip Tunnel MultipointStaticEndPoint/n*
An IP tunnel allows more than one geographically separated networks to be connected over a shared IP network (for example the Internet) because the networks at the end points are using private IP address.

This component represents a static IP Tunnel End Point of a point-to-multipoint IP Tunneling configuration. It is static in the sense that both the tunnel source address and the list of destination IP addresses are statically configured.

Only one type of IP tunnel encapsulation is supported: IP in IP as specified in RFC 2003. Note: IP in IP tunnel encapsulation is not compliant with RFC 2003 when using an ATM IP FP as a backbone FP.

### ATTRIBUTE Vr Ip Tunnel Msep linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP Vr Ip Tunnel Msep Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes for the *MultipointStaticEndPoint* component. |

### ATTRIBUTE Vr Ip Tunnel Msep pathMtu (mtu)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Path Maximum Transmission Unit (PMTU) of the IP Tunnel. If this attribute is set to discovered, the lowest PMTU value for all tunnel endpoints will be discovered and used to forward IP datagrams. Otherwise, if this attribute is set to an actual value, the value must be less or equal to the PMTU of all tunnel endpoints. IP fragmentation will occur for IP datagrams larger than PMTU. |
| Values | Decimal (100..18944)<br>discovered |
| Default | 9180 |

### ATTRIBUTE Vr Ip Tunnel Msep encapType

| | |
|---|---|
| Access | Read and write |
| Description | This component only supports one type of encapsulation technique for IP tunnel: IP in IP (RFC 2003).<br><br>***ipInIp***: As defined in RFC 2003, it can be used to encapsulated IP and IP payload only. Note: IP in IP tunnel encapsulation is not compliant with RFC 2003 when using an ATM IP FP as a backbone FP. |
| Values | ipInIp |
| Default | ipInIp |

### ATTRIBUTE Vr Ip Tunnel Msep sharedDomainVirtualRouter (sdvr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the virtual router at the source endpoint of the IP tunnel. The value must specify a *VirtualRouter* component whose *vpnMode* attribute is set to ***carrier***. |

| | |
|---|---|
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Ip Tunnel Msep sourceAddress (src)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP address of the local end of the IP tunnel in the shared domain.<br>There must be a logical interface with this IP address under the virtual router instance specified in the *sharedDomainVirtualRouter* attribute.<br>This interface IP address cannot be an IP address defined under this IP tunnel protocol port.<br><br>The *sourceAddress* of *StaticEndPoint* or *MultipointStaticEndPoint* components within the same *sharedDomainVirtualRouter* must be unique. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Tunnel Msep autoDiscovery (disc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the IP VPN auto discovery feature is enabled or disabled on this MSEP instance. If the value is ***enabled*** the MSEP instance exchanges the tunnel source and destination addresses with the BGP-4 instance configured on the same customer VR. |
| Values | disabled<br>enabled |
| Default | disabled |

### ATTRIBUTE Vr Ip Tunnel Msep destinationAddresses (dst)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the list of IP addresses mapping to each of the far end IP tunnel endpoints in the private domain. It must not match any of the IP interface addresses on the Virtual Router pointed to by the *sharedDomainVirtualRouter* attribute. |
| List of | IP address |
| Default | No default |

### GROUP Vr Ip Tunnel Msep Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status attributes of the *StaticEndPoint* component. |

### ATTRIBUTE Vr Ip Tunnel Msep discoveredPathMtu (dmtu)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the latest learned Path MTU of the tunnel.<br><br>An MTU is the maximum transmission unit of an arbitrary internet path. When a large amount of IP datagrams are to be transmitted, it is usually preferable that the datagrams be of the largest size that does not require fragmentation anywhere along the path from the source to the destination. This datagram size is referred to as the Path MTU (PMTU). It is equal to the minimum of the MTUs of each hop in the path. |
| Values | Decimal (0; 100..18944) |
| Default | 0 |

### GROUP Vr Ip Tunnel Msep DestinationDiscovery (DstDisovery)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status attributes of the *MultipointStaticEndPoint* component. |

## ATTRIBUTE Vr Ip Tunnel Msep discoveredDestinationAddresses (ddst)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the list of IP addresses mapping to each of the remote IP tunnel endpoints in the private domain. The endpoints are learned by BGP-4 when this MSEP instance is configured to run auto discovery. |
| List of | IP address |
| Default | No default |

## COMPONENT Vr Ip NextHopResolutionProtocol (Nhrp)

| | |
|---|---|
| Groups | "GROUP Vr Ip Nhrp AdministrativeControl (AdminControl)"<br>"GROUP Vr Ip Nhrp Provisioned (Prov)"<br>"GROUP Vr Ip Nhrp OsiState (State)"<br>"GROUP Vr Ip Nhrp OperationalStatus (OperStatus)"<br>"GROUP Vr Ip Nhrp Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip NextHopResolutionProtocol*<br>This component represents a co-located NHRP Client and Server as specified in RFC2332. NHRP provides a method for a station connected to a Non-Broadcast Multiple Access (NBMA) subnetwork to determine the internetworking layer address and NBMA subnetwork address of the “next hop” towards a destination station. NHRP reduces or eliminates the extra hops required by the existing logically independent IP subnet (LIS) model. |

### GROUP Vr Ip Nhrp AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Ip Nhrp snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ip Nhrp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes of the *Nhrp* component. |

### ATTRIBUTE Vr Ip Nhrp maxResCacheEntries

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of *ResCacheEntry* components which may exist under the *Nhrp* component at any one time. Reducing the value of this attribute will not clear existing entries. |
| Values | Decimal (32..1024) |
| Default | 512 |

### ATTRIBUTE Vr Ip Nhrp fwdTransitRecord (ftr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether to attach a forward transit record extension to NHRP packets (Resolution and Purge requests) that Passport originates. This extension along with NHRP debug tracing set to “verbose” can be used in tracing the path the NHRP packet takes from source to destination. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Ip Nhrp revTransitRecord (rtr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether to attach a reverse transit record extension to Resolution Request packets that Passport originates. This extension along with NHRP debug tracing set to “verbose” can be used in tracing the path the NHRP packet takes from destination to source. |
| Values | enabled<br>disabled |
| Default | disabled |

## GROUP Vr Ip Nhrp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Ip Nhrp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Vr Ip Nhrp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Nhrp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Ip Nhrp OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Ip Nhrp snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ip Nhrp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Nhrp* component. |

### ATTRIBUTE Vr Ip Nhrp currResCacheEntries

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of entries in the NHRP resolution cache table. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp peakResCacheEntries

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak value of *currResCacheEntries* since the *Nhrp snmpOperStatus* attribute last became ***up***. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## COMPONENT Vr Ip Nhrp NextHopServer (Nhs)

| | |
|---|---|
| Groups | "GROUP Vr Ip Nhrp Nhs Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Ip Nhrp NextHopServer*<br>This component represents the NHRP server. The server performs the NHRP service within the NBMA cloud. |
| Opt. Subcomp. | "COMPONENT Vr Ip Nhrp Nhs EgressPolicy (Ep)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Nhrp Nhs Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attributes of the *Nhs* component. |

## ATTRIBUTE Vr Ip Nhrp Nhs rxResolveReq

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Resolution Requests received by this server.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## ATTRIBUTE Vr Ip Nhrp Nhs txResolveReplyAck

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the positively acknowledged NHRP Resolution Replies transmitted by this server.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txResolveReplyNakProhibited

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NAK NHRP Resolution Replies transmitted by this server with the code ‘Administratively Prohibited’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txResolveReplyNakInsufResources

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NAK NHRP Resolution Replies transmitted by this server with the code ‘Insufficient Resources’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txResolveReplyNakNoBinding

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NAK NHRP Resolution Replies transmitted by this server with the code ‘No Internetworking Layer Address to NBMA Address Binding Exists’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txResolveReplyNakNotUnique

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NAK NHRP Resolution Replies transmitted by this server with the code ‘Binding Exists But Is Not Unique’.<br>This counter wraps to zero when the maximum value is exceeded. |

| | |
|---|---|
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxRegisterReq

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Registration Requests received by this server. Registration is not supported, therefore all NHRP Registration Requests are silently dropped.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxPurgeReq

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Purge Requests received by this server.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txPurgeReq

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Purge Requests transmitted by this server.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxPurgeReply

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Purge Replies received by this server.<br>This counter wraps to zero when the maximum value is exceeded. |

| | |
|---|---|
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txPurgeReply

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Purge Replies transmitted by this server.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrUnrecognizedExtension

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘Unrecognized Extension’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrLoopDetected

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘NHRP Loop Detected’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrProtoAddrUnreachable

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘Protocol Address Unreachable’.<br>This counter wraps to zero when the maximum value is exceeded. |

| | |
|---|---|
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrProtoError

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘Protocol Error’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrSduSizeExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘NHRP SDU Size Exceeded’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrInvalidExtension

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘Invalid Extension’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrInvalidResReplyReceived

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘Invalid Resolution Reply Received’.<br>This counter wraps to zero when the maximum value is exceeded. |

| | |
|---|---|
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrAuthenticationFailure

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘Authentication Failure’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs rxErrHopCountExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets received by this server with the error code ‘Hop Count Exceeded’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txErrUnrecognizedExtension

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets transmitted by this server with the error code ‘Unrecognized Extension’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txErrLoopDetected

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets transmitted by this server with the error code ‘NHRP Loop |

Detected'.
This counter wraps to zero when the maximum value is exceeded.

Values Decimal (0..4292967295)

Default No default

### ATTRIBUTE Vr Ip Nhrp Nhs txErrProtoAddrUnreachable

Access Read only

Description This attribute counts the NHRP Error Indication packets transmitted by this server with the error code 'Protocol Address Unreachable'.
This counter wraps to zero when the maximum value is exceeded.

Values Decimal (0..4292967295)

Default No default

### ATTRIBUTE Vr Ip Nhrp Nhs txErrProtoError

Access Read only

Description This attribute counts the NHRP Error Indication packets transmitted by this server with the error code 'Protocol Error'.
This counter wraps to zero when the maximum value is exceeded.

Values Decimal (0..4292967295)

Default No default

### ATTRIBUTE Vr Ip Nhrp Nhs txErrSduSizeExceeded

Access Read only

Description This attribute counts the NHRP Error Indication packets transmitted by this server with the error code 'NHRP SDU Size Exceeded'.
This counter wraps to zero when the maximum value is exceeded.

Values Decimal (0..4292967295)

Default No default

### ATTRIBUTE Vr Ip Nhrp Nhs txErrInvalidExtension

Access Read only

| | |
|---|---|
| Description | This attribute counts the NHRP Error Indication packets transmitted by this server with the error code ‘Invalid Extension’. This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txErrAuthenticationFailure

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets transmitted by this server with the error code ‘Authentication Failure’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs txErrHopCountExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets transmitted by this server with the error code ‘Hop Count Exceeded’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs fwdResolveReq

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Resolution Requests forwarded by this server acting as a transit NHS.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs fwdResolveReply

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Resolution Replies forwarded by this server acting as a transit NHS.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs fwdRegisterReq

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Registration Requests forwarded by this server acting as a transit NHS.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs fwdRegisterReply

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Registration Replies forwarded by this server acting as a transit NHS.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs fwdPurgeReq

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Purge Requests forwarded by this server acting as a transit NHS.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs fwdPurgeReply

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Purge Replies forwarded by this server acting as a transit NHS.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhs fwdErrorIndication

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Error Indication packets forwarded by this server acting as a transit NHS.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### COMPONENT Vr Ip Nhrp Nhs EgressPolicy (Ep)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Nhrp Nhs Ep Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Nhrp Nhs EgressPolicy/n*<br>This component represents an egress policy on this server.<br>The server has the following default egress policies which may be overridden by any provisioned egress policies: 1. NAK resolution request for any remotely attached destination regardless of source, 2. ACK resolution request for any locally attached destination regardless of source. |

| | |
|---|---|
| Subcomponents | "COMPONENT Vr Ip Nhrp Nhs Ep NetworkAddress (NetAddr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Nhrp Nhs Ep Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *EgressPolicy* component. |

### ATTRIBUTE Vr Ip Nhrp Nhs Ep action

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how the server should handle the NHRP Resolution Request if it matches this policy. The possible actions are:<br>***ack*** - Send a positive acknowledgement (ACK Reply) for the request.<br>***nak*** - Send a negative acknowledgement (NAK Reply) for the request. |
| Values | ack<br>nak |
| Default | nak |

### ATTRIBUTE Vr Ip Nhrp Nhs Ep protocol

| | |
|---|---|
| Access | Read and write |
| Description | This attribute species the reachability type (that is, protocol) of the destination in the NHRP Resolution Request. The possible protocols:<br>***default*** - This value is a ‘wildcard’ and matches any protocol. A policy with a ‘wildcard’ protocol is less preferred than a policy |

with a protocol which matches exactly.
***staticLocal*** - The destination is on a locally attached network.

Values: default
staticLocal

Default: default

## COMPONENT Vr Ip Nhrp Nhs Ep NetworkAddress (NetAddr)

Instance: Decimal (0..65535)

Groups: "GROUP Vr Ip Nhrp Nhs Ep NetAddr Provisioned (Prov)"

Scope: Application

Description: *Vr/<string> Ip Nhrp Nhs Ep/n NetworkAddress/n*
This component represents the source and destination address pairs for an NHRP egress policy.

Common Verbs:
- Help
- List
- Display
- Add
- DELete

## GROUP Vr Ip Nhrp Nhs Ep NetAddr Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes of the *NetworkAddress* component.

## ATTRIBUTE Vr Ip Nhrp Nhs Ep NetAddr sourceAddress (srcAddr)

Access: Read and write

Description: This attribute specifies the internetwork address of the source. This is used to match a source internetwork address in an NHRP Resolution Request.

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Ip Nhrp Nhs Ep NetAddr sourceMask (srcMask)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the netmask for the source internetwork address. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Nhrp Nhs Ep NetAddr destinationAddress (dstAddr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the internetwork address of the destination. This is used to match a destination internetwork address in an NHRP Resolution Request. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Nhrp Nhs Ep NetAddr destinationMask (dstMask)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the netmask for the destination internetwork address. |
| Values | IP address |
| Default | 0.0.0.0 |

### COMPONENT Vr Ip Nhrp NextHopClient (Nhc)

| | |
|---|---|
| Groups | "GROUP Vr Ip Nhrp Nhc Provisioned (Prov)"<br>"GROUP Vr Ip Nhrp Nhc Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Ip Nhrp NextHopClient*<br>This component represents the NHRP client. The client initiates NHRP requests of various types in order to obtain access to the NHRP service. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Nhrp Nhc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Nhc* component. |

## ATTRIBUTE Vr Ip Nhrp Nhc flowDetectPacketCount (fdpc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, along with *flowDetectTimePeriod*, specifies the IP traffic flow detection threshold; If the number of IP packets sent to a particular destination within the time interval specified by *flowDetectTimePeriod* exceeds the value specified by *flowDetectPacketCount*, then an NHRP Resolution Request will be triggerred. If successful, a shortcut will be set up. |
| Values | Decimal (1..4292967295) |
| Default | 600 |

## ATTRIBUTE Vr Ip Nhrp Nhc flowDetectTimePeriod (fdtp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, along with *flowDetectPacketCount*, specifies the IP traffic flow detection threshold; If the number of IP packets sent to a particular destination within the time interval specified by *flowDetectTimePeriod* exceeds the value specified by *flowDetectPacketCount*, then an NHRP Resolution Request will be triggerred. If successful, a shortcut will be set up. |
| Values | Decimal (10; 20; 30; 40; 50; 60) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE Vr Ip Nhrp Nhc idleDetectPacketCount (idpc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, along with *idleDetectTimePeriod*, specifies the idle shortcut threshold; If the number of frames transmitted over an outgoing shortcut, or received over an incoming shortcut, within the time interval specified by *idleDetectTimePeriod* falls below the value specified by *idleDetectPacketCount*, then the shortcut connection will be released. |
| Values | Decimal (1..4292967295) |
| Default | 900 |

### ATTRIBUTE Vr Ip Nhrp Nhc idleDetectTimePeriod (idtp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, along with *idleDetectPacketCount*, specifies the idle shortcut threshold; If the number of frames transmitted over an outgoing shortcut, or received over an incoming shortcut, within the time interval specified by *idleDetectTimePeriod* falls below the value specified by *idleDetectPacketCount*, then the shortcut connection will be released. |
| Values | Decimal (1..30) |
| Units | minutes |
| Default | 3 |

### ATTRIBUTE Vr Ip Nhrp Nhc atmFlowDetection (afd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether flow detection should be performed for IP traffic received on ATM cards. This attribute does not apply to IP traffic received on LAN or non-ATM WAN cards. |
| Values | enabled<br>disabled |
| Default | disabled |

## GROUP Vr Ip Nhrp Nhc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attributes of the *Nhc* component. |

## ATTRIBUTE Vr Ip Nhrp Nhc txResolveReq

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NHRP Resolution Requests transmitted by this client.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## ATTRIBUTE Vr Ip Nhrp Nhc rxResolveReplyAck

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the positively acknowledged NHRP Resolution Replies received by this client.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## ATTRIBUTE Vr Ip Nhrp Nhc rxResolveReplyNakProhibited

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NAK NHRP Resolution Replies received by this client that contained the code indicating ‘Administratively Prohibited’.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## ATTRIBUTE Vr Ip Nhrp Nhc rxResolveReplyNakInsufResources

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the NAK NHRP Resolution Replies received by this client that contained the code indicating 'Insufficient Resources'.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhc rxResolveReplyNakNoBinding

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NAK NHRP Resolution Replies received by this client that contained the code indicating 'No Internetworking Layer Address to NBMA Address Binding Exists'.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Nhrp Nhc rxResolveReplyNakNotUnique

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the NAK NHRP Resolution Replies received by this client that contained the code indicating 'Binding Exists But Is Not Unique'.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |

## COMPONENT Vr Ip CosPolicyGroup (Pg)

| | |
|---|---|
| Instance | String (1..20, ASCII) |
| Groups | "GROUP Vr Ip Pg Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip CosPolicyGroup/<string>*<br><br>This component and its subcomponents specify the IP Differentiated Services capabilities of an *IpPort*. Up to four different forwarding behaviors can be configured. For a greater range of forwarding behaviors, the *Vr Ip DifferentiatedServices* component should be used instead.<br><br>A *CosPolicyGroup* component is used by all *IpPort* subcomponents of a *VirtualRouter* by setting the *cosPolicyAssignment* attribute of the *Ip* component. It is used by one or more *IpPort* subcomponents directly by setting the *cosPolicyAssignment* attribute of the *IpPort*. The direct assignment to the *IpPort* completely overrides the assignment to the *Ip*.<br><br>Differentiated Services processing of IP packets with *CosPolicyGroup* components is based on a Class Of Service (CoS) value assigned to each IP packet as it processed by the *VirtualRouter*. CoS values vary over the range from 0 to 3 and have local significance only.<br><br>At any time the total number of interface profiles (*CosPolicyGroup*, *DifferentiatedServicesInterface*, and *Filter* components) in the current view plus the total number of newly created interface profiles in the edit view must be less than the system limit, regardless how many interface profiles have been |

deleted in the edit view. Any interface profile created in the edit view that results in a total count greater than the system limit is identified as invalid and must be deleted; otherwise a *Check Prov* command will produce an error. If invalid interface profiles exist after a software migration prior to a *Check Prov* command, then those interface profiles are ignored and have no impact on IP forwarding. However, a subsequent *Check Prov* command fails until the invalid interface profiles are deleted. It is recommended that all interface profile deletions be activated using the *Activate Prov* command before any new interface profiles are created.

There are seven logical stages in CoS processing on the *VirtualRouter.* These seven stages are presented below, along with the behavior of locally generated packets, and the behavior of any *IpPort* that does not use a *CosPolicyGroup*.

1. INGRESS CLASSIFICATION AND CoS ASSIGNMENT

The Class Of Service (CoS) value assigned to an IP packet is initialized to be equal to the IP CoS value associated with the ingress link layer connection where the packet was received.

For *AtmMpe*, the CoS of a connection is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte*, the CoS of a connection is specified by the *ipCoS* attribute of the *StaticDlci* or *DynamicDlciDef* subcomponent. For *IpDlciGroup*, the CoS of a connection is specified by the *ipCos* attribute of the *FrConnection* subcomponent. For all other media, the CoS of a connection is specified by the *ipCoS* attribute of the *IpPort.*

After classification is performed as described above, if one or more *TosMap* components exist under a *Policy* subcomponent of the *CosPolicyGroup* used by the *IpPort* where the packet was received, then the Class Of Service (CoS) assigned to the packet is updated according to these components if there is a match. A match occurs if selected bits of the Differentiated Services (DS) field, also known at the Type of Service (ToS) field, are equal to the same selected bits of one of the values specified by the *tos* attribute of a *TosMap* subcomponent of the *CosPolicyGroup* used by the *IpPort* where the packet was received. If a match occurs,

then the CoS value assigned to the packet is set equal to the value of the *assignedCos* attribute of the parent *Policy* of the *TosMap* where the match occurred. This overrides any prior CoS assignment.

If one or more *IpAddrLayer4Flow* subcomponents exist under a *Policy* subcomponent of the *CosPolicyGroup* used by the *IpPort* where the packet was received, then the Class Of Service (CoS) assigned to the packet is updated according to these components if there is a match.

The Class Of Service (CoS) assigned to a packet received on a Gigabit Ethernet interface is always 0. Packets are not assigned a Class Of Service (CoS) when the *VirtualRouter* has a *DifferentiatedServicesDomain* subcomponent.

2. DROP PRECEDENCE ASSIGNMENT

The packet is assigned a logical drop precedence value according to the *IngressCosTreatment* subcomponents of the *CosPolicyGroup* used by the *IpPort* where the packet was received. The drop precedence is obtained from *discardPriority* attribute of the *IngressCosTreatment* component whose instance value matches the Class Of Service (CoS) value currently assigned to the packet. If the selected *IngressCosTreatment discardPriority* attribute specifies ***low***, ***medium***, or ***high***, then a drop precedence is assigned accordingly. If the selected *IngressCosTreatment* specifies ***unchanged***, then the drop precedence assigned to the packet is not modified. It remains at the value provided by the ingress link.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue, as explained in Step 7.

Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The high ***value*** indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the

dropping mechanism at the queue.

The drop precedence assigned to a packet received on a Gigabit Ethernet interface is always ***high*** when the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent.

3. SCHEDULING CLASS ASSIGNMENT

The packet is assigned a scheduling class value for eight, four, three, and two queues in the range from 0 to 7, 0 to 3, 0 to 2, and 0 to 1, respectively. These values are derived from the *emissionPriority* attribute of the *EgressCosTreatment* subcomponents of the *CosPolicyGroup* used by the *IpPort* where the packet is transmitted. The *emissionPriority* attribute of the *EgressCosTreatment* subcomponent whose instance value matches the Class Of Service (CoS) value assigned to the packet is used.

The *emissionPriority* attribute of the *EgressCosTreatment* component is mapped to scheduling classes according to the following table:

| *Emission Priority* | Scheduling Class 8 Queues | 4Queues | 3Queues | 2 Queues |
|---|---|---|---|---|
| ***1*** | 5 | 3 | 2 | 1 |
| ***2*** | 4 | 2 | 1 | 0 |
| ***3*** | 2 | 1 | 0 | 0 |
| ***4*** | 0 | 0 | 0 | 0 |
| ***5*** | 0 | 0 | 0 | 0 |
| ***6*** | 0 | 0 | 0 | 0 |
| ***7*** | 0 | 0 | 0 | 0 |
| ***8*** | 0 | 0 | 0 | 0 |

Scheduling classes are assigned to a packet to control its scheduling behavior relative to other packets at the egress interface where the packets are transmitted, as explained in Step 7.

Generally, a numerically lower value indicates the packet is less

likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically higher value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism and number of queues at the egress interface.

The sheduling class for eight, four, three, and two queues assigned to a packet received on a Gigabit Ethernet interface is always 0 when the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent.

4. CONNECTION CLASS ASSIGNMENT

The packet is assigned an connection class value in the range from ***0*** to ***3*** that is equal to the Class of Service (CoS) value assigned to the packet in Step 1.

A connection class value is assigned to a packet to select one of up to four egress link layer connections for transmitting the packet as described in Step 6.

5. EGRESS CLASSIFICATION AND MARKING

The DSCP field of the packet is marked according to the *EgressCosTreatment* subcomponents of the *CosPolicyGroup* used by the *IpPort* where the packet is transmitted. The DSCP value is obtained from *tos* attribute of the *EgressCosTreatment* component whose instance value matches the Class Of Service (CoS) value currently assigned to the packet. The new value of the DSCP field does not influence the forwarding behavior of the packet as it continues to be processed by the *VirtualRouter*, but it may have significance at the next hop.

Egress classification and marking does not occur if packets are packet received on a Gigabit Ethernet interface.

6. MULTI-LINK CONGESTION CONTROL

The connection class assigned to the packet is used to select one of up to four link layer connections at the *IpPort* where the packet is transmitted. Per-packet selection of egress connections is supported only if these conditions are all true:

i) the egress media is *FrDte*, *AtmMpe*, *IpDlciGroup* or *IpoDlci*, and
ii) more than one link layer connection is configured to the next hop IP router, and
iii) each connection is provisioned with a different connection class.

Normally the packet is transmitted on the connection whose connection class is equal to the connection class assigned to the packet. If that link does not exist, then the link having the next lower connection class is used. If that link does not exist also, then the link having the next higher connection class is used.

For *AtmMpe* the connection class is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte* the connection class is specified by the *ipCoS* attribute of the *StaticDlci* and *DynamicDlciDef* subcomponents. For *IpDlciGroup* and *IpoDlci* the connection class is specified by the *ipCos* attribute of the *FrConnection* subcomponent.

If each link layer connection is configured to provide different policing and scheduling characteristics, then the forwarding behaviors of IP packets are differentiated as they transit through the link layer network. In general, the scheduling characteristics of the connections should be configured to be better for numerically greater conection class values. For example, if four *AtmConnection* components are associated with *AtmIf* components configured for ATM service classes ***UBR***, ***nrtVBR***, ***rtVBR***, and ***CBR***, then the *ipCos* attributes of the *AtmConnection* components should be either ***0***, ***1***, ***2*** and ***3***, respectively, or ***0***, ***1***, ***3*** and ***2*** respectively.

## 6. PER-LINK CONGESTION CONTROL

The drop precedence and scheduling classes assigned to the

packet are used by the egress interface where the packet is transmitted, but only if the egress interface supports these parameters on a per-link basis.

Multiple drop precedences are supported on MS3-based FPs at Gigabit Ethernet interfaces. On PQC-based FPs they are supported at *AtmMpe*, *FrDte*, *IpDlciGroup*, and Ethernet interfaces. On CQC-based FPs they are supported at *AtmMpe* interfaces. On SBIC-based FPs they are supported at PPP and *FrDte* interfaces.

Eight queues per link are supported on MS3-based FPs at Gigabit Ethernet interfaces. Four queues per link are supported on PQC-based FPs at PPP interfaces, at *FrDte* interfaces provisioned with *DirectConnection*, and at *IpDlciGroup* interfaces where FRF.12 is disabled on the DLCI. Two queues per link are supported on SBIC-based FPs at PPP and *FrDte* interfaces.

## LOCALLY GENERATED PACKETS

Ingress classification is not performed on packets generated locally at the *VirtualRouter*. For a locally generated packet that used for network control the assigned Class Of Service (CoS) value and the assigned drop precedence, is initialized to ***3*** and ***low*** respectively. For any other locally generated packet, these values are initialized to ***0*** and ***medium*** respectively.

For a locally generated ICMP echo request packet, the assigned CoS is overridden by the *-cos* option of the *Ping* command. For a locally generated ICMP echo reply packet, the assigned CoS is set equal to the assigned CoS of the received request packet.

The DSCP field of locally generated packets that used for network control is always initialized to 48. The DSCP field of other packets is always initialized to 0. For a locally generated ICMP echo request packet, the initial value of the DSCP field is overridden by the *-tos* or *-dscp* option of the *Ping* command. For a locally generated ICMP echo reply packet, the DSCP field is set to the value contained in the IP header of the received request packet.

Locally generated IP multicast and IP broadcast packets are not subject to Multi-Link Congestion Control as described above. Each of these packets is copied and transmitted individually on each of the available connections.

DEFAULT BEHAVIOR

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then the Differentiated Services behavior of any *IpPort* that does not use a *CosPolicyGroup* (by setting the *cosPolicyAssignment* attribute of the *Ip* or *IpPort* as explained above) is identical to an *IpPort* that uses the *CosPolicyGroup* described here: There are no *Policy* subcomponents. There are four *IngressCosTreatment* subcomponents with instance values ***0***, ***1***, ***2***, ***3*** where the *discardPriority* attribute of each instance is set to ***unchanged***. There are four *EgressCosTreatment* subcomponents with instance values ***0***, ***1***, ***2***, ***3*** where the *emissionPriority*, *setTosByte*, *tos*, and *tosMask* attributes of each instance are set to ***4***, ***no***, ***0***, and hexadecimal ***FC***, respectively.

If the *VirtualRouter* has a *DifferentiatedServicesDomain* subcomponent, then the Differentiated Services behavior of the *IpPort* components are controlled by *Vr Ip DifferentiatedServices* components. See the description of the *DifferentiatedServices* component for more information.

## ATTRIBUTE Vr Ip Pg Policy assignedCos (cos)

Access Read and write

Description This attribute specifies the Class of Service (CoS) assigned to an IP packet if the *Policy* applies. The assigned CoS controls the forwarding behavior and egress DSCP marking of the packet. See the description of the *CosPolicyGroup* component for more information.

Values Decimal (0..3)

Default 0

## COMPONENT Vr Ip Pg Policy TosMap

Groups "GROUP Vr Ip Pg Policy TosMap Provisioned (Prov)"
"GROUP Vr Ip Pg Policy TosMap Operational (Oper)"

Scope Application

Description

*Vr/<string> Ip Pg/<string> Policy/<string> TosMap*

This component is used to specify Behavior Aggregate (BA) criteria for assigning Class of Service (CoS) values to IP packets.

An IP packet matches the criteria specified by this component if the Differentiated Services (DS) field in the packet header (also known as the ToS field) and any element in the list of values specified by the *tos* attribute of this component satisfies the following equation:

( DS field & *tosMask* ) = ( element & *tosMask* )

This formula states that the two values must be identical after each one is individually bit-wise ANDed with the value of *tosMask* attribute of the *EgressCosTreatment* component. In other words, the two values must be identical but only those bits that are set to 1 in the *tosMask* are inspected.

For example, to assign Class of Service (CoS) value 3 to IP packets that have the DSCP field marked for Expedited Forwarding (EF) when the *tosMask* is set to ***FC***, a *TosMap* subcomponent is added to the *Policy* component whose *assignedCos* attribute is set to ***3***, and the *tos* attribute of the *TosMap* is set to include hexadecimal value ***B8***.

See the description of the *CosPolicyGroup* component for more information.

| | |
|---|---|
| Instance | Decimal (0..1023) |
| Groups | "GROUP Vr Ip Pg Policy IpAddrLayer4Flow Provisioned (Prov)"<br>"GROUP Vr Ip Pg Policy IpAddrLayer4Flow ProtoProvisioned"<br>"GROUP Vr Ip Pg Policy IpAddrLayer4Flow Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Pg/<string> Policy/<string> IpAddrLayer4Flow/n* |

The *IpAddrLayer4Flow* component is used to specify Multifield (MF) criteria for assigning Class of Service (CoS) values to IP packets.

If one or more *IpAddrLayer4Flow* components exist under the *CosPolicyGroup* component, then the IP packet is checked to see if it matches the criteria specified by each *IpAddrLayer4Flow* component. The CoS assigned to the packet is the value of the *assignedCos* attribute on the parent *Policy* component of the *IpAddrLayer4Flow* whose criteria best match the packet.

For example, to assign Class of Service (CoS) value 1 to FTP packets destined to subnet 123.123.123.0, an *IpAddrLayer4Flow* subcomponent is added to the *Policy* component where the *assignedCos* attribute is set to ***1***. The *prefix, prefixLength, protocol*, and *portNumberRange* attributes of the *IpAddrLayer4Flow* component are set to ***123.123.123.0***, ***24***, ***tcp***, and ***20***, ***21***, respectively. This criteria also applies to each FTP packet that originates from subnet 123.123.123.0, but only if the source address and port number of the packet do not match any *IpAddrLayer4Flow* subcomponents of the *CosPolicyGroup*.

Multifield classification overrides Behavior Aggregate (BA) classification. This means that BA classification, which is controlled by *TosMap* components, is performed only if the packet does not match any *IpAddrLayer4Flow* component.

The packet matching algorithm for MF classification is explained in more detail as follows.

A match can be found only if the IP header protocol field is one of ICMP, TCP, or UDP. The *prefix, prefixLength*, and *portNumberRange* attributes are checked only if the protocol field in the header is TCP or UDP.

The destination IP address and destination port number information from the packet is first compared against the *prefix* attribute in conjunction with the *prefixLength* and *portNumberRange* attributes. If the *prefixLength* is ***0*** and the *prefix* is ***0.0.0.0***, then any value in the packet's IP destination

address fields is a match. If *portNumberRange* is ***0***, then any value in the packet's destination port number fields is a match.

If more than one *IpAddrLayer4Flow* component matches a packet (for instance one component specifies a range of IP addresses and a second specifies a single IP address in the range), then the component with the more precise match is used (the one which specifies the single address in this case). Precedence is always given to the IP address over the port number. For example, if one *IpAddrLayer4Flow* component specifies an range of IP addresses that includes the IP address from the packet and any port number, while a second *IpAddrLayer4Flow* component specifies an exact port number but a wider range of addresses, the first *IpAddrLayer4Flow* component is used.

If no match is found using the packet's destination IP address and destination port number information, then a second search is performed using the packet's source IP address and source port number information. This means that an *IpAddrLayer4Flow* component where the *protocol* is ***udp*** or ***tcp***, the *prefixLength* is ***0*** and the *portNumberRange* is ***0***, always matches some destination address and port number. This prevents the source address and port number check from being performed.

An ICMP packet matches any *IpAddrLayer4Flow* component whose *protocol* attribute is set to ***icmp***.

No attempt is made to match any packets where the options or fragment bits are set.

See the description of the *CosPolicyGroup* component for more information.

| Access | Read and write |
| Description | This attribute specifies the IP address prefix for selecting IP packets.<br><br>Matching an IP address to the prefix is done in conjunction with the *prefixLength* attribute. If the value is ***0.0.0.0***, then the *prefixLength* attribute must be ***0***.<br><br>See the description of the *IpAddrLayer4Flow* component for more information. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Pg Policy IpAddrLayer4Flow prefixLength (len)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of most significant bits of an IP address to be matched with the *prefix* for selecting IP packets.<br><br>The *prefixLength* value ***0*** indicates any IP address.<br><br>See the description of the *IpAddrLayer4Flow* component for more information. |
| Values | Decimal (0..32) |
| Default | 0 |

### GROUP Vr Ip Pg Policy IpAddrLayer4Flow ProtoProvisioned

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the *protocol* and *portNumberRange* provisioned attributes of the *IpAddrLayer4Flow* component. |

### ATTRIBUTE Vr Ip Pg Policy IpAddrLayer4Flow protocol (proto)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the layer 4 (transport) protocol for selecting IP packets.<br><br>If the value is ***icmp***, then the *prefixLength* attribute must be ***0***, and the *portNumberRange* attribute must not be set.<br><br>See the description of the *IpAddrLayer4Flow* component for more information. |
| Values | icmp<br>tcp<br>udp |
| Default | tcp |

### ATTRIBUTE Vr Ip Pg Policy IpAddrLayer4Flow portNumberRange

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the TCP or UDP port numbers for selecting IP packets.<br><br>A single value specifies a single port number. Two values specifies a range of port numbers. The order of the two values is irrelevant.<br><br>See the description of the *IpAddrLayer4Flow* component for more information. |
| List of | Decimal (0..65535) |
| List Size | 2 |
| Default | No default |

### GROUP Vr Ip Pg Policy IpAddrLayer4Flow Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational attributes of the *TosMap* and the *IpAddrLayer4Flow* components. |

### ATTRIBUTE Vr Ip Pg Policy IpAddrLayer4Flow COS

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Class of Service (CoS) assigned to a packet when the *Policy* applies. The value of this attribute is equal to the *assignedCos* attribute of the *Policy* component. |
| Values | Decimal (0..3) |
| Default | No default |

### COMPONENT Vr Ip Pg IngressCosTreatment (Ict)

| | |
|---|---|
| Instance | Decimal (0..3) |
| Groups | "GROUP Vr Ip Pg Ict Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Pg/<string> IngressCosTreatment/n*<br><br>A set of *IngressCosTreatment* components specifies a mapping between Class of Service (CoS) values and drop precedence values for controlling forwarding behaviors. This mapping is applied to packets received at any *IpPort* that uses the *CosPolicyGroup*. See the description of the *CosPolicyGroup* for more information.<br><br>Four instances of this component, with instance values *0*, *1*, *2*, and *3*, are created automatically when the *CosPolicyGroup* component is added. |
| Common Verbs | Help<br>List<br>Display<br>Add |

### GROUP Vr Ip Pg Ict Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

Description — This group contains the provisioned attributes of the *IngressCosTreatment* component.

### ATTRIBUTE Vr Ip Pg Ict discardPriority (dp)

Access — Read and write

Description — This attribute specifies the drop precedence assigned to an IP packet when the Class of Service (CoS) assigned to the packet is equal to the instance value of the *IngressCosTreatment* component.

Attribute values ***low***, ***medium***, and ***high*** indicate the packet is assigned drop precedence accordingly. A value of ***unchanged*** indicates the drop precedence assigned to the packet is not modified. It remains at the value provided by the ingress link.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue.

Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The ***high*** value indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the dropping mechanism at the queue.

A warning is issued if the *discardPriority* attribute of one or more, but not all, of the *IngressCosTreatment* subcomponents the *CosPolicyGroup* is set to ***unchanged***.

Another warning is issued if the *discardPriority* attribute of two *IngressCosTreatment* subcomponents with the same instance value under any two *CosPolicyGroup* subcomponents of the *Vr Ip* are not equal. This applies only to those *IngressCosTreatment* subcomponents where the *discardPriority* attribute is not set to ***unchanged***. If this rule is violated, then the Class of Service (CoS) to drop precedence mapping will not be consistent at all *IpPorts* on the *Vr.*

See the description of the *CosPolicyGroup* for more information.

Values
unchanged
low
medium
high

Default
unchanged

## COMPONENT Vr Ip Pg EgressCosTreatment (Ect)

Instance
Decimal (0..3)

Groups
"GROUP Vr Ip Pg Ect Provisioned (Prov)"

Scope
Application

Description
*Vr/<string> Ip Pg/<string> EgressCosTreatment/n*

A set of *EgressCosTreatment* components specifies two mappings. One is a mapping between Class of Service (CoS) values and logical scheduling class values for controlling forwarding behaviors. The other is a mapping between Class of Service (CoS) values and Differentiated Services Code Point (DSCP) values for egress marking. These mappings are applied to packets transmitted at any *IpPort* that uses the parent *CosPolicyGroup*. See the description of the *CosPolicyGroup* for more information.

Four instances of this component, with instance values *0*, *1*, *2*, and *3*, are created automatically when the *CosPolicyGroup* component is added.

## GROUP Vr Ip Pg Ect Provisioned (Prov)

Properties
Provisioned

Description — This group contains the provisioned attributes of the *EgressCosTreatment* component.

### ATTRIBUTE Vr Ip Pg Ect setTosByte

Access — Read and write

Description — This attribute specifies whether the DSCP field of the packet should be marked at egress. If this attribute is set to ***yes*** and then the DSCP field is marked according to the values of the *tos* and *tosMask* attributes of the *EgressCosTreatment* component whose instance value is equal to the Class of Service (CoS) assigned to the packet.

All *EgressCosTreatment* subcomponents of the *CosPolicyGroup* should have this attribute set to the same value; otherwise, a warning is issued.

Values — no
yes

Default — no

### ATTRIBUTE Vr Ip Pg Ect tos

Access — Read and write

Description — This attribute specifies the value used to mark the DSCP field of an IP packet at egress. This marking occurs only if the Class of Service (CoS) assigned to the packet is equal to the instance value of the *EgressCosTreatment* component and the *setTosByte* attribute is set to ***yes***.

Selected bits of the Differentiated Services (DS) field in IP packet header (also known as the ToS field) are updated according to the values of the *tos* and *tosMask* attributes using the following formula:

New value = ( Original value & ~*tosMask* ) | ( *tos* & *tosMask* )

This formula states that the bits of the DS field which are modified are only those which are set to 1 in the *tosMask* attribute value. Of those bits, the bits that are set to 1 are only those which are set to 1 in the *tos* attribute value; the others being modified

are set to 0.

For example, to mark the DSCP field for Expedited Forwarding (EF):

original value: hex A0 ( binary 10100000 ) CS5
*tos* attribute: hex B8 ( binary 10111000 )
*tosMask* attribute: hex FC ( binary 11111100 )
new value: hex B8 ( binary 10111000 ) EF

Values: Hex (H.0..H.ff)

Default: H.0

### ATTRIBUTE Vr Ip Pg Ect tosMask

Access: Read and write

Description: This attribute specifies the bit mask used to mark the DSCP field of an IP packet. This marking occurs only if the Class of Service (CoS) assigned to the packet is equal to the instance value of the *EgressCosTreatment* component and the *setTosByte* attribute is set to ***yes***. This attribute also specifies which bits are examined when *TosMap* components are used for IP packet classification.

By default, this attribute is set to the value of hex ***FC*** to correspond to the six bits of the Differentiated Services Code Point (DSCP) field.

The *tosMask* attribute in all *EgressCosTreatment* components under the same *CosPolicyGroup* must be set to the same value.

A warning is issued if *tosMask* is set to any value other than ***0xFC.*** On PQC-based FPs, any other value is ignored; in other words, any setting is treated as ***0xFC*** to match the six bits of DSCP field in the IP header. On SBIC-based FP's, including the ILS forwarder, ToS field mapping and marking of IP packets will not exactly match the six bits of the DSCP field.

See the description of the *tos* attribute of the *EgressCosTreatment* component for more information.

Values: Hex (H.1..H.ff)

Default H.fc

### ATTRIBUTE Vr Ip Pg Ect emissionPriority (ep)

Access Read and write

Description This attribute specifies the logical scheduling classes to be assigned to an IP packet when the Class of Service (CoS) assigned to the packet is equal to the instance value of the *IngressCosTreatment* component.

The *emissionPriority* attribute is mapped to scheduling classes according to the following table:

| *Emission Priority* | Logical Scheduling Class 8 Queues | 4Queues 3 | 2 Queues |
|---|---|---|---|
| ***1*** | 5 | 3 | 1 |
| ***2*** | 4 | 2 | 0 |
| ***3*** | 2 | 1 | 0 |
| ***4*** | 0 | 0 | 0 |
| ***5*** | 0 | 0 | 0 |
| ***6*** | 0 | 0 | 0 |
| ***7*** | 0 | 0 | 0 |
| ***8*** | 0 | 0 | 0 |

Scheduling classes are assigned to a packet to control its scheduling behavior relative to other packets at the egress interface where the packets are transmitted.

Generally, a numerically lower value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically higher value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism and number of queues at the egress interface.

A warning is issued if the *emissionPriority* attribute of two *EgressCosTreatment* subcomponents with the same instance value under any two *CosPolicyGroup* subcomponents of the *Vr*

*Ip* are not equal. If this rule is violated, then the Class of Service (CoS) to *emissionPriority* mapping will not be consistent at all *IpPorts* on the *Vr*.

See the description of the *CosPolicyGroup* for more information.

## GROUP Vr Ip Bgp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Bgp* component. |

## ATTRIBUTE Vr Ip Bgp bgpIdentifier

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *Bgp* Identifier of this *Bgp* component instance. It is picked from the IP address space, and should follow the same rule as choosing an unique IP address for *IpPort* or *Interface*. |
| Values | IP address |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Bgp localAs

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the autonomous system identifier for this *Bgp* component instance. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp defaultLocalPreference (locPrf)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies this *Bgp* component instance's default degree of preference for routes. It can be overridden by the *localPreference* provisioned in *ImportPolicy.* A higher value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | 144 |

### ATTRIBUTE Vr Ip Bgp defaultMultiExitDisc (med)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies this *Bgp* component instance's default metric to discriminate between multiple exit points to the same adjacent autonomous system. It can be overridden by the s*endMultiExitDiscToEbgp* provisioned in *ExportPolicy.* A lower value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | 4294967294 |

### ATTRIBUTE Vr Ip Bgp routeThrottleLimit (rtl)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum number of routes in the IP forwarding table this *Bgp* component instance will process at one time to decide if a route in the IP forwarding table should be exported to a peer. This limit is used for the throttling and is made configurable because the throttling requirements will be different under different network configurations. The default value is 250. |
| Values | Decimal (1..1000) |
| Default | 250 |

### ATTRIBUTE Vr Ip Bgp routeThrottleInter (rti)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the interval in seconds, between the processing of the routes in the IP forwarding table to decide if a route in the IP forwarding table should be exported to a peer. This interval is used for the throttling and is made configurable because the throttling requirements will be different under different network configurations. The default value is 5 seconds. |
| Values | Decimal (1..30) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Vr Ip Bgp routeReflector (rr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies whether this *Bgp* instance is a Route Reflector. If the value of this attribute is ***true***, *Bgp* redistributes routes it learns from an IBGP speaker to other IBGP speakers in the AS. The rule of redistribution depends on the peer type: 1) When a route is learned from a non-client peer, it is redistributed to all the client peers within the cluster. 2) When a route is learned from a client peer, it is redistributed to all the non-client peers and also to the client peers. If the value of this attribute is ***false***, *Bgp* does not redistribute routes it learns from one IBGP speaker to other IBGP speakers in the AS. |
| Values | true<br>false |
| Default | false |

### ATTRIBUTE Vr Ip Bgp routeReflectorCluster (rrCluster)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute identifies the cluster consisting of the Route Reflector and its peer clients. When *routeReflector* of *Bgp* is ***true***, value of 0.0.0.0 or 255.255.255.255 is invalid; the default value of this attribute is same as *bgpIdentifier*. For redundancy, a cluster may have more than one Route Reflector; in this case, the value of this attribute of all the Route Reflectors in the same cluster should be same. The value of this attribute is ignored when *routeReflector* of *Bgp* is ***false*** |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp redistributeIgpToIbgp (rigp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether this *Bgp* instance allows exporting of IGP routes to internal Bgp peers. IGP routes include the routes learned from OSPF, RIP, local routes and static routes. If the value of this attribute is ***true***, and if *ExportPolicy* is specified to distribute, then *Bgp* allows IGP route to be |

distributed to internal Bgp peers. If the value of this attribute is ***false***, *Bgp* does not allow IGP routes to be distributed to internal *Bgp* peer, even if *ExportPolicy* is specified to distribute. This attribute is set to true if and only this Bgp is part of the Carrier Manage Service, otherwise, a routing loop may result.

Values: true
false

Default: false

### ATTRIBUTE Vr Ip Bgp defaultIbgpRtePreference (ibgpPref)

Access: Read and write

Description: This attribute specifies this *Bgp* component instance's default routing preference for IBGP routes. It can be overridden by the *IbgpRtePreference* provisioned in *ImportPolicy.* A lower value indicates a more preferred route.

Values: Decimal (1..253)

Default: 122

### ATTRIBUTE Vr Ip Bgp defaultEbgpRtePreference (ebgpPrf)

Access: Read and write

Description: This attribute specifies this *Bgp* component instance's default routing preference for EBGP routes. It can be overridden by the *ebgpRtePreference* provisioned in *ImportPolicy.* A lower value indicates a more preferred route.

Values: Decimal (1..253)

Default: 70

### ATTRIBUTE Vr Ip Bgp vpnPeeringTopology (topology)

Access: Read and write

Description: Under the *Vr* component, this attribute specifies the peering mode that determines if a dynamic IBGP peer is to be instantiated between this *BGP* instance and a discovered IP Tunnel endpoint on the remote customer VR. This mode controls the distribution of IP routing information among VPN sites through dynamic

BGP sessions after auto-discovery has taken place.

A ***none*** value specifies that BGP never instantiate dynamic IBGP peers.
Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value.

In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute.

Under the *Rtr* or *Rtr Vrf* component, this attribute is not used.

Values
none
hub
spoke

Default
No default

### ATTRIBUTE Vr Ip Bgp alarmGeneration (alarms)

Access
Read and write

Description
This attribute specifies the level of alarm generation for this *Bgp* instance.

A value of ***all*** specifies that all BGP alarms are made visible.

A value of ***normal*** specifies that all BGP alarms are made visible, except for the following:
- *Bgp Peer* listening failure alarms,
- *Bgp Peer* connect failure alarms, and
- *Bgp* notification alarms.

Any listening failure or connect failure alarms which were previously set for a *Peer* component under this *Bgp* instance are cleared.

A value of ***none*** specifies that no BGP alarms are made visible. Any listening failure, connect failure, or “no auto discovery” alarms which were previously set for a *Peer* component under this *Bgp* instance are cleared.

Note that, because the listening failure, connect failure, and “no auto discovery” alarms are triggered by state changes in the *Peer* component, they are not automatically regenerated when previously disabled alarm generation is enabled. For example, consider the following:
- If the *Bgp alarmGeneration* attribute is set to ***all*** and a *Peer* enters a listening failure state, a listening failure alarm is set against that *Peer* subcomponent.
- If the *Bgp alarmGeneration* attribute is then set to ***normal*** or ***none***, the above listening failure alarm is cleared.
- If the *Bgp alarmGeneration* attribute is then set back to ***all***, no alarm is generated because the *Peer* subcomponent has not changed state.
- If the *Peer* then exits the listening failure state, a listening failure alarm clear is generated for the *Peer*, even though there is no alarm set for that component.

When the scope of alarm generation has been increased for a *Bgp* instance, previously existing alarms which had been suppressed can be regenerated by locking and unlocking the *Bgp Peer* subcomponents.

For a *VirtualRouter* with *vpnMode* attribute be set to ***carrier***, it is recommanded that the *alarmGeneration* attribute set to ***all***. For a *VirtualRouter* with the *vpnMode* attribute set to ***customer***, it is recommanded that the *alarmGeneration* attribute set to either ***normal*** or ***none***, for scalability reasons.

Similarly, for a *Router* component, it is recommanded that the *alarmGeneration* attribute set to ***all***. For a *Router Vrf* component, it is recommanded that the *alarmGeneration* attribute set to either ***normal*** or ***none***, for scalability reasons.

| | |
|---|---|
| Values | none<br>normal<br>all |
| Default | all |

### GROUP Vr Ip Bgp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Bgp* component. |

### ATTRIBUTE Vr Ip Bgp tableVersion

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the version of the BGP routing table. It is incremented every time the BGP routing table changes. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp inMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BGP messages received without error. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp inErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BGP messages received from all peers that proved to be in error. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp inErrorMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BGP NOTIFICATION messages from all the peers. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp outMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of BGP messages sent to peers. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp outDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BGP messages that were locally generated but were not sent out due to resource limitations within a *Bgp* instance. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp outErrorMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the BGP NOTIFICATION messages sent to the peers. This counter will wrap to zero once the value exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp indbSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of *Bgp* indb entries under this *Bgp* component instance. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Vr Ip Bgp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Ip Bgp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Ip Bgp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Bgp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Bgp AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Ip Bgp snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ip Bgp OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Ip Bgp snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

## COMPONENT Vr Ip Bgp Peer

| | |

## GROUP Vr Ip Bgp Peer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state |

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Ip Bgp Peer adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vr Ip Bgp Peer operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Bgp Peer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Ip Bgp Peer Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes for the *Peer* component.

### ATTRIBUTE Vr Ip Bgp Peer connectionState

Access
Read only

Description
This attribute indicates the current state of this BGP peer connection. The meaning of each state is as follows:
***idle*** - it is the initial state of the BGP peer connection. Error events will also cause BGP peer connection to transit to the idle state.

***connect*** - BGP has initiated a TCP connection request to this peer, and waiting for reply from that peer.
***active*** - BGP is not initiating a TCP connection request to this peer, because TCP connection failed and is waiting for connection retry time-out.
***openSent*** - a TCP connection to this peer has been established, but the OPEN message has not been successfully exchanged.
***openConfirm*** - OPEN message has been successfully exchanged with this peer, but the first KEEPALIVE message has not been received from that peer.
***established*** - the first KEEPALIVE message has been received from this peer, which means this BGP peer connection has been established.
See RFC 1771 for a detailed description of BGP state transitions.

Values
idle
connect
active
openSent
openConfirm
established

Default
idle

## ATTRIBUTE Vr Ip Bgp Peer bgpIdentifier (bgpId)

Access
Read only

Description
This attribute indicates the BGP Identifier of this *Bgp Peer* component. It is learned from the peer through the OPEN message.

Values
IP address

Default
No default

## ATTRIBUTE Vr Ip Bgp Peer versionNegotiated (vn)

Access
Read only

Description
This attribute indicates the BGP version number negotiated with this peer through the OPEN message. Currently, only BGP version 4 is supported. BGP will reject the peer connection if our peer proposes a BGP version other than 4.

| | |
|---|---|
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer holdTimeNegotiated (htn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum time in seconds, that may elapse without receiving a KEEPALIVE or UPDATE message before the connection is considered down. This is the negotiated value with peer through the OPEN message. The hold time must be<br>either zero or at least three seconds. If the negotiated hold time is zero, then periodic KEEPALIVE messages are not expected from the peer. |
| Values | Decimal (0; 3..65535) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer keepAliveNegotiated (kan)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the interval in seconds, between BGP KEEPALIVE message retransmissions. This keepalive interval will have the same ratio to the hold time negotiated with the peer as that of the locally configured keepalive and hold time. This attribute will be zero if the *holdTimeNegotiated* attribute is zero, which means periodic KEEPALIVE messages will not be sent. |
| Values | Decimal (0..21845) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer localAddressUsed (lau)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the local IP address used for this BGP peer connection. If the *localAddressConfigured* attribute is non-zero, its value will be used. Otherwise, the local address will be |

| | |
|---|---|
| | assigned by TCP based on the remote IP address of this peer connection and the IP forwarding table. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer localPort

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the local TCP port for the connection between the BGP peers. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer remotePort

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remote TCP port for the connection between the BGP peers. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer lastError

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last error code and subcode seen by this *Bgp* component instance on this peer connection. The first byte of this two byte OCTET STRING contains the error code, and the second byte contains the subcode. A value of zero means that no error has occurred. Check RFC 1771 for mappings of error codes and error subcodes. |
| Values | String (2, Hex) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer connectionEstablishedTime (ceTime)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates how long since this *Peer* component's last transition to or from the ***established*** state. It is set to zero when the *Peer* component is activated. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer connectionEstablishedTransitions (ceTrans)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of times the BGP connection state transitioned into the ***established*** state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer inUpdateElapsedTime (iuet)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the elapsed time in seconds since the last BGP UPDATE message was received from the peer. Each time *inUpdates* attribute is incremented, the value of this attribute is set to zero. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer inMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BGP messages received without error from the BGP peer. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer inUpdates

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BGP UPDATE messages received on this peer connection. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer inErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of messages received from this BGP peer that proved to be in error. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer inErrorMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BGP NOTIFICATION messages received from this BGP peer. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer outMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of locally generated BGP messages sent to this BGP peer. It does not include discarded messages. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer outUpdates

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BGP UPDATE messages sent to this peer. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer outDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of locally generated BGP messages not sent to this BGP peer due to resource limitations within a BGP entity. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer outErrorMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of BGP NOTIFICATION messages sent to this BGP peer. This counter will wrap to zero once the value exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer inRoutes

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of routes received from this BGP peer. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Ip Bgp Peer peerType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the way this peer is created. Peer is **static,** if created through provisioning or **dynamic,** if created through IP VPN auto discovery.<br><br>For *Router* and *Vrf*, all peers are statically created. So, this value will always be ***static***. |
| Values | static<br>dynamic |
| Default | No default |

## ATTRIBUTE Vr Ip Bgp Peer addressFamilyNegotiated (afn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute indicates the list of multiprotocol extensions negotiated on this peer session. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI).<br><br>To perform IP VPN auto discovery in a VPN, the value of ***ipv4Vpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.<br><br>To perform IP VPN multi-protocol BGP route distribution in a VPN, the value of ***mbgpVpn*** and ***ipv4Vpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.<br><br>To perform RFC 2547 VPN route distribution in a VPN using multi-protocol BGP extensions, the value of ***ipv4MplsVpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.<br><br>***ipv4Unicast*** represents AFI = 1 and SAFI = 1<br>***ipv4Vpn*** represents AFI = 1 and SAFI = 140 (not for RFC 2547)<br>***mbgpVpn*** represents AFI = 1 and SAFI = 141 (not for RFC |

| | |
|---|---|
| | 2547)<br>***ipv4MplsVpn*** represents AFI = 1 and SAFI = 128 |
| List of | ipv4Unicast<br>ipv4Vpn<br>mbgpVpn<br>ipv4MplsVpn |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer capabilityNegotiated (cn)

| | |
|---|---|
| Access | Read only |
| Description | The attribute indicates the list of capabilities negotiated on this peer session. |
| List of | mpExtensions<br>routeRefresh |
| Default | No default |

### COMPONENT Vr Ip Bgp Peer Descriptor (Desc)

| | |
|---|---|
| Groups | "GROUP Vr Ip Bgp Peer Desc Provisioned (Prov)" |
| Scope | Network |
| Description | *Vr/<string> Ip Bgp Peer/<Ip Address> Desc*<br>*Rtr/<string> Bgp Peer/<Ip Address> Desc*<br>*Rtr/<string> Vrf/<string> Bgp Peer/<Ip Address> Desc*<br>This component contains provisioned attributes for BGP peers. Provisioned attributes are only used when the peer is a statically provisioned peer. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Ip Bgp Peer Desc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisional attributes for this BGP *Peer* component |

### ATTRIBUTE Vr Ip Bgp Peer Desc peerAs

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the autonomous system identifier of this BGP *Peer* component. It is used to verify the autonomous system identifier learned from the peer through the OPEN message. The peer connection is rejected and a NOTIFICATION message is sent to the peer if these two numbers don't match. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Peer Desc localAddressConfigured (lac)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the local IP address configured for this *Bgp Peer* connection. If this attribute is 0.0.0.0, TCP chooses a local IP interface based on the remote IP address of this peer connection and the IP forwarding table. The value chosen is stored in the *localAddressUsed* attribute under the same *Peer* component. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Bgp Peer Desc keepAliveConfigured (kac)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the configured interval between BGP KEEPALIVE message retransmissions. It is used to establish the ratio between keepalive interval and hold time. If this attribute is zero, then the *holdTimeConfigured* attribute must be zero, which means that periodic KEEPALIVE messages will not be sent. |
| Values | Decimal (0..21845) |

| | |
|---|---|
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Vr Ip Bgp Peer Desc holdTimeConfigured (htc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum time that may elapse without receiving a KEEPALIVE or UPDATE message before the connection is considered down. The hold time must be either zero or at least three seconds. If this attribute is zero, then the *keepAliveConfigured* attribute should also be zero, which means that periodic KEEPALIVE messages will not be sent. |
| Values | Decimal (0; 3..65535) |
| Units | seconds |
| Default | 90 |

### ATTRIBUTE Vr Ip Bgp Peer Desc connectRetryTime (connectRetry)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval for the ConnectRetry timer. It is the minimum amount of time that must elapse between successive TCP connection retries for establishing BGP peer connection. |
| Values | Decimal (1..65535) |
| Units | seconds |
| Default | 120 |

### ATTRIBUTE Vr Ip Bgp Peer Desc minAsOrigTime (minAsOrig)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval for the MinAsOriginationInterval timer. It is the minimum amount of time that must elapse between updates that advertise a change to a route within the local autonomous system to neighboring autonomous systems. |
| Values | Decimal (1..65535) |

| | |
|---|---|
| Units | seconds |
| Default | 15 |

### ATTRIBUTE Vr Ip Bgp Peer Desc minRouteAdvTime (minRouteAdv)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval for the MinRouteAdvertisementInterval timer. Feasible routes received from peers in other autonomous systems may only be re-advertised to peers in other autonomous systems at a rate no greater than MinRouteAdvertisementInterval. |
| Values | Decimal (1..65535) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Vr Ip Bgp Peer Desc defaultInAggMed (diaMed)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this *Bgp Peer* component instance's metric for generating a dynamic default route whenever this external BGP peer got established. It is used to prioritize between the dynamic default routes generated by Passport Bgp speakers. If this attribute is not set, BGP does not generate a dynamic default route. When this attribute is set, BGP automatically generates a dynamic default route when the connection established. |
| Values | Decimal (0..4294967295) |
| Default | 4294967295 |

### ATTRIBUTE Vr Ip Bgp Peer Desc isRouteReflectorClient (isRrClient)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the peer is a client peer or non-client peer of this *Bgp* instance. The attribute is ignored unless the value of the '*routeReflector*' attribute of the '*Bgp*' component is ***true.*** |

| | |
|---|---|
| Values | true<br>false |
| Default | false |

### ATTRIBUTE Vr Ip Bgp Peer Desc removePrivateAs (remPrivate)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the treatment of the AS_PATH path attribute in routes sent to the peer. If this attribute is enabled, then BGP will remove private AS numbers from the AS_PATH. This attribute is meaningful only for external peers. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Ip Bgp Peer Desc nextHopSelf (nhs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute controls the setting of the NEXT_HOP path attribute in routes advertised to the peer. If this attribute is enabled, BGP will advertise itself as the NEXT_HOP. This is useful when routes are propagated from an EBGP peer to an IBGP peer: the IBGP peer does not need to have a route to the EBGP peer. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Ip Bgp Peer Desc addressFamily

| | |
|---|---|
| Access | Read and write |
| Description | The attribute specifies the supported network layer protocols being carried in any BGP-4 UPDATE messages over this Peer session. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI).<br><br>To perform IP VPN auto discovery in a VPN, the value of ***ipv4Vpn*** must be added to this attribute on all VCGs' peer |

instances.

To perform IP VPN multi-protocol BGP route distribution in a VPN, the value of ***mbgpVpn*** and ***ipv4Vpn*** must be in the *addressFamily* list of all the VCGs' Peer instances.

To perform RFC 2547 VPN route distribution in a VPN using multi-protocol BGP extentions, the value of ***ipv4MplsVpn*** must be in the *addressFamily* list of all the VCGs' peer instances.

***ipv4Unicast*** represents AFI = 1 and SAFI = 1
***ipv4Vpn*** represents AFI = 1 and SAFI = 140 (not for RFC 2547)
***mbgpVpn*** represents AFI = 1 and SAFI = 141 (not for RFC 2547)
***ipv4MplsVpn*** represents AFI = 1 and SAFI = 128

List of: ipv4Unicast, ipv4Vpn, mbgpVpn, ipv4MplsVpn

Default: (ipv4Unicast)

## COMPONENT Vr Ip Bgp Peer Vpn

Instance: String (7, Dashed Hex)

Scope: Application

Description: *Vr*/<string> *Ip Bgp Peer*/<Ip Address> *Vpn*/<Vpn id>
This component contains all VPN information that is learned by this BGP peer instance.

Dyn. Subcomp.: "COMPONENT Vr Ip Bgp Peer Vpn Ipv4"

Common Verbs:
- Help
- List
- Display

## COMPONENT Vr Ip Bgp Peer Vpn Ipv4

Instance: IP address

Groups: "GROUP Vr Ip Bgp Peer Vpn Ipv4 Operational (Oper)"

| | |
|---|---|
| Scope | Application |
| Description | *Vr*/<string> *Ip Bgp Peer*/<Ip Address> *Vpn*/<Vpn id> *Ipv4*<br>This component contains all IPv4 tunnel based VPN information gathered by this BGP peer for the specified VPN. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ip Bgp Peer Vpn Ipv4 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Ipv4* component. |

### ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 publicIpAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the public IP Address for the remote IP VPN tunnel endpoint. It is used to encapsulate IP packets from the local IP VPN site to the remote site. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 asPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the sequence of AS path segments through which the IP VPN information arrives. The AS Path lists the ASs in reverse traversal order from the point of origin.<br>This attribute is not applicable and is not displayed for locally learned IP VPN information. |
| Values | String (2..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 vpnPeeringTopology

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the peering mode of the remote customer BGP from which this VPN information is originated. This mode determines if a dynamic IBGP peer is instantiated between this *BGP* instance and the remote IP Tunnel endpoint on the remote customer VR.<br>A ***none*** value specifies that BGP never instantiate dynamic IBGP peers.<br>Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value.<br><br>In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute. |
| Values | none<br>hub<br>spoke |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 asOriginatorId

| | |
|---|---|
| Access | Read only |
| Description | This attribute is associated with the Route Reflector. It indicates the router-id of the originator of this IP VPN information in the local AS. When the Route Reflector in the backbone distributes a discovered VPN information to other IBGP speakers, the value of this attribute in the discovered VPN information is used if one is present; otherwise, the Route Reflector's router-id is used. A value of 0.0.0.0 indicates this *Bgp* instance is not a Route Reflector.<br>This attribute is not applicable and is not displayed for locally learned IP VPN information. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 redundant

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that the IP VPN information entry learned from more than one BGP peers in the carrier backbone. This attribute is not applicable and is not displayed for locally learned IP VPN information. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 rrClusterList

| | |
|---|---|
| Access | Read only |
| Description | This attribute is associated with the Route Reflector. It indicates the sequence of cluster-ids that this discovered IP VPN information has traversed. When the Route Reflector in the backbone reflects a discovered VPN information to other non-client IBGP peers, the cluster id of the Route Reflector is added to the cluster list of the received VPN information.<br>A blank list indicates this attribute is not present in the received VPN information or if this *Bgp* instance is not a Route Reflector. This attribute is not applicable and is not displayed for locally learned IP VPN information. |
| List of | IP address |
| List Size | 256 |
| Default | No default |

### COMPONENT Vr Ip Bgp ImportPolicy (Import)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Bgp Import Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp Import/n*<br>*Rtr/<string> Bgp Import/n*<br>*Rtr/<string> Vrf/<string> Bgp Import/n* |

Each instance of this component describes a BGP import policy.
A BGP import policy is used to decide if certain routing information learned from its peer is to be ignored or used.
If no import policy is provisioned, BGP will accept all routes received from its IBGP peers, but will not use any routing information received from its EBGP peers.
If multiple import policies are provisioned, the one with the most specific match will apply.
The keys are matched in the following order from the least specified to the most specified:
*Network*,
*peerAs*,
*peerIpAddress*,
*originAs*,
*originProtocol*,
*matchAsPath*,
*matchCommunity*.

Example1:
There are 2 import policies defined:
vr/0 ip bgp import/1, originProtocol = ***any***, originAs = ***20***, usageFlag = ***use***
vr/0 ip bgp import/2, originProtocol = ***igp***, usageFlag = ***ignore***
If a BGP NLRI contains a route originally learned from an igp with origin AS 20, it will be used.
Example2:
There are 2 import policies defined:
vr/0 ip bgp import/1, originProtocol = ***any***, matchAsPath = ***"1 2 3"***, usageFlag = ***ignore***
vr/0 ip bgp import/2, originProtocol = ***any***, usageFlag = use
If a BGP NLRI contains a route originally learned from an igp with the AsPath "1 2 3 4", it will be ignored.

For Router and Vrf, the example is similar with 'Vr/0 Ip' replaced with 'Router/0' and 'Router/0 Vrf/1' respectively.

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Ip Bgp Import Network (Net)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Bgp Import Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all the provisionable attributes for the *Import* component. |

### ATTRIBUTE Vr Ip Bgp Import peerAs

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the autonomous system number of the peer from which the routes are learned. A value of 0 for this attribute means that peer AS number will match any AS number. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Import peerIpAddress

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the IP address of the peer from which the routes are learned. A value of 0.0.0.0 for this attribute means that peer IP address will match any IP address. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Bgp Import originAs

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This key attribute specifies the autonomous system number where the routes were originated. A value of 0 for this attribute means origin AS number will match any AS number. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Import originProtocol

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the protocols that originated the routes. A value of ***incomplete*** for this attribute means this information is not available. |
| Values | any<br>igp<br>egp<br>incomplete |
| Default | any |

### ATTRIBUTE Vr Ip Bgp Import usageFlag (usage)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether BGP will use or ignore information in received update if it meets criteria specified by the key attributes of this component. |
| Values | use<br>ignore |
| Default | use |

### ATTRIBUTE Vr Ip Bgp Import localPreference (locPrf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this *Bgp* component instance's degree of preference for those routes that match the criteria of this import policy. A higher value indicates a more preferred route. A value of 0 for this attribute means that the default local preference value provisioned under the *Bgp* component should be used. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Vr Ip Bgp Import asPathExpression (asExpr)

Access Read and write

Description This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the received update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280.
The basic syntax of a regular expression is a list of AS number separated by a space which making up a AS path.
The following characters has the special meaning:
'.' - Matches any AS number.
'^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path.
'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path.
'[n1 ... n2]' - Matches any AS number that appeared in the set n1 ...
n2.
'n1 - n2' - Matches any AS number between the range of n1 and n2.
'()' - is supported to change the order of evaluation.
'n*' - Matches 0 or more occurrences of n, where n can be a set, range or AS number.
'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number.
'n?' - Matches 0 or 1 occurrences of n, where n can be a AS set, range or number.
The following logical operators are evaluated in decending order:
'NOT' - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y.

For example: The AS path “5 4 3 2 1”, where 1 is the origin AS, would be match by any one of the following regular expressions:
***1$,***
***^5,***
***4 3,***
***5 3 - 4*,***
***5 [4 3 2] not10 2 1,***
***not (6 7 8 9 10) and 5 4 .* 1***
Empty regular expression implies a match on all AS path.

Values: String (0..255, ASCII)

Default: No default

### ATTRIBUTE Vr Ip Bgp Import communityExpression (comExpr)

Access: Read and write

Description: This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280.
The basic syntax of a regular expression is a list of Community number seperated by a space which making up a Community attribute.
The following characters has the special meaning:
‘[n1 ... n2]’ - Matches any Community number that appeared in the
set n1 ...n2.
‘n1 - n2’ - Matches any Community number between the range of n1 and n2.
‘()’ - is supported to change the order of evaluation.
‘n*’ - Matches 0 or more occurrences of n, where n can be a set, range or Community number.
‘n+’ - Matches 1 or more occurrences of n, where n can be a set, range or Community number.
‘n?’ - Matches 0 or 1 occurrences of n, where n can be a set, range or number.
The following logical operators are evaluated in decending order:
‘NOT’ - Given a regular expression x, NOT x matches the Community attribute that is not matched by x.
‘AND’- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that

are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y.
For example: The Community path "1 2 3 4 5" would be match by any one of the following regular expression:
***1,***
***5,***
***4 3,***
***2 3 - 4*,***
***1 [3 4 2]+,***
***not (6 7 8 9 10) and 1 2***
Empty regular expression implies a match on all Community path.

Values: String (0..255, ASCII)

Default: No default

### ATTRIBUTE Vr Ip Bgp Import expressPreference (exprPref)

Access: Read and write

Description: This attribute specifies the relative preference of the policy which use the keys *expressAsPath* and *expressCommunity.* This attribute is ignored if attributes *expressAsPath* and *expressCommunity* are both empty. This attribute is used to break the tie when two import policies' expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy.

Values: Decimal (0..255)

Default: 128

### ATTRIBUTE Vr Ip Bgp Import appendCommunity (appCom)

Access: Read and write

Description: This attribute indicates which community number this import policy will send along with the Path Attribute. Refer to RFC 1997 for the detailed description of how this attribute may be used to pass additional information to BGP peers. If the value is set to 0, no community is appended to the Community attribute.

Values: Decimal (0..4294967295)

Default 0

### ATTRIBUTE Vr Ip Bgp Import ibgpRtePreference (ibgpPref)

Access Read and write

Description This attribute specifies the routing preference of IBGP routes matching this import policy. A lower value means the route is more preferred. If ***sameAsBgp*** is specified, the value of *defaultIbgpRtePref* set under the *Bgp* component is used. Otherwise the value of this attribute will be used as the routing preference**.** The default is to use sameAsBgp.

Values Decimal (1..253)
sameAsBgp

Default sameAsBgp

### ATTRIBUTE Vr Ip Bgp Import ebgpRtePreference (ebgpPref)

Access Read and write

Description This attribute specifies the routing preference of EBGP routes matching this import policy. A lower value specifies the route is more preferred. If ***sameAsBgp*** is specified, the value of *defaultEbgpRtePref* set under the *Bgp* component is used. Otherwise the value of this attribute will be used as the routing preference**.** The default is to use sameAsBgp.

Values Decimal (1..253)
sameAsBgp

Default sameAsBgp

### ATTRIBUTE Vr Ip Bgp Import addressFamily (af)

Access Read and write

Description This attribute specifies the Address Family of the routes this import policy should apply to. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI).

It can contain one of the following :

***ipv4Unicast*** represents AFI = 1 and SAFI = 1

| | |
|---|---|
| | ***mbgpVpn*** represents AFI = 1 and SAFI = 141 (Not for RFC 2547)<br>***all*** |
| Values | all<br>ipv4Unicast<br>mbgpVpn |
| Default | all |

### ATTRIBUTE Vr Ip Bgp Import description (desc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute decribes the policy. For example, ‘to import BGP routes from AS 1’. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Vr Ip Bgp Import Network (Net)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Bgp Import Net Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp Import/n Network/n*<br>*Rtr/<string> Bgp Import/n Network/n*<br>*Rtr/<string> Vrf/<string> Bgp Import/n Network/n*<br>This is an optional subcomponent of *Import* component and identifies destination networks that this BGP import policy applies to. This component is used as a key for the import policy. If no network list is provisioned, the import policy applies to all networks. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Bgp Import Net Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the set of provisionable attributes for the *Network* component. |

## ATTRIBUTE Vr Ip Bgp Import Net prefix

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the network prefix whose length is determined by the *length* attribute under the same *Network* component. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vr Ip Bgp Import Net length

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the length of the network prefix. |
| Values | Decimal (1..32) |
| Units | bits |
| Default | No default |

## COMPONENT Vr Ip Bgp ExportPolicy (Export)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Bgp Export Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp Export/n*<br>*Rtr/<string> Bgp Export/n*<br>*Rtr/<string> Vrf/<string> Bgp Export/n*<br>Each instance of this component describes a BGP export policy. A BGP export policy is used to decide if certain routing information should be blocked or advertised to its peers.<br>If no export policy is provisioned, BGP will advertise all external BGP learned routes to its internal peers, but not advertise any routing information to its external peers. |

If multiple export policies are provisioned, the one with the most specific match will apply.
The keys are matched in the following order from the least specified to the most specified:
*peerAs*,
*peerIpAddress*,
*protocol*,
*ripInterface* (if applicable),
*egpAs*, *bgpAs*, *ripNeighbour*, or *ospfTag* (whichever is applicable),
*Network*,
*matchAsPath*,
*matchCommunity*.

Example1: (for Router and Vrf, the examples are similar by replacing ‘vr/0 ip’ with ‘Router/a’ and ‘Router/a Vrf/b’ respectively)
There are 2 export policies defined:
vr/0 ip bgp export/1, protocol = ***all***, advertiseStatus = ***send***
vr/0 ip bgp export/2, protocol = ***rip***, advertiseStatus = ***block***
BGP will generate BGP updates for all routes except the routes learned from RIP.
Example2:
There are 2 export policies defined:
vr/0 ip bgp export/1, protocol = all, matchCommunity = ***303***, advertiseStatus = ***send***
vr/0 ip bgp export/2, protocol = ***all***, advertiseStatus = ***block***
BGP will generate BGP updates for all routes that belongs to Community 303.

## GROUP Vr Ip Bgp Export Provisioned (Prov)

Properties Provisioned

| | |
|---|---|
| Description | This group contains all the provisioned attributes for the *Export* component. |

### ATTRIBUTE Vr Ip Bgp Export peerAs

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the autonomous system number of the peer where the routes are advertised to. A value of 0 for this attribute means this export policy applies to all peer ASes. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Export peerIpAddress

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the IP address of the peer where the routes are advertised to. A value of 0.0.0.0 for this attribute means this export policy applies to all peers. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Bgp Export protocol

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies which protocol the export policy applies to. If it is set to ***all***, that means this export policy will apply all routes in the IP routing table.<br>Example:<br>vr/1 ip ospf export/1 with<br>advertise Status = block<br>protocol = bgpExternal<br>bgpAsId = 3<br>peerAs = 5<br>This policy specifies that all routes learned from EBGP Peers that are originated from AS 3 should not be advertised to AS 5. |
| Values | all<br>egp<br>rip |

| | |
|---|---|
| | ospfInternal<br>ospfExternal<br>staticLocal<br>staticRemote<br>bgpInternal<br>bgpExternal<br>bgpAggregate<br>mbgp<br>bgpMplsInternal |
| Default | all |

### ATTRIBUTE Vr Ip Bgp Export egpAsId (egpAs)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the EGP autonomous system number that this export policy will apply to.<br>When this value is non-zero, the *protocol* attribute must be set to ***egp***. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Export bgpAsId (bgpAs)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the BGP autonomous system number that this export policy will apply to.<br>When this value is non-zero, the *protocol* attribute must be set to either ***bgpInternal*** or ***bgpExternal***. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Export ospfTag

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the OSPF tag when the *protocol* attribute is set to either ***ospfInternal*** or ***ospfExternal***. The default tag value 4294967295 (FFFFFFFF in hex) indicates that the tag not specified. |

| | |
|---|---|
| Values | Hex (H.0..H.ffffffff) |
| Default | H.ffffffff |

### ATTRIBUTE Vr Ip Bgp Export ripInterface (ripIf)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the local RIP interface where the routes are learned from.<br>The *ripInterface* attribute when non-zero should be equal to one of the IP addresses provisioned as a *logicalIf* component under *IpPort*, or the IP address of an *Interface* component. Otherwise, this policy will be ignored.<br>The value of the *protocol* attribute must be set to ***rip*** if a value for the *ripInterface* attribute is non-zero. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Bgp Export ripNeighbor (ripNbr)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the RIP neighbor where the routes were learned from.<br>The value of the *protocol* attribute must be set to ***rip*** if a value for the *ripNeighbor* attribute is non-zero. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Bgp Export advertiseStatus (advertise)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether data will be exported if it meets criteria specified by the other key attributes of this component. |
| Values | send<br>block |
| Default | send |

### ATTRIBUTE Vr Ip Bgp Export multiExitDisc (med)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies this *Bgp* component instance's metric to discriminate between multiple exit points to an adjacent autonomous system if the route meets the criteria specified by the key attributes of this component. A lower value indicates a more preferred route. A value of 0 for this attribute means the default MED value provisioned under the *Bgp* component should be used. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Export sendMultiExitDiscToEbgp (sendMed)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the Multi Exit Discriminator(MED) attribute should be included in an update message sent to an EBGP peer. |
| Values | false<br>true |
| Default | false |

### ATTRIBUTE Vr Ip Bgp Export asPathExpression (asExpr)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the export update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280.<br>The basic syntax of a regular expression is a list of AS number separated by a space which making up a AS path.<br>The following characters has the special meaning:<br>'.' - Matches any AS number.<br>'^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. |

‘n$’ - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path.
‘[n1 ... n2]’ - Matches any AS number that appeared in the set n1 ...
n2.
‘n1 - n2’ - Matches any AS number between the range of n1 and n2.
‘()’ - is supported to change the order of evaluation.
‘n*’ - Matches 0 or more occurrences of n, where n can be a set, range or AS number.
‘n+’ - Matches 1 or more occurrences of n, where n can be a set, range or AS number.
‘n?’ - Matches 0 or 1 occurrences of n, where n can be a set, range or number.
The following logical operators are evaluated in decending order:
‘NOT’ - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x.
‘AND’- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y.
‘OR’ - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y.
For example: The AS path “5 4 3 2 1”, where 1 is the origin AS, would be match by any one of the following regular expressions:
***1$,***
^***5,***
***4 3,***
***5 3 - 4*,***
***5 [4 3 2] not10 2 1,***
***not (6 7 8 9 10) and 5 4 .* 1***
Empty regular expression implies a match on all AS path.

| | |
|---|---|
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Export communityExpression (comExpr)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280.<br>The basic syntax of a regular expression is a list of Community number separated by a space which making up a Community attribute.<br>The following characters has the special meaning:<br>‘[n1 ... n2]’ - Matches any Community number that appeared in the<br>set n1 ...n2.<br>‘n1 - n2’ - Matches any Community number between the range of n1 and n2.<br>‘()’ - is supported to change the order of evaluation.<br>‘n*’ - Matches 0 or more occurrences of n, where n can be a set, range or Community number.<br>‘n+’ - Matches 1 or more occurrences of n, where n can be a set, range or Community number.<br>‘n?’ - Matches 0 or 1 occurrences of n, where n can be a set, range or number.<br>The following logical operators are evaluated in decending order:<br>‘NOT’ - Given a regular expression x, NOT x matches the Community attribute that is not matched by x.<br>‘AND’- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y.<br>‘OR’ - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y.<br>For example: The Community path “1 2 3 4 5” would be match by any one of the following regular expression:<br>***1,***<br>***5,***<br>***4 3,***<br>***2 3 - 4*,***<br>***1 [3 4 2]+,***<br>***not (6 7 8 9 10) and 1 2***<br>Empty regular expression implies a match on all Community path. |
| Values | String (0..255, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Export expressPreference (exprPref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the relative preference of the policy which use the keys *expressAsPath* and *expressCommunity*. This attribute is ignored if attributes *expressAsPath* and *expressCommunity* are both empty. This attribute is used to break the tie when two export policies' expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy. |
| Values | Decimal (0..255) |
| Default | 128 |

### ATTRIBUTE Vr Ip Bgp Export sendCommunity (sendCom)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates which community number this export policy will send along with the Path Attribute. Refer to RFC 1997 for the detailed description of how this attribute may be used to pass additional information to BGP peers. If the value is set to 0, no community is added to the Community attribute. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Export localPreference (locPrf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value of the LOCAL_PREFERENCE path attribute in routes sent to internal peers. A value of 0 means that the value specified in the import policy (if any) or the default local preference value should be used. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Export virtualPrivateNetworkIdentifier (vpnId)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the Virtual Private Network (VPN) identifier of the routes this export policy should apply to. This attribute is only used if *addressFamily* has included ***mbgpVpn***. The value “00-00-00-00-00-00-00” identifies an unspecified vpnId, meaning the vpnId will not be used as a matching criteria in this export policy. |
| Values | String (7, Dashed Hex) |
| Default | 00-00-00-00-00-00-00 |

### ATTRIBUTE Vr Ip Bgp Export addressFamily (af)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Address Family of the routes this export policy should apply to. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI).<br><br>It can contain one of the following :<br><br>***ipv4Unicast*** represents AFI = 1 and SAFI = 1<br>***mbgpVpn*** represents AFI = 1 and SAFI = 141<br>***all*** |
| Values | all<br>ipv4Unicast<br>mbgpVpn |
| Default | all |

### ATTRIBUTE Vr Ip Bgp Export description (desc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute decribes the policy. For example, ‘to export BGP routes to MCI’. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Export insertDummyAs (insertAs)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the AS number(s) to be inserted into the AS Path Attribute. The value is a sequence of AS number separated by period(.). For example, if the value is ***20.20.30***, the AS numbers 20, 20 and 30 would be inserted at the end of the AS Path Attribute just before the local AS number. |
| Values | Integer Sequence |
| Default | No default |

## COMPONENT Vr Ip Bgp Export Network (Net)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Bgp Export Net Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp Export/n Network/n*<br>*Rtr/<string> Bgp Export/n Network/n*<br>*Rtr/<string> Vrf/<string> Export/n Network/n*<br>This is an optional subcomponent of the *Export* component and identifies a destination network that this BGP export policy will apply to. This component is used as a key for the export policy. If no network list is provisioned, the import policy applies to all networks. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Bgp Export Net Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the set of provisionable attributes for the *Network* component. |

## ATTRIBUTE Vr Ip Bgp Export Net prefix

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the network prefix whose length is determined by the *length* attribute under the same *Network* component. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Export Net length

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the length of the network prefix. |
| Values | Decimal (1..32) |
| Units | bits |
| Default | No default |

### COMPONENT Vr Ip Bgp As

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip Bgp As Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp As/n*<br>*Rtr/<string> Bgp As/n*<br>*Rtr/<string> Vrf/<string> Bgp As/n*<br>This component associates attributes to an autonomous system. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Bgp As Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes associated to each autonomous system for this *Bgp* component instance. |

## ATTRIBUTE Vr Ip Bgp As weight

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the weight for an autonomous system. It allows users to prefer some ASes over others. It is used in route selection. Lowest weight is preferred. Setting the weight of an AS to 255 will make any route that traverses through that AS unpreferred. |
| Values | Decimal (0..255) |
| Default | 128 |

## COMPONENT Vr Ip Bgp AggregatePolicy (Aggregate)

| | |
|---|---|
| Instance | prefix [IP address]<br>length [Decimal (0..32)] |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp AggregatePolicy/<Ip Address>,<Decimal>*<br>*Rtr/<string> Bgp AggregatePolicy/<Ip Address>,<Decimal>*<br>*Rtr/<string> Vrf/<string> Bgp AggregatePolicy/<Ip Address>,<Decimal>*<br>This component is used to perform aggregation of BGP routes for exporting. Aggregation is the process of combining the characteristics of several different routes in such a way that a single route can be advertised. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Refer to RFC1771 for the set of rules regarding which routes can be aggregated.<br>A ***network*** subcomponent is automatically added with the same network range as the aggregation policy key and its action is set to ***aggregate***. So by default all subnets under the aggregation key range will be aggregated.<br>Examples (For *Router* and *Vrf*, the examples are similar by replacing ‘vr/0 ip’ with ‘Router/a’ and ‘Router/a Vrf/b’ respectively):<br>Example #1: aggregate all the networks covered by A.0.0.0/8<br>add vr/0 ip bgp aggregate/A.0.0.0,8<br>(Note: the following subcomponent vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.0.0.0, length 8, action aggregate will be automatically added) |

Example #2: aggregate A.B.0.0/16 and A.C.0.0/16 as A.0.0.0/8 and advertise other networks
add vr/0 ip bgp aggregate/A.0.0.0,8
set vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.B.0.0, length 16, action aggregate
(Note: this set command will overwrite the default network subcomponent
vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.0.0.0, length 8, action aggregate)
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.C.0.0, length 16, action aggregate

Example #3: aggregate A.B.0.0/16 and A.C.0.0/16 as A.0.0.0/8 and advertise other networks; also advertise A.B.C.0/24
add vr/0 ip bgp aggregate/A.0.0.0,8
set vr/0 ip bgp aggregate/A.0.0.0,8 networkl/0 prefix A.B.0.0, length 16, action aggregate
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.C.0.0, length 16, action aggregate
add vr/0 ip bgp aggregate/A.0.0.0,8 network/2
set vr/0 ip bgp aggregate/A.0.0.0,8 network/2 prefix A.B.C.0, length 24, action advertise

Example #4: aggregate all networks under A.0.0.0/8, meanwhile advertise A.B.0.0/16
add vr/0 ip bgp aggregate/A.0.0.0,8
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.B.0.0, length 16, action advertise

| Groups | "GROUP Vr Ip Bgp Aggregate Net Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp Aggregate/<IP address>,<n> Network/n*<br>*Rtr/<string> Bgp Aggregate/<IP address>,<n> Network/n*<br>*Rtr/<string> Vrf/<string> Bgp Aggregate/<IP address>,<n> Network/n*<br>This is an optional subcomponent of *Aggregate* component and identifies a set of more specific routes that this BGP will aggregate or advertise together with the aggregated route. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Bgp Aggregate Net Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the set of provisionable attributes for the *Network* component. |

## ATTRIBUTE Vr Ip Bgp Aggregate Net prefix

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the network prefix whose length is determined by the *length* attribute under the same *Network* component. |
| Values | IP address |
| Default | 0.0.0.0 |

## ATTRIBUTE Vr Ip Bgp Aggregate Net length

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the length of the network prefix. |

| | |
|---|---|
| Values | Decimal (0..32) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Aggregate Net protocol

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP protocols to which this route should belong. |
| Values | all<br>egp<br>rip<br>ospfInternal<br>ospfExternal<br>staticLocal<br>staticRemote<br>bgpInternal<br>bgpExternal |
| Default | all |

### ATTRIBUTE Vr Ip Bgp Aggregate Net egpAsId (egpAs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies an EGP autonomous system number.<br><br>When this value is non-zero, the *protocol* attribute must be set to either ***egp*** or to ***all***. And this more specific route will be advertised together with the aggregated route only if it is learned through egp and this attribute matches the EGP autonomous system number where the network is learned from.<br>The default value 0 indicates that the EGP autonomous system number is not specified. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Aggregate Net bgpAsId (bgpAs)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the BGP autonomous system number.<br><br>When this value is non-zero, the *protocol* attribute must be set to either ***bgp*** or to ***all***. And this more specific route will be advertised together with the aggregated route only if it is learned through BGP and this attribute matches the BGP autonomous system number where the network is learned from.<br>The default value 0 indicates that the BGP autonomous system number is not specified. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip Bgp Aggregate Net ospfTag

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the OSPF tag.<br><br>When this attribute is set to a value other than the default value FFFFFFFF in hex, the *protocol* attribute must be set to either ***ospf*** or to ***all***. And this more specific route will be advertised together with the aggregated route only if its OSPF tag matches this value.<br>The default tag value 4294967295 (FFFFFFFF in hex) indicates that the tag is not specified. |
| Values | Hex (H.0..H.ffffffff) |
| Default | H.ffffffff |

### ATTRIBUTE Vr Ip Bgp Aggregate Net ripInterface (ripIf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a local RIP interface which should be equal to one of the IP addresses provisioned as a *logicalIf* component under *IpPort*, or one of the IP addresses provisioned as an *Interface* component.<br><br>When this value is non-zero, the value of the *protocol* attribute must be either set to ***rip*** or to ***all.*** And this more specific route will be advertised together with the aggregated route only if it is learned through RIP and this RIP interface. |

The default value 0.0.0.0 indicates that the RIP interface is not specified.

Values: IP address

Default: 0.0.0.0

### ATTRIBUTE Vr Ip Bgp Aggregate Net action

Access: Read and write

Description: This attribute specifies whether this network should be aggregated or advertised out.

Values:
aggregate
advertise

Default: aggregate

### COMPONENT Vr Ip Bgp IndbEntry (Indb)

Instance:
prefix [IP address]
length [Decimal (0..32)]
peer [IP address]

Groups: "GROUP Vr Ip Bgp Indb Operational (Oper)"

Scope: Application

Description:
*Vr/<string> Ip Bgp IndbEntry/<Ip Address>,<Decimal>,<Ip Address>*
*Rtr/<string>Bgp IndbEntry/<Ip Address>,<Decimal>,<Ip Address>*
*Rtr/<string> Vrf/<string> Bgp IndbEntry/<Ip Address>,<Decimal>,<Ip Address>*
This component describes a BGP route received from one of its peers.

### GROUP Vr Ip Bgp Indb Operational (Oper)

Properties: Operational

| | |
|---|---|
| Description | This group contains all the operational attributes of the *IndbEntry* component. |

### ATTRIBUTE Vr Ip Bgp Indb origin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ultimate origin of the path information. A value of ***incomplete*** means this information is not available. |
| Values | igp<br>egp<br>incomplete |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb inLocaldb

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not this route was chosen as the best BGP4 route. |
| Values | false<br>true |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the border router that should be used as the next hop for the destination network. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb localPreference

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates our IBGP peer’s degree of preference for an advertised route. A higher value indicates a more preferred route. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb calcLocalPref

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates our degree of preference for this route. A higher value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb multiExitDiscriminator (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a metric used to discriminate between multiple exit points to the same adjacent autonomous system. A lower value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb atomicAggregate

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not the local system has selected a less specific route without selecting a more specific route. |
| Values | lessSpecificRouteNotSelected<br>lessSpecificRouteSelected |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb aggregatorAs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the AS number of the last BGP4 speaker that performed route aggregation. A value of zero (0) indicates the absence of this attribute. |

| | |
|---|---|
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb aggregatorAddr

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the last BGP4 speaker that performed route aggregation. A value of 0.0.0.0 indicates the absence of this attribute. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb asPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the sequence of AS path segments. The AS Path Attribute lists the ASs in reverse traversal order. |
| Values | String (2..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb unknownAttributes (unknown)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates all the path attributes not understood by this *Bgp* component instance. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb communityPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Community path attribute. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb asOriginatorId

| | |
|---|---|
| Access | Read only |
| Description | This attribute is associated with the Route Reflector. It indicates the router-id of the originator in the local AS. A value of 0.0.0.0 indicates this attribute is not present in the learned IBGP route or if this *Bgp* instance is not a Route Reflector. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Indb rrClusterList

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a sequence of cluster-ids that the route has traversed. A blank list indicates this attribute is not present in the learned IBGP route or if this *Bgp* instance is not a Route Reflector. |
| List of | IP address |
| List Size | 256 |
| Default | No default |

### COMPONENT Vr Ip Bgp LocaldbEntry (Localdb)

| | |
|---|---|
| Instance | prefix [IP address]<br>length [Decimal (0..32)]<br>peer [IP address] |
| Groups | "GROUP Vr Ip Bgp Localdb Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp LocaldbEntry/<Ip Address>,<Decimal>,<Ip Address>*<br>*Rtr/<string> Bgp LocaldbEntry/<Ip Address>,<Decimal>,<Ip Address>*<br>*Rtr/<string> Vrf/<string> Bgp LocaldbEntry/<Ip Address>,<Decimal>,<Ip Address>*<br>This component describes an entry in the BGP local database. This database contains the routing information that the BGP |

speaker has selected by applying its local import policies and decision process to the routing information stored in *IndbEntry*.

## GROUP Vr Ip Bgp Localdb Operational (Oper)

Properties: Operational

Description: This group contains all the operational attributes of the *LocaldbEntry* component.

## ATTRIBUTE Vr Ip Bgp Localdb origin

Access: Read only

Description: This attribute indicates the ultimate origin of the path information. A value of ***incomplete*** means this information is not available.

Values:
igp
egp
incomplete

Default: No default

## ATTRIBUTE Vr Ip Bgp Localdb nextHop

Access: Read only

Description: This attribute indicates the IP address of the border router that should be used as the next hop for the destination network.

Values: IP address

Default: No default

## ATTRIBUTE Vr Ip Bgp Localdb localPreference

Access: Read only

Description: This attribute indicates our IBGP peer's degree of preference for an advertised route. A higher value indicates a more preferred route.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Localdb multiExitDiscriminator (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a metric used to discriminate between multiple exit points to the same adjacent autonomous system. A lower value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Localdb atomicAggregate

| | |
|---|---|

| Default | No default |

### ATTRIBUTE Vr Ip Bgp Localdb aggregatorAs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the AS number of the last BGP4 speaker that performed route aggregation. A value of zero (0) indicates the absence of this attribute. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Localdb aggregatorAddr

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the last BGP4 speaker that performed route aggregation. A value of 0.0.0.0 indicates the absence of this attribute. |

| | |
|---|---|
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Localdb asPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the sequence of AS path segments. The AS Path Attribute lists the ASs in reverse traversal order. |
| Values | String (2..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Localdb unknownAttributes (unknown)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates all the path attributes not understood by this *Bgp* component instance. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Localdb communityPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Community path attribute. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Localdb asOriginatorId

| | |
|---|---|
| Access | Read only |
| Description | This attribute is associated with the Route Reflector. It indicates the router-id of the originator in the local AS. A value of 0.0.0.0 indicates this attribute is not present in the learned IBGP route or if this *Bgp* instance is not a Route Reflector. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Vr Ip Bgp Localdb rrClusterList

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a sequence of cluster-ids that the route has traversed. A blank list indicates this attribute is not present in the learned IBGP route or if this *Bgp* instance is not a Route Reflector. |
| List of | IP address |
| List Size | 256 |
| Default | No default |

## COMPONENT Vr Ip Bgp OutdbEntry (Outdb)

| | |
|---|---|
| Instance | prefix [IP address]<br>length [Decimal (0..32)]<br>peer [IP address] |
| Groups | "GROUP Vr Ip Bgp Outdb Operational (Oper)" |

## GROUP Vr Ip Bgp Outdb Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains all the operational attributes of the *OutdbEntry* component. |

### ATTRIBUTE Vr Ip Bgp Outdb origin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ultimate origin of the path information. A value of ***incomplete*** means this information is not available. |
| Values | igp<br>egp<br>incomplete |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the border router that should be used as the next hop for the destination network. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb localPreference

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates this *Bgp* instance's degree of preference for an advertised route. A higher value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb multiExitDiscriminator (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a metric used to discriminate between multiple exit points to the same adjacent autonomous system. A lower value indicates a more preferred route. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Vr Ip Bgp Outdb atomicAggregate

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not the local system has selected a less specific route without selecting a more specific route. |
| Values | lessSpecificRouteNotSelected<br>lessSpecificRouteSelected |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb aggregatorAs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the AS number of the last BGP4 speaker that performed route aggregation. A value of zero (0) indicates the absence of this attribute. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb aggregatorAddr

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the last BGP4 speaker that performed route aggregation. A value of 0.0.0.0 indicates the absence of this attribute. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb asPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the sequence of AS path segments. The AS Path Attribute lists the ASs in reverse traversal order. |

| | |
|---|---|
| Values | String (2..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb unknownAttributes (unknown)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates all the path attributes not understood by this *Bgp* component instance. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb communityPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Community path attribute. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb asOriginatorId

| | |
|---|---|
| Access | Read only |
| Description | This attribute is associated with the Route Reflector. It indicates the router-id of the originator of a route in the local AS. When the Route Reflector distributes a learned IBGP route to other IBGP speakers, the value of this attribute in the learned route is used if one is present; otherwise, the Route Reflector's router-id is used. A value of 0.0.0.0 indicates this *Bgp* instance is not a Route Reflector. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp Outdb rrClusterList

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a sequence of cluster-ids that the route has traversed. When the Route Reflector redistributes a learned IBGP to other IBGP speakers, the cluster id of this Route Reflector is |

appended to the cluster list of the learned IBGP route. If this *Bgp* instance is not a Route Reflector, this attribute is blank.

| | |
|---|---|
| List of | IP address |
| List Size | 256 |
| Default | No default |

### COMPONENT Vr Ip Bgp LocalVpn

| | |
|---|---|
| Instance | String (7, Dashed Hex) |
| Scope | Application |
| Description | *Vr*/<string> *Ip Bgp LocalVpn*/<Vpn id><br>This component contains all VPN information from the specified VPN that is learned from customer VR on the local node. |
| Dyn. Subcomp. | "COMPONENT Vr Ip Bgp LocalVpn Ipv4" |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Vr Ip Bgp LocalVpn Ipv4

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP Vr Ip Bgp LocalVpn Ipv4 Operational (Oper)" |
| Scope | Application |
| Description | *Vr*/<string> *Ip Bgp LocalVpn*/<Vpn id> *Ipv4* This component contains all IPv4 tunnel based VPN information gathered by this BGP locally for the specified VPN. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ip Bgp LocalVpn Ipv4 Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational attributes of the *Ipv4* component. |

### ATTRIBUTE Vr Ip Bgp LocalVpn Ipv4 publicIpAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the public IP Address for the remote IP VPN tunnel endpoint. It is used to encapsulate IP packets from the local IP VPN site to the remote site. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp LocalVpn Ipv4 vpnPeeringTopology

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peering mode of the remote customer BGP from which this VPN information is originated. This mode determines if a dynamic IBGP peer is instantiated between this *BGP* instance and the remote IP Tunnel endpoint on the remote customer VR.<br>A ***none*** value specifies that BGP never instantiate dynamic IBGP peers.<br>Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value.<br><br>In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute. |
| Values | none<br>hub<br>spoke |
| Default | No default |

## COMPONENT Vr Ip Bgp MBgpRibEntry (MBgpRib)

| | |
|---|---|
| Instance | vpnId [String (7, Dashed Hex)]<br>prefix [IP address]<br>length [Decimal (0..32)]<br>peer [IP address] |
| Groups | "GROUP Vr Ip Bgp MBgpRib Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Bgp MBgpRibEntry/ <vpnid>,<prefix>,<length>,<peer_ip_address>*<br>This component represents a single MBGP routing database entry received from one of the BGP peers of this virtual router.<br><br>The instance values of this component have the following meanings:<br>- *vpnId:* the virtual private network identifer associated with the MBGP route.<br>- *prefix*: the destination IP address prefix of the MBGP route.<br>- *length:* the length of the IP address prefix of the MBGP route.<br>- *peer_ip_address:* the IP address prefix of the BGP peer that the MBGP route has been learned from. A value of 0.0.0.0 indicates that the MBGP route is learned from a locally attaching customer VR.<br><br>This component only appears under a *VirtualRouter* component whose *vpnMode* attribute is set to ***carrier***. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Bgp MBgpRib Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *MBgpRibEntry* component. |

### ATTRIBUTE Vr Ip Bgp MBgpRib origin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ultimate origin of the path information. A value of ***incomplete*** means this information is not available. |
| Values | igp<br>egp<br>incomplete |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib status

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the MBGP route has been distributed into the routing table of the customer VR corresponding to the VPN identifier value. |
| Values | localVpnRoute<br>inCvrRdb<br>importBlocked<br>importLimitExceeded<br>unreachableNh |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the router that should be used as the next hop to reach the destination address prefix given by the instance value of this component. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib localPreference

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the local IBGP peer's degree of preference for an advertised route. A higher value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib multiExitDiscriminator (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a metric used to discriminate between multiple exit points to the same adjacent autonomous system. A lower value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib atomicAggregate

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not the local system has selected a less specific route. |
| Values | lessSpecificRouteNotSelected<br>lessSpecificRouteSelected |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib aggregatorAs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the AS number of the last BGP4 speaker that performed route aggregation. A value of zero (0) indicates the absence of this path attribute. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib aggregatorAddr

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the IP address of the last BGP4 speaker that performed route aggregation. A value of 0.0.0.0 indicates the absence of this path attribute. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib asPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the sequence of AS path segments. The AS Path Attribute lists the ASs in reverse traversal order. |
| Values | String (2..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib communityPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Community path attribute. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MBgpRib unknownAttributes (unknown)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates all the path attributes not understood by this *Bgp* component instance. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Vr Ip Bgp MplsVpnRibEntry (MvRib)

| | |
|---|---|
| Instance | routeDistinguisher [String (3..21, RFC2547RdRtSyntax)]<br>prefix [IP address]<br>length [Decimal (0..32)]<br>peer [IP address] |
| Groups | "GROUP Vr Ip Bgp MvRib Operational (Oper)" |

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> Ip Bgp MplsVpnRibEntry/* <routeDistinguisher>,<prefix>,<length>,<peerIpAddr><br>*Rtr/<string> Ip Bgp MplsVpnRibEntry/* <routeDistinguisher>,<prefix>,<length>,<peerIpAddr><br>The *MplsVpnRibEntry* component represents a single entry in the MPLS VPN routing information database.This component is used to maintain the MPLS VPN routes learned both locally and from the BGP peers.<br><br>The instance values of this component have the following meaning:<br>- *routeDistinguisher:* a string associated with the MPLS VPN route.<br>The string is in the form of (1) AS:nn or (2) IPAddr:mm.<br>where<br>AS represents an autonomous system number,<br>nn represents an index value,<br>IPAddr represents an IP address,<br>mm represents an index value<br><br>- *prefix*: the destination IP address prefix of the MPLS VPN route. This is an IP address prefix as specified in the Network Layer Reachability Information field of the MP_REACH_NLRI path attribute.<br><br>- *length:* the length of the IP address prefix of the MPLS VPN route. This is the IP address prefix length as specified in the Network Layer Reachability Information field.<br><br>- peerIpAddr: the IP address prefix of the BGP peer that the MPLS VPN route has been learned from. |

This component is only applicable to the *Router* component or a virtual router whose *vpnMode* attribute is set to ***carrier***.

## GROUP Vr Ip Bgp MvRib Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes of the *BgpMplsRibEntry* component.

## ATTRIBUTE Vr Ip Bgp MvRib serviceLabel (sl)

Access: Read only

Description: This attribute indicates the service label (the inner label in a two-level MPLS label stack) allocated by the Provider Edge (PE) node and distributed together with the routing information toward the remote end PE. The service label is then used by the remote PE node to encapsulate traffic of the same VPN to the local PE node. When the local PE node processes a received packet which has the service label at the top of the stack, the PE pops the stack, and sends the packet to the Customer Edge (CE) node from which the route leads. (See also transportLabel attribute description.)

Values: Decimal (0..1048575)

Default: No default

## ATTRIBUTE Vr Ip Bgp MvRib transportLabel (tl)

Access: Read only

Description: This attribute indicates the transport label (the outer label in a two-level MPLS label stack) allocated by the Provider Edge (PE) node. The transport label identifies the MPLS tunnel (Labeled Switched Path) used to transport the service label encapsulated VPN traffic, between two PE nodes, through the backbone.

| | |
|---|---|
| | The transport label is applied on top of the service label at the source PE node, and used to direct the VPN traffic (travelling through the network core) to the destination PE. At the destination PE node the transport label is stripped, leaving the service label encapsulated packet to be processed and forwarded to a CE node based on the service label.<br>A value of ***awaitingLabel*** indicates the MPLS tunnel is currently not available and waiting to be established. A value of ***notApplicable*** indicates this is a local route and hence doesn't have a transport label. |
| Values | Decimal (0..1048575)<br>awaitingLabel<br>notApplicable |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib reachable (reach)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a route is currently reachable through an LSP tunnel. |
| Values | true<br>false |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib bgpNextHop (bgpNh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bgp next hop IP address that should be used to reach the destination address prefix. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib origin

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the value of the ORIGIN path attribute of the route. A value of ***incomplete*** means that this information is not available. |
| Values | igp<br>egp<br>incomplete |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib localPreference (locPrf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the LOCAL_PREFERENCE path attribute of the route. The LOCAL_PREFERENCE path attribute is used by a BGP speaker to inform other BGP speakers in its own autonomous system of the originating speaker's degree of preference for an advertised route. A higher value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib asPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the AS_PATH path attribute of the route. The AS_PATH path attributes lists the sequence of AS path segments in reverse traversal order. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib multiExitDiscriminator (med)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a metric used to discriminate between multiple exit points to the same adjacent autonomous system. A lower value indicates a more preferred route. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib atomicAggregate

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not the local system has selected a less specific route. |
| Values | lessSpecificRouteNotSelected<br>lessSpecificRouteSelected |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib aggregatorAs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the AS number of the last BGP4 speaker that performed route aggregation. A value of ***0*** indicates the absence of this path attribute. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib aggregatorAddr

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the last BGP4 speaker that performed route aggregation. A value of ***0.0.0.0*** indicates the absence of this path attribute. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Bgp MvRib communityPath

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Community path attribute. |
| Values | String (0..255, ASCII) |
| Default | No default |

## COMPONENT Vr Ip SecurityPolicyDatabase (Spd)

| | |
|---|---|
| Instance | String (1..20, ASCII) |
| Groups | "GROUP Vr Ip Spd Provisioned (Prov)"<br>"GROUP Vr Ip Spd Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Ip SecurityPolicyDatabase/<string>*<br><br>The *SecurityPolicyDatabase* component represents a set of policies collectively known as the security policy database (SPD), which is used for applying and bypassing IPSec services.<br><br>At most one *Spd* instance is allowed for a virtual router. Only the management virtual router can have a security policy database. |
| Opt. Subcomp. | "COMPONENT Vr Ip Spd Policy" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Vr Ip Spd Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *SecurityPolicyDatabase* component. |

## ATTRIBUTE Vr Ip Spd alarmOnViolation

| | |
|---|---|
| Access | Read: All<br>Write: System_admin |
| Description | This attribute specifies whether an alarm is generated when a security violation is detected by this security policy database. Examples of security violations include policy mismatch and authentication failure. |

| | |
|---|---|
| Values | enabled<br>disabled |
| Default | enabled |

### GROUP Vr Ip Spd Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics for the *SecurityPolicyDatabase* component. These counts cannot be associated with individual SAs, so they are aggregated under the *SecurityPolicyDatabase* component. Counts that can be associated with a particular SA are defined under the *Sa* component. |

### ATTRIBUTE Vr Ip Spd outDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets discarded by an outbound security policy. This count includes packets that are discarded because they have no matching security policy; the default security policy action is always discard.<br>The count wraps to zero when it reaches the value 2 to the power 64. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Ip Spd inSaLookupFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the inbound packets for which an SA could not be found.<br>The count wraps to zero when it reaches the value 2 to the power 64. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Ip Spd inDiscards

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the packets discarded because the Security Parameter Index (SPI) in the packet is unknown, or no SA is found with matching selectors.<br>The count wraps to zero when it reaches the value 2 to the power 64. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Ip Spd inMismatch

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets discarded due to a mismatch between the packet and what the security policy dictates. An example of a mismatch is when a packet is received on a security enabled management virtual router in the clear (no security services applied), but the security policy for that VR specifies that this packet should have an applied security service.<br>The count wraps to zero when it reaches the value 2 to the power 64. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Ip Spd outBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes processed, including discarded packets.<br>The count wraps to zero when it reaches the value 2 to the power 64. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Ip Spd outPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets processed, including discarded packets. |

| | |
|---|---|
| | The count wraps to zero when it reaches the value 2 to the power 64. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Ip Spd inBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes processed, including discarded packets.<br>The count wraps to zero when it reaches the value 2 to the power 64. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr Ip Spd inPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets processed, including discarded packets.<br>The count wraps to zero when it reaches the value 2 to the power 64. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Vr Ip Spd Policy

| | |
|---|---|
| Instance | Decimal (1..65535) |
| Groups | "GROUP Vr Ip Spd Policy Selectors"<br>"GROUP Vr Ip Spd Policy Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip Spd/<string> Policy/n*<br>The *Policy* component defines an IPSec policy to be applied for a virtual router. An IPSec policy is defined by the following parameters: |

1. The selector criteria specifying packets to which the security policy is to be applied.

2. The action taken when a packet matches the security policy selectors.

Up to 4096 policies are allowed for each instance of the *SecurityPolicyDatabase* component. The instance value of the *Policy* component specifies the policy's precedence. Policy lookup occurs in the order of increasing precedence value. If no match is found, the packet is discarded.

It is recommended that the instance values of consecutive *Policy* components be separated by more than 1 (say 10). This allows a new *Policy* component to be added whose precedence value is intermediate between two existing policies.

Each *Policy* component instance has an associated direction: inbound or outbound.
- An inbound *Policy* instance corresponds to an entry in the inbound security policy database (SPD), as referred to in RFC 2401. IPSec traffic received on the management virtual router, is matched against inbound policies.
- An outbound *Policy* instance corresponds to an entry in the outbound SPD, as referred to in RFC 2401. Locally generated traffic is matched against outbound policies.

The *Policy* component allows the operator to distinguish a flow based on:
1. destination IP address,
2. source IP address,
3. layer 4 (transport) protocol, and
4. for TCP and UDP, the source and destination port numbers.

| | |
|---|---|

## GROUP Vr Ip Spd Policy Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes of the *Policy* component related to its treatment.

## ATTRIBUTE Vr Ip Spd Policy direction

Access Read: All
Write: System_admin

Description This attribute specifies the direction of the policy:
- ***inbound***: this policy is to be matched against locally destined traffic received on the management virtual router.
- ***outbound***: this policy is to be matched against traffic that is generated by the management virtual router.

Values inbound (in)
outbound (out)

Default No default

## ATTRIBUTE Vr Ip Spd Policy action

Access Read: All
Write: System_admin

Description This attribute specifies the action to be taken when a packet is received that matches the selectors for this policy. The value can be one of the following:

- ***discard***: the packet is to be discarded.
- ***bypass***: no security is to be applied to the packet. Instead the packet is forwarded as usual.
- ***apply***: the security service specified by the *Sa* subcomponent is applied to the packet. *Check Prov* will fail if the *action* is ***apply*** and there is no *Sa* subcomponent.

Values discard
bypass
apply

| | |
|---|---|
| Default | apply |

### ATTRIBUTE Vr Ip Spd Policy description

| | |
|---|---|
| Access | Read: All<br>Write: System_admin |
| Description | This attribute specifies a meaningful name or description for the *Policy* instance. |
| Values | String (0..20, ASCII) |

### ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa encAlgorithm (encAlg)

| | |
|---|---|
| Access | Read: All<br>Write: System_admin |
| Description | This attribute specifies the encryption algorithm to be used for this Encryption Security Protocol (ESP) security association (SA).<br><br>The following encryption algorithms are supported:<br>- ***des***: data encryption standard (DES), which is the most widely used algorithm<br>- ***3des***: encryption using DES three times.<br><br>3DES is a stronger encryption algorithm than DES.<br><br>If no ESP encryption is desired, set this attribute to ***none***.<br><br>At least one of *encAlg* and *authAlg* attribute must be specified; they cannot both be set to ***none***. |
| Values | none<br>des<br>3des |
| Default | 3des |

### ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa authAlgorithm (authAlg)

| | |
|---|---|
| Access | Read: All<br>Write: System_admin |
| Description | This attribute specifies the authentication algorithm to be used for this ESP security association (SA).<br><br>The following authentication algorithms are supported:<br>- ***md5***: message digest<br>- ***sha1***: secure hash algorithm |

SHA-1 is considered stronger than MD5.

If no ESP authentication is desired, set this attribute to ***none***.

At least one of *encAlg* and *authAlg* attribute must be specified; they cannot both be set to ***none***.

Values
none
sha1
md5

Default
none

### ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa encKey

Access
Read: Illegal
Write: System_admin

Description
This attribute specifies the symmetric encryption key to be used in the ESP protocol.

When the *encAlgorithm* attribute is set to ***des***, the length of the key must be 16 hex digits. When the *encAlgorithm* attribute is set to ***3des***, the length of the key must be 48 hex digits.

The key itself is stored in an encrypted form.

A warning is issued if the key is weak according to RFC 2409 Appendix A.

Values
String (0..24, Hex)

Default
No default

### ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa authKey

Access
Read: Illegal
Write: System_admin

Description
This attribute specifies the symmetric key to use for the keyed-hash function of the ESP protocol.

When the *authAlgorithm* attribute is set to ***md5***, the length of the key must be 32 hex digits. When *authAlgorithm* attribute is set to ***sha1***, the length of the key must be 40 hex digits.

The key itself is stored in an encrypted form.

| | |
|---|---|
| Values | String (0..24, Hex) |
| Default | No default |

## COMPONENT Vr Ip Filter (Filt)

| | |
|---|---|
| Instance | String (1..20, ASCII) |
| Groups | "GROUP Vr Ip Filt Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip* Filter/<string><br>The Filter component specifies which set of IP packet flows are admitted at a protocol port.<br><br>A Filter component can be assigned to the Ip component and any number of the Pp IpPort components under the same Vr component. A Filter assigned to a Vr Ip component is associated by default with all of the protocol ports on the virtual router. A Filter assigned to a Vr Pp IpPort component is associated with the protocol port only. A Filter assigned at the port overrides a Filter assigned at the virtual router.<br><br>A Filter associated with a protocol port is applied to all ingress IP traffic at that port; it is not applied to egress traffic at that port. Filtering is performed prior to making the forwarding decision that determines the egress port where the packet will be transmitted.<br>If no Filter component is associated with a port (because there is neither an assignment to the Vr Ip component, nor an assignment to the Vr Pp IpPort component) all IP packet flows are admitted at that port.<br><br>A Filter defined under one Vr cannot be assigned to components under another Vr. |

A Filter component must have at least one *FilterFlow* subcomponent where the value of the *action* attribute is ***permit***.

At any time the total number of interface profiles (*CosPolicyGroup*, *DifferentiatedServicesInterface*, and *Filter* components) in the current view plus the total number of newly created interface profiles in the edit view must be less than the system limit, regardless how many interface profiles have been deleted in the edit view. Any interface profile created in the edit view that results in a total count greater than the system limit is identified as invalid and must be deleted; otherwise a *Check Prov* command will produce an error. If invalid interface profiles exist after a software migration prior to a *Check Prov* command, then those interface profiles are ignored and have no impact on IP forwarding. However, a subsequent *Check Prov* command fails until the invalid interface profiles are deleted. It is recommended that all interface profile deletions be activated using the *Activate Prov* command before any new interface profiles are created.

## GROUP Vr Ip Filt Flow Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for the *FilterFlow* component.

## ATTRIBUTE Vr Ip Filt Flow saPrefix

Access: Read and write

Description: This attribute specifies the IP source address prefix for this flow. Matching an actual source address to the prefix is done in conjunction with the *saPrefixLength* attribute.

A source address prefix of 0.0.0.0 means any source IP address is a match regardless of the prefix length.

When the source or destination address of an IP packet matches more than one of the specified flows under a filter, the following precedence rule is applied to determine which filter action to apply:

Given a set of flows with overlapping source addresses, the match made with the most precise source address specification (that is the one with the greatest prefix length) is always given the highest precedence over all the others; once the source address specification is selected in this manner, if there exists several overlapping destination addresses, the match made with the most precise destination address specification (that is the one with the greatest prefix length) is used.

Values: IP address

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Ip Filt Flow saPrefixLength (salen)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of most significant bits of the IP source address that are to be matched with the *saPrefix* attribute. A source prefix length of 0 means any IP source address is a match regardless of the prefix. |
| Values | Decimal (0..32) |
| Default | No default |

### ATTRIBUTE Vr Ip Filt Flow action

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies one of the following two filter actions to be taken for an IP packet that matches this flow:<br>***permit*** : the packet is processed normally<br>***deny*** : the packet is dropped.<br><br>A *Filter* component must have at least one *FilterFlow* subcomponent where the filter action is ***permit***. |
| Values | deny<br>permit |
| Default | permit |

### ATTRIBUTE Vr Ip Filt Flow daPrefix

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP destination address prefix for this flow. Matching an actual destination address to the prefix is done in conjunction with the daPrefixLength attribute.<br><br>A destination address prefix of 0.0.0.0 means any destination IP address is a match regardless of the prefix length.<br><br>When the source or destination address of an IP packet matches more than one of the specified flows under a filter, the following precedence rule is applied to determine which filter action to |

apply:

Given a set of flows with overlapping source addresses, the match made with the most precise source address specification (that is the one with the greatest prefix length) is always given the highest precedence over all the others; once the source address specification is selected in this manner, if there exists several overlapping destination addresses, the match made with the most precise destination address specification (that is the one with the greatest prefix length) is used.

Values: IP address

Default: No default

### ATTRIBUTE Vr Ip Filt Flow daPrefixLength (dalen)

Access: Read and write

Description: This attribute specifies the number of most significant bits of the IP destination address that are to be matched with the *daPrefix* attribute. A destination prefix length of 0 means any IP destination address is a match regardless of the prefix.

Values: Decimal (0..32)

Default: No default

### COMPONENT Vr Ip Multicast (Mcast)

Groups:
"GROUP Vr Ip Mcast AdministrativeControl (AdminControl)"
"GROUP Vr Ip Mcast Provisioned (Prov)"
"GROUP Vr Ip Mcast OsiState (State)"
"GROUP Vr Ip Mcast OperationalStatus (OperStatus)"

Scope: Application

Description: *Vr/<string> Ip Multicast*
This component provides support for IP Multicast. It does the inter semantic check for whether all cards are properly provisioned first.

| | |
|---|---|
| Subcomponents | "COMPONENT Vr Ip Mcast Domain" |
| Opt. Subcomp. | "COMPONENT Vr Ip Mcast Igmp"<br>"COMPONENT Vr Ip Mcast Static"<br>"COMPONENT Vr Ip Mcast PolicyGroup (Pg)"<br>"COMPONENT Vr Ip Mcast PimSparseMode (PimSm)" |
| Dyn. Subcomp. | "COMPONENT Vr Ip Mcast ForwardTable (Fwd)"<br>"COMPONENT Vr Ip Mcast Cache"<br>"COMPONENT Vr Ip Mcast NeighborEntry (Nbr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Ip Mcast AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

## ATTRIBUTE Vr Ip Mcast snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

### GROUP Vr Ip Mcast Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Mcast* component. |

### ATTRIBUTE Vr Ip Mcast borderRouterCapability (brc)

| | |
|---|---|
| Access | Read and write |
| Description | This attributes specifies if this virtual router supports multicast border router functionality. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vr Ip Mcast cacheTableSize (cacheSize)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of entries supported in the IP multicast cache table on each *Lp*. The default is 100 for a CP and 200 for an FP. The value must be multiple of 100 and not more than 500 for FPs and not more than 200 for the CPs. |
| Vector of | Decimal (100..500) |
| Index | Decimal (0..15) |
| Default | ([1] 100, [15] 200) |

### GROUP Vr Ip Mcast OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Ip Mcast adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Vr Ip Mcast operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Ip Mcast usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Mcast OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Ip Mcast snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

## COMPONENT Vr Ip Mcast Igmp

| | |
|---|---|
| Groups | "GROUP Vr Ip Mcast Igmp AdministrativeControl (AdminControl)"<br>"GROUP Vr Ip Mcast Igmp OsiState (State)"<br>"GROUP Vr Ip Mcast Igmp OperationalStatus (OperStatus)" |
| Scope | Application |
| Description | *Vr/<string> Ip Multicast Igmp*<br>This component provides support for the IGMP protocol. The IGMP protocol is used between routers and locally attached hosts to communicate multicast group memebership information. A host sends a membership report in order to join a multicast group. A router periodically sends membership queries on a network to confirm the continued presence of interested hosts. |
| Dyn. Subcomp. | "COMPONENT Vr Ip Mcast Igmp Cache" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Ip Mcast Igmp AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

## ATTRIBUTE Vr Ip Mcast Igmp snmpAdminStatus

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ip Mcast Igmp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Ip Mcast Igmp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Ip Mcast Igmp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Ip Mcast Igmp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Mcast Igmp OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Ip Mcast Igmp snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### COMPONENT Vr Ip Mcast Igmp Cache

| | |

## GROUP Vr Ip Mcast Igmp Cache Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes of the *Cache* component.

## ATTRIBUTE Vr Ip Mcast Igmp Cache upTime

Access: Read only

Description: This attribute indicates the time elapsed since this entry was created.

Values: Time (DHMS)

Default: No default

## ATTRIBUTE Vr Ip Mcast Igmp Cache expiryTime

Access: Read only

Description: This attribute indicates the minimum amount of time remaining before this entry will be aged out.

Values: Time (HMS)

Default: No default

## ATTRIBUTE Vr Ip Mcast Igmp Cache lastReporter

Access: Read only

Description: This attribute indicates the IP address of the source of the last membership report received for this IP multicast group address on this *ProtocolPort*. If no membership report has been received, this attribute has the value 0.0.0.0.

Values: IP address

| | |
|---|---|
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip Mcast Igmp Cache version1HostTimer

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time remaining until the local router will assume that there are no longer any IGMPv1 members on the IP subnet attached to this *ProtocolPort*. Upon hearing any IGMPv1 Membership Report, this value is reset to the group membership timer. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### COMPONENT Vr Ip Mcast Static

| | |
|---|---|
| Groups | "GROUP Vr Ip Mcast Static OsiState (State)" |
| Scope | Application |
| Description | *Vr/<string> Ip Mcast Static*<br>This component provides support for multicast static routes. |
| Opt. Subcomp. | "COMPONENT Vr Ip Mcast Static RouteEntry (Route)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vr Ip Mcast Static OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Ip Mcast Static adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Vr Ip Mcast Static operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Mcast Static usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### COMPONENT Vr Ip Mcast Static RouteEntry (Route)

Instance
gAddr (addr) [IP address]
domain (dom) [Decimal (0..3)]

Groups
"GROUP Vr Ip Mcast Static Route Provisioned (Prov)"

Scope
Application

Description
*Vr/<string> Ip Mcast Static RouteEntry*/<IP Address>,<Domain>
This component represents a multicast static route entry. For a *RouteEntry* to be valid, there should be at least one *outInterface* provisioned.

| Opt. Subcomp. | "COMPONENT Vr Ip Mcast Pg Group (Grp)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Vr Ip Mcast Pg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *PolicyGroup* component. |

### ATTRIBUTE Vr Ip Mcast Pg action

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the action to be taken if a join request is received for any of the multicast group addresses configured as part of this policy. The default action is to deny the join request. |
| Values | deny<br>allow |
| Default | deny |

### ATTRIBUTE Vr Ip Mcast Pg linkToPolicyUser

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a list of IpPorts on which this policy group is applied and all the IpPorts must belong to the same virtual router. |
| List of | Link (Service, mcastPolicyAssignment) |
| List Size | 256 |
| Default | No default |

## COMPONENT Vr Ip Mcast Pg Group (Grp)

| | |
|---|---|
| Instance | gAddr (addr) [IP address]<br>gMask (mask) [IP address] |
| Scope | Application |
| Description | Vr/*<string> Ip Mcast Pg/<string> Group/<IpAddress>, <IpAddress>*<br>This component specifies a range of multicast addresses for which the policy group applies. The range is specified as an IP address and mask combination. There is a limit of 100 *Group* components under the same *PolicyGroup.* |

| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ip Mcast Fwd Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes associated with a multicast forwarding entry. |

### ATTRIBUTE Vr Ip Mcast Fwd age

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds since this route was last updated. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Fwd inProtocolPortName (inPpName)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the name of the (incoming) protocol port from which the route was learned. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Fwd reversePathForwardingNeighbor (rpfNbr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the address of the upstream neighbor (RPF neighbor) from which IP datagrams from these sources to this multicast address are received. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Fwd flags

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates state concerning the forwarding entry. In particular, the flag state indicates wildcard, SPT, RPT, and Reg entries. |
| Values | String (3..20, ASCII) |
| Default | No default |

## ATTRIBUTE Vr Ip Mcast Fwd protocol

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the multicast routing protocol via which this multicast forwarding entry was learned. |
| List of | none<br>other<br>local<br>pimSparse<br>pimDense<br>dvmrp<br>igmp<br>igmpOnly |
| Default | No default |

## COMPONENT Vr Ip Mcast Fwd OutInterface (Oif)

| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Mcast Fwd Oif Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *OutInterface* component. |

### ATTRIBUTE Vr Ip Mcast Fwd Oif ifIndex

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *ifIndex* value of this outgoing interface entry. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Fwd Oif age

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds since this route was last updated |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Fwd Oif outProtocolPort (outPp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the name of the protocol port by which the next hop of this route should be reached. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Fwd Oif protocol

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the multicast routing protocol from which this outinterface entry was learned. |

| | |
|---|---|
| List of | none<br>other<br>local<br>pimSparse<br>pimDense<br>dvmrp<br>igmp<br>igmpOnly |

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Vr Ip Mcast Cache OsiState (State)"<br>"GROUP Vr Ip Mcast Cache Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ip Mcast CacheStats/n*<br>This component represents the IP MCAST cache table on an LP. This component is dynamically created. One per LP so there are 16 of them. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ip Mcast Cache OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Ip Mcast Cache adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Vr Ip Mcast Cache operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Ip Mcast Cache usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vr Ip Mcast Cache Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group houses all the operational attributes of an *Ip* cache table. |

### ATTRIBUTE Vr Ip Mcast Cache entriesFree (ef)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is indicative of the number of free *Ip* cache table entries.<br>A consistently high value for this attribute indicates that there is a resource surplus of the memory requirements for cache table. This surplus could be utilized elsewhere if needed by adjusting the appropriate *cacheTableMaxEntries* attribute. For *Vr*, *cacheTableMaxEntries* is under the *Ip* component; for *Rtr* and *Vrf*, it is under the respective components. |

| | |
|---|---|
| Values | Decimal (0..8000) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Cache totalLookups (tl)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of local cache lookups. It wraps around to zero when it exceeds its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Cache lookupMisses (lm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of local cache lookup misses. It wraps around to zero when it exceeds its maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast Cache cacheTableMaxEntries (ctme)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current maximum number of entries that can exist in the IP local cache table on each LP. |
| Values | Decimal (0..8000) |
| Default | No default |

### COMPONENT Vr Ip Mcast PimSparseMode (PimSm)

| | |
|---|---|
| Groups | "GROUP Vr Ip Mcast PimSm AdministrativeControl (AdminControl)"<br>"GROUP Vr Ip Mcast PimSm OsiState (State)"<br>"GROUP Vr Ip Mcast PimSm OperationalStatus (OperStatus)" |
| Scope | Application |

| | |
|---|---|
| Description | *Vr/<string> Ip Mcast PimSm*<br>The Protocol Independent Multicast Sparse Mode (PIM-SM) component represents a multicast protocol which can be used to efficiently route multicast traffic to multicast groups that may span wide-area internets. The PIM-SM is referred as protocol independent multicast because it is not dependent on any particular unicast routing protocol and it is designed to support groups which are sparsely located. |
| Opt. Subcomp. | "COMPONENT Vr Ip Mcast PimSm Domain" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Vr Ip Mcast PimSm AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

## ATTRIBUTE Vr Ip Mcast PimSm snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## GROUP Vr Ip Mcast PimSm OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Ip Mcast PimSm adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Vr Ip Mcast PimSm operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Mcast PimSm usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Ip Mcast PimSm OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

## ATTRIBUTE Vr Ip Mcast PimSm snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## COMPONENT Vr Ip Mcast PimSm Domain

| | |
|---|---|
| Instance | Decimal (0..3) |
| Groups | "GROUP Vr Ip Mcast PimSm Domain Provisioned (Prov)"<br>"GROUP Vr Ip Mcast PimSm Domain Operational (Oper)"<br>"GROUP Vr Ip Mcast PimSm Domain Statistics (Stats)" |
| Scope | Application |
| Description | Vr/<string> Ip Mcast PimSm domain/n<br>The Domain component represents a logical link to the Domain component under Mcast component. A PIM domain is a set of contiguous routers which implement the PIM protocol configured to operate within a common boundary. Information relevant to a domain are included under the PimSm Domain component. The domain number is checked to ensure it exists under Mcast Domain component. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Vr Ip Mcast PimSm Domain CandidateRendezvousPoint (CRP)"<br>"COMPONENT Vr Ip Mcast PimSm Domain CandidateBootstrapRouter (CBsr)" |
| Dyn. Subcomp. | "COMPONENT Vr Ip Mcast PimSm Domain RendezvousPoint (RpSet)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### VERB RpHash Vr Ip Mcast PimSm Domain

| | |
|---|---|
| Impact | Passive |
| Description | *RpHash -gAddr(Ip Address) Vr/<string> Ip Mcast PimSm Domain/n*<br>The *RpHash* verb is intended for trouble-shooting RP address at the PIM protocol domain level. The verb takes a multicast group (IP) address as an argument and finds the corresponding RP for that group address.<br>If the *RpHash* is successful, it outputs the IP Address of the RP. |

### GROUP Vr Ip Mcast PimSm Domain Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Domain* component under the *PimSm* component. |

### ATTRIBUTE Vr Ip Mcast PimSm Domain joinPruneInterval (jp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the frequency at which PIM Join/Prune messages are transmitted on this PIM domain. |
| Values | Decimal (5..4292967295) |

| | |
|---|---|
| Units | seconds |
| Default | 60 |

### ATTRIBUTE Vr Ip Mcast PimSm Domain sptJoinThreshold (spt)

| | |
|---|---|
| Access | Read and write |
| Description | The attribute specifies the threshold at which the last-hop router joins the shortest-path tree. If immediate is selected then the router immediately joins the shortest path tree upon receipt of the first data packet. If never is selected then the router never joins the shortest path tree. |
| Values | immediate<br>never |
| Default | never |

### GROUP Vr Ip Mcast PimSm Domain Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Domain* component under the *PimSm* component. |

### ATTRIBUTE Vr Ip Mcast PimSm Domain bsrAddress (bsr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the bootstrap router (BSR) for this PIM domain. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain bsrExpiryTimer (bsrExpiry)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum time remaining before the bootstrap router in this domain will be declared down. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

## GROUP Vr Ip Mcast PimSm Domain Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attributes of the *Domain* component under the *PimSm* component. |

## ATTRIBUTE Vr Ip Mcast PimSm Domain txBsrMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Bootstrap Message transmitted by the BootStrap Router (BSR) for this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## ATTRIBUTE Vr Ip Mcast PimSm Domain rxBsrMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Bootstrap Message received by this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## ATTRIBUTE Vr Ip Mcast PimSm Domain txCRpAdvMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Candidate-RP Advertisement Message transmitted by the configured C-RP for this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## ATTRIBUTE Vr Ip Mcast PimSm Domain rxCRpAdvMsgs

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the Candidate-RP Advertisement Message received by the BootStrap Router (BSR) for this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain txHelloMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Hello Message transmitted from PimIf belonging to this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |

| Description | This attribute counts the Assert Message received by this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain txJPMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the JP Message transmitted for this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain rxJPMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the JP Message received by this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain discardBsrMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Bootstrap Message discarded by this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain discardCRpAdvMsgs

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the Candidate-RP Advertisement Message discarded by the BootStrap Router (BSR) for this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain discardHelloMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Hello Message discarded if it is not destined for this virtual router.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain discardRegisterMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Register Message discarded if this virtual router is not the RP for this PIM domain.<br>This counter wraps to zero when the maximum value is exceeded. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Vr Ip Mcast PimSm Domain discardRegisterStopMsgs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Register-Stop Message discarded.<br>This counter wraps to zero when the maximum value is exceeded. |

### GROUP Vr Ip MBgp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *MBgp* component. |

### ATTRIBUTE Vr Ip MBgp defaultMBgpRtePreference (pref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default routing preference assigned to MBGP routes for this virtual router. A lower value indicates a more preferred route. |
| Values | Decimal (1..253) |
| Default | 123 |

### ATTRIBUTE Vr Ip MBgp importRoutesLimit (importl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of MBGP routes to be imported to this virtual router's routing table from the associated VCG virtual router. |
| Values | Decimal (1..65535) |
| Default | 300 |

### ATTRIBUTE Vr Ip MBgp exportRoutesLimit (exportl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of routes to be exported from this virtual router's routing table to the MBGP routing database of the associated VCG virtual router. |
| Values | Decimal (1..65535) |
| Default | 50 |

### GROUP Vr Ip MBgp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *MBgp* component. |

### ATTRIBUTE Vr Ip MBgp importRoutes

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of MBGP routes that have been imported to this virtual router's routing table from the associated VCG virtual router. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip MBgp exportRoutes

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of MBGP routes that have been exported from this virtual router's routing table to the MBGP routing database of the associated VCG virtual router. Only routes that are allowed to be exported by the export policies are included in this number. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## GROUP Vr Ip MBgp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Vr Ip MBgp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Vr Ip MBgp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip MBgp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

Groups
"GROUP Vr Ip MBgp Import Provisioned (Prov)"

Scope
Application

Description

*Vr/<string> Ip MBgp ImportPolicy/n*
Each instance of this component defines a MBGP import policy. A MBGP import policy is used to decide whether certain routing information learned from the associated VCG BGP instance is to be used or ignored.

If no import policy is provisioned, MBGP accepts all routes received from the associated VCG BGP. If multiple import policies are provisioned, the policy with the most specific match to the received route is applied.

Example 1:
Two import policies are defined:
*vr/0 ip mbgp import/1*, *peer* = ***0.0.0.0***, *usageFlag* = ***use***
*vr/0 ip mbgp import/2*, *peer* = ***47.138.190.1***, *usageFlag* = ***ignore***
This example specifies that MBGP should import all routes from the MBGP routing database of the associated VCG virtual router, except routes learned from the VCG peer 47.138.190.1.

Example 2:
Two import policies are defined:
*vr/0 ip mbgp import/1*, *peer* = ***0.0.0.0***, *usageFlag* = ***use***
*vr/0 ip mbgp import/2*, *peer* = ***47.138.190.1***, *usageFlag* = ***ignore***
*vr/0 ip mbgp import/2 network/1*, *prefix* = ***50.0.0.0***, *length* = ***8***
This example specifies that MBGP should import all routes from the MBGP routing database of the associated VCG virtual router, except routes learned from the VCG peer 47.138.190.1 which match the network prefix address 50.0.0.0/8.

## GROUP Vr Ip MBgp Import Provisioned (Prov)

Properties

Provisioned

| | |
|---|---|
| Description | This group contains the provisionable attributes for the *ImportPolicy* component. |

### ATTRIBUTE Vr Ip MBgp Import vcgPeerIpAddress (vcgPeer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address of the peer from which MBGP routes are learned. A value of ***0.0.0.0*** matches any peer IP address. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip MBgp Import usageFlag (usage)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether this virtual router uses or ignores MBGP routing entries which match the criteria for this import policy. |
| Values | use<br>ignore |
| Default | use |

### ATTRIBUTE Vr Ip MBgp Import originAs

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the autonomous system number where the routes were originated. A value of 0 for this attribute means origin AS number will match any AS number. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip MBgp Import originProtocol

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the protocols that originated the routes. A value of ***incomplete*** for this attribute means this |

information is not available. A value of ***any*** for this attribute means that any originating protocol will match this import policy.

Values
any
igp
egp
incomplete

Default
any

### ATTRIBUTE Vr Ip MBgp Import asPathExpression (asExpr)

Access
Read and write

Description
This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the received update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280.
The basic syntax of a regular expression is a list of AS number separated by a space which make up a AS path.
The following characters has the special meaning:
‘.’ - Matches any AS number.
‘^n’ - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path.
‘n$’ - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path.
‘[n1 ... n2]’ - Matches any AS number that appeared in the set n1 ...
n2.
‘n1 - n2’ - Matches any AS number between the range of n1 and n2.
‘()’ - is supported to change the order of evaluation.
‘n*’ - Matches 0 or more occurrences of n, where n can be a set, range or AS number.
‘n+’ - Matches 1 or more occurrences of n, where n can be a set, range or AS number.
‘n?’ - Matches 0 or 1 occurrences of n, where n can be a AS set, range or number.
The following logical operators are evaluated in decending order:
‘NOT’ - Given a regular expression x, NOT x matches the AS

number pattern that is not matched by x.
‘AND’- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y.
‘OR’ - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y.
For example: The AS path “5 4 3 2 1”, where 1 is the origin AS, would be match by any one of the following regular expressions:
***1$,***
***^5,***
***4 3,***
***5 3 - 4*,***
***5 [4 3 2] not10 2 1,***
***not (6 7 8 9 10) and 5 4 .* 1***
Empty regular expression implies a match on all AS path.

Values: String (0..255, ASCII)

Default: No default

### ATTRIBUTE Vr Ip MBgp Import communityExpression (comExpr)

Access: Read and write

Description: This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280.
The basic syntax of a regular expression is a list of Community number seperated by a space which make up a Community attribute.
The following characters has the special meaning:
‘[n1 ... n2]’ - Matches any Community number that appeared in the
set n1 ...n2.
‘n1 - n2’ - Matches any Community number between the range of n1 and n2.
‘()’ - is supported to change the order of evaluation.
‘n*’ - Matches 0 or more occurrences of n, where n can be a set, range or Community number.
‘n+’ - Matches 1 or more occurrences of n, where n can be a set, range or Community number.

‘n?’ - Matches 0 or 1 occurrences of n, where n can be a set, range or number.
The following logical operators are evaluated in decending order:
‘NOT’ - Given a regular expression x, NOT x matches the Community attribute that is not matched by x.
‘AND’- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y.
‘OR’ - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y.
For example: The Community path “1 2 3 4 5” would be match by any one of the following regular expression:
***1,***
***5,***
***4 3,***
***2 3 - 4*,***
***1 [3 4 2]+,***
***not (6 7 8 9 10) and 1 2***
Empty regular expression implies a match on all Community path.

Values: String (0..255, ASCII)

Default: No default

## ATTRIBUTE Vr Ip MBgp Import matchPreference (matchPref)

Access: Read and write

Description: This attribute specifies the relative preference of the policy which use the keys *asPathExpression* and *communityExpression*. This attribute is ignored if attributes *asPathExpression* and *communityExpression* are both empty. This attribute is used to break the tie when two import policies’ expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy. Two import policies having the same *matchPreference* are considered duplicate policies if the *asPathExpression* attribute and the *communityExpression* attribute are not both empty.

Values: Decimal (0..255)

| | |
|---|---|
| Default | 128 |

### ATTRIBUTE Vr Ip MBgp Import localPreference (locPrf)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the degree of preference for those routes that match the criteria of this import policy. A higher value indicates a more preferred route. A value of 0 for this attribute means that the local preference value remains unchanged. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ip MBgp Import mbgpRtePreference (mbgpPref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the routing preference of MBGP routes matching this import policy. A lower value means the route is more preferred. If ***sameAsMBgp*** is specified, the value of *defaultMbgpRtePref* set under the *MBgp* component is used. Otherwise the value of this attribute will be used as the routing preference. |
| Values | Decimal (1..253)<br>sameAsMBgp |
| Default | sameAsMBgp |

### COMPONENT Vr Ip MBgp Import Network (Net)

| | |

## GROUP Vr Ip MBgp Import Net Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for the *Network* component.

## ATTRIBUTE Vr Ip MBgp Import Net prefix

Access: Read and write

Description: This attribute specifies the network address prefix. The prefix length is specified by the *length* attribute.

Values: IP address

Default: No default

## ATTRIBUTE Vr Ip MBgp Import Net length

Access: Read and write

Description: This attribute specifies the length of the network address prefix. The prefix is specified by the *prefix* attribute.

Values: Decimal (1..32)

Units: bits

Default: No default

## COMPONENT Vr Ip MBgp ExportPolicy (Export)

Instance: Decimal (0..65535)

Groups: "GROUP Vr Ip MBgp Export Provisioned (Prov)"

Scope: Application

Description

*Vr/<string> Ip MBgp ExportPolicy/n*
Each instance of this component defines a MBGP export policy. A MBGP export policy is used to decide whether locally learned routing information is to be sent or blocked.

If no export policy is provisioned, MBGP exports all routes into the MBGP routing database of the associated VCG virtual router, except those learned from IBGP and MBGP. If multiple export policies are provisioned, the policy with the most specific match to the route is applied.

Example 1:
Two export policies are defined:
*vr/0 ip mbgp export/1, protocol =* ***all,*** *advertiseStatus =* ***send***
*vr/0 ip mbgp export/2, protocol =* ***rip****, advertiseStatus =* ***block***
This example specifies that MBGP should export all routes in this virtual router's routing table, except routes learned from RIP.

Example 2:
Two export policies are defined:
*vr/0 ip mbgp export/2, protocol =* ***all****, advertiseStatus =* ***send***
*vr/0 ip mbgp export/3, protocol =* ***rip****, advertiseStatus =* ***block***
*vr/0 ip mbgp export/3 network/1, prefix =* ***47.0.0.0****, length =* ***8***
This example specifies that MBGP exports all routes in this virtual router's routing table except routes learned from RIP which match the network address prefix 47.0.0.0/8.

## GROUP Vr Ip MBgp Export Provisioned (Prov)

Properties

Provisioned

Description

This group contains the provisionable attributes for the *Export* component.

### ATTRIBUTE Vr Ip MBgp Export protocol

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which protocol the export policy applies to. If the value is ***all***, the export policy is applied to routes from all protocols in the IP routing table. |
| Values | all<br>rip<br>ospfInternal<br>ospfExternal<br>staticLocal<br>staticRemote<br>bgpInternal<br>bgpExternal<br>bgpAggregate |
| Default | all |

### ATTRIBUTE Vr Ip MBgp Export advertiseStatus (advertise)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether routing data which match the criteria for this policy are exported. |
| Values | send<br>block |
| Default | send |

### ATTRIBUTE Vr Ip MBgp Export bgpAsId (bgpAs)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the adjacent autonomous system (AS) number of the routes as a matching criteria. This corresponds to the first AS number in the AS Path.<br><br>When this value is non-zero, the *protocol* attribute must be set to either ***bgpInternal*** or ***bgpExternal***. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Vr Ip MBgp Export ospfTag

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the OSPF tag when the *protocol* attribute is set to either ***ospfInternal*** or ***ospfExternal***. The default tag value 4294967295 (FFFFFFFF in hex) indicates that the tag is not specified. |
| Values | Hex (H.0..H.ffffffff) |
| Default | H.ffffffff |

### ATTRIBUTE Vr Ip MBgp Export ripInterface (ripIf)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the local RIP interface where the routes are learned from.<br><br>The *ripInterface* attribute when non-zero should be equal to one of the IP addresses provisioned as a *LogicalIf* component under *IpPort*. Otherwise, this attribute will be ignored.<br><br>The value of the *protocol* attribute must be set to ***rip*** if the value for the *ripInterface* attribute is non-zero. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Vr Ip MBgp Export ripNeighbor (ripNbr)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute specifies the RIP neighbor where the routes were learned from.<br><br>The value of the *protocol* attribute must be set to ***rip*** if the value for the *ripNeighbor* attribute is non-zero. |
| Values | IP address |
| Default | 0.0.0.0 |

## ATTRIBUTE Vr Ip MBgp Export asPathExpression (asExpr)

| | |
|---|---|
| Access | Read and write |
| Description | This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the export update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280.<br>The basic syntax of a regular expression is a list of AS number separated by a space which make up a AS path.<br>The following characters has the special meaning:<br>‘.’ - Matches any AS number.<br>‘^n’ - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path.<br>‘n$’ - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path.<br>‘[n1 ... n2]’ - Matches any AS number that appeared in the set n1 ...<br>n2.<br>‘n1 - n2’ - Matches any AS number between the range of n1 and n2.<br>‘()’ - is supported to change the order of evaluation.<br>‘n*’ - Matches 0 or more occurrences of n, where n can be a set, range or AS number.<br>‘n+’ - Matches 1 or more occurrences of n, where n can be a set, range or AS number.<br>‘n?’ - Matches 0 or 1 occurrences of n, where n can be a set, range or number.<br>The following logical operators are evaluated in decending order:<br>‘NOT’ - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x.<br>‘AND’- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y.<br>‘OR’ - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y.<br>For example: The AS path “5 4 3 2 1”, where 1 is the origin AS, would be match by any one of the following regular expressions: |

***1$,***
***^5,***
***4 3,***
***5 3 - 4*,***
***5 [4 3 2] not10 2 1,***
***not (6 7 8 9 10) and 5 4 .* 1***
Empty regular expression implies a match on all AS path.

Values: String (0..255, ASCII)

Default: No default

### ATTRIBUTE Vr Ip MBgp Export communityExpression (comExpr)

Access: Read and write

Description: This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280.
The basic syntax of a regular expression is a list of Community number separated by a space which make up a Community attribute.
The following characters has the special meaning:
‘[n1 ... n2]’ - Matches any Community number that appeared in the
set n1 ...n2.
‘n1 - n2’ - Matches any Community number between the range of n1 and n2.
‘()’ - is supported to change the order of evaluation.
‘n*’ - Matches 0 or more occurrences of n, where n can be a set, range or Community number.
‘n+’ - Matches 1 or more occurrences of n, where n can be a set, range or Community number.
‘n?’ - Matches 0 or 1 occurrences of n, where n can be a set, range or number.
The following logical operators are evaluated in decending order:
‘NOT’ - Given a regular expression x, NOT x matches the Community attribute that is not matched by x.
‘AND’- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y.
‘OR’ - Given two regular expressions x and y, x OR y

matches the union of the Community attribute that are matched by x and those are matched by y.
For example: The Community path “1 2 3 4 5” would be match by any one of the following regular expression:
***1,***
***5,***
***4 3,***
***2 3 - 4*,***
***1 [3 4 2]+,***
***not (6 7 8 9 10) and 1 2***
Empty regular expression implies a match on all Community path.

Values: String (0..255, ASCII)

Default: No default

### ATTRIBUTE Vr Ip MBgp Export matchPreference (matchPref)

Access: Read and write

Description: This attribute specifies the relative preference of the policy which use the keys *asPathExpression* and *communityExpression*. This attribute is ignored if attributes *asPathExpression* and *communityExpression* are both empty. This attribute is used to break the tie when two export policies’ expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy. Two export policies having the same *matchPreference* are considered duplicate policies if the *asPathExpression* attribute and the *communityExpression* attribute are not both empty.

Values: Decimal (0..255)

Default: 128

### ATTRIBUTE Vr Ip MBgp Export localPreference (locPrf)

Access: Read and write

Description: This attribute specifies the value of the LOCAL_PREFERENCE path attribute in routes exported to the VCG. A value of 0 means that the local preference value remains unchanged.

Values: Decimal (0..4294967295)

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Ip MBgp Export insertDummyAs (insertAs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the AS number(s) to be inserted into the AS Path Attribute. The value is a sequence of AS number separated by period(.). For example, if the value is ***20.20.30***, the AS numbers 20, 20 and 30 would be inserted at the end of the AS Path Attribute just before the local AS number. The number of AS(s) specified by the attribute can not exceed 25. And the value of each AS number must be within the range of 1 to 65535. |
| Values | Integer Sequence |
| Default | No default |

### ATTRIBUTE Vr Ip MBgp Export sendCommunity (sendCom)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates which community number this export policy will pass to the VCG. If the value is set to 0, the Community value remains unchanged. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Ip MBgp Export Network (Net)

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Vr Ip MBgp Export Net Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ip MBgp Import/n Network/n*<br>*Vr/<string> Ip MBgp Export/n Network/n*<br>Each *Network* component instance specifies a destination network address prefix that this MBGP import or export policy applies to.<br><br>If no *Network* component is provisioned under the *Policy* |

component, the policy applies to all destination network address prefixes.

## GROUP Vr Ip Vrrp AdministrativeControl (AdminControl)

Properties

Provisioned

Description

This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.

## ATTRIBUTE Vr Ip Vrrp snmpAdminStatus

Access

Read and write

Description

The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.

Values

up
down
testing

Default

up

## GROUP Vr Ip Vrrp OperationalStatus (OperStatus)

Properties

Operational

Description — This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Ip Vrrp snmpOperStatus

Access — Read only

Description — The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values — up
down
testing

Default — up

### GROUP Vr Ip Vrrp OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Ip Vrrp adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vr Ip Vrrp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ip Vrrp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vr Ip Rtd usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

Values idle
active (activ)
busy

Default idle

## COLLECTED STATS VirtualRouter Ip Rtd

Description The statistics record generated by the VirtualRouter Ip Rtd component.

### ATTRIBUTE Vr Ip Rtd localNodeIdentifier

Description This attribute identifies the node by a unique number assigned to each node. This value is provisioned in the attribute *namsId* of the component *ModuleData*.

Values Decimal (256..49151)

### ATTRIBUTE Vr Ip Rtd ipVcgInstance

Description This attribute indicates which VCG VR generated the statistics record

Values String (1..16, ASCII)

### ATTRIBUTE Vr Ip Rtd localVcgIpAddress

Description This attribute indicates the VCG loopback IP address of the VCG VR that generated the statistics record.

Values IP address

### ATTRIBUTE Vr Ip Rtd remoteVcgIpAddress

Description This attribute indicates the remote VCG destination address that will have the delays measured.

Values IP address

### ATTRIBUTE Vr Ip Rtd framesSent

Description This attribute contains the number of frames transmitted by the *Virtual Carrier Gateway* during the latest interval.

| | |
|---|---|
| Vector of | Decimal (1..5) |
| Index | Decimal (0..3) |

### ATTRIBUTE Vr Ip Rtd framesReceived

| | |
|---|---|
| Description | This attribute contains the number of frames received by the *Virtual Carrier Gateway during* the collection interval. |
| Vector of | Decimal (1..5) |
| Index | Decimal (0..3) |

### ATTRIBUTE Vr Ip Rtd sample1StartTime

| | |
|---|---|
| Description | This attribute represents the timestamp when the first sample was sent to this remote *Virtual Carrier Gateway.* |
| Values | Time (DHMS) |

### ATTRIBUTE Vr Ip Rtd RoundTripDelays1

| | |
|---|---|
| Description | This attribute indicates an array of round trip delays for the first sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3). |
| Vector of | Decimal (0..65535) |
| Index | Decimal (0..3) |

### ATTRIBUTE Vr Ip Rtd sample2StartTime

| | |
|---|---|
| Description | This attribute represents the timestamp when the second sample of packets was sent to this remote *Virtual Carrier Gateway.* |
| Values | Time (DHMS) |

### ATTRIBUTE Vr Ip Rtd RoundTripDelay2

| | |
|---|---|
| Description | This attribute indicates an array of round trip delays for the second sample of packets received by the *Virtual Carrier* |

| | |
|---|---|
| | *Gateway* during the last monitoring session, for each class of service (0 to 3) |
| Vector of | Decimal (0..65535) |
| Index | Decimal (0..3) |

### ATTRIBUTE Vr Ip Rtd sample3StartTime

| | |
|---|---|
| Description | This attribute represents the timestamp when the third sample of packets was sent to this remote *Virtual Carrier Gateway*. |
| Values | Time (DHMS) |

### ATTRIBUTE Vr Ip Rtd RoundTripDelay3

| | |
|---|---|
| Description | This attribute indicates an array of round trip delays for the third sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3) |
| Vector of | Decimal (0..65535) |
| Index | Decimal (0..3) |

### ATTRIBUTE Vr Ip Rtd sample4StartTime

| | |
|---|---|
| Description | This attribute represents the timestamp when the fourth sample of packets was sent to this remote *Virtual Carrier Gateway*. |
| Values | Time (DHMS) |

### ATTRIBUTE Vr Ip Rtd RoundTripDelay4

| | |
|---|---|
| Description | This attribute indicates an array of round trip delays for the fourth sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3). |
| Vector of | Decimal (0..65535) |
| Index | Decimal (0..3) |

### ATTRIBUTE Vr Ip Rtd sample5StartTime

| | |
|---|---|
| Description | This attribute represents the timestamp when the fifth sample of packets was sent to this remote *Virtual Carrier Gateway*. |

| | |
|---|---|
| Values | Time (DHMS) |

### ATTRIBUTE Vr Ip Rtd RoundTripDelay5

| | |
|---|---|
| Description | This attribute indicates an array of round trip delays for the fifth sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3). |
| Vector of | Decimal (0..65535) |
| Index | Decimal (0..3) |

### COMPONENT Vr Ip Rtd VcgDestAddr

| | |
|---|---|
| Instance | addr [IP address]<br>cos [0<br>1<br>2<br>3] |
| Groups | "GROUP Vr Ip Rtd VcgDestAddr Operational (Oper)"<br>"GROUP Vr Ip Rtd VcgDestAddr Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Ip Rtd VcgDestAddr/IP, COS*<br>This component is indexed by the IP address of the peer for which the round trip delay is measured. Each IP entry in the table is uniquely defined by its IP address and Class of Service (CoS) index |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ip Rtd VcgDestAddr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status attributes of the *VcgDestAddr* component. This component is a table that contains all destination addresses (both static and dynamic). Each IP entry |

in the table is uniquely defined by its IP address and Class of Service (CoS) index.

### ATTRIBUTE Vr Ip Rtd VcgDestAddr time

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the start time of the latest RTD session for this remote VCG. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Vr Ip Rtd VcgDestAddr size

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the size of the ICMP IP packets used to calculate the round trip delay measurement in the latest session. |
| Values | Decimal (30..4096) |
| Default | No default |

### GROUP Vr Ip Rtd VcgDestAddr Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attributes of the *DstAddr* component. This component is a table that contains all destination addresses, both static and dynamic. Each IP entry in the table is uniquely defined by its IP address and Class of Service index. |

### ATTRIBUTE Vr Ip Rtd VcgDestAddr minRoundTripDelay (minRtd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum of the round trip delays measured in the last monitoring session. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Vr Ip Rtd VcgDestAddr maxRoundTripDelay (maxRtd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum of the round trip delays measured in the last monitoring session. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Vr Ip Rtd VcgDestAddr avgRoundTripDelay (avgRtd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the average of the round trip delay measurements in the last monitoring session. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Vr Ip Rtd VcgDestAddr framesTransmitted (frmTx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of RTD frames transmitted to this remote destination address. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (1..5) |
| Default | No default |

### ATTRIBUTE Vr Ip Rtd VcgDestAddr framesReceived (frmRx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of frames that have been received and have the delays calculated in the last measurement session. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (1..5) |

| | |
|---|---|
| Default | No default |

## COMPONENT Vr Ipx

| | |
|---|---|
| Groups | "GROUP Vr Ipx AdministrativeControl (AdminControl)"<br>"GROUP Vr Ipx Provisioned (Prov)"<br>"GROUP Vr Ipx OsiState (State)"<br>"GROUP Vr Ipx OperationalStatus (OperStatus)"<br>"GROUP Vr Ipx Operational (Oper)"<br>"GROUP Vr Ipx Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Ipx*<br>This component provides for routing of Novell IPX packets in Novell's NetWare environment. |
| Subcomponents | "COMPONENT Vr Ipx Rip"<br>"COMPONENT Vr Ipx Sap" |
| Opt. Subcomp. | "COMPONENT Vr Ipx NetSentry (Ns)" |
| Dyn. Subcomp. | "COMPONENT Vr Ipx Forwarding (Fwd)"<br>"COMPONENT Vr Ipx Services (Srvc)"<br>"COMPONENT Vr Ipx Adjacencies (Adj)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### VERB Ping Vr Ipx

| | |
|---|---|
| Impact | Passive |
| Description | *Ping -network (<network number>) [-node (<node number>)]*<br><br>The ping verb allows the user to test the ability of an interface to contact other nodes.<br><br>The *-network* option is used to receive responses from all nodes on that network.<br>The *-node* option is used to or specify a particular node to ping.<br><br>The nodes are given two seconds to respond. All responses received within the two second wait period will be displayed to the user. Pinging a remote wan link or network will produce unexpected results. Pinging a local wan link or network is invalid. |

### GROUP Vr Ipx AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Ipx snmpAdminStatus

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ipx Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | IPX system provisionable attributes. |

### ATTRIBUTE Vr Ipx networkNumber

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the internal network number portion of the IPX address. This network number must be unique within the internetwork and is necessary to determine master/slave relationships during IPXWAN negotiations. |
| Values | String (1..4, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Vr Ipx maxPathSplits (maxPaths)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the maximum number of paths with equal routing metric value which this instance of IPX may split between when forwarding packets. |
| Values | Decimal (1..4) |
| Default | 1 |

### ATTRIBUTE Vr Ipx maxHops (hops)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the maximum number of hops a packet may take. |
| Values | Decimal (1..64) |
| Default | 16 |

### ATTRIBUTE Vr Ipx ripUpdateInterval (rUpd)

| | |
|---|---|
| Access | Read and write |
| Description | The RIP periodic update interval, in seconds. |
| Values | Decimal (1..255) |
| Units | seconds |

| | |
|---|---|
| Default | 60 |

### ATTRIBUTE Vr Ipx sapUpdateInterval (sUpd)

| | |
|---|---|
| Access | Read and write |
| Description | The SAP periodic update interval, in seconds. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE Vr Ipx controlDelay (ctrlDelay)

| | |
|---|---|
| Access | Read and write |
| Description | The delay, in microsecs, between receiving a request from a client and sending a response. This router is significantly faster than some Ipx clients. If a problem is being experienced between a router and an Ipx client, it might be resolved by changing the *controlDelay.* |
| Values | Decimal (1..30) |
| Units | microsec |
| Default | 1 |

### ATTRIBUTE Vr Ipx updateDelay (updDelay)

| | |
|---|---|
| Access | Read and write |
| Description | The delay, in milliseconds, between sending consecutive (RIP and/or SAP) packets. 55 milliseconds is the minimum specified in the Ipx Router Specification. |
| Values | Decimal (55..500) |
| Units | msec |
| Default | 55 |

### ATTRIBUTE Vr Ipx ripAgeMultiplier (rAge)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | After this many Rip Update intervals unrefreshed Rip information is considered expired. |
| Values | Decimal (1..10) |
| Default | 3 |

### ATTRIBUTE Vr Ipx sapAgeMultiplier (sAge)

| | |
|---|---|
| Access | Read and write |
| Description | After this many SAP Update intervals unrefreshed SAP information is considered expired. |
| Values | Decimal (1..10) |
| Default | 3 |

### ATTRIBUTE Vr Ipx damping (damp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether damping is applied. Damping refers to the damping of incoming RIP and SAP requests. It handles cases where a rogue client or server is making an extraodinary number of requests. With *damping* set to ***disabled***, the switch will reply to all requests with no check for rogue nodes.With *damping* set to ***enabled***, the switch will not reply to a request if the same node made more than the allowable number of requests within 10 seconds. The maximum number of requests to damp at is specified by the following provisionable attributes: *ripMaxDampedGeneralRequest*, *ripMaxDampedSpecificRequests*, *sapMaxDampedGeneralRequests*, *sapMaxDampedSpecificRequests*. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Vr Ipx ripMaxDampedGeneralRequests (rDampGenReqs)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute is only used when the attribute *damping* is ***enabled***. It is used to limit the average rate at which the switch responds to general RIP requests. If more than this number are received within a ten second interval, the first *ripMaxDampedGeneralRequests* are responded to and the remainder are ignored. |
| Values | Decimal (1..100) |
| Default | 1 |

### ATTRIBUTE Vr Ipx ripMaxDampedSpecificRequests (rDampSpecReqs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is only used when the attribute *damping* is ***enabled***. It is used to limit the average rate at which the switch responds to specific RIP requests. If more than this number are received within a ten second interval, the first *ripMaxDampedSpecificRequests* are responded to and the remainder are ignored. |
| Values | Decimal (1..100) |
| Default | 4 |

### ATTRIBUTE Vr Ipx sapMaxDampedGeneralRequests (sDampGenReqs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is only used when the attribute *damping* is ***enabled***. It is used to limit the average rate at which the switch responds to general SAP requests. If more than this number are received within a ten second interval, the first *sapMaxDampedGeneralRequests* are responded to and the remainder are ignored. |
| Values | Decimal (1..100) |
| Default | 1 |

### ATTRIBUTE Vr Ipx sapMaxDampedSpecificRequests (sDampSpecReqs)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute is only used when the attribute *damping* is ***enabled***. It is used to limit the average rate at which the switch responds to specific SAP requests. If more than this number are received within a ten second interval, the first *sapMaxDampedSpecificRequests* are responded to and the remainder are ignored. |
| Values | Decimal (1..100) |
| Default | 4 |

### ATTRIBUTE Vr Ipx initialGeneralRequests (genReqs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the RIP and SAP general requests are sent out a port when the port first comes up. If this attribute is ***enabled*** the initial requests will be made; whereas if the attribute is ***disabled*** the initial requests will not be made. This attribute may be disabled in order to avoid the traffic resulting within the network from these initial requests and the ensuing responses. With the initial request ***disabled***, the switch will learn about other network segments off of the IPX ports via the periodic broadcasts which are received on those port. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Vr Ipx holdDownInterval (hold)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies an interval, after a network is removed from the route table, during which other incoming route updates for the same network will be ignored. The use of this interval prevents the slow convergence which results when switches that receive late network down broadcasts advertise false routes. |
| Values | Decimal (0..255) |
| Units | seconds |
| Default | 10 |

### GROUP Vr Ipx OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vr Ipx adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Ipx operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Ipx usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Ipx OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vr Ipx snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Ipx Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains IPX related operational attributes. |

### ATTRIBUTE Vr Ipx protocolPortCount (ppCnt)

| | |
|---|---|
| Access | Read only |
| Description | The number of portsknown to this instance of Ipx. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE Vr Ipx destinationCount (destCnt)

| | |
|---|---|
| Access | Read only |
| Description | The number of currently reachable destinations known to Ipx. |
| Values | Decimal (0..65535) |
| Default | 65535 |

### ATTRIBUTE Vr Ipx servicesCount (srvCnt)

| | |
|---|---|
| Access | Read only |
| Description | The number of Services known to Ipx. |

| | |
|---|---|
| Values | Decimal (0..65535) |
| Default | 65535 |

### GROUP Vr Ipx Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains IPX related statistics on the CP. |

### ATTRIBUTE Vr Ipx inReceives

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of IPX packets received, including those received in error. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx inHeaderErrors

| | |
|---|---|
| Access | Read only |
| Description | The number of IPX packets discarded due to errors in their headers, including any IPX packet with a size less than the minimum of 30 bytes. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx inUnknownSocket

| | |
|---|---|
| Access | Read only |
| Description | The number of IPX packets discarded because the destination socket was not open. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx inDiscards

| | |
|---|---|
| Access | Read only |
| Description | Number of packets received but discarded due to reasons other than those accounted for by *inHeaderErrors* and *inUnknownSocket*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx inBadChecksums

| | |
|---|---|
| Access | Read only |
| Description | Number of packets received with incorrect checksums. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx inDelivers

| | |
|---|---|
| Access | Read only |
| Description | Number of IPX packets delivered locally, including packets from local applications. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx noRoutes

| | |
|---|---|
| Access | Read only |
| Description | Number of times no route to a destination was found. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Ipx outRequests

| | |
|---|---|
| Access | Read only |
| Description | The number of IPX packets supplied locally for transmission, not including any packets counted in the *forwarded* attribute. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx outMalformedRequests

| | |
|---|---|
| Access | Read only |
| Description | Number of outgoing packets supplied locally that contained errors in their structure. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx outDiscards

| | |
|---|---|
| Access | Read only |
| Description | The number of outgoing IPX packets discarded due to reasons other than those accounted for in *outMalformedRequests* or *outFiltered*. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx outPackets

| | |
|---|---|
| Access | Read only |
| Description | The total number of IPX packets transmitted. This counter wraps around to zero after reaching the maximum value of 4294967295. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx inTooManyHops

| | |
|---|---|
| Access | Read only |
| Description | Number of packets discarded due to exceeding the *maxHops* value. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx inFiltered

| | |
|---|---|
| Access | Read only |
| Description | The number of incoming IPX packets discarded due to filtering. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx inNetBIOS

| | |
|---|---|
| Access | Read only |
| Description | The number of NetBIOS packets received. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx forwarded

| | |
|---|---|
| Access | Read only |
| Description | The number of IPX packets forwarded. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Ipx outFiltered

| | |
|---|---|
| Access | Read only |
| Description | The number of outgoing packets discarded due to filtering. This also includes the number of forwarded packets filtered. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Ipx Rip

| | |
|---|---|
| Groups | "GROUP Vr Ipx Rip Statistics (Stats)" |
| Scope | Application |
| Description | *Vr/<string> Ipx Rip*<br>The Routing Information Protocol (RIP) exchanges IPX route information that is used to maintain the routing table. Routing information is added to the route table for all known networks whose hops count is equal to or less than the value provisioned for *maxHops*, and is propagated for networks less than *maxHops* away. |
| Opt. Subcomp. | "COMPONENT Vr Ipx Rip RipFilter (RFltr)"<br>"COMPONENT Vr Ipx Rip RipApplyEntry (RipApp)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Ipx Rip Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | IPX statistics related to the RIP protocol. |

### ATTRIBUTE Vr Ipx Rip ripIn

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of IPX RIP packets received. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx Rip ripOut

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of RIP packets locally generated and sent out. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Ipx Rip ripIncorrectPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times an incorrectly formatted RIP packet was received. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Ipx Rip RipFilter (RFltr)

| | |
|---|---|
| Instance | Decimal (1..4294967295) |
| Groups | "GROUP Vr Ipx Rip RFltr Provisioned (Prov)"<br>"GROUP Vr Ipx Rip RFltr Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Ipx Rip RipFilter*<br>RIP filters remove the specified service advertisements from RIP packets passing through this IPX router instance thereby filtering knowledge of those network routes. This is done by telling the router to ignore certain advertised networks present in incoming |

RIP packet tuples and/or omit certain networks from outgoing RIP packet advertisements. The networks are indicated by the attributes *hops*, *ticks*, *networkNumber*, *node* and *port*. For a given filter, networks matching all the attributes of that filter are filtered or passed depending on the *disposition* of the filter. RIP filters are applied as input or output filters via the *RipApplyEntry* component.

## GROUP Vr Ipx Rip RFltr Provisioned (Prov)

Properties: Provisioned

Description: This is the provisionable attribute group for *RipFilter*.

## ATTRIBUTE Vr Ipx Rip RFltr hops

Access: Read and write

Description: This attribute specifies the distance in terms of number of hops. Networks in RIP packets which are the specified distance away from the switch are filtered or passed depending on the *disposition* of the filter. A hops value preceded by an equality operator(=), less than operator(<) or greater than operator(>) should be interpreted as matching all RIP packet tuples which are an equal, smaller or greater distance, respectively, away from the switch than the hops value specified. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter. The number of hops is specified as a decimal number between 0 and 999.

Values: String (0..4, ASCII)

Default: No default

## ATTRIBUTE Vr Ipx Rip RFltr ticks

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the distance in terms of delay in ticks. A tick is 1/18 of a second. Networks in RIP packets which are the specified distance away from the switch are filtered or passed depending on the *disposition* of the filter. A ticks value preceded by a equality operator(=), less than operator(<) or greater than operator(>) should be interpreted as matching all RIP packet tuples which are an equal, greater or lower delay, respectively, away from the switch than the ticks value specified. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter. The ticks value is specified as a decimal number between 0 and 999. |
| Values | String (0..4, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ipx Rip RFltr networkNumber (net)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the network number of matching networks in RIP packets to be filtered or passed depending on the *disposition* of the filter. The network number can be entered either as a dashed hex string or a string of hex digits entered in pairs of hex digits up to a maximum length of 8 digits; in addition to hex digits, use of the character '?' to indicate wildcarding is allowed. (For example a valid network number would be ff-ff-ff-?? or ffffff??). Wildcard characters may be used only in pairs to replace a pair of hex digits. Filters with a network number preceded by a caret (^) should be interpreted as matching all RIP packet tuples except for the tuples with this network number. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter. |
| Values | String (0..12, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ipx Rip RFltr node

| | |
|---|---|
| Access | Read and write |

Description

This attribute specifies the node portion in the source IPX address (that is, the MAC address or circuit ID) of received RIP packets for which the contained network tuples should be filtered or passed depending on the *disposition* of the filter. This attribute is only valid for filters applied to a port in the ***input*** *direction* and will be ignored if the filter is applied in the ***output*** *direction*.The node number can be entered either as a dashed hex string or a string of hex digits entered in pairs of hex digits up to a maximum length of 12 digits; in addition to hex digits, use of the character '?' to indicate wildcarding is allowed. (For example a valid node number would be 00-20-??-??-??-?? or 0020???????? ). Wildcard characters may be used only in pairs to replace a pair of hex digits. A node number preceded by a caret (^) should be interpreted as matching all RIP packets' network tuples except for the RIP packets with this source node address. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter.

Values

String (0..18, ASCII)

Default

No default

### ATTRIBUTE Vr Ipx Rip RFltr port

Access

Read and write

Description

This attribute specifies the name of a *protocol port* whereby networks learned over this port are to be filtered or passed depending on the *disposition* of the filter. This attribute is only valid for filters applied to a port in the ***output*** *direction* and will be ignored if the filter is applied in the ***input*** *direction*. This attribute is entered as an ascii string and must correspond to a name of a provisioned *protocol port*. A port name preceded by a caret (^) should be interpreted as matching all RIP packet tuples except for those learned on this port. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter.

Values

String (0..18, ASCII)

Default

No default

### ATTRIBUTE Vr Ipx Rip RFltr disposition (disp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates a reversal of the filter pattern match. If the value is pass, then matching filters will cause the RIP packet tuple to be passed. If the value is filter, then matching filters will cause the RIP packet tuple to be filtered. |
| Values | pass<br>filter |
| Default | filter |

### GROUP Vr Ipx Rip RFltr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This is the operational attribute group for *IpxRipFilter*. |

### ATTRIBUTE Vr Ipx Rip RFltr numberOfApplyEntries (applied)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of times this filter is referenced by a *RipApplyEntry*. If zero, this filter is not applied on any ports. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Vr Ipx Rip RipApplyEntry (RipApp)

| | |
|---|---|
| Instance | protocolPortName (ppName) [String (1..20, ASCII)]<br>filterIdentifier (fltrId) [Decimal (1..4294967295)] |
| Groups | "GROUP Vr Ipx Rip RipApp Provisioned (Prov)" |
| Scope | Application |
| Description | *Vr/<string> Ipx Rip RipFilter RipApplyEntry/<protocol port name, filter ID>*<br>This component contains a list of RIP filters that have been applied to each IPX port and information pertaining to each application of such RIP filters. Filters should be applied to ports such that the most specific filter has the lowest identifier while the |

least specific filter has the highest identifier. It should be kept in mind that the filter with the lowest filter identifier that matches will decide based on its *disposition* whether the network tuple is passed or filtered.

## GROUP Vr Ipx Rip RipApp Provisioned (Prov)

Properties: Provisioned

Description: This is the *RipApplyEntry* provisionable group of attributes.

## ATTRIBUTE Vr Ipx Rip RipApp direction (dir)

Access: Read and write

Description: This attribute specifies whether this RIP filter is applied as an ***input*** filter or an ***output*** filter. If set to ***none***, this indicates that the filter, though applied to the port, is not currently active in either direction.

Values:
none
output
input

Default: none

## COMPONENT Vr Ipx Sap

Groups: "GROUP Vr Ipx Sap Statistics (Stats)"

Scope: Application

Description: *Vr/<string> Ipx Sap*
The Service Advertising Protocol (SAP) exchanges information on the network about available network services (for example file services or print services). Service information is kept for services residing on networks which are known to the router via the routing table (RIP protocol). That is, services will be added to

| | |
|---|---|
| | the services table only if a route to them has been previously discovered via RIP and entered in the route table. |
| Opt. Subcomp. | "COMPONENT Vr Ipx Sap SapFilter (SFltr)"<br>"COMPONENT Vr Ipx Sap SapApplyEntry (SapApp)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vr Ipx Sap Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | IPX statistics specific to the SAP protocol. |

## ATTRIBUTE Vr Ipx Sap sapIn

| | |
|---|---|
| Access | Read only |
| Description | The total number of SAP packets received. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Ipx Sap sapOut

| | |
|---|---|
| Access | Read only |
| Description | The total number of SAP packets locally generated and sent out. This counter wraps around to zero after reaching the maximum value of 4294967295. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Vr Ipx Sap sapIncorrectPackets

| | |

| Description | The provisionable attribute group for *SapFilter*. |

## ATTRIBUTE Vr Ipx Sap SFltr type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Novell Service type of the services to be filtered from the SAP packets. The type can be entered either as a dashed hex string or a string of hex digits entered in pairs of |

hex digits up to a maximum length of 4 digits. (For example a valid type would be ff-ff or ffff). A type preceded by a caret(^) should be interpreted as filtering all SAP packets except for those with this type.

Values: String (0..6, ASCII)

Default: No default

### ATTRIBUTE Vr Ipx Sap SFltr name

Access: Read and write

Description: This attribute specifies the readable name of the service to be filtered from SAP packets. The name can be 47 characters or less. This does not include the caret (^) character which precedes the name. A name preceded by a caret (^) should be interpreted as filtering all SAP packets except for the ones with this name.

Values: String (0..48, ASCII)

Default: No default

### ATTRIBUTE Vr Ipx Sap SFltr networkNumber (net)

Access: Read and write

Description: This attribute specifies the network number of the service to be filtered from SAP packets. The network number can be entered either as a dashed hex string or a string of hex digits entered in pairs of hex digits up to a maximum length of 8 digits. (For example a valid network number would be ff-ff-ff-ff or ffffffff). A network number preceded by a caret (^) should be interpreted as filtering all SAP packets except for the ones with this network number.

Values: String (0..12, ASCII)

Default: No default

### ATTRIBUTE Vr Ipx Sap SFltr node

Access: Read and write

Description: This attribute specifies the node portion of the IPX address of the service to be filtered from SAP packets. The node number can be

| | |
|---|---|
| | entered either as a dashed hex string or a string of hex digits entered in pairs of hex digits up to a maximum length of 12 digits.. (For example a valid node number would be ff-ff-ff-ff-ff-ff or ffffffffffff). A node number preceded by a caret (^) should be interpreted as filtering all SAP packets except for the ones with this node number. |
| Values | String (0..18, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ipx Sap SFltr disposition (disp)

| | |
|---|---|
| Access | Read and write |
| Description | Indicates a reversal of the filter pattern match. |

### ATTRIBUTE Vr Ipx Ns NetSentryApp filter

| | |
|---|---|
| Access | Read and write |
| Description | The name of the filter to be applied to packets matching the conditions in this entry of the *IpxNetSentryApplyList*. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ipx Ns NetSentryApp networkNumber1 (net1)

| | |
|---|---|
| Access | Read and write |
| Description | The first IPX network Number used to compare. This network number can be entered either as a dashed hex string or a string of hex digits. (For example a valid network number would be ff-ff-ff-ff or ffffffff). In addition a value of * will be accepted as a wildcard for all networks. |
| Values | String (1..11, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ipx Ns NetSentryApp node1

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute is the first IPX node address used to compare. This node number can be entered either as a dashed hex string or a string of hex digits. (For example a valid node number would be ff-ff-ff-ff-ff-ff or ffffffffffff). In addition a value of * will be accepted as a wildcard for all nodes. |
| Values | String (1..17, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ipx Ns NetSentryApp direction (dir)

| | |
|---|---|
| Access | Read and write |
| Description | Indicates the direction a packet must be moving between the first and second apply list entries in order for the entries to match. First “to” second, first “from” second, or first “tofrom” second (either direction). |
| Values | to<br>from<br>tofrom |
| Default | No default |

### ATTRIBUTE Vr Ipx Ns NetSentryApp networkNumber2 (net2)

| | |
|---|---|
| Access | Read and write |
| Description | The second IPX network Number used to compare. This network number can be entered either as a dashed hex string or a string of hex digits. (For example a valid network number would be ff-ff-ff-ff or ffffffff). In addition a value of * will be accepted as a wildcard for all networks. |
| Values | String (1..11, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Ipx Ns NetSentryApp node2

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the second IPX node address used to compared. This node can be entered either as a dashed hex string or a string of hex digits. (For example a valid network number would be ff- |

| | |
|---|---|
| | ff-ff-ff-ff-ff or ffffffffffff). In addition a value of * will be accepted as a wildcard for all nodes. |
| Values | String (1..17, ASCII) |
| Default | No default |

## COMPONENT Vr Snmp

| | |
|---|---|
| Groups | "GROUP Vr Snmp Provisioned (Prov)"<br>"GROUP Vr Snmp OsiState (State)"<br>"GROUP Vr Snmp Statistics (Stats)" |
| Scope | Device |
| Description | *Vr/<string> Snmp*<br>This component contains all provisionable and operational data relating to the SNMP Management of a Virtual Router.<br><br>SNMP management defined for the Virtual Router having managementAccess, has access to shelf-wide enterprise MIBs and standard MIBs applicable to the Virtual Router.<br><br>SNMP management defined for all other Virtual Routers have access only to standard MIBs applicable to the particular Virtual Router. |
| Subcomponents | "COMPONENT Vr Snmp System (Sys)" |
| Opt. Subcomp. | "COMPONENT Vr Snmp Community (Com)"<br>"COMPONENT Vr Snmp View" |
| Dyn. Subcomp. | "COMPONENT Vr Snmp MibIIStats" |
| Common Verbs | Help<br>List<br>Display<br>Add : System_admin<br>DELete : System_admin<br>LOCK<br>Unlock |

## GROUP Vr Snmp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes defining the SNMP management entity's capabilities, particularly in regards to standard SNMPv1 and SNMPv2 traps. |

## ATTRIBUTE Vr Snmp enableAuthenTraps (authen)

| | |
|---|---|
| Access | Read: System_admin<br>Write: System_admin |
| Description | This attribute controls whether the *Snmp* component generates authentication failure traps. The attribute is derived from RFC 1907. |
| Values | enabled<br>disabled |
| Default | enabled |

## ATTRIBUTE Vr Snmp alarmsAsTraps

| | |
|---|---|
| Access | Read: System_admin<br>Write: System_admin |
| Description | This attribute specifies whether the *Snmp* component sends alarms to SNMPv1, SNMPv2, and SNMPv3 managers. If ***enabled***, alarms are sent as SNMPv1 Traps to managers with SNMPv1 Trap privilege allowed, as SNMPv2 Traps to managers with SNMPv2 Trap privilege allowed and as notifications to SNMPv3 managers based on the provisioning of the *V3* sub-components *NotificationCapability* and *Manager.* |
| Values | enabled<br>disabled |
| Default | disabled |

## ATTRIBUTE Vr Snmp ipStack

| | |
|---|---|
| Access | Read: System_admin<br>Write: System_admin |

Description

This attribute controls which IP stack the *Snmp* component will use to send and receive SNMP traffic.

If the value of this attribute is ***vrIp*** then SNMP Udp traffic is sent and received using *Ip* as provisioned under the *VirtualRouter*. This requires provisioning of the ***ip*** feature.

If the value of this attribute is ***ipiFrIpiVc*** then SNMP Udp traffic is sent and received using *IpiFr* (Ip over Frame Relay) or *IpiVc* (Ip over Vc), whichever is provisioned. This requires provisioning of one of the ***ipiVc*** or ***ipiFr*** features.

Values

vrIp
ipiFrIpiVc

Default

vrIp

### ATTRIBUTE Vr Snmp cidInEntTraps

Access

Read: System_admin
Write: System_admin

Description

This attribute controls whether the Customer Identifier (CID) is included in the SNMP Enterprise Traps. If ***enabled***, the CID is included in the SNMP Enterprise traps.

Values

enabled
disabled

Default

disabled

### ATTRIBUTE Vr Snmp supportedVersions

Access

Read: System_admin
Write: System_admin

Description

This attribute specifies which SNMP message versions are accepted and sent by the SNMP agent. Messages with unsupported version are dropped and the corresponding statistics are incremented.

Set of

snmpV1 (v1)
snmpV2c (v2c)

Default No default

### GROUP Vr Snmp OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Snmp adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

## ATTRIBUTE Vr Snmp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Vr Snmp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Vr Snmp availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Vr Snmp proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Vr Snmp controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Vr Snmp alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Vr Snmp standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Vr Snmp unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Vr Snmp Statistics (Stats)

Properties
Operational

| | |
|---|---|
| Description | This attribute group contains miscellaneous SNMP management entity operational attributes which includes statistics for processing traps as well as attributes to assist with identifying authentication failures generated by SNMPv1 managers. |

### ATTRIBUTE Vr Snmp trapsProcessed (trapsPr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of Standard and Enterprise notifications (traps) processed by the SNMP Agent. This total includes the number discarded by the *Snmp* component when it is ***locked*** or ***disabled***.<br><br>This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp trapsDiscarded (trapsDisc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of notifications (traps) discarded since the processor last restarted. They are discarded when the *Snmp* component is ***locked*** or ***disabled***.<br><br>This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp lastAuthFailure

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of *sysUpTime* at the time of the last authentication failure. |
| Values | Decimal (0..4294967295) |
| Units | centiseconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vr Snmp mgrOfLastAuthFailure

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the manager station that caused the last authentication failure. |
| Values | IP address |
| Default | 0.0.0.0 |

### COMPONENT Vr Snmp System (Sys)

| | |
|---|---|
| Groups | "GROUP Vr Snmp Sys Provisioned (Prov)"<br>"GROUP Vr Snmp Sys Operational (Op)" |
| Scope | Device |
| Description | *Vr/<string> Snmp System*<br>This component represents the SNMP System Group. The component attributes are derived from RFC 1907. |
| Dyn. Subcomp. | "COMPONENT Vr Snmp Sys ObjectResource (Or)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Snmp Sys Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | The group contains provisionable attributes relating to the SNMP System Group. The attributes are derived from RFC 1907. |

### ATTRIBUTE Vr Snmp Sys contact (con)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the contact person for this managed node, together with information on how to contact this person. |
| Values | String (0..255, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr Snmp Sys name

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the administratively assigned name for this managed node. By convention, it is the node's fully qualified domain name. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Snmp Sys location (loc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute identifies the physical location of this node. For example, 'telephone closet, third floor'. |
| Values | String (0..255, ASCII) |
| Default | No default |

### GROUP Vr Snmp Sys Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | The group contains operational attributes relating to the SNMP System Group. The attributes are derived from RFC 1907. |

### ATTRIBUTE Vr Snmp Sys description (desc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute presents a textual description of the entity. This value should include the full name and version identification of the system's hardware type, software operating-system, and networking software. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Snmp Sys objectId (oid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the Structure of Management Information (SMI) enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. |
| Values | Integer Sequence |
| Default | No default |

### ATTRIBUTE Vr Snmp Sys upTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the time (in hundredths of a second) since the network management portion of the system was last re-initialized. |
| Values | Decimal (0..4294967295) |
| Units | centiseconds |
| Default | No default |

### ATTRIBUTE Vr Snmp Sys services (serv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the set of services that this entity primarily offers.<br><br>The value is a sum. This sum initially takes the value zero, then, for each layer, L, in the range 1 through 7, that this node performs transactions for, 2 raised to (L-1) is added to the sum. For example, a node which performs primarily routing functions would have a value of 4 (2^(3-1)). In contrast, a node which is a host offering application services would have a value of 72 ((2^4-1) + 2^(7-1)). Note that in the context of the Internet suite of protocols, values should be calculated accordingly:<br>layer 1 - physical (for example, repeaters) |

| | |
|---|---|
| | layer 2 - datalink/subnetwork (for example, bridges)<br>layer 3 - internet (for example, IP gateways)<br>layer 4 - end-to-end (for example, IP hosts)<br>layer 7 - applications (for example, mail relays)<br>For systems including OSI protocols, layers 5 and 6 may also be counted. |
| Values | Decimal (0..127) |
| Default | 6 |

### ATTRIBUTE Vr Snmp Sys sysORLastChange

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of *sysUpTime* at the time of the most recent change to any *ObjectResource* component. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Snmp Sys ObjectResource (Or)

| | |
|---|---|
| Instance | Decimal (1..1024) |
| Groups | "GROUP Vr Snmp Sys Or Or" |
| Scope | Device |
| Description | *Vr/<string> Snmp System ObjectResource/n*<br>This component represents an entry in the SNMPv2 Object Resources Table (RFC 1907). It lists the MIBs currently supported by the SNMP management entity. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr Snmp Sys Or Or

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | The attributes of this group describe a MIB currently supported by the SNMP agent. This group of attributes is derived from RFC 1907. |

### ATTRIBUTE Vr Snmp Sys Or id

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the authoritative identification of a dynamically-configurable management entity object resource. This is a MIB Object Identifier. |
| Values | Integer Sequence |
| Default | No default |

### ATTRIBUTE Vr Snmp Sys Or description (desc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the textual description of a dynamically-configurable management entity object resource. This is an ASCII description of a supported MIB. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr Snmp Sys Or upTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the value of *sysUpTime* of the *Snmp System* component at the time this *ObjectResource* component was instantiated. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Vr Snmp Community (Com)

| | |
|---|---|
| Instance | Decimal (1..1024) |
| Groups | "GROUP Vr Snmp Com Provisioned (Prov)" |
| Scope | Device |

Description

*Vr/<string> Snmp Community/<decimal>*
This component represents an SNMPv1 or SNMPv2c community. A community represents a pairing of an SNMP Agent with an arbitrary set of application entities.

The combination of *communityString* and *tDomain* attributes must be unique across all *Community* components.

Opt. Subcomp.

"COMPONENT Vr Snmp Com Manager (Man)"

Add : System_admin
DELete : System_admin

## GROUP Vr Snmp Com Provisioned (Prov)

Properties

Provisioned

Description

This group contains provisionable attributes relating to SNMPv1 or SNMPv2c communities.

The *Check Prov* command verifies that *viewIndex* corresponds to the first index of one of the *View* components.

## ATTRIBUTE Vr Snmp Com communityString (string)

Access

Read: System_admin
Write: System_admin

Description

This attribute is the SNMPv1 or SNMPv2c community name. The value of this attribute is used to authenticate SNMP messages received from SNMPv1 or SNMPv2c management entities, and is placed in SNMP messages sent out by the SNMPv1 or SNMPv2c network management entity. The string “public” is commonly used.

When an SNMPv1 or SNMPv2c message is received, the community name in the message is checked to ensure that it matches a *communityString*. If there are no *Manager* subcomponents for that *Community* then the level of access is

determined by the *accessMode* attribute. If there are *Manager* subcomponents for the *Community* then the originating transport address in the message must match the *transportAddress* of one of the *Manager* subcomponents, and the level of access of the sending entity is determined by the *privileges* attribute for that *Manager.*
The combination of *communityString* and *tDomain* attributes must be unique across all *Community* components.

Values: String (1..255, ASCII)

Default: public

### ATTRIBUTE Vr Snmp Com accessMode (acMode)

Access: Read: System_admin
Write: System_admin

Description: Once the sending SNMP entity is authenticated as a member of a community, the community access mode determines what level of access it has for each object in its view.

Values: readOnly
readWrite

Default: readOnly

### ATTRIBUTE Vr Snmp Com tDomain (tDom)

Access: Read: System_admin
Write: System_admin

Description: This attribute indicates the kind of transport service by which the community receives and sends network management traffic.
The combination of *communityString* and *tDomain* attributes must be unique across all *Communities.*

Values: snmpUdpDomain

Default: snmpUdpDomain

### ATTRIBUTE Vr Snmp Com viewIndex (vIndex)

Access: Read: System_admin
Write: System_admin

| | |
|---|---|
| Description | This attribute specifies the *View* component for this community. This index must correspond to the first index of one of the *View* components. |
| Values | String (1..32, ASCII) |
| Default | No default |

## COMPONENT Vr Snmp Com Manager (Man)

| | |
|---|---|
| Instance | Decimal (0..100) |
| Groups | "GROUP Vr Snmp Com Man Provisioned (Prov)" |
| Scope | Device |
| Description | *Vr/<string> Snmp Community/<decimal> Manager/<decimal>* This component defines the access privileges for an SNMPv1 or SNMPv2c Manager within the Community. If a *Community* has no *Manager* components, SNMPv1 or SNMPv2 messages are accepted from all source addresses using the proper *communityString*, and no Traps are sent out using the *communityString*. If at least one *Manager* component exists for a *Community* then SNMPv1 or SNMPv2 messages containing that *Community string* are only accepted if they originate from a transport address which matches the *transportAddress* of one of the *Manager* components.<br><br>The value of *transportAddress* must be unique for all *Manager* components under the same *Community.* |
| Common Verbs | Help<br>List<br>Display<br>Add : System_admin<br>DELete : System_admin |

## GROUP Vr Snmp Com Man Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | The group contains provisionable attributes relating to an SNMPv1 or SNMPv2c Community Manager. |

The *Check Prov* command verifies that the value of the *privileges* attribute is correctly set:

**-** Setting ***v1trap*** bit and setting ***v2trap*** bit are not allowed simultaneously.

**-** Setting ***set*** bit is allowed if the *Community accessMode* is ***readWrite***.

**-** Setting ***get*** bit is only allowed if the *Community accessMode* is ***readOnly*** or ***readWrite***.

## ATTRIBUTE Vr Snmp Com Man transportAddress (tAddress)

| | |
|---|---|
| Access | Read: System_admin<br>Write: System_admin |
| Description | This attribute is the transport service address of the SNMPv1 or SNMPv2c Manager, formatted according to the value of *Community tDomain*.<br>The only currently supported format is that of a UDP Transport Address. It must be of the form “IpAddress-UDP Port”, where UDP Port = 162. For example, 23.45.67.89-162 is a suitable UDP Transport Address.<br><br>The value of *transportAddress* must be unique for all *Manager* components under the same *Community.* |
| Values | String (1..100, ASCII) |
| Default | No default |

## ATTRIBUTE Vr Snmp Com Man privileges (priv)

| | |
|---|---|
| Access | Read: System_admin<br>Write: System_admin |
| Description | This attribute identifies the access privileges which govern what management operations the SNMPv1/SNMPv2c Manager may perform.<br><br>***set*** and ***get*** operations are allowed if the *Community accessMode* |

is ***readWrite***.

***get*** operations are only allowed if the *Community accessMode* is ***readOnly*** or ***readWrite***.

The ***v1trap*** bit and ***v2trap*** bit can not be set at same time.

Set of
sets
gets
v1trap
v2trap

Display

## GROUP Vr Snmp MibIIStats Statistics (Stats)

Properties Operational

Description This attribute group contains the collection of statistics as defined by MIB II providing basic instrumentation of a SNMP Agent. The group is derived from RFC 1213. Statistics which are only relevant for SNMP managers do not appear.

## ATTRIBUTE Vr Snmp MibIIStats inPackets

Access Read only

Description This attribute indicates the total number of SNMP messages received by the SNMP management entity.

| | |
|---|---|
| | This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp MibIIStats inBadCommunityNames

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of SNMPv1 or SNMPv2c messages received by the SNMP management entity which had an unknown SNMPv1 or SNMPv2c Community string.<br><br>This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp MibIIStats inBadCommunityUses

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of SNMPv1 or SNMPv2c messages received by the SNMP management entity which attempted to perform an operation not allowed for the indicated SNMPv1 or SNMPv2c Community.<br><br>This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp MibIIStats inAsnParseErrs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of SNMP messages received by the SNMP management entity which were improperly BER encoded or had an invalid ASN.1 syntax. |

| | |
|---|---|
| | This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp MibIIStats outPackets

| | |

| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp MibIIStats inSetRequests

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of SNMP Set requests accepted and processed by the SNMP management entity.<br><br>This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp MibIIStats outTooBigs

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of SNMP responses generated by the SNMP management entity with an error-status field of tooBig.<br><br>This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Vr Snmp MibIIStats outNoSuchNames

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of SNMP responses generated by the SNMP management entity with an error status field of noSuchName. |

This attribute wraps to zero when its maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Snmp MibIIStats outBadValues

Access: Read only

Description: This attribute indicates the number of SNMP responses generated by the SNMP management entity with an error status field of badValue.

This attribute wraps to zero when its maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Snmp MibIIStats outGenErrs

Access: Read only

Description: This attribute indicates the number of SNMP responses generated by the SNMP management entity with an error-status field of genErr.

This attribute wraps to zero when its maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Snmp MibIIStats outGetResponses

Access: Read only

Description: This attribute indicates the number of SNMP Get responses generated by the SNMP management entity.

This attribute wraps to zero when its maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Snmp MibIIStats outTraps

Access: Read only

Description: This attribute indicates the number of SNMP Traps generated by the SNMP management entity.

This attribute wraps to zero when its maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Vr Snmp MibIIStats silentDrops

Access: Read only

Description: This attribute indicates the total number of GetRequests, GetNextRequests, GetBulkRequests, SetRequests, and InformRequests delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

This attribute wraps to zero when its maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: 0

## ATTRIBUTE Vr Snmp MibIIStats proxyDrops

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of GetRequests, GetNextRequests, GetBulkRequests, SetRequests, and InformRequests delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.<br><br>This attribute wraps to zero when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT Vr Snmp View

| | |
|---|---|
| Instance | name [String (1..32, ASCII)]<br>subtree [Integer Sequence] |
| Groups | "GROUP Vr Snmp View Provisioned (Prov)" |
| Scope | Device |
| Description | *Vr/<string> Snmp View/<string, Int_Sequence>*<br>This component represents an entry in the SNMP View Table of RFC 2575.<br><br>The indices of the *View* component are:<br><br>- *name* index that is used to identify a family (or a set) of *View* components<br><br>- *subTree* index that identifies a MIB subTree to be included or excluded in this view<br><br>The component attributes are derived from RFC 2575. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add : System_admin<br>DELete : System_admin |

## GROUP Vr Snmp View Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes relating to SNMP View Table subTrees. The attributes are derived from RFC 2575. |

## ATTRIBUTE Vr Snmp View mask

| | |
|---|---|
| Access | Read: System_admin<br>Write: System_admin |
| Description | This attribute in combination with the *subTree* replication value specifies a family of view subtrees.<br><br>Each bit of this bit mask corresponds to a sub-identifier of *subTree*. The most significant bit of the n-th octet of this octet string value (extended if necessary, see below) corresponds to the (8*n- 7)-th sub-identifier, and the least significant bit of the n-th octet of this octet string corresponds to the (8*n)-th sub-identifier, where n is in the range 1 through 16.<br><br>Each bit of this bit mask specifies whether or not the corresponding sub-identifiers must match when determining if an OBJECT IDENTIFIER is in this family of view subtrees; a ‘1’ indicates that an exact match must occur; a ‘0’ indicates ‘wild card’, meaning that any sub-identifier value matches.<br><br>Thus, the OBJECT IDENTIFIER X of an object instance is contained in a family of view subtrees if the following criteria are met:<br><br>For each sub-identifier of the value of *View subTree*, either the n- |

th bit of *mask* is 0, or the n-th sub-identifier of X is equal to the n-th sub-identifier of the value of *subTree.*

If the value of this bit mask is M bits long and there are more than M sub-identifiers in the *subTree* value, then the bit mask is extended with 1's to be the required length.

Note that when the value of this object is the zero-length string, this extension rule results in a mask of all 1's being used (no wild card) and the family of *subTrees* is the one uniquely identified by the *subTree* value.

Values: String (0..16, Hex)

Default: ""

### ATTRIBUTE Vr Snmp View type

Access: Read: System_admin
Write: System_admin

Description: This attribute specifies whether the particular family of view subtrees is included or excluded in the SNMPv3 context's or SNMPv1 or SNMPv2c community's MIB view.

The value ***includedSubtree*** indicates that the corresponding instances of *subTree* and *mask* define a family of view subtrees included in the MIB view.

The value ***excludedSubtree*** indicates that the corresponding instances of *subTree* and *mask* define a family of view subtrees excluded in the MIB view.

Values: includedSubtree
excludedSubtree

Default: includedSubtree

### COMPONENT Vr IfTableEntry

Instance: Decimal (1..65535)

Groups: "GROUP Vr IfTableEntry IfTable (Ift)"
"GROUP Vr IfTableEntry AdditionalInfo"

| | |
|---|---|
| Scope | Application |
| Description | *Vr/<string> IfTableEntry/n*<br>Each instance of this component represents one row in the IfTable as defined in rfc1213. One entry will exist for each *ProtocolPort* |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vr IfTableEntry IfTable (Ift)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents the SNMP interface table entry. |

### ATTRIBUTE Vr IfTableEntry ifAdminStatus (admStatus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the current administration status of the interface. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Vr IfTableEntry ifOperStatus (opStatus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the current operational status of the interface. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | down |

### ATTRIBUTE Vr IfTableEntry ifLastChange (lastChange)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re- initialization of the local network management subsystem, then this object contains a zero value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifInOctets (inOctets)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the total number of octets received on the interface, including framing characters. The 64-bit version may be available in the *ifHCInOctets* attribute. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifOutOctets (outOctets)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the total number of octets transmitted out of the interface, including framing characters. The 64-bit version may be available in the *ifHCOutOctets* attribute. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifInDiscards (inDiscard)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher layer protocol. One possible reason for discarding such a packet could be to free up buffer space. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifOutDiscards (outDiscard)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifInErrors (inErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the number of inbound packets that contained errors preventing them from being deliverable to a higher layer protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifOutErrors (outErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the number of outbound packets that could not be transmitted because of errors. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifInUcastPkts (inUcast)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a |

| | |
|---|---|
| | multicast or broadcast address at this sub-layer. The 64-bit version may be available in the *ifHCInUcastPkts* attribute. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifOutUcastPkts (outUcast)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the total number of packets that higher level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. The 64-bit version may be available in the *ifHCOutUcastPkts* attribute. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifInNuCastPkts (inNucast)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the number of non-unicast (i.e., subnetwork- broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol. The corresponding 64-bit versions may be available in the *ifInMulticastPkts* attribute and the *ifInBroadcastPkts* attribute. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifOutNuCastPkts (outNuCast)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the total number of packets that higher level protocols request be transmitted to a non-unicast address, including those that were discarded or not sent. The corresponding 64-bit versions may be available in the *ifOutMulticastPkts* and *ifOutBroadcastPkts* attributes. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifInUnknownProtos (inUknownProt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifOutQlength (outQlen)

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the length of the output packet queue (in packets). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifDescription (desc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides a textual string containing information about the interface. This string includes the name of the manufacturer, the product name and the version of the hardware interface. |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifType (type)

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the type of interface, distinguished according to the physical/link protocol(s) immediately below the network layer in the protocol stack |

| | |
|---|---|
| Values | other<br>ddnX25<br>rfc877x25<br>ethernetCsmacd<br>ethernet8023<br>tokenBus8024<br>tokenring8025<br>man802<br>starLan<br>hyperChannel<br>fddi<br>lapb<br>sdlc<br>ds1<br>e1<br>basicIsdn<br>primaryIsdn<br>propPointToPointSerial<br>ppp<br>bnx<br>ds3<br>smds<br>frameRelay<br>sonetSdh<br>frameRelayService<br>v35<br>hssi<br>sonetPath<br>aflane8023<br>aflane8025<br>v11<br>channel<br>atmMpeVcEncap<br>atmMpeLlcEncap<br>ilsForwarder<br>ipTunnel<br>virtualMedia<br>localMedia |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifMtu (mtu)

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the size of the largest datagram which can be sent/received on the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifSpeed (speed)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides an estimate of the interface's current bandwidth in bits per second. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifPhysicalAddress (phys)

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the interface's address at the protocol layer immediately `below' the network layer in the protocol stack. For interfaces which do not have such an address (e.g., a serial line), this object should be an octet string of zero length. |
| Values | String (0..17, ASCII) |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifSpecific (spec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides a reference to MIB definitions specific to the particular media being used to realize the interface. For |

example, if the interface is realized by an ethernet, then the value of this object refers to a document defining objects specific to ethernet. If this information is not present, its value should be set to the OBJECT IDENTIFIER 0.0, which is a syntactically valid object identifier, and any conformant implementation of ASN.1 and BER must be able to generate and recognize this value.

Values: Integer Sequence

Default: No default

### GROUP Vr IfTableEntry AdditionalInfo

Properties: Operational

Description: This group contains additional information associated with this ifEntry, including SNMP ifXTable entry information.

### ATTRIBUTE Vr IfTableEntry componentName (compName)

Access: Read only

Description: This attribute provides a component name associated with this ifEntry. This component is the source of the data stored in this entry. More data may be determined about this entry by looking at the component associated with this component name.

Values: The name of the component

Default: No default

### ATTRIBUTE Vr IfTableEntry ifHCInOctets (inHCOctets)

Access: Read only

Description: This attribute reports the total number of octets received on the interface, including framing characters. This High Capacity counter is a 64-bit version of the *ifInOctets* attribute.

Values: Long Integer

Default: No default

### ATTRIBUTE Vr IfTableEntry ifHCInUcastPkts (inHCUcast)

Access: Read only

| | |
|---|---|
| Description | This attribute reports the number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer. This High Capacity counter is a 64-bit version of the *ifInUcastPkts* attribute. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifHCOutOctets (outHCOctets)

| | |
|---|---|
| Access | Read only |
| Description | This attribute reports the total number of octets transmitted out of the interface, including framing characters. This High Capacity counter is a 64-bit version of the *ifOutOctets* attribute. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vr IfTableEntry ifHCOutUcastPkts (outHCUcast)

| | |
|---|---|
| Access | Read only |
| Description | This attibutes reports the total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This High Capacity counter is a 64-bit version of the *ifOutUcastPkts* attribute. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Vr SourceRouteEndStation (Sres)

| | |
|---|---|
| Groups | "GROUP Vr Sres AdministrativeControl (AdminControl)"<br>"GROUP Vr Sres Provisioned (Prov)"<br>"GROUP Vr Sres OperationalStatus (OperStatus)"<br>"GROUP Vr Sres OsiState (State)"<br>"GROUP Vr Sres Operational (Oper)" |
| Scope | Application |

| | |
|---|---|
| Description | *Vr/<string> SourceRouteEndStation*<br>This component defines source routing for source routing end stations. |
| Dyn. Subcomp. | "COMPONENT Vr Sres RouteEntry (Re)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### VERB Clear Vr Sres

| | |
|---|---|
| Impact | Service |
| Description | *Clear Vr/<string> Sres*<br>This clears all entries in the *RouteEntry* table. This will in effect delete all *RouteEntry* subcomponents of *Sres*. Routes will then be relearned and the *RouteEntry* subcomponents will be recreated. |

### GROUP Vr Sres AdministrativeControl (AdminControl)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component. |

### ATTRIBUTE Vr Sres snmpAdminStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute is used to set the desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. Changing this attribute from its default value of ***up*** is not allowed at this time. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

### GROUP Vr Sres Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *SourceRouteEndStation* component. |

### ATTRIBUTE Vr Sres routeTableNumEntries (rtNe)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute identifies the maximum number of entries in the *SourceRouteEndStation* routing table. Before you change it, check the network configuration to see how many protocol ports, such as *IpPort* or *IpxPort*, under *Vr Pp* have *endStationSupport* set to ***enable***. The value of *routeTableNumEntries* also depends on the *VirtualRouter* attribute *sresMaxHeapSpace*.<br><br>Consider the following attributes of the *SourceRouteEndStation* component when adjusting this number:<br>- *rtEntriesUsed*<br>- *rtEntriesFree*<br>- *rtEntriesDenied* |
| Values | Decimal (0..65535) |
| Default | 5000 |

### ATTRIBUTE Vr Sres agingTime (at)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time period used in seconds, to age out learned entries in the routing table. |
| Values | Decimal (200..1000000) |
| Units | seconds |
| Default | 900 |

### ATTRIBUTE Vr Sres routeDescriptorLength (rdLength)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of route descriptors supported by this implementation. The maximum number of hops will be one less because one route descriptor is always required for the destination. This attribute affects the amount of memory used by the route entry table. The larger this attribute is, the more memory the route entry table will use. |
| Values | Decimal (8..14) |
| Default | 14 |

### GROUP Vr Sres OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vr Sres snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vr Sres OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vr Sres adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vr Sres operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vr Sres usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vr Sres Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes for the *SourceRouteEndStation* component.

### ATTRIBUTE Vr Sres rtEntriesUsed (rteU)

Access
Read only

Description
This attribute specifies the total number of *SourceRouteEndStation* routing table entries. The value is limited by the attribute *routeTableNumEntries*, which is a provisionable attribute. If the value is consistently approaching the value of *routeTableNumEntries*, it is advisable to increase the value

provisioned for *routeTableNumEntries*. It indicates a potential shortage of routing table entries in the future.

Values: Decimal (0..65535)

Default: 0

### ATTRIBUTE Vr Sres rtEntriesFree (rteF)

Access: Read only

Description: This attribute is indicative of the number of *Sres* routing table entries free. A consistently high value for this attribute indicates that there is a resource surplus here, in terms of the memory requirements of the routing table. This surplus could be utilized elsewhere if need be. The value of this attribute is directly influenced by the value of the attribute *routeTableNumEntries.*

Values: Decimal (0..65535)

Default: 0

### ATTRIBUTE Vr Sres rtEntriesDenied (rteD)

Access: Read only

Description: This attribute counts the number of times a *SourceRouteEndStation* routing table entry was unavailable. Each count indicates an instance of a new route which could not be learned because of a lack of routing table entries. A rapid increase indicates a shortage of routing table entries. To rectify this, increase the number of routing table entries through the provisioned attribute *routeTableNumEntries* under the *SourceRouteEndStation* component. This counter wraps around its maximum value of 4294967295.

Values: Decimal (0..4294967295)

Default: 0

### COMPONENT Vr Sres RouteEntry (Re)

Instance: destMacAddress (dma) [String (6, Dashed Hex)]
protocolPortName (port) [String (1..20, ASCII)]

| | |
|---|---|
| Groups | "GROUP Vr Sres Re Operational (Oper)" |
| Scope | Application |
| Description | *Vr/<string> Sres RouteEntry/xx-xx-xx-xx-xx-xx,<string>*<br>This component is used to contain the data associated with a source routing destination address. Each entry represents one row in the Route Table. The table is indexed by the route destination MAC address in canonical format and *ProtocolPort* name. |
| Common Verbs | Help<br>List<br>Display |

### VERB Clear Vr Sres Re

| | |
|---|---|
| Impact | Service |
| Description | *Clear Vr/<string> Sres RouteEntry/xx-xx-xx-xx-xx-xx,<string>*<br>This clears this entry in the *RouteEntry* table. This will in effect delete this *RouteEntry* subcomponent of *Sres*. The route may then be relearned and the *RouteEntry* subcomponent will be recreated. |

### GROUP Vr Sres Re Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains information relating to a source routing destination address. |

### ATTRIBUTE Vr Sres Re routeControl (rc)

| | |
|---|---|
| Access | Read only |
| Description | This is the value of the routing control field for this route. |
| Values | String (2, Hex) |
| Default | No default |

### ATTRIBUTE Vr Sres Re rifLength

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is used to display the length of the routing information field in the routing control field. |
| Values | Decimal (2..30) |
| Default | No default |

### ATTRIBUTE Vr Sres Re rdDirection

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the direction to use routing descriptors (RDs). If set to ***leftToRight*** the routing descriptors, displayed in *routeDescr*, will be interpreted from left to right. If set to ***rightToLeft*** they will be interpreted from right to left. If *rifLength* is zero, this attribute will be set to ***noRif*** to indicate that there are no routing descriptors to be read. |
| Values | leftToRight<br>rightToLeft<br>noRif |
| Default | No default |

### ATTRIBUTE Vr Sres Re routeDescr (rd)

| | |
|---|---|
| Access | Read only |
| Description | This is the embedded sequence of bridge and ring IDs for this route. For destinations on the local ring, the value of this attribute is the zero-length string. Refer to *rdDirection* for the direction in which to read the route descriptors. The format of the hexadecimal data displayed is as follows:<br><br>12 bit Ring Number - 4 bit Bridge Number...<br>XXX-X XXX-X XXX-X... |
| Values | String (0..90, ASCII) |
| Default | No default |

### COMPONENT Vr CustomizationSpecification (CustSpec)

| | |
|---|---|
| Groups | "GROUP Vr CustSpec Provisioned (Prov)" |
| Scope | Application |

Description *Vr/n CustomizationSpecification*

This component represents the type of customized behavior which will be provided by the parent *VirtualRouter* component when this component is present.

This component can only be provisioned when the ***ip*** feature is added to at least one of the following card types:

***Vsp2***
***2pGeMmSrVsp3***
***2pOC3ChSmIrVsp3***

Common Verbs

## GROUP Vr CustSpec Provisioned (Prov)

Properties Provisioned

Description This group contains provisioning data for the *CustSpec* component.

## ATTRIBUTE Vr CustSpec customizationType (custType)

Access Read and write

Description This attribute specifies the type of customized behavior which will be provided by the parent *VirtualRouter* component. The following customizations are supported:

***pvg*** - It supports *IfTable* stats for the port linked to *VirtualMedia* and CG for *VirtualMedia* for a generic Packet Voice Gateway.

***cdma*** - It is customized for CDMA wireless application over a Packet Voice Gateway.

| | |
|---|---|
| Values | pvg<br>cdma |
| Default | pvg |

# COMPONENT VoiceSubroute (Vsr)

| | |
|---|---|
| Instance | Decimal (1..1534) |
| Groups | "GROUP Vsr CustomerIdentifierData (CidData)"<br>"GROUP Vsr IfEntryProv (IfEntry)"<br>"GROUP Vsr Provisioned (Prov)"<br>"GROUP Vsr OsiState (State)"<br>"GROUP Vsr OperationalStatus (OperStatus)"<br>"GROUP Vsr Statistics (Stats)"<br>"GROUP Vsr Operational (Oper)" |

"COLLECTED STATS VoiceSubroute"

| | |
|---|---|
| Scope | Application |
| Description | *VoiceSubroute/n*<br>A *VoiceSubroute* component defines the characteristics of the connection to a Private Branch Exchange (PBX). A *VoiceSubroute* is a collection of 64 kbit/s channels on the same physical DS1 or E1 interface. Typically there is one *VoiceSubroute* per physical link. |
| Opt. Subcomp. | "COMPONENT Vsr SwitchedVoiceService (Svs)" |
| Dyn. Subcomp. | "COMPONENT Vsr DebugStatus (Debug)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vsr CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Vsr customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Vsr IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Vsr ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Vsr ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Vsr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group represents the provisionable attributes of a *VoiceSubroute*. |

### ATTRIBUTE Vsr commentText

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | Use of this attribute is at the discretion of the system administrator. Typically, it specifies the name of the customer that is using this *VoiceSubroute*. Typical use of this attribute is to store customer name. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Vsr voiceRoute (vRoute)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the *VoiceRoute* component that this *VoiceSubroute* belongs to. |
| Values | Link (Service, subroutes) |
| Default | No default |

### ATTRIBUTE Vsr signallingChannel (sigChan)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the signalling channel to be used by the *VoiceSubroute*. |
| Values | Link (Service, subroutes) |
| Default | No default |

### GROUP Vsr OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vsr adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component. |

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vsr operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vsr usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Vsr OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vsr snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vsr Statistics (Stats)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group provides the operational statistics for the *VoiceSubroute* component. |

### ATTRIBUTE Vsr totalCallsFromIf

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the total number of calls that have been received by this *VoiceSubroute* from the PBX.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr totalFailedCallsFromIf

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts indicates the total number of calls that have been received by this *VoiceSubroute* from the PBX which failed to be successfully routed through the subnet for various reasons.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr invalidNumberingPlanCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the calls from the interface for which the type of number and the numbering plan identification was not associated to an access code. The numbering plan types *noAccessCode*, *accessCode1* and *accessCode2* are provisioned in the *VoiceRoute*. Refer to NTP-241-7001-xxx for more information.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr addressResolutionFailedCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the calls from the interface which had dialled numbers that had no entry in the *VoiceNetworkingCallServer* data base.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr addressIncompleteCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the calls from the interface which had dialled numbers with insufficient digits to resolve to a unique entry in the *VoiceNetworkingCallServer* data base.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr pathAttributesNotMetCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the calls from the interface for which a path to the end point could not be established based on the attributes specified in the *VoiceProfile*.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr pathSetupTimeOutCalls

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the calls from the interface for which a path to the end point could not be established due to a subnet path setup time-out.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr callsRejectedLocally

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the calls from the interface which were rejected by the originating end because it was:<br>1) a data call on a voice only *VoiceRoute*, or<br>2) a voice call on a data only *VoiceRoute*, or<br>3) a data call to an end-point whose *VoiceProfile* prevents data calls from being made.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr callsRejectedByFarEnd

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the calls from the interface which were rejected by the far-end. This rejection could be due to:<br>1) no free channels at the end-point, or<br>2) a voice call going to a data only *VoiceRoute*, or<br>3) a data call going to a voice only *VoiceRoute*, or<br>4) a signalling protocol incompatibility between end-points.<br>The value wraps to zero when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## GROUP Vsr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *VoiceSubroute* component. |

## ATTRIBUTE Vsr activeChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the total number of B-channels that currently have active calls. |
| Values | Decimal (0..30) |
| Default | No default |

## ATTRIBUTE Vsr peakActiveChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the peak number of B-channels that were active. |
| Values | Decimal (0..30) |
| Default | No default |

## ATTRIBUTE Vsr activeVoiceChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of B-channels that are currently carrying voice. |
| Values | Decimal (0..30) |
| Default | No default |

## ATTRIBUTE Vsr activeModemChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the number of B-channels that are currently active, where a 2100Hz tone was detected. |
| Values | Decimal (0..30) |
| Default | No default |

### ATTRIBUTE Vsr activeDataChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of B-channels that are currently active carrying data. |
| Values | Decimal (0..30) |
| Default | No default |

### ATTRIBUTE Vsr peakActiveVoiceChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the peak number of B-channels that were active carrying voice traffic. |
| Values | Decimal (0..30) |
| Default | No default |

### ATTRIBUTE Vsr peakActiveModemChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the peak number of active B-channels that a 2100Hz tone was detected during the previous polling period. |
| Values | Decimal (0..30) |
| Default | No default |

### ATTRIBUTE Vsr peakActiveDataChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the maximum number of B-channels that were active carrying data during the previous polling period. |
| Values | Decimal (0..30) |
| Default | No default |

### ATTRIBUTE Vsr activeFaxRelayChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of B-channels that are currently performing fax relay. |
| Values | Decimal (0..30) |
| Default | No default |

### ATTRIBUTE Vsr activeTptChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of B-channels that are currently performing tandem pass through. |
| Values | Decimal (0..32) |
| Default | No default |

### ATTRIBUTE Vsr peakActiveFaxRelayChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the peak number of B-channels that performed fax relay during the previous polling period. |
| Values | Decimal (0..30) |
| Default | No default |

### ATTRIBUTE Vsr peakActiveTptChannels

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the peak number of B-channels that performed tandem pass through during the previous polling period. |
| Values | Decimal (0..30) |
| Default | No default |

# COLLECTED STATS VoiceSubroute

| | |
|---|---|
| Description | The statistics record generated by the VoiceSubroute component. |

### ATTRIBUTE Vsr totalCallsFromIf

| | |
|---|---|
| Description | This spooled statistic counts the number of calls that have been received by this *VoiceSubroute* from the PBX in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE Vsr totalFailedCallsFromIf

| | |
|---|---|
| Description | This spooled statistic counts the number of calls that have been received by this *VoiceSubroute* from the PBX which failed to be successfully routed through the subnet in the last statistics collection interval. |
| Values | Decimal (0..65535) |

### ATTRIBUTE Vsr invalidNumberingPlanCalls

| | |
|---|---|
| Description | This spooled statistic counts the calls from the interface for which the type of number and the numbering plan identification was not associated with a diallingPlan in the last statistics collection interval. The numbering plan types *diallingPlan0, diallingPlan1, diallingPlan2* are provisioned in the *VoiceRoute*. Refer to *NTP-241-7001-410* for more information. |
| Values | Decimal (0..65535) |

### ATTRIBUTE Vsr addressResolutionFailedCalls

| | |
|---|---|
| Description | This spooled statistic counts the calls from the interface which had dialled numbers that had no entry in the |

*VoiceNetworkingCallServer* data base in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Vsr addressIncompleteCalls

Description This spooled statistic counts the calls from the interface which had dialled numbers with insufficient digits to resolve to a unique entry in the *VoiceNetworkingCallServer* data base in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Vsr pathAttributesNotMetCalls

Description This spooled statistic counts the calls from the interface for which a path to the end point could not be established based on the attribute specified in the *VoiceProfile* in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Vsr pathSetupTimeOutCalls

Description This spooled statistic counts the calls from the interface for which a path to the end point could not be established due to a subnet path setup time-out in the last statistics collection interval.

Values Decimal (0..65535)

### ATTRIBUTE Vsr callsRejectedLocally

Description This spooled statistic counts the calls from the interface which were rejected by the originating end in the last statistics collection interval because it was:
1) a data call on a voice only *VoiceRoute*, or
2) a voice call on a data only *VoiceRoute*, or
3) a data call to an end-point whose *VoiceProfile* prevents data calls from being made.

Values Decimal (0..65535)

### ATTRIBUTE Vsr callsRejectedByFarEnd

| | |
|---|---|
| Description | This spooled statistic counts the calls from the interface which were rejected by the far-end in the last statistics collection interval.This rejection could be due to:<br>1) no free channels at the end-point, or<br>2) a voice call going to a data only *VoiceRoute*, or<br>3) a data call going to a voice only *VoiceRoute*, or<br>4) a signalling protocol incompatibility between end-points. |
| Values | Decimal (0..65535) |

### ATTRIBUTE Vsr peakActiveChannels

| | |
|---|---|
| Description | This spooled statistic counts the peak number of B-channels that were active in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE Vsr peakActiveVoiceChannels

| | |
|---|---|
| Description | This spooled statistic counts the peak number of B-channels that were active carrying voice in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE Vsr peakActiveModemChannels

| | |
|---|---|
| Description | This spooled statistic counts the peak number of active B-channels that a 2100Hz tone was detected in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE Vsr peakActiveDataChannels

| | |
|---|---|
| Description | This spooled statistic counts the maximum number of B-channels that were active carrying data in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE Vsr peakActiveFaxRelayChannels

| | |
|---|---|
| Description | This spooled statistic counts the maximum number of B-channels that were active carrying fax relay calls in the last statistics collection interval. |
| Values | Decimal (0..30) |

### ATTRIBUTE Vsr totalCalls

| | |
|---|---|
| Description | This spooled statistic counts the call attempts processed on this channel (in both directions) in the last statistics collection interval. This counter includes the number of unsuccessful as well as successful call attempts. |
| Vector of | Decimal (0..65535) |
| Index | Decimal (1..32) |

### ATTRIBUTE Vsr totalCallSeconds

| | |
|---|---|
| Description | This spooled statistic counts the number of seconds that each channel is handling a call in the last statistics collection interval. This is regardless of whether the call is successful or not. In other words, this is the amount of time that the channel is not in the idle state. |
| Vector of | Decimal (0..65535) |
| Units | seconds |
| Index | Decimal (1..32) |

### ATTRIBUTE Vsr voiceRouteInstance

| | |
|---|---|
| Description | This spooled statistic is the value of the *VoiceRoute* linked to this *VoiceSubRoute*. |
| Values | Decimal (1..16) |

### COMPONENT Vsr SwitchedVoiceService (Svs)

| | |
|---|---|
| Instance | Decimal (1..32) |
| Groups | "GROUP Vsr Svs IfEntryProv (IfEntry)"<br>"GROUP Vsr Svs Operational (Oper)" |

| | |
|---|---|
| | "GROUP Vsr Svs Statistics (Stats)"<br>"GROUP Vsr Svs OsiState (State)"<br>"GROUP Vsr Svs OperationalStatus (OperStatus)" |
| Scope | Application |
| Description | *Vsr/n SwitchedVoiceService/n*<br>The *SwitchedVoiceService* component defines the operational characteristics of the connection to a Private Branch Exchange (PBX). One instance of this component must be required for each channel (that is, timeslot) which is part of the *VoiceSubroute*. |
| Subcomponents | "COMPONENT Vsr Svs Framer (Framer)" |
| Dyn. Subcomp. | "COMPONENT Vsr Svs LogicalConnection (LCo)"<br>"COMPONENT Vsr Svs VnetSvsDebug (Debug)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Vsr Svs IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Vsr Svs ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

### ATTRIBUTE Vsr Svs ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Vsr Svs Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *SwitchedVoiceService* component. |

### ATTRIBUTE Vsr Svs status

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the channel.<br>***idle*** means that there is no call currently active on this channel.<br>***seized*** means that the channel is currently setting up a call, but a connect message has not been received.<br>***answered*** means that a connect message has been received.<br>***clearing*** means that the call is being taken down.<br>***lockout*** means that due to glare or channel rejection, the channel is available for ingress calls only. That is, either the PBX and the Passport tried to seize the channel for a call at the same time (glare), or the PBX rejected the Passport seizure.<br>***idleMaintenance*** means that due to explicit channel maintenance messages, the channel is not available for egress calls. This can only happen when the protocol control places the channel into a maintenance state, and only happens if the Passport receives a message causing the channel state change such as the SERVICE maintenance message. |

| | |
|---|---|
| Values | idle<br>seized<br>answered<br>clearing<br>lockout<br>idleMaintenance (maint) |
| Default | No default |

### ATTRIBUTE Vsr Svs profileNumber (pn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the *VoiceProfile* number that is being used for this call. If no call is active, then it displays the value of the last profile used. |
| Values | Decimal (0..128) |
| Default | 0 |

### ATTRIBUTE Vsr Svs callType (ct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the type of call that this channel is currently carrying. If no call is active, then it displays the value for the last call. |
| Values | voice<br>data<br>modem |
| Default | No default |

### ATTRIBUTE Vsr Svs calledNumber (cldn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the dialled number that is active on this channel. If no call is active, then it displays the dialled number from the last call. |

| | |
|---|---|
| Values | BCD (1..32) |
| Default | No default |

### ATTRIBUTE Vsr Svs callingNumber (clgdn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the originator's number for the currently active call. If no call is active, then it displays the originator's number from the last call. |
| Values | BCD (1..16) |
| Default | No default |

### ATTRIBUTE Vsr Svs clearCauseCode (ccc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the clear cause code of the call. This code is always the Q.931 code, regardless of the access protocol. |
| Values | Hex (H.0..H.7f) |
| Default | No default |

### GROUP Vsr Svs Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *SwitchedVoiceService* component. |

### ATTRIBUTE Vsr Svs totalCalls (tc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the call attempts processed on this channel (in both directions). This counter includes the number of unsuccessful as well as successful call attempts.<br>The value wraps when it reaches its maximum. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Vsr Svs totalCallSeconds (tcs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the total number of seconds that this channel is handling a call. This is regardless of whether the call is successful or not. In other words, this is the amount of time that the channel is not in the idle state.<br>The value wraps when it reaches its maximum. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### GROUP Vsr Svs OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vsr Svs adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it |

is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Vsr Svs operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Vsr Svs usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Vsr Svs OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Vsr Svs snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### COMPONENT Vsr Svs Framer (Framer)

Groups
"GROUP Vsr Svs Framer Provisioned (Prov)"
"GROUP Vsr Svs Framer OsiState (State)"
"GROUP Vsr Svs Framer Statistics (Stats)"
"GROUP Vsr Svs Framer Operational (Oper)"
"GROUP Vsr Svs Framer Negotiation (Neg)"

Scope
Device

Description
*Vsr/n Svs/n Framer*
The *Framer* component controls link layer framing for

application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.
The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *E1* or *DS1*).
The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.
The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts).

Dyn. Subcomp. "COMPONENT Vsr Svs Framer VfpDebug"
"COMPONENT Vsr Svs Framer MvpDebug"
"COMPONENT Vsr Svs Framer PcmCapture (PcmCapture)"

## GROUP Vsr Svs Framer Provisioned (Prov)

Properties Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

## ATTRIBUTE Vsr Svs Framer interfaceName

Access Read and write

Criticality Process

Description

This attribute contains a hardware component name.

The attribute associates the application with a specific link. This

| | |
|---|---|
| | defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP Vsr Svs Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Vsr Svs Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Vsr Svs Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vsr Svs Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Vsr Svs Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a Framer component. |

## ATTRIBUTE Vsr Svs Framer totalCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of cells received from the interface.<br>Each cell contains 44 bytes of data from the DS0 channel. Since a DS0 provides data at 64 kbit/s, each cell contains 5.5 ms of audio data.<br>This data flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Vsr Svs Framer audioCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of cells containing audio data received from the interface while the channel was seized. A CCS channel is always considered to be seized. Audio data includes cells containing voice as well modem audio, but not silence.<br>A cell contains 44 bytes of data from the DS0 channel(5.5 ms). This flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Vsr Svs Framer silenceCells

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total number of cells containing silence data received from the interface which was not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the operation of the silence suppression feature or for CAS channels when the ABCD signalling bits go idle.<br>A cell contains 44 bytes of data from the DS0 channel(5.5 ms).<br>This flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the network with LRC errors. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer frmLostInNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which the service knows it did not receive from the network although they were sent in to the network from the far end. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer frmUnderRuns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that a frame was needed but was not available because it had been delayed too long in the network.<br>This error may occur repeatedly if the interface clocks at the two access points to the network are operating at different rates. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer frmDumped

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which have been dumped because the output queue grew too large. This can occur if the clock rate on the incoming interface is faster than the clock rate on the outgoing interface and there are no silence periods to absorb the difference, or when a compression rate change occurs. This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer faxRelayCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of fax relay cells sent to the network.<br><br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer modemFaxCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of cells containing modem data received from the interface while the channel was seized. A CCS channel is always considered to be seized. Cells are considered to be modem data if a constant energy level above -25 dBmO is detected for more than 900 ms. An energy level below -36 dBmO for more than 650 ms is required to detect that the modem is no longer present.<br>A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the |

channel.
This counter wraps to zero after reaching its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Vsr Svs Framer faxIdleCells

Access: Read only

Description: This attribute counts the total number of cells containing silent fax data received from the interface which were not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the silence Suppression feature or for CAS channels when the ABCD signalling bits go idle.

A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel.

This counter wraps to zero after reaching its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Vsr Svs Framer frmToNetwork

Access: Read only

Description: This attribute counts the number of frames sent to the network at each encoding rate. Fax relay cells are not included.

Vector of: Decimal (0..4294967295)

Index:
64 kbit/s
32 kbit/s
24 kbit/s
16 kbit/s
8 kbit/s

Default: No default

### ATTRIBUTE Vsr Svs Framer frmFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the network at each encoding rate. |
| Vector of | Decimal (0..4294967295) |
| Index | 64 kbit/s<br>32 kbit/s<br>24 kbit/s<br>16 kbit/s<br>8 kbit/s |
| Default | No default |

### GROUP Vsr Svs Framer Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for a *Svs Framer.* |

### ATTRIBUTE Vsr Svs Framer currentEncoding

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the encoding currently being performed on this channel. ***g711*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 is being performed. ***g726*** indicates that adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726 is being performed. ***g728*** indicates that the Low Delay Coded Excited Linear Predictive Coder (LD-CELP) algorithm defined by ITU-T G.728 is being performed. ***g729*** indicates that the Conjunctive Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) algorithm defined by ITU-T G.729 is being performed. ***v27*** indicates that the algorithm defined by ITU-T V.27 is being performed. ***v29*** indicates that the algorithm defined by ITU-T V.29 is being performed. |
| Values | none<br>g729<br>g728<br>g723 |

| | |
|---|---|
| | g726<br>g711<br>v22<br>v22bis<br>faxRelay<br>v27<br>v29<br>v17 |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer currentRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current encoding rate for frames being sent to the network. |
| Values | 0<br>0.3<br>1.2<br>2.4<br>4.8<br>5.3<br>6.3<br>7.2<br>8.0<br>9.6<br>12.0<br>14.4<br>16.0<br>24.0<br>32.0<br>64.0 |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer tptStatus

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the current status of the tandem pass through algorithm. If *tptStatus* is ***operating,*** the tandem pass through algorithm is cutting through a voice switch. If *tptStatus* is ***monitoring***, *negotiatedTandemPassThrough* is ***enabled***, but the tandem pass through algorithm is not cutting through a voice switch. If *tptStatus* is ***disabled***, *negotiatedTandemPassThrough* is ***disabled***. |
| Values | operating<br>monitoring<br>disabled |
| Default | No default |

### GROUP Vsr Svs Framer Negotiation (Neg)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes indicating the results of voice networking end to end negotiation. |

### ATTRIBUTE Vsr Svs Framer negotiatedSilenceSuppression (nSilenceSuppression)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the result of negotiating silence suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp silenceSuppression*.<br><br>If *negotiatedSilenceSuppression* is ***off***, silence suppression is never performed.<br>If *negotiatedSilenceSuppression* is ***on***, silence suppression is always performed.<br>If *negotiatedSilenceSuppression* is ***congested***, silence suppression is performed only when the network is congested.<br>If *negotiatedSilenceSuppression* is ***slow***, silence suppression begins after 10 to 20 seconds without any speech or audio being detected.<br>If *negotiatedSilenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are applied. |
| Values | off<br>on |

congested
slow
slowAndCongested

Default: No default

### ATTRIBUTE Vsr Svs Framer negotiatedFisG711G726 (nFisG711G726)

Access: Read and write

Description: This attribute indicates the result of negotiating G.711/G.726 fax idle suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp faxIdleSuppressionG711G726*.

Values:
off
on

Default: No default

### ATTRIBUTE Vsr Svs Framer negotiatedDtmfRegeneration (nDtmfRegeneration)

Access: Read and write

Description: This attribute indicates the result of negotiating DTMF regeneration with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp dtmfRegeneration*.

If *negotiatedDtmfRegeneration* is ***on***, DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is generated before being sent to the link.

If *negotiatedDtmfRegeneration* is ***off***, DTMF tones are transported transparently.

Values:
off
on

Default: No default

### ATTRIBUTE Vsr Svs Framer negotiatedV17AsG711G726 (nV17AsG711G726)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates how this *SwitchedVoiceService* negotiates with V.17 fax machines, as determined by negotiation with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp v17EncodedAsG711G726*.<br><br>If *negotiatedV17AsG711G726* is ***no,*** V.17 fax machines are instructed to use V.29, and V.29 fax traffic sent by fax machines is demodulated and encoded using fax relay.<br><br>If *negotiatedV17AsG711G726* is ***yes***, V.17 fax machines are permitted to use V.17 and V.17 fax traffic sent by fax machines is encoded using G.711 or G.726, at the rates given in *negotiatedRates*. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer negotiatedTandemPassThrough (nTpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the result of negotiating tandem pass through with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp tandemPassThrough*. |
| Values | enabled<br>disabled |
| Default | No default |

### ATTRIBUTE Vsr Svs Framer negotiatedEncoding (nEncoding)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the results of negotiating audio call encodings for ***voice***, ***modemFax*** and ***fax*** traffic with the remote end across the subnet. The parameters used for negotiating with the remote end are provisioned in *Vncs Vp voiceEncodingChoice* and *Vncs Vp modemFaxEncodingChoice*. |

***voice*** traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ***modemFax*** traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. ***fax*** traffic is all traffic after a fax preamble but before speech or call release.

***g711*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 is the negotiated encoding.
***g726*** indicates that Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 is the negotiated encoding.
***g711G726*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 and Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 are both negotiated encodings. If *negotiatedEncoding* is ***g711G726***, the actual encoding performed can be either G.711 or G.726, depending on network congestion.
***g728*** indicates that Low Delay Coded Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.728 is the negotiated encoding.
***g729*** indicates that Conjunctive Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.729 is the negotiated encoding.
***v29V27Relay*** indicates that fax relay using ITU-T V.29 or ITU-T V.27 is the negotiated encoding.
***v17V29V27Relay*** indicates that fax relay using ITU-T V.17, ITU-T V.29, or ITU-T V.27 is the negotiated encoding.

If all negotiated encodings are ***none***, the negotiation of audio call encodings is not complete.

| | |
|---|---|

| Default | No default | |

## COMPONENT Vsr Svs Framer VfpDebug

| | |
|---|---|
| Scope | Application |
| Description | *Vsr/m Svs/n Framer VfpDebug*<br>This component contains debugging attributes for a voice service running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** functional processor. |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Vsr Svs Framer MvpDebug

| | |
|---|---|
| Scope | Application |
| Description | *Vsr/m Svs/n Framer MvpDebug*<br>This component contains debugging attributes on a voice service's framer running on a ***1pE1Mvp***, ***1pDS1Mvp*** or ***1pTTC2mMvp*** functional processor. |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Vsr Svs Framer PcmCapture (PcmCapture)

| | |
|---|---|
| Scope | Application |
| Description | *Vsr/n Svs/m Framer PcmCapture*<br>This component contains attributes for PCM data capture. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Vsr Svs LogicalConnection (LCo)

| | |
|---|---|
| Groups | "GROUP Vsr Svs LCo PathData"<br>"GROUP Vsr Svs LCo Statisitics (Stats)" |
| Scope | Application |
| Description | ...*Lc*<br>This component contains all of the operation attributes for a Path Oriented Logical Connection. |
| Common Verbs | Help<br>List<br>Display |

### VERB RERoute Vsr Svs LCo

| | |
|---|---|
| Impact | Service |
| Description | RERoute ..Lc<br>This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified.<br>This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively.<br><br>When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path.<br><br>If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent. |

### GROUP Vsr Svs LCo PathData

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all operational attributes for the path oriented LCo. |

### ATTRIBUTE Vsr Svs LCo state

| | |
|---|---|
| Access | Read only |
| Description | This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal |

operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.

Values
pathDown
selectingRoute
connecting
pathUp
pathDownRetrying

Default
No default

### ATTRIBUTE Vsr Svs LCo overrideRemoteName (orn)

Access
Read: All
Write: All

Description
If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.

Values
String (0..40, ASCII)

Default
""

### ATTRIBUTE Vsr Svs LCo end

Access
Read only

Description
This attribute identifies whether this is the calling or called end of the path.

Values
calling
called

Default
No default

### ATTRIBUTE Vsr Svs LCo costMetric (cost)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo delayMetric (delay)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond.<br>For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic.<br>For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip |

| | |
|---|---|
| | delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC.<br>When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond. |
| Values | Decimal (0..200000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo setupPriority (spri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo holdingPriority (hpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType***,** will be candidates for this connection. |

| | |
|---|---|
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo permittedTrunkTypes (pttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo requiredSecurity (rsec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* |

attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.*

Values — Decimal (0..7)

Default — No default

### ATTRIBUTE Vsr Svs LCo requiredCustomerParameter (rcparm)

Access — Read only

Description — This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.

Values — Decimal (0..7)

Default — No default

### ATTRIBUTE Vsr Svs LCo emissionPriority (epri)

Access — Read only

Description — This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).

Values — Decimal (0..2)

Default — No default

### ATTRIBUTE Vsr Svs LCo discardPriority (dpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically). |
| Values | Decimal (1..3) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo pathType (pType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).<br><br>The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself. |
| Values | normal<br>manual<br>forced |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo retryCount (rcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology.<br>This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo pathFailureCount (pfcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo reasonForNoRoute (rnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason |

***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

Values

none

attributeProfileProblem
manualPathIndexProblem

Default

none

## ATTRIBUTE Vsr Svs LCo lastTearDownReason

Access

Read only

Description

This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:
***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up.
***normalShutDown*** - This path has gone down due to normal call termination.
***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.

***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
***trunkCardFailure***- A trunk FP card has failed along the path.
***accessCardFailure***- The FP on which the peer access service was running has failed.
***operatorForced***- The path has terminated due to the operator locking a trunk along the path.
***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
***networkCongestion*** - The path has failed due to control information being lost and not recoverable.
***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name.
***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid.
***unknownReason*** - The failure was not resolved.
***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled.
***remoteNameMismatch*** - The remote end has alarmed and rejected this setup due to remoteName provisioning.
***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.
***reconnectFromFarEnd*** - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.

***bumped*** - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
***optimized*** - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
***trunkOrFarEndDidNotSupportMode*** - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

### ATTRIBUTE Vsr Svs LCo pathFailureAction

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.<br>With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.<br><br>All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends |
| Values | reRoutePath<br>disconnectConnection |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo bumpPreference (bpref)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority*. A connection may also always bump in order to obtain the best route. |

| | |
|---|---|
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo optimization (opt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval. |
| Values | disabled<br>enabled |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo pathUpDateTime

| | |
|---|---|
| Access | Read: Service<br>Write: Illegal |
| Description | This is the time stamp when the current path was established or reestablished. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo path

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the trunk component names over which the path has been instantiated and the remote end point name terminating the path. |
| List of | String (0..40, ASCII) |
| List Size | 21 |

| | |
|---|---|
| Default | No default |

### GROUP Vsr Svs LCo Statisitics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics attributes for the path oriented LCo. |

### ATTRIBUTE Vsr Svs LCo pktsToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets transmitted to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo bytesToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo pktsFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote LCo via the network. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vsr Svs LCo bytesFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the remote LCo via the network. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### COMPONENT Vsr Svs VnetSvsDebug (Debug)

| | |
|---|---|
| Scope | Application |
| Description | *Vsr/n Svs/n Debug*<br>The *Debug* component defines the debug operational characteristics of the *svs* component. |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Vsr DebugStatus (Debug)

| | |
|---|---|
| Scope | Application |
| Description | *Vsr/n Debug*<br>The *Debug* component defines the debug operational characteristics of the VoiceSubroute component. There are three main areas of interest, the VoiceSubroute itself, the call state machines (CSM), and the call channel manager (CCM).<br>These debug groups can be reached by typing:<br>d Vsr/n debug<br>d Vsr/n debug sr<br>d Vsr/n debug csm<br>d Vsr/n debug ccm |
| Common Verbs | Help<br>List<br>Display |

## GROUP Vs CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Vs customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Vs IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Vs ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Vs ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Vs OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Vs snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Vs OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vs adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Vs operationalState (osiOper)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Vs usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Vs availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Vs proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Vs controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Vs alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Vs standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Vs unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Vs Operational

Properties
Operational

Description
This group contains operational attributes related to a *Vs*.

### ATTRIBUTE Vs serviceFailureReason

Access
Read: Passive
Write: Illegal

Description

This attribute indicates the result of end to end negotiation with the remote end across the subnet.

If *serviceFailureReason* is ***undetermined***, this *Vs* has not performed end to end negotiation with the remote end, and may or may not be up. *serviceFailureReason* is ***undetermined*** if this *Vs* just became enabled, if there is not enough available bandwidth to perform negotiation or if the remote end cannot perform negotiation with this *Vs*.
If *serviceFailureReason* is ***none***, end to end negotiation passed.
If *serviceFailureReason* is ***mismatchedService***, end to end negotiation failed because the remote end service is not a *Vs*.
If *serviceFailureReason* is ***mismatchedVoiceEncoding***, end to end negotiation failed because the local *Vs Framer voiceEncoding* does not match the remote *Vs Framer voiceEncoding*.
If *serviceFailureReason* is ***mismatchedVoiceRates***, end to end negotiation failed because the local provisioned ingress voice rates are not compatible with the remote end's egress capabilities or the remote provisioned ingress voice rates are not compatible with the local egress capabilities.
If *serviceFailureReason* is ***mismatchedModemFaxEncoding***, end to end negotiation failed because the local *Vs Framer modemFaxEncoding* does not match the remote *Vs Framer modemFaxEncoding*.
If *serviceFailureReason* is ***mismatchedModemFaxRates***, end to end negotiation failed because the local provisioned ingress modem and fax rates are not compatible with the remote end's egress capabilities or the remote provisioned ingress modem and fax rates are not compatible with the local egress capabilities.
If *serviceFailureReason* is ***mismatchedCasSignalling***, end to end negotiation failed because the local *Vs Framer casSignalling* does not match the remote *Vs Framer casSignalling*.
If *serviceFailureReason* is ***mismatchedSignalBits***, end to end negotiation failed because the local *Vs Framer signalBits* does not match the remote *Vs Framer signalBits*.
*serviceFailureReason* is ***mismatchedSignalBits*** only if the local *Vs Framer casSignalling* is ***transparent***.
If *serviceFailureReason* is ***compDecodeFailed***, end to end

negotiation failed because the information received from the remote end was not recognized as valid data.

Scope

Application

Description

*Vs/n Framer*
The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *Lp E1/n* or *Lp DS1/n*).
The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.
The *Framer* component contains operational attributes for

| | |
|---|---|
| | statistics and the results of end to end negotiation with the remote end across the subnet. |
| Dyn. Subcomp. | "COMPONENT Vs Framer VfpDebug"<br>"COMPONENT Vs Framer MvpDebug"<br>"COMPONENT Vs Framer PcmCapture (PcmCapture)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vs Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE Vs Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP Vs Framer CoderOptions (Coder)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes which specify how audio data on a channel is encoded and decoded. |

### ATTRIBUTE Vs Framer maxVoiceG711G726Rate (maxVoiceBitRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum desired ingress bit rate used during voice traffic when *voiceEncoding* is ***g711G726***.<br><br>The negotiated maximum ingress ***voice*** rate is available in *negotiatedIgRates.*<br><br>*maxVoiceG711G726Rate* can be set to ***16*** only if this *Voice Service* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card. |
| Values | 64<br>32<br>24<br>16 |
| Units | kbit/s |
| Default | 64 |

### ATTRIBUTE Vs Framer minVoiceG711G726Rate (minVoiceBitRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the minimum desired ingress bit rate used during voice traffic when *voiceEncoding* is ***g711G726***.<br><br>The negotiated minimum ingress ***voice*** rate is available in *negotiatedIgRates.*<br><br>*minVoiceG711G726Rate* defaults to ***24*** if the ***voiceCompressor*** or ***vtds*** feature is present. Otherwise, *minVoiceG711G726Rate* defaults to ***64***. |
| Values | 64<br>32 |

| | |
|---|---|
| | 24<br>16 |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Vs Framer maxModemFaxG711G726Rate (maxModemBitRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum desired ingress rate used during modemFax and/or fax traffic.<br><br>Voice traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ModemFax traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. Fax traffic is all traffic after a fax preamble but before speech or call release.<br><br>If *modemFaxEncoding* is ***g711G726***, *maxModemFaxG711G726Rate* specifies the maximum rate used during modemFax traffic and fax traffic.<br>If *modemFaxEncoding* is ***faxRelayG711G726***, *maxModemFaxG711G726Rate* specifies the maximum rate used during modemFax traffic only.<br>If *modemFaxEncoding* is ***faxRelayOnly*** or ***useVoiceEncoding***, *maxModemFaxG711G726Rate* is ignored.<br><br>The negotiated maximum ingress ***modemFax*** and ***fax*** rates are available in *negotiatedIgRates.*<br><br>*maxModemFaxG711G726Rate* can be set to ***16*** or ***24*** only if this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card. |
| Values | 64<br>32<br>24<br>16 |

| | |
|---|---|
| Units | kbit/s |
| Default | 64 |

### ATTRIBUTE Vs Framer minModemFaxG711G726Rate (minModemBitRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the minimum desired ingress rate used during modemFax and/or fax traffic.<br><br>Voice traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ModemFax traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. Fax traffic is all traffic after a fax preamble but before speech or call release.<br><br>If *modemFaxEncoding* is ***g711G726***, *minModemFaxG711G726Rate* specifies the minimum desired rate used during modemFax traffic and fax traffic.<br>If *modemFaxEncoding* is ***faxRelayG711G726***, *minModemFaxG711G726Rate* specifies the minimum desired rate used during modemFax traffic only.<br>If *modemFaxEncoding* is ***faxRelayOnly*** or ***useVoiceEncoding***, *minModemFaxG711G726Rate* is ignored.<br><br>The negotiated minimum ingress ***modemFax*** and ***fax*** rates are available in *negotiatedIgRates.*<br><br>*minModemFaxG711G726Rate* defaults to ***32*** if the ***voiceCompressor*** or ***vtds*** feature is present. Otherwise, *minModemFaxG711G726Rate* defaults to ***64***. |
| Values | 64<br>32<br>24<br>16 |
| Units | kbit/s |
| Default | No default |

## ATTRIBUTE Vs Framer silenceSuppression

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies when ingress silence suppression is desired during voice traffic.<br><br>If *silenceSuppression* is ***off***, silence suppression is never desired.<br>If *silenceSuppression* is ***on***, silence suppression is always desired.<br>If *silenceSuppression* is ***congested***, silence suppression is desired only when the network is congested.<br>If *silenceSuppression* is ***slow***, silence suppression is desired only after 20 seconds without audio.<br>If *silenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are desired.<br>If *silenceSuppression* is ***casIdleCod***e, the silence suppression is only desired when the *idleCode* is active for 20 to 40 seconds.<br>*casSignalling* must be set to ***interpret*** if *silenceSuppression* is set to ***casIdleCode***. *silenceSuppression* can be set to ***casIdleCode*** only if this *VoiceService* is running on a ***DS1V, E1V, 1pDS1V, 1pE1V*** or ***J2MV*** card.<br><br>The negotiated ingress silence suppression is available in *negotiatedIgSilenceSuppression.*<br><br>If the ***silenceSuppressor*** or ***vtds*** feature is present, *silenceSuppression* defaults to ***on***. Otherwise, *silenceSuppression* defaults to ***off***. |
| Values | off<br>on<br>congested<br>slow<br>slowAndCongested<br>casIdleCode |
| Default | No default |

## ATTRIBUTE Vs Framer echoCancellation

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether echo cancellation is performed on this *VoiceService*. If *echoCancellation* is ***on***, the internal echo canceler is enabled and echo cancellation is performed. If *echoCancellation* is ***off***, the internal echo canceler is placed in transparent bypass mode and echo cancellation is never performed. If the ***echoCancellor*** or ***vtds*** feature is present, *echoCancellation* defaults to ***on***. Otherwise *echoCancellation* defaults to ***off***. |
| Values | off<br>on |
| Default | No default |

## ATTRIBUTE Vs Framer aLawConversion

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether mu-law to A-law PCM conversion is performed. *aLawConversion* only needs to be set to ***on*** when this voice service is running on a ***DS1V*** or ***1pDS1V*** FP and the *VoiceService* at the remote end of the connection is running on an ***E1V*** or ***1pE1V*** FP using a software release prior to 5.0. If the remote end software release is 5.0 or later, end to end negotiation determines the compander law to use at each end of the connection. In this case, the value of *aLawConversion* is ignored. |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Vs Framer voiceEncoding

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies how ingress voice traffic is encoded.<br><br>If *voiceEncoding* is ***g711G726***, ingress voice traffic is encoded using either pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726. The actual encoding and rates performed depends on congestion in the network and the minimum and maximum negotiated ingress ***voice*** rates in *negotiatedIgRates*.<br><br>If *voiceEncoding* is ***g728at16***, ingress voice traffic is encoded using the Low Delay Coded Excited Linear Predictive Coder (LD-CELP) algorithm defined by ITU-T G.728. If *voiceEncoding* is ***g728at16***, the bit rate of all voice traffic is fixed at 16 kbit/s. *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* do not apply if *voiceEncoding* is ***g728at16***.<br><br>If *voiceEncoding* is ***g729at8***, ingress voice traffic is encoded using the Conjugated Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) algorithm defined by ITU-T G.729. If *voiceEncoding* is ***g729at8***, the bit rate of all voice traffic is fixed at 8 kbit/s. *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* do not apply if *voiceEncoding* is ***g729at8***.<br><br>The current ingress encoding and encoding rate are available in *currentEncoding* and *currentRate*.<br><br>*voiceEncoding* cannot be set to ***g728at16*** or ***g729at8*** if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card. Also, *voiceEncoding* can only be set to ***g728at16*** or ***g729at8*** if the corresponding feature exists in the *featureList* of the *Sw Lpt*.<br><br>The negotiated ingress ***voice*** encoding is available in |

*negotiatedIgEncoding.*

*voiceEncoding* must have the same value at both ends of a *VoiceService*. If *voiceEncoding* does not have the same value at both ends of a *VoiceService*, the *VoiceService* will be out of service. In this case, *serviceFailureReason* is ***mismatchedVoiceEncoding***.

Values
g711G726
g728at16
g729at8

Default
g711G726

### ATTRIBUTE Vs Framer modemFaxEncoding (faxEncoding)

Access
Read: Passive
Write: Service

Criticality
Process

Description
This attribute specifies how ingress modemFax and fax traffic are encoded.

Voice traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ModemFax traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. Fax traffic is all traffic after a fax preamble but before speech or call release.

If *modemFaxEncoding* is ***useVoiceEncoding***, all ingress traffic is treated like voice traffic and encoded according to *voiceEncoding*. If *voiceEncoding* is ***g728at16*** or ***g729at8***, modem and fax calls are not supported.

If *modemFaxEncoding* is ***g711G726***, ingress modemFax traffic and fax traffic are both encoded using pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726. The actual encoding and rates performed depends on congestion in the network and the minimum and maximum ingress ***modemFax*** rates in *negotiatedIgRates*.

If *modemFaxEncoding* is ***faxRelayG711G726***, ingress modemFax traffic is encoding using G.711 or G.726, exactly as it is if *modemFaxEncoding* is ***g711G726***. Until a fax preamble is detected, the rate may fluctuate between the minimum and maximum ***modemFax*** rates in *negotiatedIgRates* due to network congestion, exactly as it does if *modemFaxEncoding* is ***g711G726***. If a fax preamble is detected, all subsequent traffic during a call is demodulated and sent through the network as cells at the base rate of the sending machine. Supported demodulation methods are V.29 (up to 9.6 kbit/s) and V.27 (up to 4.8 kbit/s). The modulation and demodulation of fax traffic is called “fax relay”.

If *modemFaxEncoding* is ***faxRelayOnly***, “fax relay” is entered immediately upon 2100 Hz tone detection and modemFax traffic is treated like fax traffic. If *modemFaxEncoding* is ***faxRelayOnly***, modem calls are not supported.

The negotiated ingress ***modemFax*** and ***fax*** encodings are available in *negotiatedIgEncoding*.

*modemFaxEncoding* cannot be set to ***faxRelayG711G726*** or ***faxRelayOnly*** if this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card. The ***faxRelay*** feature is required to set *modemFaxEncoding* to ***faxRelayG711G726*** or ***faxRelayOnly***.

*modemFaxEncoding* must have the same value at both ends of a *VoiceService*. If *modemFaxEncoding* does not have the same value at both ends of a *VoiceService*, the *VoiceService* will be out of service. In this case, *serviceFailureReason* is ***mismatchedModemFaxEncoding***.

Values

faxRelayOnly
faxRelayG711G726
useVoiceEncoding

Default

g711G726

### ATTRIBUTE Vs Framer tandemPassThrough (tpt)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies whether tandem pass through is desired. If *tandemPassThrough* is ***enabled***, tandem pass through is used if possible. If *tandemPassThrough* is ***disabled***, tandem pass through is not used under any circumstances.<br><br>The negotiated tandem pass through is available in *negotiatedTandemPassThrough.*<br><br>The actual state of tandem pass through is available in *tptStatus*.<br><br>*tandemPassThrough* can be set to ***enabled*** only if the *tandemPassThrough* feature exists in the *featureList* of the *Sw Lpt*. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Vs Framer insertedOutputDelay

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the amount of added output delay used to compensate for cross network delay variations. It applies to voice, modem and fax traffic. It is required to add output delay so that the statistical variation in the transit time of cells crossing the network does not cause gaps in speech. Backbone networks where high priority traffic consumes a high percentage of trunk bandwidth will require a higher *insertedOutputDelay* to compensate for the greater cell delay variation (CDV).<br><br>*insertedOutputDelay* must be ***default*** if this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card. On all |

other cards, *insertedOutputDelay* can be set to any value. On these cards, ***default*** is equivalent to ***22***.

### ATTRIBUTE Vs Framer faxIdleSuppressionG711G726

Access
Read: Passive
Write: Service

Criticality
Process

Description
This attribute specifies whether ingress fax idle suppression is desired during G.711 and G.726 fax traffic. It applies only if *modemFaxEncoding* is ***g711G726*** or ***faxRelayG711G726.***

The negotiated ingress G.711/G.726 fax idle suppression is available in *negotiatedIgFisG711G726.*

If the ***silenceSuppressor*** or ***vtds*** feature is present, *faxIdleSuppressionG711G726* defaults to ***on***. Otherwise, *faxIdleSuppressionG711G726* defaults to ***off***.

Values
off
on

Default
No default

## ATTRIBUTE Vs Framer endOfCallPattern

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the pattern that indicates the end of CCS and CAS calls. The pattern is specified as a hexadecimal byte. If this pattern is detected for one second, the echo canceler is reset and prepares itself to start a new call. If 1000 consecutive samples consisting of the pattern defined by the *endOfCallPattern* attribute are detected, during a modem or fax call, this *VoiceService* assumes the call is over and switches to the encoding specified in *voiceEncoding*. When there is no call, this pattern replaces the PCM data that would normally be sent to the link.<br><br>*endOfCallPattern* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** card.<br><br>To determine the correct setting of *endOfCallPattern*, view the operational attribute *recentIngressLineSamples* while no calls are up.<br><br>If *endOfCallPattern* is ***standard***, the actual pattern used depends on the card this voice service is running on. If this voice service is running on a ***1pDs1Mvp***, ***1pDS1Mvpe***, ***1pTTC2mMvp*** or ***1pTTC2mMvpe*** card, the actual pattern used is ***7f***. If this voice service is running on a ***1pE1Mvp*** or ***1pE1Mvpe*** card, the actual pattern used is ***54***.<br><br>The default value for *endOfCallPattern* is ***standard***. |

### ATTRIBUTE Vs Framer ingressAudioGain

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the gain in dB that is applied to data coming from outside the network before it is transferred across the network. It applies to voice, modem and fax traffic. For example, ingress gain is applied to audio data coming from a PBX. If *ingressAudioGain* is negative, a loss is applied.<br><br>If this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card, *ingressAudioGain* must be set to ***0***. If this voice service is running on any other *cardtype*, *ingressAudioGain* can be set to any integral value from ***-12*** to ***+12***.<br><br>*ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in the network to ensure that the signal level from any point in the network to any other point is correct. |
| Values | Signed (-12..12) |
| Units | dB |
| Default | 0 |

### ATTRIBUTE Vs Framer egressAudioGain

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the gain in dB that is applied to data before it leaves the network. It applies to voice, modem and fax traffic. For example, egress gain is applied to audio data going to a PBX. If *egressAudioGain* is negative, a loss is applied. |

If this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card, *egressAudioGain* can be set to ***-6***, ***-4***, ***-2***, ***0***, ***2***, ***4*** or ***6***. If this voice service is running on any other *cardType*, *egressAudioGain* can be set to any integral value from ***-12*** to ***+12***.

*ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in the network to ensure that the signal level from any point in the network to any other point is correct.

| | |
|---|---|
| Values | -12<br>-11<br>-10<br>-9<br>-8<br>-7<br>-6<br>-5<br>-4<br>-3<br>-2<br>-1<br>0<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12 |
| Units | dB |

## ATTRIBUTE Vs Framer comfortNoiseCap

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the maximum level at which comfort noise is generated. The comfort noise is limited by *comfortNoiseCap* before *egressAudioGain* is applied. The default value of ***-40*** dBm0 equates to the maximum level of comfort noise available and effectively disables the *comfortNoiseCap*. |
| Values | Signed (-78; -65; -60; -54; -52; -50; -48; -46; -44; -42; -40) |
| Units | dBm0 |
| Default | -40 |

## ATTRIBUTE Vs Framer echoTailDelay

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum echo canceler tail delay coverage. It should be selected higher than the summation of the round trip delay of echo and hybrid response time. A ***32*** msec setting is good for a radius of 2700 km, assuming that the signal is going through 4 exchanges and the hybrid response time is 6 msec. A ***64*** msec setting offers even greater coverage (more distance or more switches), with comparable convergence time. The recommended setting is ***64*** msec. This attribute is not used if this VoiceService is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp,*** or ***1pTTC2mMvp*** cards. |
| Values | Decimal (32; 64) |
| Units | msec |
| Default | 64 |

### ATTRIBUTE Vs Framer echoReturnLoss

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the echo return loss parameter of the echo canceler. If the line quality is poor, in terms of echo, selecting a higher value may allow the echo canceler to perform better. A side effect is that the voice level is attenuated by the same amount, which may not always be acceptable. This attribute is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp***, or ***1pTTC2mMvp*** card. |
| Values | Decimal (0; 3; 6) |
| Units | dB |
| Default | 6 |

### ATTRIBUTE Vs Framer dtmfRegeneration (detGen)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies the DTMF regeneration parameter used during negotiation with the remote end across the subnet.<br><br>If *dtmfRegeneration* is ***on***, it is desired that DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is desired to be generated before being sent to the link.<br><br>If *dtmfRegeneration* is ***off***, DTMF tones are transported transparently.<br><br>DTMF regeneration is not supported on ***1pDS1V***, ***1pE1V***, and ***J2MV*** cards. *dtmfRegeneration* must be ***off*** if this *VoiceService* is running on one of these cards. |

The negotiated DTMF regeneration is available in *negotiatedDtmfRegeneration*.

Values
off
on

Default
off

### ATTRIBUTE Vs Framer speechHangoverTime

Access
Read: Passive
Write: Service

Criticality
Process

Description
This attribute specifies the time after the end of speech before silence suppression starts. It applies only to voice traffic. It is not used unless *negotiatedIgSilenceSuppression* is ***on***, ***congested*** *or* ***slowAndCongested***.
Higher values of *speechHangoverTime* reduce undesirable clipping but increase bandwidth usage.
*speechHangoverTime* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card.

Values
Signed (10..500)

Units
msec

Default
150

### ATTRIBUTE Vs Framer faxHangoverTimeG711G726

Access
Read: Passive
Write: Service

Criticality
Process

Description
This attribute specifies the time after the end of fax traffic before ingress G.711/G.726 fax idle suppression starts. It applies only if *modemFaxEncoding* is ***g711G726*** or ***faxRelayG711G726*** and *negotiatedIgFisG711G726* is ***on***.

*faxHangoverTimeG711G726* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** card.

| | |
|---|---|
| Values | Signed (300..20000) |
| Units | msec |
| Default | 1000 |

### ATTRIBUTE Vs Framer modemFaxSpeechDiscrim (fsd)

| | |
|---|---|
| Access | Read: Passive<br>Write: Service |
| Criticality | Process |
| Description | This attribute specifies whether this *VoiceService* differentiates modemFax traffic and speech. If *modemFaxSpeechDiscrim* is ***on*** and a false 2100 Hz tone is detected, this *VoiceService* reverts to speech mode when speech is detected.<br><br>*modemFaxSpeechDiscrim* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** card. |
| Values | on<br>off |
| Default | on |

### ATTRIBUTE Vs Framer v17EncodedAsG711G726

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the desired negotiation between this *VoiceService* and V.17 fax machines when *modemFaxEncoding* is ***faxRelayG711G726***. This attribute is not used unless *modemFaxEncoding* is ***faxRelayG711G726***.<br><br>The actual negotiation between this *VoiceService* and V.17 fax machines is available in *negotiatedV17AsG711G726*.<br><br>If *v17EncodedAsG711G726* is ***no,*** it is desired that V.17 fax machines be instructed to use V.29 so that V.29 fax traffic sent by fax machines can be demodulated and encoded using fax relay.<br><br>If *v17EncodedAsG711G726* is ***yes***, it is desired that V.17 fax |

machines be permitted to use V.17 so that V.17 fax traffic sent by fax machines can be encoded using G.711 or G.726. The actual encoding performed depends on network congestion and the negotiated ingress ***modemFax*** rates, available in *negotiatedIgRates*.

Values
no
yes

Default
no

### ATTRIBUTE Vs Framer ecanBypassMode

Access
Read and write

Criticality
Process

Description
This attribute specifies when version 2 internal echo cancelers are placed in bypass mode on this *VoiceService*. This attribute only applies if *echoCancellation* is ***on***. If *ecanBypassMode* is ***g165***, the internal echo canceler is placed in bypass mode as per ITU-T G.165. If *ecanBypassMode* is ***g164***, the internal echo canceler is placed in bypass mode as per ITU-T G.164. If *ecanBypassMode* is ***never***, the internal echo canceler is never placed in bypass mode. This mode should only be used for debugging.

This attribute does not apply to ***1pE1V***, ***1pDS1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp***, or ***1pTTC2mMvp*** cards.

Values
g164
g165
never

Default
g165

### ATTRIBUTE Vs Framer maxFaxRelayRate

Access
Read: Passive
Write: Service

Criticality
Process

Description
This attribute specifies the maximum desired fax relay rate. This attribute only applies if *modemFaxEncoding* is ***faxRelayOnly*** or ***faxRelayG711G726***. The maximum fax relay rate is negotiated

| | |
|---|---|
| | and depends on the setting of *maxFaxRelayRate* and the fax relay capabilities on the origination side and destination side. If the negotiated ***fax*** encoding in *negotiatedIgEncoding* is ***relay***, the negotiated maximum fax relay rate is available in the ***fax*** row of *negotiatedIgRates*. |
| Values | Decimal (2.4; 4.8; 7.2; 9.6; 12.0; 14.4) |
| Units | kbit/s |
| Default | 14.4 |

### GROUP Vs Framer SignalOptions (Signal)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes which define the means for transporting channel associated signaling through the network. |

### ATTRIBUTE Vs Framer transmitBusyYellow

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | When this attribute is set to ***yes*** and the DS1 or E1 line is set to Channel Associated Signaling (CAS) mode, a “busy-out” signaling condition is transmitted onto the voice timeslot associated with this Framer when its path across the network is down. The busy-out code transmitted is given by the *seizeCode* attribute. If *transmitBusyYellow* is set to ***yes*** on a CAS-based interface, *seizeCode* must be set. When *transmitBusyYellow* is set to ***yes*** and the DS1 or E1 line is set to Common Channel Signaling (CCS) mode, a yellow alarm condition is transmitted onto the DS1/E1 line when the path across the network associated with this Framer is down. Note that in CCS mode, a yellow alarm condition is transmitted when the path is down for **any** of the Framers with this attribute set to ***yes***. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Vs Framer invertBits

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether the ABCD bits are inverted before being output onto the link. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Vs Framer signalBits

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute identifies the combination of ABCD bits used for channel associated signaling.<br><br>If *casSignalling* is ***transparent***, *signalBits* must have the same value at both ends of a *Vs*. If *casSignalling* is ***transparent*** and *signalBits* does not have the same value at both ends of a *Vs*, the *Vs* will be out of service. In this case, *Vs serviceFailureReason* is ***mismatchedSignalBits***. |
| Values | A<br>AB<br>ABCD |
| Default | A |

### ATTRIBUTE Vs Framer transmitCasYellow

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | When the associated DS1 or E1 line is operating in CCS mode, this attribute is not applicable, and must be set to ***no***.<br><br>Normally, all the *VoiceService Framer*s associated with the same DS1 or E1 line should have the same value for this attribute. |

When the value is ***yes*** on all *VoiceService Framer*s, a yellow alarm will be asserted on the port whenever loss of subnet connectivity occurs for all these *VoiceService*s. This will prevent the external equipment from using this port for call attempts.

If this attribute is set to ***no*** for all *VoiceService Framer*s associated with a DS1 or E1 line, a yellow alarm will never be asserted on the line for subnet connectivity reasons, agreeing with DS1/E1 port standards.

If some *VoiceService Framer*s associated with the same DS1 or E1 line have this value set to ***yes***, and some ***no***, a yellow alarm will be asserted on the line only if there are subnet connectivity problems for all the *VoiceService Framer*s with the attribute *transmitCasYellow* set to ***yes***. The *VoiceService Framer*s with this attribute set to ***no*** will have no effect on whether a yellow alarm should be asserted on the line.

Values
no
yes

Default
no

## ATTRIBUTE Vs Framer casSignalling

Access
Read and write

Criticality
Process

Description
This attribute specifies how channel associated signaling information is transported through the network.
***none*** specifies that channel associated signaling information is not transported through the network.
***transparent*** specifies signaling information is transported transparently through the network. ***transparent*** can be used when both sides are using equivalent signaling tables.
***interpret*** specifies signaling information is interpreted for idle and seize codes. ***interpret*** can be used when both sides are not using equivalent signaling tables but only require two unique codes (seize and idle) for signaling.
Using a value of ***interpret*** requires correct *idleCode* and *seizeCode* attributes. ***interpret*** mode must be used if *silenceSuppression* is set to ***casIdleCode***.

| | |
|---|---|
| Values | none<br>transparent<br>interpret |
| Default | none |

### ATTRIBUTE Vs Framer idleCode

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the ABCD idle line signaling code. This attribute must be set correctly when *casSignalling* is ***interpret***. |
| Vector of | Decimal (0..1) |
| Index | A<br>B<br>C<br>D |
| Default | (0, 0, 0, 0) |

### ATTRIBUTE Vs Framer seizeCode

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the ABCD seized line signaling code. This attribute must be set correctly when *casSignalling* is ***interpret***. |
| Vector of | Decimal (0..1) |
| Index | A<br>B<br>C<br>D |
| Default | (1, 1, 1, 1) |

### GROUP Vs Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Vs Framer adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Vs Framer operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Vs Framer usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP Vs Framer Statistics (Stats)

Properties: Operational

Description: This group contains the operational statistics data for a Framer component.

### ATTRIBUTE Vs Framer totalCells

Access: Read only

| | |
|---|---|
| Description | This attribute counts total cells received from the interface.<br>Each cell contains 44 bytes of data from the DS0 channel. Since a DS0 provides data at 64 kbit/s, each cell contains 5.5 ms of audio data.<br>This data flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vs Framer audioCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts total cells containing audio data received from the interface. Audio data includes cells containing voice as well as modem audio but not silence.<br>A cell contains 44 bytes of data from the DS0 channel(5.5 ms).<br>This flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vs Framer silenceCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts total cells containing silence (speech or modem/fax) data received from the interface which was not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the operation of the silence suppression feature (refer to the *silenceSuppression* attribute) or for CAS channels when the ABCD signaling bits go idle.<br>A cell contains 44 bytes of data from the DS0 channel(5.5 ms).<br>This flow is measured before compression is performed on the channel.<br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vs Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames with LRC errors that are received from the network. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vs Framer frmLostInNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which the service knows it did not receive from the network although they were sent in to the network from the remote end. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vs Framer frmUnderRuns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that a frame was needed but was not available because it had been delayed too long in the network.<br>This error may occur repeatedly if the interface clocks at the two access points to the network are operating at different rates. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vs Framer frmDumped

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which have been dumped because the output queue grew too large. This can occur if the clock rate on the incoming interface is faster than the clock rate on the outgoing interface and there are no silence periods to |

| | |
|---|---|
| | absorb the difference or when a compression rate change occurs. This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vs Framer faxRelayCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts total fax relay cells sent to the network. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vs Framer modemFaxCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts total cells containing modem or fax data received from the interface.<br><br>A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel.<br><br>This counter wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Vs Framer faxIdleCells

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts total cells containing silent modem or fax data received from the interface which was not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the silence Suppression feature (refer to the *silenceSuppression* attribute) or for CAS channels when the ABCD signaling bits go idle.<br>A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the |

channel.
This counter wraps to zero after reaching its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Vs Framer frmToNetwork

Access: Read only

Description: This attribute counts the number of frames sent to the network at each encoding rate. Fax relay cells are not included.

Vector of: Decimal (0..4294967295)

Index:
64 kbit/s
32 kbit/s
24 kbit/s
16 kbit/s
8 kbit/s

Default: No default

### GROUP Vs Framer Negotiation (Neg)

Properties: Operational

Description: This group contains attributes indicating the results of end to end negotiation.

### ATTRIBUTE Vs Framer negotiatedIgSilenceSuppression (nSilenceSuppression)

Access: Read only

Description: This attribute indicates the result of negotiating ingress silence suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *silenceSuppression*.

*negotiatedIgSilenceSuppression* can be different on either side of a *VoiceService*.

If *negotiatedIgSilenceSuppression* is ***off***, ingress silence suppression is never performed.

If *negotiatedIgSilenceSuppression* is ***on***, ingress silence suppression is always performed.
If *negotiatedIgSilenceSuppression* is ***congested***, ingress silence suppression is performed only when the network is congested.
If *negotiatedIgSilenceSuppression* is ***slow***, ingress silence suppression begins after 20 seconds without any speech or audio being detected.
If *negotiatedIgSilenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are applied.
If *negotiatedIgSilenceSuppression* is ***casIdleCode***, ingress silence suppression is only performed when the *idleCode* is active for 20 to 40 seconds. Both *transportSignalling* and *interpretSignalling* must be set to ***yes*** if *silenceSuppression* is set to ***casIdleCode***.

Values

### ATTRIBUTE Vs Framer negotiatedIgFisG711G726 (nFisG711G726)

Access
Read only

Description
This attribute indicates the result of negotiating ingress G.711/G.726 fax idle suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *faxIdleSuppressionG711G726*.

The value of *negotiatedIgFisG711G726* can be different on either side of the connection.

Values
off
on

Default
No default

### ATTRIBUTE Vs Framer negotiatedDtmfRegeneration (nDtmfRegeneration)

Access
Read only

Description

This attribute indicates the result of negotiating DTMF regeneration with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *dtmfRegeneration.*

If *negotiatedDtmfRegeneration* is ***on***, DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is generated before being sent to the link.

If *negotiatedDtmfRegeneration* is ***off***, DTMF tones are transported transparently.

Values

off
on

Default

No default

## ATTRIBUTE Vs Framer negotiatedV17AsG711G726 (nV17AsG711G726)

Access

Read only

Description

This attribute indicates how this *VoiceService* negotiates with V.17 fax machines, as determined by negotiation with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *v17EncodedAsG711G726*. This attribute is irrelevant unless *modemFaxEncoding* is ***faxRelayG711G726***.

If *negotiatedV17AsG711G726* is ***no,*** V.17 fax machines are instructed to use V.29, and V.29 fax traffic sent by fax machines is demodulated and encoded using fax relay.

If *negotiatedV17AsG711G726* is ***yes***, V.17 fax machines are permitted to use V.17 and V.17 fax traffic sent by fax machines is encoded using G.711 or G.726, at the rates given in *negotiatedIgRates*.

Values

yes
no

Default

No default

### ATTRIBUTE Vs Framer negotiatedTandemPassThrough (nTpt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the result of negotiating tandem pass through with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *tandemPassThrough*. |
| Values | enabled<br>disabled |
| Default | No default |

### ATTRIBUTE Vs Framer negotiatedIgEncoding (nEncoding)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the results of negotiating ingress audio call encodings for ***voice***, ***modemFax*** and ***fax*** traffic with the remote end across the subnet. The parameters used for negotiating with the remote end are provisioned in *voiceEncoding* and *modemFaxEncoding*.<br><br>***voice*** traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ***modemFax*** traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. ***fax*** traffic is all traffic after a fax preamble but before speech or call release.<br><br>***g711*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 is the negotiated encoding.<br>***g726*** indicates that Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 is the negotiated encoding.<br>***g711G726*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 and Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 are both negotiated encodings. If *negotiatedIgEncoding* is ***g711G726***, the actual encoding performed can be either G.711 or G.726, depending on network congestion.<br>***g728*** indicates that Low Delay Coded Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.728 is the negotiated encoding. |

***g729*** indicates that Conjunctive Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.729 is the negotiated encoding.
***v29V27Relay*** indicates that fax relay is performed using ITU-T V.29 or ITU-T V.27.
***v17V29V27Relay*** indicates that fax relay using ITU-T V.17, ITU-T V.29, or ITU-T V.27 is the negotiated encoding.

If all negotiated encodings are ***none***, the negotiation of audio call encodings is not complete.

### ATTRIBUTE Vs Framer tptStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current status of the tandem pass through algorithm. If *tptStatus* is ***operating,*** the tandem pass through algorithm is cutting through a voice switch. If *tptStatus* is ***monitoring***, *negotiatedTandemPassThrough* is ***enabled***, but the tandem pass through algorithm is not cutting through a voice switch. If *tptStatus* is ***disabled***, *negotiatedTandemPassThrough* is ***disabled***. |
| Values | operating<br>monitoring<br>disabled |
| Default | No default |

### ATTRIBUTE Vs Framer recentIngressLineSamples

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates two recent ingress line samples, represented as four hex digits. The first two hex digits give one sample. The last two hex digits give the other sample. If no call is up on this voice service's channel, each sample indicates the idle pattern sent by the adjoining PBX. Therefore, the two samples should be the same if no call is up on this voice service's channel. These samples should also be consistent each time *recentIngressLineSamples* is displayed, as long as no call is up on this voice service's channel. It indicates a fault on the PBX if the samples are not consistent when no call is up on this voice service's channel.<br><br>If no call is up on this *VoiceService*'s channel and the two samples are the same, each sample gives the correct setting of the |

provisionable attribute *endOfCallPattern*. Note that *endOfCallPattern* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** card. On these cards, *recentIngressLineSamples* is always ***0000***.

Values: String (2, Hex)

Default: No default

## COLLECTED STATS VoiceService Framer

Description: The statistics record generated by the VoiceService Framer component.

### ATTRIBUTE Vs Framer rxBytes

Description: This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values: Long Integer

### ATTRIBUTE Vs Framer rxFrames

Description: This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values: Long Integer

### ATTRIBUTE Vs Framer txBytes

Description: This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values: Long Integer

### ATTRIBUTE Vs Framer txFrames

Description: This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values: Long Integer

### ATTRIBUTE Vs Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |
| Values | Decimal (0..100) |

### COMPONENT Vs Framer VfpDebug

| | |
|---|---|
| Scope | Application |
| Description | *Vs/n Framer VfpDebug*<br>This component contains debugging attributes for a voice service running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** functional processor. |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Vs Framer MvpDebug

| | |
|---|---|
| Scope | Application |
| Description | *Vs/n Framer MvpDebug*<br>This component contains debugging attributes on a voice service's framer running on a ***1pE1Mvp***, ***1pDS1Mvp***, ***1pTTC2mMvp, 1pE1Mvpe***, ***1pDS1Mvpe*** or ***1pTTC2mMvpe*** functional processor. |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Vs Framer PcmCapture (PcmCapture)

| | |
|---|---|
| Scope | Application |

| | |
|---|---|
| Description | *Vs/n Framer PcmCapture*<br>This component contains attributes for PCM data capture. |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Vs PermanentLogicalConnection (Plc)

| | |
|---|---|
| Groups | "GROUP Vs Plc Provisioning (Prov)" |
| Scope | Application |
| Description | *Vs/n PLC*<br>This is the description of the PLC Component for the voice service. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Vs Plc Provisioning (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all provisionable attributes for a permanent logical connection. Note that all of the attributes are valid and provisionable on both ends of a connection. However with the exception of *remoteName*, all operational attributes are derived from the originating end provisioning, which may be either end unless *remoteName* is not provisioned on one end. |

### ATTRIBUTE Vs Plc remoteName (rName)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s remote end point's address in the format of a Passport component name. The syntax of a component is:<br>"em/node type/instance". For an alternative representation of end point's addresses, see *addressToCall* and l*ocalAddress PLC* |

attributes. When using Passport component name representation, end points are identified using a node name and a service name. As an example, the end point component for a third voice service on node MoonBase is: "*EM/MoonBase VS/3*". If the *remoteName* is provisioned, it must match the name of the remote end or the connection will not be established even if the remote end is provisioned correctly. If no *remoteName* is provisioned, then this *LC* will accept connections from any other remote *LC* and it will not originate calls. Connections establish faster and are unique if both ends are provisioned with *remoteName*.
*RemoteName* should be used when the remote end of the connection resides within the same topology region. If it resides in a different topology region, then *addressToCall* and *localAddress PLC* attributes should be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*.
These strings are case insensitive, but the complete component name must be input.

| | |
|---|---|
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Vs Plc setupPriority (spri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | 2 |

### ATTRIBUTE Vs Plc holdingPriority (hpri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the priority that a path holds once it is established. Zero is the highest priority and four is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | 2 |

### ATTRIBUTE Vs Plc requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the bandwidth (in bits per second) reserved by a path on each of the trunks of its route.This attribute represents the bandwidth for traffic outgoing to the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value. |
| Values | Decimal (0..2048000) |
| Units | bit/s |
| Default | 32000 |

### ATTRIBUTE Vs Plc requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the bandwidth (in bits per second) reserved by a path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value. |
| Values | Decimal (0..2048000) |
| Units | bit/s |
| Default | 32000 |

### ATTRIBUTE Vs Plc requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection. |

| | |
|---|---|
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | voice |

### ATTRIBUTE Vs Plc permittedTrunkTypes (pttyp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute lists up to eight(8) types of trunk that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six(6) remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | (terrestrial, satellite, trunkType1, trunkType2, trunkType3) |

### ATTRIBUTE Vs Plc requiredSecurity (rsec)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can |

| | |
|---|---|
| | transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection. |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Vs PIc requiredCustomerParm (rcparm)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the allowed customer defined parameter of the trunks on the route. Its value, a number from zero to seven, is chosen by network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path. |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Vs PIc pathAttributeToMinimize (pamin)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. |

The delay of a selected route is the sum of the trunk delay metric for all trunks included in the route.

Values
cost
delay

Default
cost

### ATTRIBUTE Vs Plc maximumAcceptableCost (maxCost)

Access
Read and write

Criticality
Process

Description
This attribute indicates an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done for any minimization criterion. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.

Values
Decimal (0..65535)

Default
1280

### ATTRIBUTE Vs Plc maximumAcceptableDelay (maxDelay)

Access
Read and write

Criticality
Process

Description
This attribute indicates an upper bound on the delay of a route, which is the sum of the delay of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512-byte packet. Remember, that the trunk during its staging measures a *measuredRoundTripDelay*. This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512-byte packet is used to

| | |
|---|---|
| | perform the measurement.<br>If for any trunk the half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection.<br>While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay.* |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | 100000 |

### ATTRIBUTE Vs Plc emissionPriority (epri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. *EmissionPriority* of Zero(0) indicates the highest emission priority, while two (2) indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher). |
| Values | Decimal (0..2) |
| Default | 0 |

### ATTRIBUTE Vs Plc discardPriority (dpri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the importance of the packets on the path. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically). |

| | |
|---|---|
| Values | Decimal (1..3) |
| Default | 1 |

### ATTRIBUTE Vs Plc pathType (pType)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies if the path for this PLC is determined automatically or by static provisioning. The default (***normal***) is to automatically choose a route with Route Selection. ***Normal*** *pathTypes* require less provisioning and can dynamically handle path failures. The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).<br>The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself. |
| Values | normal<br>manual<br>forced |
| Default | normal |

### ATTRIBUTE Vs Plc pathFailureAction (pfa)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute is used to specify whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.<br>With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.<br>All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends. |
| Values | reRoutePath<br>disconnectConnection |
| Default | reRoutePath |

### ATTRIBUTE Vs Plc bumpPreference (bpref)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute controls when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *holdingPriority* in order to acquire its bandwidth and be established. By default, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. A connection may be set to always bump in order to find the best route it may have. |
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | bumpWhenNecessary |

### ATTRIBUTE Vs Plc optimization (opt)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval. |
| Values | disabled<br>enabled |
| Default | enabled |

### ATTRIBUTE Vs Plc addressToCall (addrToCall)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s remote end point's address in the format of a NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. For an alternative representation of end point's addresses, see *remoteName* attribute. If the *addressToCall* is provisioned, it must match *localAddress* provisioned on the remote end or the connection will not be established. Connections establish faster and are unique if both ends are provisioned with *addressToCall*. *AddressToCall* must be used when the remote end of the connection resides in different topology region. If it resides in the same topology region, then *remoteName* may be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Vs Plc localAddress (localAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s end point address in the format of an NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. *LocalAddress* must share a prefix with MOD nodePrefix or one of MOD alternatePorsPrefixes for this node, otherwise PORS will not be able to route calls to this service. *LocalAddress* is used in conjunction with *addressToCall*. That is, the end responsible for originating calls must have *addressToCall* provisioned, while the end responsible for terminating calls must have *localAddress* provisioned. In such a case, *addressToCall* on the originating end must match exactly the *localAddress* of the terminating end. Note that both ends may be originating and terminating at the same time. That is, both ends may have *addressToCall* and *localAddress* provisioned as long as *addressToCall* and *localAddress* on different ends are identical. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Vs Plc maximumAcceptableGatewayCost (maxGateCost)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates an upper bound on the gateway cost metric of a route, which is the sum of the gateway cost metrics of all gateway links on the route. It has the same semantics as the *maximumAcceptableCost* except that gateway cost metrics are used instead of trunk cost metrics. Gateway cost metrics are provisioned under *Trunk Address* component of a gateway link specifying a gateway costs of reaching an address through the link. |
| Values | Decimal (0..65535) |
| Default | 2048 |

## ATTRIBUTE Vs Plc manualPath (mpath)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is optional and specifies the sequence of trunks to be used as the route for the path, thus bypassing PORS' automatic route selection. If the path fails the validation, no other path can be selected[1]. This attribute should only be used in special cases since the route selection algorithm is able to find and maintain the best routes. A related path attribute, the *pathType*, determines if this route will be used as a manual or forced path type.<br>As an example, the trunk component name for the third trunk on node MoonBase is "*EM/MoonBase Trk/3*". Note that only the first end of the trunk that the packet would encounter is provisioned. These strings are case insensitive but the complete component name must be input.<br><br>Note 1: the trunk designation must be a 3-letter form, e.g., 'trk'.<br>Note 2: only the outbound trunks component names are used to provision the ***manualPath***.<br><br>Note 3: It is recommended to have two independent routes specified for a manual path by specifying a different ***manualPath*** (non-symmetric) for each end. In this case, there is no way to select which route will be used (first up wins) but if one path is torn down due to a failure then the other ***manualPath*** may be used to reroute the path. |
| Vector of | String (0..40, ASCII) |
| Index | Decimal (0..9) |
| Default | ([10] "") |

## COMPONENT Vs LogicalConnection (LCo)

| | |
|---|---|
| Groups | "GROUP Vs LCo PathData"<br>"GROUP Vs LCo Statisitics (Stats)" |
| Scope | Application |

Description ...*Lc*
This component contains all of the operation attributes for a Path Oriented Logical Connection.

Common Verbs
Help
List
Display

## VERB RERoute Vs LCo

Impact Service

Description RERoute ..Lc
This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified.
This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively.

When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path.

If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

## GROUP Vs LCo PathData

Properties Operational

Description This group contains all operational attributes for the path oriented LCo.

### ATTRIBUTE Vs LCo state

| | |
|---|---|
| Access | Read only |
| Description | This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again. |
| Values | pathDown<br>selectingRoute<br>connecting<br>pathUp<br>pathDownRetrying |
| Default | No default |

### ATTRIBUTE Vs LCo overrideRemoteName (orn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Vs LCo end

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute identifies whether this is the calling or called end of the path. |
| Values | calling<br>called |
| Default | No default |

### ATTRIBUTE Vs LCo costMetric (cost)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vs LCo delayMetric (delay)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Vs LCo roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest |

| | |
|---|---|
| | millisecond.<br>For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic.<br>For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC.<br>When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond. |
| Values | Decimal (0..200000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Vs LCo setupPriority (spri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Vs LCo holdingPriority (hpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. |
| Values | Decimal (0..4) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vs LCo requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Vs LCo requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Vs LCo requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this |

traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType***,** will be candidates for this connection.

Values
voice
data
video
trafficType1 (tt1)
trafficType2 (tt2)
trafficType3 (tt3)
trafficType4 (tt4)
trafficType5 (tt5)

Default
No default

### ATTRIBUTE Vs LCo permittedTrunkTypes (pttyp)

Access
Read only

Description
This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.

Set of
terrestrial
satellite
trunkType1 (tt1)
trunkType2 (tt2)
trunkType3 (tt3)
trunkType4 (tt4)
trunkType5 (tt5)
trunkType6 (tt6)

Default
No default

### ATTRIBUTE Vs LCo requiredSecurity (rsec)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.* |
| Values | Decimal (0..7) |
| Default | No default |

### ATTRIBUTE Vs LCo requiredCustomerParameter (rcparm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path. |
| Values | Decimal (0..7) |
| Default | No default |

### ATTRIBUTE Vs LCo emissionPriority (epri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher). |

| | |
|---|---|
| Values | Decimal (0..2) |
| Default | No default |

### ATTRIBUTE Vs LCo discardPriority (dpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically). |
| Values | Decimal (1..3) |
| Default | No default |

### ATTRIBUTE Vs LCo pathType (pType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).<br><br>The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself. |

| | |
|---|---|
| Values | normal<br>manual<br>forced |
| Default | No default |

### ATTRIBUTE Vs LCo retryCount (rcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology.<br>This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Vs LCo pathFailureCount (pfcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Vs LCo reasonForNoRoute (rnr)

| | |
|---|---|
| Access | Read only |

Description

This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

Values

none
destinationNameTooLong

### ATTRIBUTE Vs LCo lastTearDownReason

Access

Read only

Description

This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:
***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not

been up.
***normalShutDown*** - This path has gone down due to normal call termination.
***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.
***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
***trunkCardFailure***- A trunk FP card has failed along the path.
***accessCardFailure***- The FP on which the peer access service was running has failed.
***operatorForced***- The path has terminated due to the operator locking a trunk along the path.
***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
***networkCongestion*** - The path has failed due to control information being lost and not recoverable.
***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name.
***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid.
***unknownReason*** - The failure was not resolved.
***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled.
***remoteNameMismatch*** - The remote end has alarmed and

rejected this setup due to remoteName provisioning.
***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.
***reconnectFromFarEnd*** - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
***bumped*** - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
***optimized*** - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
***trunkOrFarEndDidNotSupportMode*** - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

Values

trunkOrFarEndDidNotSupportMode

Default none

### ATTRIBUTE Vs LCo pathFailureAction

Access Read only

Description This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Values reRoutePath
disconnectConnection

Default No default

### ATTRIBUTE Vs LCo bumpPreference (bpref)

Access Read only

Description This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always.

It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority*. A connection may also always bump in order to obtain the best route.

Values: bumpWhenNecessary
bumpToObtainBestRoute

Default: No default

### ATTRIBUTE Vs LCo optimization (opt)

Access: Read only

Description: This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

Values: disabled
enabled

Default: No default

### ATTRIBUTE Vs LCo pathUpDateTime

Access: Read: Service
Write: Illegal

Description: This is the time stamp when the current path was established or reestablished.

Values: Time (DHMS)

Default: No default

### ATTRIBUTE Vs LCo path

Access: Read only

| | |
|---|---|
| Description | This attribute contains the trunk component names over which the path has been instantiated and the remote end point name terminating the path. |
| List of | String (0..40, ASCII) |
| List Size | 21 |
| Default | No default |

### GROUP Vs LCo Statisitics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics attributes for the path oriented LCo. |

### ATTRIBUTE Vs LCo pktsToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets transmitted to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vs LCo bytesToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Vs LCo pktsFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote LCo via the network. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Vs LCo bytesFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the remote LCo via the network. |
| Values | Long Integer |
| Default | No default |

### GROUP X25Dte CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE X25Dte customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those |

components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP X25Dte Interface (If)

Properties: Provisioned

Description: This group provides the administrative set of parameters for the X.25 interface.

### ATTRIBUTE X25Dte interfaceMode (ifM)

Access: Read only

Description: This attribute specifies the packet mode in which the X.25 interface operates. When this attribute is set to ***dte***, interface on the other side of the physical link must be configured as a ***dce***.

Values: dte
dce

Default: dte

### ATTRIBUTE X25Dte maxActiveChannels (maxAc)

Access: Read and write

Criticality: Process

Description: This attribute specifies the maximum number of channels that can be active on this interface including the Permanent Lcns and the Switched Lcns. In total *maxActiveChannel* will determine the maximum number of *Lcn* components which may exist at a given time. This should be set to a value greater or equal to the *numberOfPLcn* provisioned.

Values: Decimal (0..4095)

| | |
|---|---|
| Default | 10 |

### ATTRIBUTE X25Dte numberOfPLcn (numOPLcn)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of Permanent Logical Channels that are supported on this X.25 interface (that is, the number of *PermLcn* components that may be provisioned at this interface). The *PermLcn* components use channel numbers starting from 1 and up to *lowestILChannelNumber*.<br>A value of ***0*** for this attribute indicates that no Permanent Logical channels are supported on this X.25 interface. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE X25Dte packetSequencing (pS)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the sequence numbering of packets for the X.25 interface. The value of this attribute must be the same as the packet sequencing configured at the X.25 interface on the other side of the physical link. |
| Values | modulo8<br>modulo128 |
| Default | modulo8 |

### ATTRIBUTE X25Dte t20RestartTimer (t20)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the period in milliseconds within which a restart request packet should be confirmed. |
| Values | Decimal (1000..65536000) |
| Units | msec |

| | |
|---|---|
| Default | 60000 |

### ATTRIBUTE X25Dte t21CallTimer (t21)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the period in milliseconds within which a call request packet should be confirmed. |
| Values | Decimal (1000..65536000) |
| Units | msec |
| Default | 180000 |

### ATTRIBUTE X25Dte t22ResetTimer (t22)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the period in milliseconds within which a reset request packet should be confirmed. |
| Values | Decimal (1000..65536000) |
| Units | msec |
| Default | 60000 |

### ATTRIBUTE X25Dte t23ClearTimer (t23)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the period in milliseconds within which a clear request packet should be confirmed. |
| Values | Decimal (1000..65536000) |
| Units | msec |
| Default | 60000 |

### GROUP X25Dte LcnConfig (LcnC)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the Logical Channel configuration of the X.25 Interface. The logical channel range table is ordered as follows: |

Permanent Logical Channels(PLC),
One-way Incoming Channels (IC),
Two-way Channels(TC) and
One-way Outgoing Channels (OC),

in a consecutive manner.

### ATTRIBUTE X25Dte lowestILChannelNumber (lILcn)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the lowest Lcn number of the One-way Incoming Channel range for this X.25 interface. The value for this attribute must be greater than the *numberOfPLcn* attribute. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE X25Dte highestILChannelNumber (hILcn)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the highest Lcn number of the One-way Incoming Channel range for this X.25 interface. A value of ***0*** indicates that there are no channels in this range. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE X25Dte lowestTLChannelNumber (lTLcn)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the lowest Lcn number of the Two-way Channel range for this X.25 interface. The value for this attribute must be greater than the *highestILChannelNumber* attribute. |

| | |
|---|---|
| Values | Decimal (0..4095) |
| Default | 1 |

### ATTRIBUTE X25Dte highestTLChannelNumber (hTLcn)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the highest Lcn number of the Two-way Channel range for this X.25 interface. A value of ***0*** indicates that there are no channels in this range. |
| Values | Decimal (0..4095) |
| Default | 20 |

### ATTRIBUTE X25Dte lowestOLChannelNumber (lOLcn)

| | |
|---|---|
| Access | Read and write |
| Criticality | ProcessThis attribute specifies the lowest Lcn number of the One-way Outgoing Channel range for this X.25 interface. The value for this attribute must be greater than the *highestTLChannelNumber* attribute. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE X25Dte highestOLChannelNumber (hOLcn)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the highest Lcn number of the One-way Outgoing Channel range for this X.25 interface. A value of ***0*** indicates that there are no channels in this range. |
| Values | Decimal (0..4095) |
| Default | 0 |

## GROUP X25Dte DefaultCallParam (Dcp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes giving the default call parameters used by all the logical channels during call setup. It is possible that different default call parameters will be used for a particular call, based on the *Peer* component for the given call. The actual call parameters operational for a given call are found in the *Lcn* component. |

## ATTRIBUTE X25Dte inPacketSize (iPktSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum receive packet size in octets for the X.25 interface. |
| Values | Decimal (16; 32; 64; 128; 256; 512; 1024; 2048; 4096) |
| Default | 128 |

## ATTRIBUTE X25Dte outPacketSize (oPktSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum transmit packet size in octets for the X.25 interface. |
| Values | Decimal (16; 32; 64; 128; 256; 512; 1024; 2048; 4096) |
| Default | 128 |

## ATTRIBUTE X25Dte inWindowSize (iWdwSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum receive window size for the X.25 interface. A window size greater than ***7*** is only valid when the *packetSequencing* attribute is set to ***modulo128***. |
| Values | Decimal (1..127) |
| Default | 2 |

### ATTRIBUTE X25Dte outWindowSize (oWdwSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum transmit window size for the X.25 interface. A window size greater than ***7*** is only valid when the *packetSequencing* is set to ***modulo128***. |
| Values | Decimal (1..127) |
| Default | 2 |

### ATTRIBUTE X25Dte acceptReverseCharging (aRC)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether local end will accept or refuse charges for a call. A value of ***neverAccept*** is only used at the X.25 interface level and indicates that this interface will never accept reverse charging (that is no *Peer* component can override this parameter, allowing reverse charged calls to be accepted). |
| Values | accept<br>refuse<br>neverAccept |
| Default | refuse |

### ATTRIBUTE X25Dte proposeReverseCharging (pRC)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether ***local***/***reverse*** charging is signalled in the call request packet. |
| Values | reverse<br>local |
| Default | local |

### ATTRIBUTE X25Dte outThroughputClassSize (oTpCSz)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the value of the transmit throughput class to be negotiated. A value of ***notSpecified*** means the facility is not signalled. |
| Values | 75<br>150<br>300<br>600<br>1200<br>2400<br>4800<br>9600<br>19200<br>48000<br>64000<br>notSpecified |
| Default | notSpecified |

### ATTRIBUTE X25Dte inThroughputClassSize (iTpCSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value of the receive throughput class to be negotiated. A value of ***notSpecified*** means the facility is not signalled. |
| Values | 75<br>150<br>300<br>600<br>1200<br>2400<br>4800<br>9600<br>19200<br>48000<br>64000<br>notSpecified |
| Default | notSpecified |

### ATTRIBUTE X25Dte cugIndex (cI)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the index of the Closed User Group facility to signal. The index consists of two or four octets each representing a digit in the range of 0 to 9. A value of null (empty string) at the X.25 interface means no CUG facility is signalled. If a *cugIndex* is provisioned to be signalled, the *cugoaIndex* attribute must be null. |
| Values | String (0..4, ASCII) |
| Default | "" |

### ATTRIBUTE X25Dte cugoaIndex (coaI)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the index of the Close User Group with Outgoing Access facility to signal. The index consists of two or four octets each representing a digit in the range of 0 to 9. A value of null (empty string) at the X.25 interface means no CUGOA facility is signalled. If a *cugoaIndex* is provisioned to be signalled, the *cugIndex* attribute must be null. |
| Values | String (0..4, ASCII) |
| Default | "" |

### ATTRIBUTE X25Dte chargingInformation (cInfo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the charging information facility is to be signalled in a call request packet. A value of ***notSpecified*** means the facility is not signalled. A value of ***notRequested*** means the facility is signalled but charging information is not requested (that is, the charging info field of the facility is set Off). A value of ***requested*** means the facility is signalled to explicitly request charging information. |
| Values | notSpecified<br>notRequested<br>requested |

| | |
|---|---|
| Default | notSpecified |

### ATTRIBUTE X25Dte rpoa (rp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value of the RPOA facility to signal in a call request packet. The value of null (empty string) at the X.25 interface means no RPOA facility is signalled. |
| Values | String (0..108, ASCII) |
| Default | "" |

### ATTRIBUTE X25Dte trnstDlySlctnAInd (tdsai)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value of the Transit Delay Selection and Indication facility to signal in a call request packet. A value of ***65536*** at the X.25 interface level means no TDSAI facility is signalled. |
| Values | Decimal (0..65536) |
| Default | 65536 |

### ATTRIBUTE X25Dte callingNetworkFax (clgNFax)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Calling Network facilities to be signalled in a call request packet. A value of null (empty string) at the X.25 interface means no facilities are signalled. |
| Values | String (0..108, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte calledNetworkFax (cldNFax)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the called network facilities to be signalled in a call request packet. A value of null (empty string) at the X.25 interface means no facilities are signalled. |

| | |
|---|---|
| Values | String (0..108, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte callUserData (cud)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the user data to be signalled in the call request packet. A value of null (empty string) means no user data is signalled. |
| Values | String (0..128, Hex) |
| Default | "" |

### GROUP X25Dte IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE X25Dte ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE X25Dte ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |

| | |
|---|---|
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP X25Dte OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE X25Dte adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE X25Dte operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE X25Dte usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP X25Dte OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE X25Dte snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP X25Dte Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status of the X.25 interface. |

### ATTRIBUTE X25Dte interfaceState (intfState)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the state of the interface. The ***notReady*** state, is the initial state of the service, when it is being initialized. The ***localRestarting*** state is entered when a Restart packet is sent to the link and the interface is waiting for a response. The ***remoteRestarting*** state is entered when a Restart packet is received from the link, and is being processed. In ***ready*** state, the service is operational and ready to provide service. |
| Values | notReady<br>localRestarting |

| | |
|---|---|
| | remoteRestarting<br>ready |
| Default | No default |

### GROUP X25Dte Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This component contains the statistics for the X.25 interface. |

### ATTRIBUTE X25Dte inCalls (iC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of call packets received from link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inCallRefusals (iCR)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of calls received from the link which have been cleared. This includes calls cleared by the X.25 interface and calls cleared by the higher level. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inPrvdrInitiatedClrs (iPIC)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of clear packets received from the link with a cause code other than DTE initiated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inRmtInitiatedRsts (iRIRsts)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of reset packets received from the link with the cause code DTE initiated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inPrvdrInitiatedRsts (iPIRsts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of reset packets received from the link with the cause code other than DTE initiated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inRestarts (iRstrts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of restart packets received from the link while the service is in ready state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inDataPackets (iDPkts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of data packets received from link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inPktsAcusdOfPrtclErr (iPktsPErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of clear, reset, restart and diagnostic packets received from link containing a procedure error cause code. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inInterruptPackets (iIntPkts)

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the number of interrupt packets received from link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte outCallAttempts (oCAtt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of call packets sent from this interface. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte outCallFailures (oCFlrs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of call attempts from this interface that failed. This includes calls that were cleared because of restrictive fast select. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte outInterruptPackets (oIntPkts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of interrupt packets sent to the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte outDataPackets (oDPkts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of data packets sent to the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte outActiveChannels (oActCh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of One-way Outgoing Channels that are currently in use. This counter includes the call requests that have not been accepted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte inActiveChannels (iActCh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates number of One-way Incoming Channels that are currently active. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte twowayActiveChannels (tWActCh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of Two-way Channels that are in use. This includes call requests sent but not yet accepted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte t20RestartTimeouts (t20Tmo)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of times the T20 restart timer has expired. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte t21CallTimeouts (t21Tmo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the T21 call timer has expired. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte t22ResetTimeouts (t22Tmo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the T22 reset timer has expired. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte t23ClearTimeouts (t23Tmo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the T23 clear timer has expired. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT X25Dte Peer

| | |
|---|---|
| Instance | Decimal (1..4095) |
| Groups | "GROUP X25Dte Peer Interface (If)"<br>"GROUP X25Dte Peer Encapsulation (Enc)" |

"GROUP X25Dte Peer CallParameter (Cp)"
"GROUP X25Dte Peer Operational (Op)"

Scope: Application

Description: *X25Dte/n Peer/n*

This optional component defines the parameters to be used in setting up a switched circuit call to a particular remote destination. Multiple instances of this component can co-exist under the same *X25Dte* component.
An instance of this component is needed for each remote host with which the X.25 Dte is to communicate (that is, each peer to which it may establish calls or from which it is to accept calls).

Common Verbs:
Help
List
Display
Add
DELete

## GROUP X25Dte Peer Interface (If)

Properties: Provisioned

Description: This group provides the administrative set of parameters for the *Peer* interface.

## ATTRIBUTE X25Dte Peer encAddressType (eAddrT)

Access: Read and write

Criticality: Component

Description: This attribute specifies the encapsulation type for the address of the remote host with which this *Peer* component allows communication.

Values: ip

Default: ip

### ATTRIBUTE X25Dte Peer encAddress (eAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the encapsulation address of the remote host with which this *Peer* component allows communication. This address must correspond with the encapsulation address type. Thus in the case of IP, it will contain a IP address. |
| Values | String (0..128, ASCII) |
| Default | No default |

### ATTRIBUTE X25Dte Peer x25Address (x25Addr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the X.25 address that identifies the remote host with which this *Peer* component allows communication. The remote X.25 interface could be subdivided through the use of *RemoteGroup* components; in which case this *x25Address* is the X.25 address of the destination's *RemoteGroup* (not to be confused with the *RemoteGroup* indicated by the *linkToRemoteGroup* attribute of THIS *Peer* component). |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE X25Dte Peer linkToRemoteGroup (lTRg)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This is a link to a *RemoteGroup* component. The *RemoteGroup* components logically divide up the X.25 Interface such that a number of Protocol Ports (and consequently a number of Virtual Routers) may share the same X.25 Interface into a Wide Area Network. In particular, the remote host identified by this *Peer* component is designated as belonging to the *RemoteGroup* linked by this attribute. The set of all *Peer* components and *PermLcn* |

components which link to a given *RemoteGroup* determine the subset of remote hosts which are accessible to a particular Protocol Port (and ultimately a Virtual Router).

Values: Link (Service, linkToPeer)

Default: No default

### GROUP X25Dte Peer Encapsulation (Enc)

Properties: Provisioned

Description: This group contains the protocol encapsulation types supported for communicating over an lcn to the remote host identified by this *Peer* component. An lcn may be established to the remote host for each of the supported protocol encapsulation types. For each lcn an *Lcn* dynamic component is created under the *X25Dte*.

### ATTRIBUTE X25Dte Peer protocolEncType (pEnc)

Access: Read and write

Description: Each instance of this replicated attribute describes an encapsulation method permitted for encapsulating the protocol data units (PDUs) of an upper layer protocol when communicating with the remote host identified by this *Peer* component. The index of a given replicated instance of this attribute represents the relative priority of the encapsulation method specified by the given attribute instance. An attribute with index “1” has the highest priority, so the encapsulation method described by it will be the first one attempted when signaling a call to the link. If the *protocolEncType* is set to ***IP*** to encapsulate IP traffic according to RFC1356, the *callUserData* for this *Peer* component and the *X25Dte* component must both be null, so that ***H.CC*** will be signaled as the call user data of the call request. This indicates that the protocol encapsulation type of IP is to be used for the channel.
A call received from the link will be accepted as long as the encapsulation method indicated in the call user data of the incoming call packet is included in one of these replicated attributes. (This presupposes that the incoming call has been directed to the *RemoteGroup* to which this *Peer* is linked through the *linkToRemoteGroup* attribute.)

| | |
|---|---|
| Values | ip |
| Replication | Decimal (1..1) |
| Default | No default |

### GROUP X25Dte Peer CallParameter (Cp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the call parameters used to establish a call to/ from the remote host identified by this *Peer* component |

### ATTRIBUTE X25Dte Peer inPacketSize (iPktSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default maximum receive packet size in octets. A setting of ***0*** indicates the *inPacketSize* setting for the X.25 interface (in *X25Dte* component) is used during call setup to the remote host identified by this *Peer* component. |
| Values | Decimal (0; 16; 32; 64; 128; 256; 512; 1024; 2048; 4096) |
| Default | 128 |

### ATTRIBUTE X25Dte Peer outPacketSize (oPktSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default maximum transmit packet size in octets. A setting of ***0*** indicates the *outPacketSize* setting for the X.25 interface (in the *X25Dte* component) is used during call setup to the remote host identified by this *Peer* component. |
| Values | Decimal (0; 16; 32; 64; 128; 256; 512; 1024; 2048; 4096) |
| Default | 128 |

### ATTRIBUTE X25Dte Peer inWindowSize (iWdwSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default receive window size. A window size of ***0*** indicates the *inWindowSize* setting for the X.25 interface (in the *X25Dte* component) is used during call setup to the remote host identified by this *Peer* component. A window |

size greater than ***7*** is only valid when the *packetSequencing* attribute of the *X25Dte* component is set to ***modulo128***.

Values: Decimal (0..127)

Default: 2

### ATTRIBUTE X25Dte Peer outWindowSize (oWdwSz)

Access: Read and write

Description: This attribute specifies the default transmit window size. A window size of 0 indicates the *outWindowSize* setting for the X.25 interface is used during call setup to the *Peer* identified by this component. A window size greater than ***7*** is only valid when the *packetSequencing* attribute of the *X25Dte* component is set to ***modulo128***.

Values: Decimal (0..127)

Default: 2

### ATTRIBUTE X25Dte Peer acceptReverseCharging (aRC)

Access: Read and write

Description: This attribute specifies whether the local end will ***accept*** or ***refuse*** charges for a call from the remote host identified by this *Peer* component. A value of ***default*** indicates the use of the *acceptReverseCharging* value from the *X25Dte* component. If the value at the *X25Dte* level is ***neverAccept***, a value of ***accept*** in this *Peer* component will be ignored because no reverse charge calls are to be accepted by this X.25 Dte.

Values:
default
accept
refuse

Default: refuse

### ATTRIBUTE X25Dte Peer proposeReverseCharging (pRC)

Access: Read and write

Description: This attribute specifies whether local/reverse charging is signaled in a call request packet. A value of ***default*** indicates the use of

the value from the *proposeReverseCharging* attribute of the *X25Dte* component.

Values
default
reverse
local

Default
local

### ATTRIBUTE X25Dte Peer outThroughputClassSize (oTpCSz)

Access
Read and write

Description
This attribute specifies the value of the transmit throughput class to be negotiated. A value of ***default*** indicates the use of the value from the *outThroughputClassSize* attribute of the *X25Dte* component. A value of ***notSpecified*** means the facility is not signaled.

Values
75
150
300
600
1200
2400
4800
9600
19200
48000
64000
notSpecified
default

Default
notSpecified

### ATTRIBUTE X25Dte Peer inThroughputClassSize (iTpCSz)

Access
Read and write

Description
This attribute specifies the value of the receive throughput class to be negotiated. A value of ***default*** indicates the use of the value from the *inThroughputClassSize* attribute of the *X25Dte* component. A value of ***notSpecified*** means the facility is not signaled.

| | |
|---|---|
| Values | 75<br>150<br>300<br>600<br>1200<br>2400<br>4800<br>9600<br>19200<br>48000<br>64000<br>notSpecified<br>default |
| Default | notSpecified |

### ATTRIBUTE X25Dte Peer cugIndex (cI)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the index of the Closed User Group facility to signal. A value of "***DEF***" indicates the use of the value from the *cugIndex* attribute of the *X25Dte* component. A value of null (empty string) indicates no CUG facility is to be signaled. If a *cugIndex* is provisioned to be signaled, the *cugoaIndex* attribute must be null. |
| Values | String (0..4, ASCII) |
| Default | "" |

### ATTRIBUTE X25Dte Peer cugoaIndex (coaI)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the index of the Closed User Group with Outgoing Access facility to signal. A value of "***DEF***" indicates the use of the value from the *cugoaIndex* attribute of the *X25Dte* component. A value of null (empty string) indicates no CUGOA facility is to be signaled. If a *cugoaIndex* is provisioned to be signaled, the *cugIndex* attribute must be null. |
| Values | String (0..4, ASCII) |

| | |
|---|---|
| Default | "" |

### ATTRIBUTE X25Dte Peer networkUserIdentifier (nui)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Network User Identifier facility to signal. A value of null (empty string) indicates no NUI facility is to be signaled. |
| Values | String (0..108, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte Peer chargingInformation (cInfo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the charging information facility is signaled in the call request packet. A value of ***default*** indicates the use of the value from the *chargingInformation* attribute of the *X25Dte* component. A value of ***notSpecified*** means the facility is not signaled. A value of ***notRequested*** means the facility is signaled but charging information is not requested (that is, the charging info field of the facility is set Off). A value of ***requested*** means the facility is signaled to explicitly request charging information. |
| Values | default<br>notSpecified<br>notRequested<br>requested |
| Default | notSpecified |

### ATTRIBUTE X25Dte Peer rpoa (rp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the RPOA facility to signal in a call request packet. A value of "***DEF***" indicates the use of the value from the *rpoa* attribute of the *X25Dte* component. A value of null (empty string) indicates no RPOA facility is to be signaled. |
| Values | String (0..108, ASCII) |

| | |
|---|---|
| Default | "" |

### ATTRIBUTE X25Dte Peer trnstDlySlctnAInd (tdsai)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value of the Transit Delay Selection and Indication facility to signal in a call request packet. A value of ***65536*** indicates no facility is signaled. A value of 65537 indicates the use of the value from the *trnstDlySlctnAInd* attribute of the *X25Dte* component. |
| Values | Decimal (0..65537) |
| Default | 65536 |

### ATTRIBUTE X25Dte Peer callingNetworkFax (clgNFax)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Calling Network facilities to signal in a call request packet. The facilities are encoded here exactly as they are encoded in the call packet. These facilities do not include the marker facility code. A value of null (empty string) indicates the *callingNetworkFax* from the *X25Dte* are to be signaled. If that value is also null, no Calling Network Facilities are signaled. |
| Values | String (0..108, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte Peer calledNetworkFax (cldNFax)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Called Network facilities to signal in a call request packet. The facilities are encoded here exactly as they are encoded in the call packet. These facilities do not include the marker facility code. A value of null (empty string) indicates the *calledNetworkFax* from the *X25Dte* are to be signaled. If that value is also null, no Called Network Facilities are signaled. |
| Values | String (0..108, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte Peer callUserData (cud)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the user data to signal in a call request packet. A value of null (empty string) indicates that the *callUserData* from the *X25Dte* is to be signaled. If *callUserData* of the *X25Dte* component is also null and *protocolEncType* of this *Peer* has the value ***IP***, H.CC will be signaled as the call user data of a call request packet. Thus for IP encapsulation according to RFC1356, both the *callUserData* from the *Peer* and *X25Dte* components must be null and the *protocolEncType* set to ***IP***. |
| Values | String (0..128, Hex) |
| Default | "" |

### GROUP X25Dte Peer Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational parameters for the *Peer* interface. |

### ATTRIBUTE X25Dte Peer lcnList (lcn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the local logical channel numbers (*Lcn*) in use for the X.25 calls to the remote host identified by this *Peer* component. |
| List of | Decimal (1..4095) |
| List Size | 4095 |
| Default | No default |

### COMPONENT X25Dte PermLcn (PLcn)

| | |
|---|---|
| Instance | Decimal (1..4095) |
| Groups | "GROUP X25Dte PLcn Provisioned (Prov)" |
| Scope | Application |

| | |
|---|---|
| Description | *X25Dte/n PermLcn/n*<br><br>This component defines the parameters required for the Permanent logical channels of an X.25 interface. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP X25Dte PLcn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable parameters for the permanent logical channels (PLcns) on the X.25 interface (corresponding to Permanent Virtual Circuits (PVCs) provisioned on the Wide Area Network). |

## ATTRIBUTE X25Dte PLcn encAddressType (eAddrT)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the encapsulation type for the address of the remote host with which this *Peer* component allows communication. |
| Values | none<br>ip |
| Default | ip |

## ATTRIBUTE X25Dte PLcn encAddress (eAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the encapsulation address of the remote host with which this *PermLcn* component defines a connection |
| Values | String (0..128, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE X25Dte PLcn protocolEncType (pEnc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the encapsulation method to use when exchanging protocol data units (PDUs) over this channel. ***IP*** and ***Null*** *protocolEncTypes* are as defined in RFC1356. ***NscNull*** is an encapsulation method for carrying IP datagrams which requires removing 3 padding octets of zeroes and the protocol identifier H.CC from the front of each data packet received from the link in order to obtain the PDU. PDUs sent to the link are propounded by a the protocol identifier H.CC. ***NscNull*** should only be set when the remote host is following this same encapsulation method. |
| Values | ip<br>null<br>nscNull |
| Default | ip |

### ATTRIBUTE X25Dte PLcn linkToRemoteGroup (lTRg)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the link to the *RemoteGroup*, indicating the *RemoteGroup* component with which this *PermLcn* component is associated. The *RemoteGroup* components logically divide up the X.25 Interface such that a number of Protocol Ports (and consequently a number of Virtual Routers) may share the same X.25 Interface into a Wide Area Network. In particular, the remote host identified by this *PermLcn* component is designated as belonging to the *RemoteGroup* linked by this attribute. The set of all *PermLcn* and *Peer* components which link to a given *RemoteGroup* determine the subset of remote hosts which are accessible to a particular Protocol Port (and ultimately a Virtual Router). |

| | |
|---|---|
| Values | Link (Service, linkToPermLcn) |
| Default | No default |

### ATTRIBUTE X25Dte PLcn inPacketSize (iPktSz)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum receive packet size in octets. |
| Values | Decimal (16; 32; 64; 128; 256; 512; 1024; 2048; 4096) |
| Default | 128 |

### ATTRIBUTE X25Dte PLcn outPacketSize (oPktSz)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum transmit packet size in octets. |
| Values | Decimal (16; 32; 64; 128; 256; 512; 1024; 2048; 4096) |
| Default | 128 |

### ATTRIBUTE X25Dte PLcn inWindowSize (iWdwSz)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum receive window size. A *inWindowSize* greater than ***7*** is only valid when the *packetSequencing* attribute of the *X25Dte* component is set to ***modulo128***. |
| Values | Decimal (1..127) |
| Default | 2 |

## ATTRIBUTE X25Dte PLcn outWindowSize (oWdwSz)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum transmit window size. A *outWindowSize* greater than ***7*** is only valid when the *packetSequencing* attribute of the *X25Dte* component is set to ***modulo128***. |
| Values | Decimal (1..127) |
| Default | 2 |

## COMPONENT X25Dte Lcn (Lcn)

| | |
|---|---|
| Instance | Decimal (1..4095) |
| Groups | "GROUP X25Dte Lcn OsiState (State)"<br>"GROUP X25Dte Lcn CallParameter (Cp)"<br>"GROUP X25Dte Lcn LcnStatus"<br>"GROUP X25Dte Lcn Statistics (Stats)" |
| Scope | Application |
| Description | *X25Dte/x Lcn/x*<br><br>This component contains information about a specific logical channel of an X.25 interface. |
| Common Verbs | Help<br>List<br>Display |

## VERB CLEAR X25Dte Lcn

| | |
|---|---|
| Impact | Service |
| Description | *CLEAR X25Dte/n Lcn/n*<br>This verb will cause the specified logical channel to close by signaling a clear packet to the link. It only affects SVCs. |

## VERB RESET X25Dte Lcn

| | |
|---|---|
| Impact | Service |
| Description | *RESET X25Dte/n Lcn/n*<br>This verb will cause the specified logical channel to reset, by sending a reset packet to the link. A reset will cause the data path to be flushed, so data packets in transition will be lost. |

## GROUP X25Dte Lcn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE X25Dte Lcn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE X25Dte Lcn operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE X25Dte Lcn usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP X25Dte Lcn CallParameter (Cp)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the call parameters that are in use for this logical channel. For a PVC only the packet size and the window size attributes are meaningful. |

### ATTRIBUTE X25Dte Lcn inPacketSize (iPktSz)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum receive packet size in octets. |
| Values | Decimal (16; 32; 64; 128; 256; 512; 1024; 2048; 4096) |
| Default | No default |

### ATTRIBUTE X25Dte Lcn outPacketSize (oPktSz)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum transmit packet size in octets. |
| Values | Decimal (16; 32; 64; 128; 256; 512; 1024; 2048; 4096) |
| Default | No default |

### ATTRIBUTE X25Dte Lcn inWindowSize (iWdwSz)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the receive window size. |
| Values | Decimal (1..127) |
| Default | No default |

### ATTRIBUTE X25Dte Lcn outWindowSize (oWdwSz)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the transmit window size. |
| Values | Decimal (1..127) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE X25Dte Lcn proposeReverseCharging (pRC)

| | |
|---|---|
| Access | Read only |
| Description | Specifies whether local/reverse charging was negotiated for this logical channel. To determine which end of the channel is paying for the call, this attribute must be examined in combination with the *callDirection* attribute. For example, if this attribute is set to ***reverse*** and the *callDirection* attribute indicates ***incoming***, it means the incoming call signaled reverse charging, so the local end of the channel is being charged. On the other, if the value of this attribute is ***reverse*** and the *callDirection* is ***outgoing***, it means that the call request sent to the link signaled reverse charging; so the remote end is charged. Similarly, a value of ***local*** must also be interpreted in combination with the *callDirection* to determine which end is being charged. If the value of the *callDirection* attribute is ***plcn***, the *proposeReverseCharging* attribute is meaningless. |
| Values | reverse<br>local |
| Default | local |

### ATTRIBUTE X25Dte Lcn fastSelect (fSel)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the fast select was used in establishing this logical channel. |
| Values | unrestricted<br>restricted<br>no |
| Default | no |

### ATTRIBUTE X25Dte Lcn outThroughputClassSize (oTpCSz)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the transmit throughput class. |

| | |
|---|---|
| Values | 75<br>150<br>300<br>600<br>1200<br>2400<br>4800<br>9600<br>19200<br>48000<br>64000<br>notSpecified |
| Default | notSpecified |

### ATTRIBUTE X25Dte Lcn inThroughputClassSize (iTpCSz)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the receive throughput class. |
| Values | 75<br>150<br>300<br>600<br>1200<br>2400<br>4800<br>9600<br>19200<br>48000<br>64000<br>notSpecified |
| Default | notSpecified |

### ATTRIBUTE X25Dte Lcn cugIndex (cI)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the index of the Closed User Group facility used in establishing this logical channel. |
| Values | String (0..4, ASCII) |

| | |
|---|---|
| Default | "" |

### ATTRIBUTE X25Dte Lcn cugoaIndex (coa)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the index of the Closed User Group with Outgoing Access facility used in establishing this logical channel. |
| Values | String (0..4, ASCII) |
| Default | "" |

### ATTRIBUTE X25Dte Lcn networkUserIdentifier (nui)

| | |
|---|---|
| Access | Read only |
| Description | Specifies the Network User Identifier used for this logical channel. |
| Values | String (0..108, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte Lcn chargingInformation (cInfo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not the charging information facility was used in establishing this logical channel. A value of ***notSpecified*** means the facility was not signaled. A value of ***notRequested*** means the facility was signaled but charging information was not requested (that is, the charging info field of the facility was set Off). A value of ***requested*** means the facility was signaled to explicitly request charging information. |
| Values | notSpecified<br>notRequested<br>requested |
| Default | notSpecified |

### ATTRIBUTE X25Dte Lcn rpoa (rp)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the RPOA facility which was signaled in establishing this logical channel. |
| Values | String (0..108, ASCII) |
| Default | "" |

### ATTRIBUTE X25Dte Lcn trnstDlySlctnAInd (tdsai)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Transit Delay Selection and Indication value used for this logical channel. A value of ***65536*** means no facility was signaled. |
| Values | Decimal (0..65536) |
| Default | 65536 |

### ATTRIBUTE X25Dte Lcn callingNetworkFax (clgNFax)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Calling Network facilities which were signaled in the call packet. A value of null (empty string) means no calling network facilities were signaled. |
| Values | String (0..108, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte Lcn calledNetworkFax (cldNFax)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the called network facilities which were signaled in the call packet. A value of null (empty string) means no called network facilities were signaled. |
| Values | String (0..108, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte Lcn callUserData (cud)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the user data which was signaled in the call packet. A value of null (empty string) means no user data was signaled. |
| Values | String (0..128, Hex) |
| Default | "" |

### GROUP X25Dte Lcn LcnStatus

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the status for an X.25 Logical Channel. |

### ATTRIBUTE X25Dte Lcn status

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current state of the logical channel. |
| Values | closed<br>calling<br>dataTransfer<br>clearing<br>resetting |
| Default | No default |

### ATTRIBUTE X25Dte Lcn callDirection (cDir)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the direction of the call that caused the establishment of this channel. |
| Values | incoming<br>outgoing<br>permanentLcn |
| Default | No default |

### ATTRIBUTE X25Dte Lcn calledAddress (cldAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the called X.25 address to which the call is established. |

| | |
|---|---|
| Values | BCD (0..15) |
| Default | No default |

### ATTRIBUTE X25Dte Lcn callingAddress (clgAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the calling X.25 address from which the call originated |
| Values | BCD (0..15) |
| Default | No default |

### ATTRIBUTE X25Dte Lcn originalCalledAddress (oCldAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the X.25 address of the originally called DTE to which the call was attempted. This could be different from the value of the *calledAddress* attribute in the case where the original call was redirected. |
| Values | BCD (0..15) |
| Default | No default |

### GROUP X25Dte Lcn Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for an X.25 Logical Channel. |

### ATTRIBUTE X25Dte Lcn inUknownProtocols (iUP)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number packets received from link which were discarded because of an unknown or unsupported protocols. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn inDataOctets (iDOct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets of user data received from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn inDataPackets (iDPkts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of data packets received from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn inRmtInitiatedRsts (iRIRsts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of reset packets, with a cause code of “DTE initiated”, which were received from the link |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn inPrvdrInitiatedRsts (iPIRsts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of reset packets, with a cause code other than “DTE initiated”, which were received from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn inInterruptPackets (iIntPkts)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of interrupt packets received from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn outDataOctets (oDOct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets of user data sent to the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn outDataPackets (oDPkts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of data packets sent to link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn outInterruptPackets (oIntPkts)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of interrupt packets sent to link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lcn t22ResetTimeouts (t22Tmo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the t22 reset timer has expired. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

## COMPONENT X25Dte Lapb

| | |
|---|---|
| Groups | "GROUP X25Dte Lapb ControlParam (Cp)"<br>"GROUP X25Dte Lapb OsiState (State)"<br>"GROUP X25Dte Lapb Status"<br>"GROUP X25Dte Lapb Statistics (Stats)" |
| Scope | Application |
| Description | This component defines the LAPB protocol and its related service options. |
| Subcomponents | "COMPONENT X25Dte Lapb Framer" |
| Common Verbs | Help<br>List<br>Display |

## GROUP X25Dte Lapb ControlParam (Cp)

| | |
|---|---|
| Properties | Provisioned |
| Description | X25Dte/n Lapb<br>This group contains the set of configuration parameters for the LAPB interface. |

## ATTRIBUTE X25Dte Lapb stationType (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the DCE or the DTE role of operation for the LAPB interface. Changing this attribute will cause the lapb link to Reset. |
| Values | dte<br>dce |
| Default | dte |

## ATTRIBUTE X25Dte Lapb frameSequencing (fs)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the modulo of the frame sequence numbering of the LAPB interface. Changing this attribute will cause the lapb link to Reset. |
| Values | modulo8<br>modulo128 |
| Default | modulo8 |

### ATTRIBUTE X25Dte Lapb n1FrameSize (n1)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum frame size in bits that can be transmitted or received. This value must be greater than or equal to the maximum packet size across the interface(in bits)+ max level 3 header size(in bits)+ max level 2 header size(in bits)+ crc in bits.<br><br>(max Pkt size + ----------> 4096*8<br>max level 3 header size + ---> 4*8<br>level 2 header size + --------> 5*8<br>crc ----------> 2*8) |
| Values | Decimal (40..32856) |
| Units | bits |
| Default | 32856 |

### ATTRIBUTE X25Dte Lapb kWindowSize (k)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the window size. This is the maximum number of unacknowledged sequenced frames that may be outstanding from or to this interface at any one time. A window size of greater than 7 is only valid when the sequence numbering of frames is modulo 128. |
| Values | Decimal (1..127) |
| Default | 7 |

### ATTRIBUTE X25Dte Lapb n2TransmitLimit (n2)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of times a frame can be transmitted before appropriate recovery action is taken. |
| Values | Decimal (1..20) |
| Default | 10 |

### ATTRIBUTE X25Dte Lapb t1AckTimer (t1)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the period in milliseconds within which an acknowledgment of a sent frame must be received. The value set for t1 ack timer must be less than the value set for the t4 idle probe timer. |
| Values | Decimal (1000..10000) |
| Units | msec |
| Default | 3000 |

### ATTRIBUTE X25Dte Lapb t2AckDelayTimer (t2)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum period in milliseconds permissible to wait before sending an acknowledgment for a received in sequenced I-frame. A value of 0 means there will be no delay in acknowledgment. |
| Values | Decimal (0..10000) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb t4IdleProbeTimer (t4)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time period in milliseconds the link will be permitted to remain idle (that is, no frames are exchanged |

| | |
|---|---|
| | on the data link). Upon expiry of this timer, LAPB will poll its peer for status. The value set for t4 idle probe timer must be greater than the value set for the t1 ack timer. |
| Values | Decimal (1000..65535000) |
| Units | msec |
| Default | 60000 |

### ATTRIBUTE X25Dte Lapb actionInitiate (ai)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the action to be taken by the LAPB interface to initiate link setup. |
| Values | sendSABM<br>sendDM<br>none |
| Default | sendSABM |

### ATTRIBUTE X25Dte Lapb actionRecvDM (ardm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the action to be taken by the LAPB interface when it receives a DM response. |
| Values | sendSABM |
| Default | sendSABM |

### ATTRIBUTE X25Dte Lapb txQDegradeThreshold (txdt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the threshold of the number of higher layer packets queued, beyond which LAPB should initiate a service degrade alarm. A value of 65536 means no threshold. |
| Values | Decimal (1..65536) |
| Default | 65536 |

### ATTRIBUTE X25Dte Lapb txQResetThreshold (txrt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the threshold of the number of higher layer packets queued, beyond which LAPB should initiate an overload alarm and reset the link. A value of 65536 means no threshold. |
| Values | Decimal (1..65536) |
| Default | 65536 |

### GROUP X25Dte Lapb OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE X25Dte Lapb adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE X25Dte Lapb operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE X25Dte Lapb usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP X25Dte Lapb Status

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the status for the LAPB interface. |

### ATTRIBUTE X25Dte Lapb currentState (cs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the current state of the LAPB interface. |
| Values | disconnected<br>linkSetup<br>frameReject<br>disconnectRequest<br>informationTransfer<br>waitingAck |
| Default | No default |

### ATTRIBUTE X25Dte Lapb lastStateChangeReason (lscr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the reason for the most recent state change. |
| Values | notStarted<br>abmEntered<br>abmeEntered<br>abmReset<br>abmeReset<br>dmReceived<br>dmSent<br>discReceived<br>discSent<br>frmrReceived<br>frmrSent |

| | |
|---|---|
| | n2TimeOut<br>other |
| Default | No default |

### ATTRIBUTE X25Dte Lapb frmrTransmit (frmrtx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the Information field of the FRMR most recently sent. |
| Values | String (0..7, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte Lapb frmrReceive (frmrrx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the Information field of the FRMR most recently received. |
| Values | String (0..7, Hex) |
| Default | "" |

### ATTRIBUTE X25Dte Lapb currentQueueSize (cqs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of packets on the lapb transmit queue. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP X25Dte Lapb Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics for the LAPB interface. |

### ATTRIBUTE X25Dte Lapb stateChanges (sc)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of times LAPB state has changed. Refer to the attribute “linkState” for the set of possible states. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb remoteBusy (rb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times transmission of an I-frame was un-successful due to a perceived remote busy condition (window closed or remote busy). |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb transmitRejectFrames (txrejs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of REJ frames sent by the interface. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb receiveRejectFrames (rxrejs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of REJ frames received by the interface. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb t1AckTimeout (t1Tmo)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of times the T1 timer has expired. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT X25Dte Lapb Framer

| | |
|---|---|
| Groups | "GROUP X25Dte Lapb Framer Provisioned (Prov)"<br>"GROUP X25Dte Lapb Framer LinkOptions (Link)"<br>"GROUP X25Dte Lapb Framer OsiState (State)"<br>"GROUP X25Dte Lapb Framer Statistics (Stats)"<br>"GROUP X25Dte Lapb Framer LinkUtilization (Util)" |

"COLLECTED STATS X25Dte Lapb Framer"

| | |
|---|---|
| Scope | Application |
| Description | *X25Dte/n Lapb Framer*<br><br>The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.<br><br>The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.<br><br>The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts). |
| Common Verbs | Help<br>List<br>Display |

### GROUP X25Dte Lapb Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

### ATTRIBUTE X25Dte Lapb Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP X25Dte Lapb Framer LinkOptions (Link)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes defining the framing of data on the link interface. |

### ATTRIBUTE X25Dte Lapb Framer flagsBetweenFrames

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the number of flags that are inserted between frames sent to the link interface. |
| Values | Decimal (1..16) |
| Default | 1 |

### GROUP X25Dte Lapb Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE X25Dte Lapb Framer adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE X25Dte Lapb Framer operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE X25Dte Lapb Framer usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP X25Dte Lapb Framer Statistics (Stats)

Properties: Operational

Description: This group contains the operational statistics data for a Framer component.

### ATTRIBUTE X25Dte Lapb Framer aborts

Access: Read only

Description: This attribute is the total number of aborts received.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE X25Dte Lapb Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE X25Dte Lapb Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE X25Dte Lapb Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### GROUP X25Dte Lapb Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |

Description This group contains the link utilization operational data for a Framer component.

### ATTRIBUTE X25Dte Lapb Framer normPrioLinkUtilToIf

Access Read only

Description This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.

Values Decimal (0..100)

Units %

Default 0

### ATTRIBUTE X25Dte Lapb Framer normPrioLinkUtilFromIf

Access Read only

Description This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.

Values Decimal (0..100)

Units %

Default 0

## COLLECTED STATS X25Dte Lapb Framer

Description The statistics record generated by the X25Dte Lapb Framer component.

### ATTRIBUTE X25Dte Lapb Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

### ATTRIBUTE X25Dte Lapb Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

### ATTRIBUTE X25Dte Lapb Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

### ATTRIBUTE X25Dte Lapb Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

### ATTRIBUTE X25Dte Lapb Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

## COMPONENT X25Dte PacketLayerEntity (Ple)

Groups "GROUP X25Dte Ple Provisioned (Prov)"
"GROUP X25Dte Ple Operational (Op)"

Scope Application

Description *X25Dte/n PacketLayerEntity*

This component provides information that applies to multiprotocol interconnect over an X.25 service.

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### GROUP X25Dte Ple Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes relevant to an interface used to carry Multiprotocol Interconnect traffic over X.25. |

### ATTRIBUTE X25Dte Ple inactivityTimer (iTmr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the period in milliseconds this interface will keep an idle connection open before closing it. |
| Values | Decimal (0..65536000) |
| Default | 180000 |

### GROUP X25Dte Ple Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Operational attributes relevant to an interface used to carry Multiprotocol Interconnect traffic over X.25. |

### ATTRIBUTE X25Dte Ple encAddrToX25LkupFlrs (enAddrTX25Flr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of times a translation attempt from an Encapsulation address to an X.25 address failed to find a corresponding X.25 address. Such a failure could occur when a Protocol Port, linked to a *RemoteGroup* via the *linkToProtocolPort* attribute of the *RemoteGroup*, requests through the software that a X.25 call be established to a particular Encapsulation address. If the *RemoteGroup* does not have a *Peer* |

component linked in its *linkToPeer* attribute list, with the *encAddress* attribute equal to the Encapsulation address specified, this counter will be incremented, because the corresponding *Peer* component needed to establish an X.25 connection was not found.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE X25Dte Ple lastFailedEncAddr (lFEnaddr)

Access: Read only

Description: This attribute indicates the last Encapsulation address for which no corresponding X.25 address was found and thus caused *encAddressToX25LkupFlrs* to be incremented.

Values: String (2..128, Hex)

Default: No default

### ATTRIBUTE X25Dte Ple x25AddrToEncLkupFlrs (x25AddrTEnFlr)

Access: Read only

Description: This attribute indicates the number of times a translation attempt from an X.25 address to an Encapsulation address failed to find a corresponding Encapsulation address. Such a failure could occur when a incoming call received from the link by the X.25 DTE is directed to a specific *RemoteGroup* because the called address matches the *localAddress* attribute of the *RemoteGroup* component. If the *RemoteGroup* component does not have a *Peer* component linked in its *linkToPeer* attribute list, with the *x25Address* attribute equal to the calling address from the incoming call packet, there is no appropriate *Peer* component, so the call is cleared and this counter is incremented.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE X25Dte Ple lastFailedX25Addr (lFX25Addr)

Access: Read only

| | |
|---|---|
| Description | This field specifies the last X.25 address that caused *x25AddressToEncLkupFlrs* to be incremented. |
| Values | BCD (0..15) |
| Default | No default |

## COMPONENT X25Dte RemoteGroup (Rg)

| | |
|---|---|
| Instance | Decimal (1..1023) |
| Groups | "GROUP X25Dte Rg IfEntryProv (IfEntry)"<br>"GROUP X25Dte Rg Provisioned (Prov)"<br>"GROUP X25Dte Rg OsiState (State)"<br>"GROUP X25Dte Rg OperationalStatus (OperStatus)"<br>"GROUP X25Dte Rg Operational (Op)" |
| Scope | Application |
| Description | *X25Dte/n RemoteGroup/n*<br><br>At least one *RemoteGroup* is required for each *X25Dte* component. The *RemoteGroup* allows the X.25 DTE interface to be shared amongst a number of Protocol Ports. This allows separate Virtual Routers to share the same physical X.25 connection into a Wide Area Network. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP X25Dte Rg IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

## ATTRIBUTE X25Dte Rg ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE X25Dte Rg ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP X25Dte Rg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *RemoteGroup* component. |

### ATTRIBUTE X25Dte Rg linkToProtocolPort

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains a protocol port component name. The attribute associates the application with a protocol port. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### ATTRIBUTE X25Dte Rg localAddress (lAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains the unique X.25 address which identifies this *RemoteGroup*. It should correspond to the called address in X.25 incoming call packets which are to be directed to this *RemoteGroup*. This allows calls received from the link to be directed to the appropriate *RemoteGroup* based on the called address in the X.25 call packet. The *RemoteGroup* components allow the X.25 interface to be shared amongst a number of Protocol Ports (and ultimately Virtual Routers) because each *RemoteGroup* is coupled with a specific *ProtocolPort* through its *linkToProtocolPort* attribute. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE X25Dte Rg mtuSize (mtuSz)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Maximum Transmit Unit (MTU); that is, the size of the largest datagram (in octets) which can be sent/ received on the interface. |
| Values | Decimal (576..9188) |
| Units | octets |
| Default | 1600 |

### ATTRIBUTE X25Dte Rg linkToPermLcn (lTPlcn)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is a list of links to *PermLcn* components. The set of all *Peer* and *PermLcn* components which link to a given *RemoteGroup* determine the subset of remote hosts which are accessible to a particular Protocol Port (and ultimately a Virtual Router). |

| | |
|---|---|
| List of | Link (Service, linkToRemoteGroup) |
| List Size | 4095 |
| Default | No default |

### ATTRIBUTE X25Dte Rg linkToPeer (ltPeer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute gives a list of links to *Peer* components. The set of all *Peer* and *PermLcn* components which link to a given *RemoteGroup* determine the subset of remote hosts which are accessible to a particular Protocol Port (and ultimately a Virtual Router). |
| List of | Link (Service, linkToRemoteGroup) |
| List Size | 4095 |
| Default | No default |

### GROUP X25Dte Rg OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE X25Dte Rg adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE X25Dte Rg operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE X25Dte Rg usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP X25Dte Rg OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE X25Dte Rg snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP X25Dte Rg Operational (Op)

Properties
Operational

Description
This group gives the operational attributes of the *RemoteGroup* component.

## ATTRIBUTE X25Dte Rg lcnList (lcn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute lists the *Lcn* components for the *X25Dte*, which belong to this *RemoteGroup*. There is an *Lcn* component listed here for every lcn connection belonging to this *RemoteGroup*. The lcns were established using either a *Peer* component linked to this *RemoteGroup* (in response to a switched call) or using a *PermLcn* component linked to this *RemoteGroup* (a permanent connection). |
| List of | Decimal (1..4095) |
| List Size | 4095 |
| Default | No default |

Passport 7400, 15000, 20000
