| Values | Decimal (1..8187) |
| Units | octets |
| Default | 4096 |

### ATTRIBUTE FrNni Sig defaultMaximumFrameSize (defaultdn1)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default maximum number of octets that may be included in the information field of the user DLCI assigned for any switched connections using this interface. This value is used during call parameter negotiation for switched calls on this interface when the maximum frame size is not specified in the user's SETUP message. The value of this attribute must not exceed the value of the *maximumFrameSize* attribute. |
| Values | Decimal (1..8187) |
| Units | octets |
| Default | 2100 |

### ATTRIBUTE FrNni Sig defaultCommittedInformationRate (defaultCir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default user to network direction CIR. This value is used during call parameter negotiation for switched calls on this interface when the CIR is not specified in the user's SETUP message. |
| Values | Decimal (0..52000000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE FrNni Sig defaultCommittedBurstSize (defaultBc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default user to network direction Bc. This value is used during call parameter negotiation for switched calls on this interface when the Bc is not specified in the user's SETUP message. |
| Values | Decimal (0..52000000) |
| Units | bits |
| Default | 64000 |

### ATTRIBUTE FrNni Sig defaultExcessBurstSize (defaultBe)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default user to network direction Be. This value is used during call parameter negotiation for switched calls on this interface when the Be is not specified in the user's SETUP message. |
| Values | Decimal (0..52000000) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE FrNni Sig rateEnforcement (re)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether rate enforcement is in effect for SVCs on this interface. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE FrNni Sig rateAdaptation (ra)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies whether closed-loop rate adaptation is in effect for SVCs on this interface. Rate adaptation is a feature that, in periods of congestion, adapts the rate at which the user is allowed to send data into the network to that which the network is able to handle at that time. This proactive measure of handling congestion optimizes network resources by causing the ingress to discard frames that would otherwise be discarded in the network.<br><br>If this attribute is set to ***on***, then, at the onset of congestion, the excess information rate (EIR) is reduced to a very low rate. If congestion persists, then the allowed CIR is reduced geometrically by 25% of the current value at that time. The minimum to which CIR can be reduced is 1/16th (6.25%) of the provisioned value. As congestion alleviates, CIR is increased linearly by 6.25% of the provisioned value specified in *committedInformationRate*.<br><br>If set to ***eirOnly***, then rate adaptation will only apply to the excess information rate (EIR). At the onset of congestion, the allowed EIR is reduced by 25% of its provisioned value. If congestion persists, EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR.<br><br>If set to ***cirProportionate***, then rate adaptation will also only apply to the excess information rate (EIR). At the onset of congestion the initial allowed EIR is set to a multiple of the provisioned CIR. If congestion persists, the allowed EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. Note that the allowed EIR may be set higher than the provisioned EIR, since it is calculated initially using another parameter, the provisioned CIR. If the allowed EIR at the moment is higher than the provisioned EIR, then the provisioned EIR is used instead.<br><br>This attribute can only be set to ***on*** or ***eirOnly*** if *rateEnforcement* is set to ***on***. |
| Values | off<br>on |

| | |
|---|---|
| | eirOnly<br>cirProportionate |
| Default | off |

### ATTRIBUTE FrNni Sig raSensitivity (rasens)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sensitivity of the rate adaptation system for all switched connections on this interface.<br><br>A higher number indicates a higher sensitivity and therefore a quicker reaction time to network conditions. A quicker reaction time allows the network to discard frames at the access and protect network resources, but can lead to false alarms and a greater fluctuation of the allowed rate. A higher setting therefore tends to favor the protection of the network over the allowed throughput of the user.<br><br>A lower number indicates a lower sensitivity and therefore a slower reaction to network conditions. A slower reaction time results in a greater amount of user traffic allowed into the network, but can lead to a waste of network bandwidth since the traffic may be discarded at the congested resource. A lower setting therefore tends to favour the allowed throughput of the user over the protection of the network.<br><br>This attribute is applicable for adapting EIR when *rateAdaptation* is ***eirOnly*** or ***cirProportionate***, or CIR when *rateAdaptation* is ***on***.<br><br>This attribute is ignored if *rateAdaptation* is ***off***. |
| Values | Decimal (1..20) |
| Default | 7 |

### ATTRIBUTE FrNni Sig updateBCI (updBCI)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether internal Backward Congestion Indication (BCI) bits will report congestion external to the |

Passport network, as communicated through incoming BECN bits.

If *updateBCI* is set to ***on***, then BCI bits for incoming frames will be set if the BECN on the frame is set. If *updateBCI* is set to ***off***, then incoming BECN bits has no effect.

Setting *updateBCI* ***on*** for a DLCI means that the remote end of the DLCI, which is specified by the *remoteDna* and *remoteDlci* attributes of the *Dc* component of the *Dlci*, may perform Rate Adaptation using the flow of incoming BECN bits, in addition to internal Passport congestion management systems.

If the *rateAdaptation* attribute of the remote DLCI is provisioned as ***eirOnly***, ***cirProportionate***, or ***on***, then congestion from another network connected to a Passport network may trigger dynamic congestion management. If there is no rate adaptation at the other end, then the setting of *updateBCI* attribute here will have no effect.

| | |
|---|---|
| Values | off<br>on |
| Default | off |

## GROUP FrNni Sig SystemParameters (SysParms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable FRF.10 system parameters. |

## ATTRIBUTE FrNni Sig callSetupTimer (t303)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time this interface waits for a response to the SETUP message sent to the adjacent network. Upon timer expiry, the SETUP message is retransmitted. The second expiry of this timer causes the call to be cleared. |
| Values | Decimal (1..255) |
| Units | seconds |

| | |
|---|---|
| Default | 4 |

### ATTRIBUTE FrNni Sig releaseTimer (t308)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time this interface waits for a response to the RELEASE message sent to the adjacent network. Upon timer expiry, the RELEASE message is retransmitted. The second expiry of the timer causes the call to be released. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE FrNni Sig callProceedingTimer (t310)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time this interface waits for the CONNECT message from the adjacent network after the network has received the optional CALL PROCEEDING message from the adjacent network. Upon timer expiry, the call is cleared. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE FrNni Sig restartReqTimer (t316)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time this interface waits for the RESTART ACKNOWLEDGE message from the adjacent network after sending a first RESTART message. Upon timer expiry, another RESTART message is sent. After the second expiry, the interface is treated as idle.<br><br>If the *restartReqTimer* attribute is set to the default value, then the interface is treated as idle when it receives an indication that the link is up and does not send a RESTART message. |

| | |
|---|---|
| Values | Decimal (0..255) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE FrNni Sig restartRcvTimer (t317)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time this interface waits for the processing of a RESTART message received by the interface. Upon expiry of this timer, an alarm will be displayed to report the problem. The timer value must be less than the *restartReqTimer* provisioned value at the adjacent node. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 110 |

### ATTRIBUTE FrNni Sig statusEnqTimer (t322)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time the network waits for the requested STATUS message from the adjacent network. Upon expiry of this timer, another STATUS ENQUIRY message will be sent. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE FrNni Sig networkType (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether this Frame Relay service is running on a public or a private network. This value is used solely in populating applicable information elements within those signaling messages that require a public or private network indication. |

| | |
|---|---|
| Values | private<br>public |
| Default | private |

### GROUP FrNni Sig LapfSystemParameters (LapfSys)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the SVC data link layer. The data link layer is governed primarily through ITU specification Q.922, and operates over DLCI 0. |

### ATTRIBUTE FrNni Sig windowSize (ws)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the window size. This is the maximum number of unacknowledged sequenced frames that may be outstanding from or to this interface at any one time. |
| Values | Decimal (1..127) |
| Default | 7 |

### ATTRIBUTE FrNni Sig retransmitLimit (rtl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of times a frame can be retransmitted by the SVC data link layer before appropriate recovery action is taken. |
| Values | Decimal (0..20) |
| Default | 3 |

### ATTRIBUTE FrNni Sig ackTimer (at)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how long the layer 2 protocol waits for an acknowledgment to a sent frame. The value set for *ackTimer* must be less than the value set for *idleProbeTimer*. |
| Values | Decimal (1000..10000) |

| | |
|---|---|
| Units | msec |
| Default | 1500 |

### ATTRIBUTE FrNni Sig ackDelayTimer (adt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how long the network waits before sending an acknowledgment for a received in-sequence I-frame. A value of 0 means that every frame is acknowledged and there will be no delay in acknowledgment. A non-zero value means that one acknowledgement is sent for a number of frames. |
| Values | Decimal (0..10000) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE FrNni Sig idleProbeTimer (ipt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how long the link is permitted to remain idle (that is, no frames are exchanged on the data link). Upon expiry of this timer, the network side's link layer polls its peer for status. The value set for *idleProbeTimer* must be greater than the value set for *ackTimer.* |
| Values | Decimal (1000..65535000) |
| Units | msec |
| Default | 30000 |

### GROUP FrNni Sig LastSvcClearCodes (Codes)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the remote data network address, the last SVC clear cause and the last SVC diagnostic code coming from the subnet or the local VC. |

### ATTRIBUTE FrNni Sig lastClearRemoteDataNetworkAddress

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the Data Network Address (DNA) of the remote (the other end of the SVC connection) of the call which cleared last and whose clear and diagnostic codes were recorded. |
| Values | BCD (0..15) |
| Default | No default |

### ATTRIBUTE FrNni Sig lastClearCause

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last SVC clear cause signalled at the end of the connection or failure to connect. It is updated only if the clear request comes from the subnet or the call is rejected locally by the VC. The same set of possible values provides the clear cause field in the accounting record. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE FrNni Sig lastDiagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last SVC diagnostic code signalled at the end of the connection or failure to connect. It is updated if the clear request comes from the subnet or the call is rejected locally by the VC. The same set of possible values provides the diagnostic code field in the accounting record. |
| Values | Decimal (0..255) |
| Default | 0 |

### GROUP FrNni Sig OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE FrNni Sig adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE FrNni Sig operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE FrNni Sig usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrNni Sig Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics related to the SVC signaling layer at the interface level. |

### ATTRIBUTE FrNni Sig currentNumberOfSvcCalls (ncall)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of Frame Relay SVCs currently existing on this interface. |
| Values | Decimal (0..992) |
| Default | No default |

### ATTRIBUTE FrNni Sig inCalls (incall)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of incoming SVCs on this interface (that is, the number of SVCs for which this interface represents the destination end of the call). |
| Values | Decimal (0..992) |
| Default | No default |

### ATTRIBUTE FrNni Sig inCallsRefused (icr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the incoming SVC call requests that are rejected by either this interface or by the called user. When this count exceeds the maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig outCalls (outcall)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of outgoing SVCs on this interface (that is, the number of SVCs for which this interface represents the source end of the call). |
| Values | Decimal (0..992) |
| Default | No default |

### ATTRIBUTE FrNni Sig outCallsFailed (ocf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the outgoing SVC call requests that are rejected by either this interface, or by the network side of the destination end, or by the called user. When this count exceeds the maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE FrNni Sig protocolErrors (pe)

Access Read only

Description This attribute counts the number of times a FRF.10 protocol error has occurred. Any one of the following events constitutes a protocol error:
1. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir*, *Bc* and *Be* are all zero;
2. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir* is zero but *Bc* is non-zero, or *Bc* is zero but *Cir* is non-zero;
3. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, the *Minimum Acceptable CIR* is greater than *Cir*;
4. At the destination end, any of the destination to source direction
link layer core parameters has been increased in the CONNECT message from the called user;
5. At the destination end, the destination to source direction *Cir* in the CONNECT message is smaller than the corresponding *minimum acceptable Cir* signaled to the called user;
6. At the source end, any of the source to destination direction link layer core parameters in the CONNECT message from the destination end has been increased;
7. At the source end, the source to destination direction *Cir*, after negotiation, is smaller than the corresponding *minimum acceptable Cir*;
8. The network has received a STATUS message from the user with an incompatible FRF.10 state.

When this count reaches maximum, it wraps to zero.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE FrNni Sig qualityOfServiceNotAvailable (qosna)

Access Read only

| | |
|---|---|
| Description | This attribute counts the number of incoming and outgoing SVCs that are rejected because the quality of service requested cannot be met by the network. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig setupTimeout (setupt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the T303 setup timer has expired. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig lastCauseInStatusMsgReceived (lcis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cause value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute.<br><br>The initial value of this attribute is **0** which means that no STATUS message has been received for an existing call yet. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE FrNni Sig lastStateInStatusMsgReceived (lsis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute.<br><br>The initial value of this attribute is ***notApplicable***. |

| | |
|---|---|
| Values | null<br>callInitiated<br>outgoingCallProceeding<br>callPresent<br>incomingCallProceeding<br>active<br>releaseRequest<br>releaseIndication<br>restartRequest<br>restart<br>notApplicable<br>2<br>4<br>5<br>7<br>8<br>13<br>14<br>15<br>16<br>17<br>18<br>19<br>21<br>22<br>23<br>24<br>25<br>26<br>27<br>28<br>29<br>30<br>31<br>32<br>33<br>34<br>35<br>36<br>37<br>38 |

### ATTRIBUTE FrNni Sig lastDlciReceivedStatus (ldrs)

Access Read only

Description This attribute shows the value of the DLCI that has most recently received a STATUS message from the user.

The initial value of this attribute is ***0***.

Values Decimal (0; 16..1007)

Default 0

### ATTRIBUTE FrNni Sig lastStateReceivedStatus (lsrs)

Access Read only

| | |
|---|---|
| Description | This attribute shows the network FRF.10 state of the DLCI that has most recently received a STATUS message from the user. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute.<br><br>The initial value of this attribute is ***notApplicable***. |
| Values | null<br>callInitiated<br>outgoingCallProceeding<br>callPresent<br>incomingCallProceeding<br>active<br>releaseRequest<br>releaseIndication<br>restartRequest<br>restart<br>notApplicable |
| Default | notApplicable |

### ATTRIBUTE FrNni Sig dlciCollisions

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of call failures due to DLCI collisions. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig bandwidthNotAvailable

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of call failures for each bandwidth pool due to the requested bandwidth not being available. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (0..15) |
| Default | No default |

## GROUP FrNni Sig LapfStatus

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Q.922 SVC data link layer status. |

## ATTRIBUTE FrNni Sig currentState (currState)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the current state of the SVC data link layer interface. |
| Values | disconnected<br>linkSetup<br>disconnectRequest<br>informationTransfer<br>waitingAck |
| Default | No default |

## ATTRIBUTE FrNni Sig lastStateChangeReason (lscr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the reason for the most recent state change.<br>***notStarted*** - this is the default state after SVC data link has just been created.<br><br>***abmeEntered*** - SVC data link has entered Asynchronous Balanced Mode after SABME or UA has been received.<br>***abmeReset*** - the data link has been reset.<br>***dmReceived*** - DM response received.<br>***dmSent*** - DM sent.<br>***discReceived*** - DISC response received.<br>***discSent*** - DISC sent.<br>***frmrReceived*** - FRMR received.<br>***n200RetranTimeOut*** - *retransmitLimit* has been exceeded.<br>***other*** - unspecified state change reasons. The most likely reason for this is the transition from state ***waitingAck*** to state ***informationTransfer***. |
| Values | notStarted<br>abmeEntered |

| | |
|---|---|
| | abmeReset<br>dmReceived<br>dmSent<br>discReceived<br>discSent<br>frmrReceived<br>n200RetranTimeOut<br>other |
| Default | notStarted |

### ATTRIBUTE FrNni Sig frmrReceive (frmrr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the information field of the Frame Reject (FRMR) most recently received. |
| Values | String (0..8, Hex) |
| Default | No default |

### ATTRIBUTE FrNni Sig currentQueueSize (queues)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the current number of frames in the SVC data link layer transmit queue. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrNni Sig LapfStatistics (LapfStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics for the SVC data link layer. |

### ATTRIBUTE FrNni Sig remoteBusy

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times transmission of an I-frame was unsuccessful due to a perceived remote busy condition |

| | |
|---|---|
| | (window closed or remote busy). When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig receiveRejectFrame

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of REJ frames received by the interface. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig ackTimeout

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the *ackTimer* has expired. Frequent increments of this counter indicate a problem at the link or improper values have been chosen for *ackTimer* and *ackDelayTimer* between the local and remote sides. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig iFramesTransmitted

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVC I-frames transmitted to the interface on DLCI 0. An I-frame may be counted more than once if there are retransmissions at the SVC data link layer. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig iFramesTxDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVC I-frames that are bound for the link but have been discarded. Discard reasons may be one of the following:<br>1. the frame length is beyond the allowed limit.<br>2. the SVC data link layer is in ***disconnected*** state.<br>3. the transmit queue has been purged because the queue length has reached the reset threshold.<br>4. the transmit queue or the queue waiting for acknowledgment has been purged because the link cannot be re-established.<br><br>When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig iFramesReceived

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVC I-frames received from the interface. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig iFramesRcvdDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVC I-frames received but have been discarded. The discard reasons are:<br>1. incorrect frame size<br>2. frame is out of sequence<br>3. frame received while the network side of the SVC data link layer is not in the ***informationTransfer*** or ***waitingAck*** state.<br><br>When this count reaches maximum, it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrNni Sig stateChange

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the SVC data link layer interface has changed state. While the data link layer is in ***informationTransfer*** state, this counter will increment on each expiry of *idleProbeTimer* as its state goes from ***informationTransfer*** to ***waitingAck*** and back. When this count exceeds the maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrNni Sig FrsSvcAcc (Svcacc)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute which controls accounting for this interface. |

### ATTRIBUTE FrNni Sig defaultAccounting (defAcc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether accounting data collection and record generation is turned on for switched connections at this interface. For accounting data collection and record generation to occur, this attribute must be ***on*** and at least one of the *accountCollection* reasons in the *Dna* component must be present. |
| Values | off<br>on |
| Default | on |

## COMPONENT FrNni LoadTestSystem (Lts)

| | |
|---|---|
| Groups | "GROUP FrNni Lts Setup (Setup)"<br>"GROUP FrNni Lts OperationalState (State)"<br>"GROUP FrNni Lts Results (Results)" |
| Scope | Application |
| Description | *FrUni/n LoadTestSystem*<br>*FrNni/n LoadTestSystem*<br>This component defines an instance of the Frame Relay Load Test System (UNI) service. The component instance value n is a unique positive integer within a module. |
| Subcomponents | "COMPONENT FrNni Lts Pattern (Pat)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## VERB START FrNni Lts

| | |
|---|---|
| Impact | Service |
| Description | *START FrUni/n Lts*<br>This verb starts the load generator. The load generator can be stopped by issuing the stop verb. |

## VERB STOP FrNni Lts

| | |
|---|---|
| Impact | Service |
| Description | *STOP FrUni/n Lts*<br>This verb stops the traffic generator. |

## VERB RESET FrNni Lts

| | |
|---|---|
| Impact | Service |
| Description | *RESET FrUni/n Lts*<br>This verb clears the TestStatistics |

## GROUP FrNni Lts Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the parameters used to configure the behavior of the Frame Relay Load Test System. |

## ATTRIBUTE FrNni Lts duration (dur)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duration of the test in milliseconds. The test will run until the duration expires or the STOP command is issued. A value of 0 is used to indicate infinity. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | 0 |

## ATTRIBUTE FrNni Lts algorithm (alg)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which algorithm is used to generate the frames.<br><br>**ContinuousBurst**<br>This mode of traffic generation creates traffic at the maximum rate possible until all of the frames have been sent. The generator then waits until the end of the timeInterval to begin again.<br><br>**IntervalBurst**<br>This algorithm attempts to generate 10 ms bursts of burstSize frames. It will generate as many of the burstSize frames as it can per sub-interval.<br><br>**DelayedBurst**<br>This algorithm generates bursts of burstSize frames separated by 10 ms delays.<br><br>**FixedBurst**<br>This aglorithm is similar to IntervalBurst, except a fixed burst |

size of 12 frames is used.

**delayMeasurement**
This algorithm is used to measure delay. The specified number of frames in the indicated pattern are generated, one at a time, with a maximum wait of maxDelay before sending the next frame.
This algorithm is not implemented yet.

| | |
|---|---|
| Values | continousBurst (cont)<br>intervalBurst (int)<br>delayBurst (delay)<br>fixedBurst (fixed) |
| Default | continousBurst |

### ATTRIBUTE FrNni Lts burstSize (fpb)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of frames per burst under the delayedBurst and intervalBurst algorithms. |
| Values | Decimal (1..250) |
| Default | 50 |

### ATTRIBUTE FrNni Lts timeInterval (tint)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval to the specified number of seconds. Granuality is in centiseconds. Maximum is 1 minute. |
| Values | Decimal (1..60000) |
| Units | csec |
| Default | 100 |

### GROUP FrNni Lts OperationalState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operation statistics of the load generator. |

### ATTRIBUTE FrNni Lts generatorState (gstate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the Lts is generating traffic. |
| Values | stopped<br>running |
| Default | stopped |

### ATTRIBUTE FrNni Lts cycleIncomplete (cycle)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the time required to generate all of the enabled patterns is more than timeInterval by a true value. Otherwise, this flag is set to false. Default is True. |
| Values | false<br>true |
| Default | true |

### ATTRIBUTE FrNni Lts lastActiveInterval (actInt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the actual time it took to generate all of the enabled patterns in the last cycle. If cycleIncomplete is true, this value should be zero. |
| Values | Decimal (0..4294967295) |
| Units | microsec |
| Default | No default |

### ATTRIBUTE FrNni Lts load

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the load being generated. This value represents that calculated using the set number of ticks. The actual burstTimeInterval may differ. One entire cycle of the patterns is completed in activeInterval and thus most of the load may be concentrated early in the set interval. |

| | |
|---|---|
| Values | Decimal (0.000..4294967.295) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE FrNni Lts elapsedGenerationTime (etime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates how many milliseconds have elapsed since the start of this test. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### GROUP FrNni Lts Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the frame counting attributes for the LTS component. |

### ATTRIBUTE FrNni Lts framesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames send to the network since the last time these statistics were cleared. This is similar to the framesToIf attribute of the FRAMER component. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrNni Lts bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of bytes sent. |
| Values | Decimal (0..4294967295) |
| Units | bytes |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrNni Lts bitRateTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bit rate being sent to the link. It should only differ from the load if the burstTimeInterval would be >= the timeInterval or burstSize frames cannot be generated in 10ms (intervalBurst algorithm). |
| Values | Decimal (0.000..4294967.295) |
| Units | kbit/s |
| Default | 0.000 |

### ATTRIBUTE FrNni Lts frameRateTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the frame rate being sent to the link. It is calculated using the number of frames sent to the link in one cycle of the patterns. |
| Values | Decimal (0..4294967295) |
| Units | frame/s |
| Default | 0 |

### COMPONENT FrNni Lts Pattern (Pat)

| | |
|---|---|
| Instance | Decimal (0..29) |
| Groups | "GROUP FrNni Lts Pat Defaults (Defaults)"<br>"GROUP FrNni Lts Pat Setup (Setup)"<br>"GROUP FrNni Lts Pat OperationalData (OpData)"<br>"GROUP FrNni Lts Pat OperationalState (OpState)" |
| Scope | Application |
| Description | FrUni/n Lts Pattern<br>FrNni/n Lts Pattern<br>Each instance of this component specifies a pattern to be |

generated as part of each cycle. One cycle represents one pass through each pattern.

### VERB TRIGGER FrNni Lts Pat

Impact: Service

Description: *TRIGGER FrUni/x Lts Pattern/y*
This verb triggers the single execution of the specified pattern. In order for this command to be executed, the Lts component cannot be generating traffic.

### GROUP FrNni Lts Pat Defaults (Defaults)

Properties: Provisioned

Description: This attribute group contains the specifications of the pattern.

### ATTRIBUTE FrNni Lts Pat defaultDlci (dDlci)

Access: Read and write

Description: This attribute specifies for which dlci (on the local end) the frames are destined.

Values: Decimal (16..1007)

Default: 16

### ATTRIBUTE FrNni Lts Pat defaultNumFrames (dNum)

Access: Read and write

Description: This attribute specifies the number of frames in this pattern. This is the number of frames of this type which will be generated in one timeInterval.

Values: Decimal (0..4294967295)

| | |
|---|---|
| Default | 100 |

### ATTRIBUTE FrNni Lts Pat defaultDataSize (dSize)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the payload size of each frame in bytes. This is in excess to the header. |
| Values | Decimal (0..8200) |
| Units | octets |
| Default | 512 |

### ATTRIBUTE FrNni Lts Pat defaultHeaderBits (dBits)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the following bits are on/off in the header of each frame. The following bits can be set: BeCn, C/R, De, FeCn |
| Set of | becn<br>fecn<br>cr<br>de |
| Default | No default |

### ATTRIBUTE FrNni Lts Pat defaultHeaderLength (dLen)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the size of the frame relay header in bytes. Passport currently only supports a 2-byte header. |
| Values | Decimal (0; 2..4) |
| Units | octets |
| Default | 2 |

### ATTRIBUTE FrNni Lts Pat defaultEABits (dEABits)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies how the address field extension bits are set in the frame header. Consider the value to be a four bit binary number. For example, 4 = 0100. Only the first headerLength bits are used. For instance, suppose headerLength is 3, then the appropriate EABits is 2, or 0010. This attribute can be used to create a header of length greater than two bytes or to specify incorrect EABits in the header. |
| Values | Hex (H.0..H.f) |
| Default | H.4 |

### ATTRIBUTE FrNni Lts Pat defaultPayloadPattern (dPattern)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the payload of each frame. The value specified is in hexadecimal, where every two digits represent a byte. A maximum of 24 digits (12 bytes) may be set, after which the pattern will repeat in the payload (depending on repeatPattern attribute).<br>NOTE: If a RFC 1490 header is specified, via the 1490Header attribute, the specified pattern will begin following the header (i.e. at the 9th byte in the payload). |
| Values | String (1..12, Hex) |
| Default | 55 |

### ATTRIBUTE FrNni Lts Pat defaultRfc1490Header (d1490)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the appropriate RFC 1490 encapsulated header of the frame. A value of 0 indicates no 1490 header.<br>NOTE: This header resides in the first 8 bytes of the payload. If the specified value is non-zero, then the payload pattern provisioned will begin at the 9th byte. |
| Values | 0<br>1<br>2<br>3<br>4 |

5
6
7

11
12
13
14
15
16
17
none

Default none

### ATTRIBUTE FrNni Lts Pat defaultUseBadLrc (dBadLrc)

Access Read and write

Description This attribute specifies whether the frames from this pattern are to have a bad LRC prior to being sent to the framer. The LRC is checked while the frame is being put onto the link and the failure should cause an abort frame to be sent.

Values no
yes

Default no

### GROUP FrNni Lts Pat Setup (Setup)

Properties Operational

Description This attribute group contains the specifications of the pattern.

### ATTRIBUTE FrNni Lts Pat dlci

Access Read and write

Description This attribute specifies for which dlci (on the local end) the frames are destined.

Values Decimal (16..1007)

| | |
|---|---|
| Default | 16 |

### ATTRIBUTE FrNni Lts Pat numFrames (num)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of frames in this pattern. This is the number of frames of this type which will be generated in one timeInterval. |
| Values | Decimal (0..4294967295) |
| Default | 100 |

### ATTRIBUTE FrNni Lts Pat dataSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the payload size of each frame in bytes. This is in excess to the header. |
| Values | Decimal (0..8200) |
| Units | octets |
| Default | 512 |

### ATTRIBUTE FrNni Lts Pat headerBits (bits)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the following bits are on/off in the header of each frame. The following bits can be set: BeCn, C/R, De, FeCn |
| Set of | becn<br>fecn<br>cr<br>de |
| Default | No default |

### ATTRIBUTE FrNni Lts Pat headerLength (len)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the size of the frame relay header in bytes. Passport currently only supports a 2-byte header. Valid values are 0, 2, 3, 4. 0 indicates to use no header. That is, the frame will start with either the payload or rfc1490 header. |
| Values | Decimal (0; 2..4) |
| Units | octets |
| Default | 2 |

### ATTRIBUTE FrNni Lts Pat eaBits

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how the address field extension bits are set in the frame header. Consider the value to be a four bit binary number. For example, 4 = 0100. Only the first headerLength bits are used. For instance, suppose headerLength is 3, then the appropriate eaBits is 2, or 0010. This attribute can be used to create a header of length greater than two bytes or to specify incorrect eaBits in the header. |
| Values | Hex (H.0..H.f) |
| Default | H.4 |

### ATTRIBUTE FrNni Lts Pat payloadPattern (pattern)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the payload of each frame. The value specified is in hexadecimal, where every two digits represent a byte. A maximum of 24 digits (12 bytes) may be set, after which the pattern will repeat in the payload (depending on repeatPattern attribute).<br>NOTE: If a RFC 1490 header is specified, via the 1490Header attribute, the specified pattern will begin following the header (i.e. at the 9th byte in the payload). |
| Values | String (1..12, Hex) |
| Default | 55 |

### ATTRIBUTE FrNni Lts Pat rfc1490Header (rfc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the appropriate RFC 1490 encapsulated header of the frame. A value of 0 indicates no 1490 header. NOTE: This header resides in the first 8 bytes of the payload. If the specified value is non-zero, then the payload pattern provisioned will begin at the 9th byte. |
| Values | 0<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15<br>16<br>17<br>none |
| Default | none |

### ATTRIBUTE FrNni Lts Pat useBadLrc

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the frames from this pattern are to have a bad LRC prior to being sent to the framer. The LRC is checked while the frame is being put onto the link and the failure should cause an abort frame to be sent. |
| Values | no<br>yes |

| | |
|---|---|
| Default | no |

### GROUP FrNni Lts Pat OperationalData (OpData)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes which allow changing the pattern outside of provisioning mode. |

### ATTRIBUTE FrNni Lts Pat framePattern

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the first 20 to 24 bytes of the frame payload, depending on the frame relay header size selected. This attribute represents the frame if it were at least 20 to 24 bytes in size. That is, the actual frame may be smaller. |
| Values | String (20..24, Hex) |
| Default | No default |

### ATTRIBUTE FrNni Lts Pat hdlcBitsInserted (hdlc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays how many times a zero bit will be inserted after 5 consecutive 1 bits when a frame from this pattern is sent out. |
| Values | Decimal (0..65535) |
| Default | No default |

### GROUP FrNni Lts Pat OperationalState (OpState)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes containing the operational statistics of the pattern. |

### ATTRIBUTE FrNni Lts Pat load

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the load due to this particular pattern. The loads associated with all of the provisioned patterns are summed to arrive at the FrLts load. |
| Values | Decimal (0.000..4294967.295) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE FrNni Lts Pat status

| | |
|---|---|
| Access | Read and write |
| Description | This attributes specifies the administrative state of the pattern. A disabled pattern will not be generated, although it can still be triggered. |
| Values | disabled<br>enabled |
| Default | enabled |

### COMPONENT FrNni ServiceTrace (SrvTrace)

| | |
|---|---|
| Groups | "GROUP FrNni SrvTrace Operational" |
| Scope | Application |
| Description | *FrUni/n ServiceTrace*<br>*FrNni/n ServiceTrace*<br>The *ServiceTrace* component of the Frame Relay service determines if the trace capability is allowed on this interface. If it is not provisioned, then a service trace session cannot be started on this service.<br><br>Frame Relay service trace is restricted to use FrameRelay, X25 or ATM service trace receiver. If the *SrvTrace rcvr* operational attribute is set to a string name of FrAtm service trace receiver, *Start* command will return a “Receiver Not Supported” response. |

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT FrNni SrvTrace Filter" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### VERB Start FrNni SrvTrace

| | |
|---|---|
| Impact | Service |
| Description | *Start FrUni/n ServiceTrace*<br>*Start FrNni/n ServiceTrace*<br>This command starts a Frame Relay service trace session. |

### VERB Stop FrNni SrvTrace

| | |
|---|---|
| Impact | Service |
| Description | *Stop FrUni/n ServiceTrace*<br>*Stop FrNni/n ServiceTrace*<br>This command stops a Frame Relay service trace session. |

### GROUP FrNni SrvTrace Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *SrvTrace* component. |

### ATTRIBUTE FrNni SrvTrace receiverName (rcvr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started. |

| | |
|---|---|
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE FrNni SrvTrace duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active. |
| Values | Decimal (0..9999) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE FrNni SrvTrace queueLimit

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately. |
| Values | Decimal (1..100) |
| Units | Kbyte |
| Default | 20 |

### ATTRIBUTE FrNni SrvTrace session

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active. |
| Values | The name of the component |
| Default | No default |

## COMPONENT FrNni SrvTrace Filter

| | |
|---|---|
| Groups | "GROUP FrNni SrvTrace Filter Operational" |
| Scope | Application |
| Description | *FrUni/n SrvTrace Filter*<br>*FrNni/n SrvTrace Filter*<br>The *Filter* component defines the type of traced data that is sent to the receiver. The *Filter* component provides default values for all its attributes which are sufficient to start a trace session. If required, these attributes may be changed before or during a trace session. |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrNni SrvTrace Filter Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the Frame Relay *SrvTrace Filter* component. |

## ATTRIBUTE FrNni SrvTrace Filter traceType (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the level of filtering required for this trace session. A value of ***lmi*** indicates that LMI frames are traced. A value of ***dlci*** indicates that frames from the *Dlci* specified by the *tracedDlci* attribute are traced. A value of ***badFrames*** indicates that bad received frames (overruns, CRC errors, aborts) are traced. The default is to trace all frames. This attribute can be set while a trace is active and takes effect immediately. |
| Set of | lmi<br>dlci<br>badFrames |
| Default | (lmi, dlci, badFrames) |

### ATTRIBUTE FrNni SrvTrace Filter tracedDlci (dlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies a particular DLCI to trace. A value of ***0*** specifies that all DLCIs are to be traced. This attribute can be set while a trace is active and takes effect immediately. |
| Values | Decimal (0..1007) |
| Default | 0 |

### ATTRIBUTE FrNni SrvTrace Filter direction (dir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the direction of the data to be traced as viewed by the service. The values can be ***egress*** and ***ingress***. An ***egress*** value indicates frames outbound from the service. An ***ingress*** value indicates frames inbound to the service. This attribute can be set while a trace is active and takes effect immediately. |
| Set of | egress<br>ingress |
| Default | (egress, ingress) |

### ATTRIBUTE FrNni SrvTrace Filter tracedLength (len)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of octets to trace per frame starting from the octet following the frame flag. If the frame length is longer than the value specified by this attribute, then the traced frame is truncated. If set to ***disabled***, the traced frame is not truncated.<br><br>This attribute can be set while a trace is active and takes effect immediately.<br><br>If the Frame Relay *SrvTrace* is started with an ATM service trace receiver, the *tracedLength* attribute of ATM service trace receiver is ignored. |

| | |
|---|---|
| Values | Decimal (1..4000)<br>disabled |
| Units | octets |
| Default | 2000 |

## COMPONENT FrNni ConnectionAdministrator (Ca)

| | |
|---|---|
| Groups | "GROUP FrNni Ca Provisioned (Prov)"<br>"GROUP FrNni Ca IngressCac"<br>"GROUP FrNni Ca EgressCac"<br>"GROUP FrNni Ca Operational (Op)" |
| Scope | Application |
| Description | *FrNni/n ConnectionAdministrator*<br>The *Ca* component allows the network operator to specify common subscription options for the parent interface. It defines the call admission control parameters in the ingress and egress direction for the parent interface. |
| Opt. Subcomp. | "COMPONENT FrNni Ca TransferPriorityMapping (Tpm)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrNni Ca Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the common provisionable attributes of the *Ca* component. |

## ATTRIBUTE FrNni Ca overrideLinkRate (ovLinkRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute allows the link rate to be overridden for this interface. This allows the user to specify a value other than the actual physical link rate computed when a *Framer* component is provisioned. When a *VFramer* component is provisioned, this |

| | |
|---|---|
| | attribute overrides a link rate set to the maximum value supported by CAC .<br><br>This attribute serves to provide the user control on the amount of bandwidth available for performing CAC. |
| Values | Decimal (0..429496729) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE FrNni Ca maximumBandwidthPerCall (maxBwCall)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum bandwidth that can be allocated per connection. |
| Values | Decimal (0..520000000) |
| Units | bit/s |
| Default | 520000000 |

### GROUP FrNni Ca IngressCac

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the common provisionable attributes for ingress call admission control. |

### ATTRIBUTE FrNni Ca ingressApplyToCos (ingCos)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies which Classes of Service (CoS) have ingress Call Admission Control (CAC) applied to them. Ingress CAC applies only to switched connections (SVCs and S-SPVCs).<br><br>***none*** - Ingress CAC is turned off for all classes of service.<br>***cirOnly*** - Ingress CAC is applied only to the CIR portion of a |

connection's bandwidth requirements for CIR>0 classes of service.
***cirAndEir*** - Ingress CAC is applied to both CIR and EIR portions of a connections bandwidth requirements for all classes of service.

Values
none
cirOnly
cirAndEir

Default
cirOnly

### ATTRIBUTE FrNni Ca ingressMaximumEirOnlyCalls

Access
Read and write

Criticality
Process

Description
This attribute specifies the maximum number of connections in the ingress direction with EIR only traffic that can be up at a given time.

Values
Decimal (0..992)

Default
992

### ATTRIBUTE FrNni Ca ingressCirBandwidthPool (ingCirBP)

Access
Read and write

Criticality
Process

Description
Port capacity is partitioned into 16 pools (pool 0 through pool 15) for the ingress CIR traffic. This attribute specifies the percentage of port capacity that is allowed for each pool. The percentage for each pool ranges from 0% to 1000% of the link rate. It allows for under or over subscription of the port. Under subscription occurs when the sum of the percentages assigned to the 16 pools is less than 100%. Over subscription occurs when the sum of the percentages for the 16 pools exceeds 100%.

The default is full sharing of port capacity with three pre-set partitions.

Vector of

### GROUP FrNni Ca EgressCac

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the common provisionable attributes for egress call admission control. |

### ATTRIBUTE FrNni Ca egressApplyToCos (egCos)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies which Classes of Service (CoS) have egress Call Admission Control (CAC) applied to them. Egress CAC applies only to switched connections (SVCs and S-SPVCs).<br><br>***none*** - Egress CAC is turned off for all classes of service.<br>***cirOnly*** - Egress CAC is applied only to the CIR portion of a connection's bandwidth requirements for CIR>0 classes of service.<br>***cirAndEir*** - Egress CAC is applied to both CIR and EIR portions of a connections bandwidth requirements for all classes of service. |
| Values | none<br>cirOnly<br>cirAndEir |
| Default | none |

### ATTRIBUTE FrNni Ca egressMaximumEirOnlyCalls

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum number of connections in the egress direction with EIR only traffic that can be up at a given time. |
| Values | Decimal (0..992) |
| Default | 992 |

### ATTRIBUTE FrNni Ca egressCirBandwidthPool (egCirBp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | Port capacity is partitioned into 16 pools (pool 0 through pool 15) for the egress CIR traffic. This attribute specifies the percentage of port capacity that is allowed for each pool. The percentage for each pool ranges from 0% to 1000% of the link rate. It allows for under or over subscription of the port. Under subscription occurs when the sum of the percentages assigned to the 16 pools is less than 100%. Over subscription occurs when the sum of the |

| | |
|---|---|
| | percentages for the 16 pools exceeds 100%.<br><br>The default is full sharing of port capacity with three pre-set partitions. |

### GROUP FrNni Ca Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational status of the *Ca* component. |

### ATTRIBUTE FrNni Ca linkRate (linkRate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the link rate used by both ingress and egress CAC to calculate the effective bandwidth pool sizes.<br><br>If the provisionable attribute *overrideLinkRate* under this component is 0, then the link rate reported is the actual link rate of the port or channel. Otherwise, the link rate reported is the *overrideLinkRate* under this component. |
| Values | Decimal (0..520000000) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrNni Ca ingressCirPoolAdmittedBandwidth (ingCirPoolAdmitBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total admitted CIR bandwidth from each CIR bandwidth pool in the ingress direction. Each value is the sum of the equivalent bit rates of the admitted connections. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrNni Ca ingressCirPoolAvailableBandwidth (ingCirPoolAvailBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remaining available CIR bandwidth in each ingress CIR bandwidth pool. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrNni Ca egressCirPoolAdmittedBandwidth (egCirPoolAdmitBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total admitted CIR bandwidth from each CIR bandwidth pool in the egress direction. Each value is the sum of the equivalent bit rates of the admitted connections. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrNni Ca egressCirPoolAvailableBandwidth (egCirPoolAvailBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remaining available CIR bandwidth in each egress CIR bandwidth pool. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrNni Ca ingressEirPoolAdmittedBandwidth (ingEirPoolAdmitBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total admitted EIR bandwidth from each EIR bandwidth pool in the ingress direction. Each value is the sum of the equivalent bit rates of the admitted connections.<br><br>If the *ingressApplyToCos* attribute is set to ***none***, all ingress CIR bandwidth pools are set to 0. |
| Vector of | Decimal (0..520000000) |

| | |
|---|---|
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrNni Ca ingressEirPoolAvailableBandwidth (ingEirPoolAvailBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remaining available EIR bandwidth in each ingress EIR bandwidth pool.<br><br>If the *ingressApplyToCos* attribute is set to either ***none*** or ***cirOnly***, all ingress EIR bandwidth pools are set to 0. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrNni Ca egressEirPoolAdmittedBandwidth (egEirPoolAdmitBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total admitted EIR bandwidth from each EIR bandwidth pool in the egress direction. Each value is the sum of the equivalent bit rates of the admitted connections.<br><br>If the *egressApplyToCos* attribute is set to ***none***, all egress CIR bandwidth pools are set to 0. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrNni Ca egressEirPoolAvailableBandwidth (egEirPoolAvailBw)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the remaining available EIR bandwidth in each egress EIR bandwidth pool.<br><br>If the *egressApplyToCos* attribute is set to either ***none*** or ***cirOnly***, all egress EIR bandwidth pools are set to 0. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrNni Ca numberRejectedEgressCirPermConn (numRegEgCirPerm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of permanent connections (that is, PVC and P-SPVC) that are rejected by egress CAC. A connection is rejected by egress CAC if it requests more egress CIR bandwidth than is available, and the *egressApplyToCos* attribute is set to either ***cirOnly*** or ***cirAndEir***. |
| Values | Decimal (0..992) |
| Default | No default |

### ATTRIBUTE FrNni Ca numberRejectedEgressEirPermConn (numRegEgEirPerm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of permanent connections (that is, PVC and P-SPVC) that are rejected by egress CAC. A connection is rejected by egress CAC if it requests more egress EIR bandwidth than is available, and the *egressApplyToCos* attribute is set to ***cirAndEir***. |
| Values | Decimal (0..992) |
| Default | No default |

### COMPONENT FrNni Ca TransferPriorityMapping (Tpm)

| | |
|---|---|
| Instance | Decimal (0..15) |

| | |
|---|---|
| Groups | "GROUP FrNni Ca Tpm Provisioned (Prov)" |
| Scope | Application |
| Description | *FrNni/n Ca TransferPriorityMapping/n*<br>The *Tpm* component defines the corresponding traffic management subscription options on a *FrNni* interface corresponding to a particular transfer priority. This component is needed only if there is a requirement to override the *Mod Frs DprsNet Tpm* component defaults. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrNni Ca Tpm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the provisionable attributes of the *Tpm* component at this interface. |

## ATTRIBUTE FrNni Ca Tpm assignedIngressBandwidthPool (asgInBwPool)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the ingress bandwidth pool which is used to support this transfer priority at this interface. When this attribute is set to ***sameAsModule***, the bandwidth pool that is used is obtained from the *assignedIngressBandwidthPool* attribute under the *Mod Frs DprsNet Tpm/n* component. |
| Values | Decimal (0..15)<br>sameAsModule |
| Default | sameAsModule |

## ATTRIBUTE FrNni Ca Tpm assignedEgressBandwidthPool (asgEgBwPool)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the egress bandwidth pool which is used to support this transfer priority at this interface. When this attribute is set to ***sameAsModule***, the bandwidth pool that is used is obtained from the *assignedEgressBandwidthPool* attribute under the *Mod Frs DprsNet Tpm/n* component. |
| Values | Decimal (0..15)<br>sameAsModule |
| Default | sameAsModule |

## COMPONENT FrNni BnxProtocol (Bp)

| | |
|---|---|
| Groups | "GROUP FrNni Bp Provisioned (Prov)"<br>"GROUP FrNni Bp OsiState (State)"<br>"GROUP FrNni Bp Operational (Op)" |
| Scope | Application |
| Description | *FrUni/n BnxProtocol*<br>*FrNni/n BnxProtocol*<br>This component defines how the Frame Relay interface handles the BNX protocol. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrNni Bp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the provisioning attributes to control the BNX protocol running on the Frame Relay interface. |

### ATTRIBUTE FrNni Bp linkToIpServer (linkToIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the link to a Frame Relay IP server. |
| Values | Link (Service, linkToFrameRelayApps) |
| Default | No default |

### ATTRIBUTE FrNni Bp ipAddress (ipadd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address associated with the Frame Relay interface. This address must be in the same subnet as the *ProtocolPort* associated with the *FrIpServer.* |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE FrNni Bp crossNetEnabled (cne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not cross-net status messages are sent from the Frame Relay interface. |
| Values | no<br>yes |
| Default | yes |

### ATTRIBUTE FrNni Bp crossNetPollingInterval (cnpi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval between two cross-net status messages. This attribute is used for both sending and expecting status messages. The two ends of a PVC should be provisioned with values within a close range. Otherwise, it could result in PVC failure. |
| Values | Decimal (30..86400) |
| Units | seconds |

| | |
|---|---|
| Default | 120 |

### ATTRIBUTE FrNni Bp crossNetAsyncUpdate (cnau)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies when a cross-net status message is sent following a BNX DLCI state change. If set to ***enabled***, the status message is sent as soon as the state change occurs. If set to ***disabled***, the state of the BNX DLCI will be sent in a cross-net status message only at the next polling interval. The polling interval is determined by *crossNetPollingInterval* attribute. The *crossNetAsyncUpdate* attribute is ignored if *crossNetEnabled* is set to ***no***. |
| Values | disabled<br>enabled |
| Default | enabled |

### ATTRIBUTE FrNni Bp crossNetListenEnabled (cnle)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not to expect cross-net status messages. When set to ***yes***, this interface wait for a cross-net status message from the remote end to declare the PVCs up or down. When set to ***no***, the interface assumes the PVCs are always up. |
| Values | no<br>yes |
| Default | yes |

### ATTRIBUTE FrNni Bp crossNetErrorThreshold (cnet)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how many *crossNetPollingIntervals* without receiving a status message from the remote end are permitted to elapse before declaring the PVC down. |
| Values | Decimal (1..30) |
| Default | 3 |

### ATTRIBUTE FrNni Bp trafficPriorityEnabled (tpe)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how to set the "Priority Level" field of the BNX header. When set to ***no***, both the *defaultTrafficPriority* attribute of the *BnxProtocol* component and the *trafficPriority* attribute of the *BnxIwf* component are ignored, and the "Priority Level" field is set to ***2***. When set to ***yes***, the "Priority Level" field is set to the value of the *trafficPriority* attribute of the *BnxIwf*, unless the *trafficPriority* attribute has a value of ***useDefault***. In this case the “Priority Level” field is set to the value of the *defaultTrafficPriority* attribute. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE FrNni Bp defaultTrafficPriority (dtp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default traffic priority used to tag all the ingress traffic. This attribute is used when the *trafficPriority* attribute of the *BnxIwf* is set to ***useDefault***. A larger value denotes a lower priority. This attribute is ignored if the *trafficPriorityEnabled* is set to ***no***. |
| Values | Decimal (1..3) |
| Default | 2 |

### ATTRIBUTE FrNni Bp trafficDiscardLevel (tdl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the discard level used to tag ingress traffic.This value is ignored when the attribute *discardLevelEnabled* is set to ***no***. In this case, the "Discard Level" field of BNX header is set to ***2*** for DE=1 datagrams and to ***4*** for DE=0 datagrams. When *discardLevelEnabled* is set to ***yes***, the "Discard Level" field is tagged with the value of *trafficDiscardLevel* attribute. The "Discard Level" value is used as follows: |

Discard Level=***1***: drop datagrams when congestion level >= 1
Discard Level=***2***: drop datagrams when congestion level >= 2
Discard Level=***3***: drop datagrams when congestion level >= 3
Discard Level=***4***: drop datagrams when congestion level >= 4

Values: Decimal (1..4)

Default: 4

### ATTRIBUTE FrNni Bp discardLevelEnabled (dle)

Access: Read and write

Description: This attribute specifies how to use discard level to tag ingress traffic. When set to ***yes***, the provisioned *trafficDiscardLevel* is used. Otherwise ingress DE=1 datagrams are tagged with discard level ***2*** and DE=0 datagrams are tagged with discard level ***4***.

Values:
no
yes

Default: no

### GROUP FrNni Bp OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE FrNni Bp adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component.

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrNni Bp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

## ATTRIBUTE FrNni Bp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE FrNni Bp availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE FrNni Bp proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE FrNni Bp controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE FrNni Bp alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE FrNni Bp standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE FrNni Bp unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP FrNni Bp Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational status of the *BnxProtocol* component. |

### ATTRIBUTE FrNni Bp invalidBnxHeader (ibh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams dropped because the BNX header was invalid. It could be caused by a invalid header version, invalid protocol type, or that discard level or priority level is out of range. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp lastInvalidBnxHeader (libh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the BNX header of the datagram which was last dropped by the *BnxProtocol* because one or more fields |

| | |
|---|---|
| | of the BNX header are invalid. The invalid field could be any of the following: header version, protocol type, discard level out of range, priority level out of range. |
| Values | Hex (H.0..H.ffffffff) |
| Default | No default |

### ATTRIBUTE FrNni Bp invalidIpProtocolId (ipid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams dropped because the protocol ID in IP header was invalid. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp discardedIpFragment (dipf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of fragmented datagrams dropped by this interface. The case could be unknown Dlci, or unknown ID in IP header when misordering happened. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp sourceIpAddressLastDropped (ldsia)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the source IP address of the datagram that was last dropped by the *BnxProtocol* because one or more fields of the IP header are invalid. The invalid field could be any of the following: header version, protocol ID, or Identification of a fragmented datagram. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE FrNni Bp droppedUnknownDlci (dud)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams dropped because the DLCI was unknown. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp lastUnknownDlci (lud)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the DLCI of datagram last dropped. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp droppedUnknownDlciXnet (dudx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the received cross-net status messages that were dropped because the DLCI was unknown. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp lastUnknownDlciXnet (ludx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the DLCI of last received cross-net status message that was dropped because the DLCI was unknown. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp ipFragFromSubnet (fragfs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the IP fragments received from subnet by this frame relay interface. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp lastInvalidIpFragId (lastid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Id in the IP header of the last fragment dropped by the frame relay interface. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrNni Bp lastDlciWithIpFragment (lfdlci)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Dlci which last received IP fragment. This attribute is used for tracking fragmented IP traffic. |
| Values | Decimal (0..429496729) |
| Default | 0 |

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP FrUni CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE FrUni customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top- |

level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

## GROUP FrUni OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE FrUni adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrUni operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrUni usageState (osiUsage)

Access
Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

### ATTRIBUTE FrUni availabilityStatus (osiAvail)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is

***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE FrUni proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE FrUni controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE FrUni alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE FrUni standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE FrUni unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP FrUni Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | FrUni/n Statistics<br>This group contains the statistics about the operational behavior of the service at the interface level. |

### ATTRIBUTE FrUni lastUnknownDlci (ludlc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the most recent DLCI which user frames were received on for which a DLCI has not been provisioned on the port. |
| Values | Decimal (0..1023) |
| Default | 0 |

### ATTRIBUTE FrUni unknownDlciFramesFromIf (unknown)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains a count of the number of frames received from the interface with an unknown DLCI (DLCI which is not |

| | |
|---|---|
| | provisioned). When the maximum is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni invalidHeaderFramesFromIf (invalid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrUni IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE FrUni ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE FrUni ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |

| | |
|---|---|
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP FrUni OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE FrUni snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP FrUni EmissionPriorityQs

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute to specify the number of Frame Relay egress emission priority queues to be used on that Frame Relay Interface |

### ATTRIBUTE FrUni numberOfEmissionQs

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of egress emission priority queues that will be used for that Frame Relay interface. |

For V.35, V.11, HSSI, E1, DS1, E3, DS3 or 8pDS1 the possible values are: ***2*** (in which case they are hardware queues), or ***4*** (in which case they are software queues).

For DS1C, E1C or DS3C the possible values are ***2, 4*** (in all cases they are software queues).

For 32 port Msa cards the possible values are ***2, 4*** (in all cases they are hardware queues).

For 4pDS3Ch, 1pSTM1ChSmIr PQC6v2 (also known as PQC2) the possible values are ***2, 4*** (in all cases they are hardware queues).

For 4pDS3Ch PQC12, setting this attribute has no effect on the number of egress emission priority queues, four hardware queues are always used.

Values: Decimal (2; 4)

Default: 2

## GROUP FrUni TrafficStatistics (TrafficStats)

Properties: Operational

Description: This operational group provides the traffic statistics of the service at the interface level. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE FrUni frmToIfByQueue

Access: Read only

Description: This attribute counts the frames transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority.

| | |
|---|---|
| | The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4. |
| Values | Decimal (0..4294967295) |
| Replication | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE FrUni octetToIfByQueue

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority.<br><br>The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4. |
| Values | Decimal (0..4294967295) |
| Replication | Decimal (0..3) |
| Default | No default |

### COMPONENT FrUni DataNetworkAddress (Dna)

| | |
|---|---|
| Groups | "GROUP FrUni Dna Address"<br>"GROUP FrUni Dna OutgoingOptions"<br>"GROUP FrUni Dna IncomingOptions"<br>"GROUP FrUni Dna CallOptions" |
| Scope | Application |
| Description | This group contains a superset of all attributes which may apply to a VC. Particular applications will typically offer only a subset of these attributes by providing a definition of their own DNA subcomponent. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT FrUni Dna ClosedUserGroup (Cug)"<br>"COMPONENT FrUni Dna HuntGroupMember (HgM)"<br>"COMPONENT FrUni Dna SpareDna (SDna)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrUni Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes. |

## ATTRIBUTE FrUni Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the DNA that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE FrUni Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies digits which form the unique identifier of the customer interface.<br><br>When a *SpareDna* component is provisioned this attribute specifies the main *dna*, that is the one on the *mainCard* supporting the interface. |

It is the equivalent of a telephone number in the telephone network.

Values: BCD (1..15)

Default: No default

### GROUP FrUni Dna OutgoingOptions

Properties: Provisioned

Description: This group defines DNA call options for calls made from the interface. These options are not used for calls arriving to the interface represented by this *DNA*.

### ATTRIBUTE FrUni Dna outDefaultPriority (odf)

Access: Read and write

Description: This attribute indicates the default priority of outgoing calls from the DTE to the network.

It can be overridden by the *discardPriority* under *DLCI Direct Call* subcomponent.

This option can be also included in X.25 signaling, in such case it will be overruled.

Values: normal
high

Default: normal

### ATTRIBUTE FrUni Dna outDefaultPathReliability (opr)

Access: Read and write

Description: This attribute specifies the default class of routing for reliability routing for all outgoing calls (from the DTE to the network) using this particular DNA. The chosen default class of routing applies to all outgoing calls established using this DNA, and applies to the packets travelling in both directions on all outgoing calls (local to remote, and remote to local). For incoming calls, the default class of routing is chosen by the calling party (as

opposed to DPN, where either end of the call can choose the default routing class).
This attribute, if set to a value of *normal*, indicates that the default class of routing is normal reliability routing. If set to a value of *high*, then the default class of routing is high reliability routing.
High reliability is the standard choice for most DPN and Passport services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the VC handles the duplication and disordering to ensure that packets are delivered to the DTE properly.
For the Frame Relay service, duplication of packets is not desired, in which case, normal reliability may be chosen as the preferred class of routing.

Values: normal
high

Default: normal

## ATTRIBUTE FrUni Dna outAccess (oua)

Access: Read and write

Description: This attribute is an extension of the Closed User Group (CUG) facility, as follows:
This attribute, if set to a value of *allowed* indicates that outgoing calls (from the DTE to the network) to the open (non-CUG) part of the network are permitted. It also permits outgoing calls to DTEs that have Incoming Access capabilities. If set to a value of *disallowed*, then such calls cannot be made using this DNA. Such calls will be cleared by the local DCE.
This attribute corresponds to the CCITT 'Closed User Group with Outgoing Access' feature for DNAs in that outgoing access is granted if this attribute is set to a value of *allowed*.

Values: disallowed
allowed

Default: disallowed

## ATTRIBUTE FrUni Dna defaultTransferPriority (dtp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default transfer priority for all outgoing calls using this particular *DNA*. It can be overridden by the *transferPriority* provisioned in the *Dlci DirectCall* sub-component.<br><br>The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15.<br><br>Each transfer priority n, where n indicates the transfer priority index, contains a default setting for routing class of service (multimedia, delay or throughput) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.<br><br>The default *defaultTransferPriority* is ***0***. |
| Values | 0<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15 |

Default 0

### ATTRIBUTE FrUni Dna transferPriorityOverRide (tpor)

Access Read and write

Description When this attribute is set to ***yes*** in the call request, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority.

This attribute is not applicable for Frame Relay SVCs.

For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority.*

The default of *transferPriorityOverRide* is ***yes***.

Values yes
no

Default yes

### GROUP FrUni Dna IncomingOptions

Properties Provisioned

Description This group defines options for incoming calls. These options are used for calls arriving to the interface represented by this *DNA.* For calls originated from the interface, *IncomingOptions* attributes are not used.

### ATTRIBUTE FrUni Dna incAccess (ina)

Access Read and write

Description This attribute, if set to a value of *allowed* specifies that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTEs that have outgoing access capabilities. If set to a value of *disallowed*, such calls cannot be made to this DNA. They will be cleared by the local DCE.
This attribute corresponds to the CCITT 'Closed User Group with

Incoming Access' feature for DNAs in that incoming access is granted if this attribute is set to a value of *allowed*.

Values
disallowed
allowed

Default
disallowed

### GROUP FrUni Dna CallOptions

Properties
Provisioned

Description
This group defines additional all options for not related to direction of the call.

### ATTRIBUTE FrUni Dna accountClass (acl)

Access
Read and write

Description
This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator.
This attribute is returned by the local VC in the accounting record for all calls that are set up using this particular DNA.

Values
Decimal (0..255)

Default
0

### ATTRIBUTE FrUni Dna accountCollection (aco)

Access
Read and write

Description
This attribute indicates that accounting records are to be collected by the network for the various reasons: billing, test, study, auditing. The last of the parameters, force, indicates that accounting records are to be collected irrespective of other collection reasons. The force option is available for X.75 Gateways only. If none of these reasons are set, then accounting will be suppressed.
To set a specific accounting collection reason, the reason is entered and the corresponding bit in the structure is set to a value of 1. To turn off a specific accounting collection reason, the reason is entered preceded with the '~' character, and the

| | |
|---|---|
| | corresponding bit in the structure is set to a value of 0.<br>The bit placement for the accounting collection reasons is as follows:<br>Bit 0 - Bill<br>Bit 1 - Test<br>Bit 2 - Study<br>Bit 3 - Audit<br>Bit 4 - Force |
| Set of | bill<br>test<br>study<br>audit<br>force |
| Default | (bill) |

### ATTRIBUTE FrUni Dna serviceExchange (sre)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is an arbitrary number, Data Service Exchange, as entered by the network operator and reported in accounting record. It is converted into an internal 8-bit integer value for use in the accounting record as well as in various X.25 and X.75 Tariff utilities. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE FrUni Dna egressAccounting (ega)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if egress accounting is enabled by the frame relay service. If egress accounting is disabled, only segment counts are collected by the VC. No frame relay counts appear in the accounting records for the frame relay service. If egress accounting is enabled, the accounting records for the frame relay service will contain frame relay specific counts. |
| Values | yes<br>no |

| | |
|---|---|
| Default | no |

### ATTRIBUTE FrUni Dna dataPath (dpa)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the data path to be used by Virtual Circuits on this interface. If the connection has a *DirectCall* component then the value can be overridden by the *dataPath* attribute of the *DirectCall* component.<br><br>This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.<br><br>The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.<br><br>A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value.<br><br>***dprsOnly*** - dynamic packet routing system is used<br><br>***dprsMcsOnly*** - dprs Multi-Service Cut-Through Switching path is used.<br><br>***dprsMcsFirst*** - dprs Multi-Service Cut-Through Switching path is used if it is available. If it is not available ***dprsOnly*** is used. |
| Values | dprsOnly<br>dprsMcsOnly<br>dprsMcsFirst |
| Default | dprsOnly |

### COMPONENT FrUni Dna ClosedUserGroup (Cug)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP FrUni Dna Cug CugOptions" |
| Scope | Application |

Description

*FrUni/n Dna ClosedUserGroup*
This group defines options associated with national or international *CUG* Identifier. Other *DNAs* in the network can have *CUGs* defined which groups these *DNAs* by *CUG interlockCode*. If *DNAs* are defined with *CUGs*, calls from *DNAs* which do not have the same *interlockCode* defined are refused. Attributes *incAccess* and *outAccess* can override this rule.

A CUG is provisioned by default as a SELECTABLE CUG. If a SELECTABLE CUG is provisioned, the DTE can include a CUG facility in the call request. If it does, the DTE selects a specific CUG by signaling the CUG's index. A DTE can subscribe to as many as 256 SELECTABLE CUGs.

A SIMPLE CUG is provisioned by setting a SELECTABLE CUG's preferential attribute to the value **yes**. There are two prerequisites: a single SELECTABLE CUG must exist; its attributes incCalls and outCalls must both be set to **allowed**. If a SIMPLE CUG is provisioned, it is the default CUG used to establish a call when the call request sent by the DTE does not include any CUG facility. If the DTE includes any CUG facility in the call request, the call is cleared. A DTE subscribing to a SIMPLE CUG cannot subscribe to any other CUG.

## GROUP FrUni Dna Cug CugOptions

Properties

Provisioned

Description

Attributes in this group define *ClosedUserGroup* options associated with *interlockCode*. *DNA's* with the same *CUG* (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same *CUG* group are defined here.

## ATTRIBUTE FrUni Dna Cug type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTEs for which there is no X.75 Gateway between. (National CUGs cannot normally traverse an X.75 Gateway).<br>If this attribute is set to ***national***, then the *CUG* is a national *CUG*, in which case, the *dnic* should be left at its default value since it is not part of a national *CUG*. If this attribute is set to ***international***, then the *CUG* is an international *CUG*, in which case, the *dnic* should be set appropriately as part of the *CUG interlockCode*. |
| Values | national<br>international |
| Default | national |

## ATTRIBUTE FrUni Dna Cug dnic

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *dnic* (Data Network ID Code) of the *CUG* by which packet networks are identified. This attribute is not applicable if the *CUG* is a ***national*** *CUG*, as specified by the CUG *type* attribute. There are usually 1 or 2 *dnics* assigned per country, for public networks. The U.S. is an exception where each BOC has a *dnic*. Also, a group of private networks can have its own *dnic*.<br><br>*dnic* value is not an arbitrary number. It is assigned by international agreement and controlled by CCITT. |
| Values | BCD (4) |
| Default | 0000 |

## ATTRIBUTE FrUni Dna Cug interlockCode (ilc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *CUG* identifier of a national or international *CUG* call. It is an arbitrary number and it also can be called CUG in some descriptions. Interfaces (*DNA's*) defined with this number can make calls to *DNA's* with the same *interlockCode*. |
| Values | Decimal (0..65535) |
| Default | 65535 |

## ATTRIBUTE FrUni Dna Cug preferential (pre)

| | |
|---|---|
| Access | Read and write |
| Description | The attribute "preferential", if set to ***yes*** indicates that this CUG is the SIMPLE CUG (as defined in ITU X.36 [10/96]), in which case it will be used during the call establishment phase if the DTE has not explicitly specified a CUG index in the call request packet. If set to ***no***, then this CUG is not the SIMPLE CUG, but an instance of the SELECTABLE CUG.<br><br>The attribute "preferential" is set to ***no*** by CAS when a CUG instance is created. If only one CUG instance exists under a DNA, and if this CUG's attributes "incCalls" and "outCall" are both set to ***allowed,*** **t**hen this CUG instance can be changed to a SIMPLE CUG by setting the attribute "preferential" to ***yes***. If more than one CUG instances exist under a DNA, none of the CUGs can be set by the user as "preferential". Essentially, the attribute "preferential" distinguishes a SIMPLE CUG from a SELECTABLE CUG.<br><br>In the case of a FRUNI DNA with a single CUG instance, the CUG can be a SIMPLE CUG (preferential = ***yes***) or the only instance of a SELECTABLE CUG (preferential = ***no***). |
| Values | no<br>yes |
| Default | no |

## ATTRIBUTE FrUni Dna Cug outCalls (ouc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to ***allowed*** indicates that outgoing calls (from the DTE into the network) can be made using this particular CUG. If set to a value of ***disallowed***, then outgoing calls cannot be made using this CUG - such calls will be cleared by the local DCE.<br>This attribute corresponds to the CCITT 'Outgoing Calls Barred' feature for CUGs in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | allowed |

## ATTRIBUTE FrUni Dna Cug incCalls (inc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular CUG. If set to ***disallowed***, then incoming calls cannot be made using this CUG - such calls will be cleared by the local DCE.<br>This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for CUGs in that incoming calls are barred if this attribute is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | allowed |

## COMPONENT FrUni Dna HuntGroupMember (HgM)

| | |
|---|---|
| Groups | "GROUP FrUni Dna HgM Interface (If)"<br>"GROUP FrUni Dna HgM Operational (Op)" |
| Scope | Application |
| Description | *FrUni/n Dna HuntGroupMember*<br>This component specifies the interaction of this *DNA* with one or more hunt groups to which it is expected to belong. |

| | |
|---|---|
| | Note that is not possible to automatically verify the consistency of the hunt group membership specified under this component with the hunt group provisioning on the DPN Hunt Group Server(s). |
| Subcomponents | "COMPONENT FrUni Dna HgM HuntGroupAddress (HgAddr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrUni Dna HgM Interface (If)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the interface parameters between the *HuntGroupMember* and the hunt group server. |

### ATTRIBUTE FrUni Dna HgM availabilityUpdateThreshold (aut)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how much *availableAggregateCIR* can change before an Availability Message Packet (AMP) is sent to the hunt group server informing it of the change.<br>If the value specified is not a multiple of 2048, the value actually used as the threshold will be the next higher multiple of 2048. |
| Values | Decimal (2048..16777216) |
| Units | bit/s |
| Default | 8192 |

### GROUP FrUni Dna HgM Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *HuntGroupMember* component. |

### ATTRIBUTE FrUni Dna HgM maximumAvailableAggregateCir (mcir)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum available bandwidth for this hunt group member. This value represents the total sum of the sixteen egress bandwidth pools. It is the sum of the sixteen indices of the *FrUni Ca egressBandwidthPool* attribute multiplied by the link speed. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrUni Dna HgM availableAggregateCir (acir)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current total available bandwidth reported to the hunt group server in the Availability Message Packet (AMP). This value represents the sum of the sixteen currently available egress bandwidth pools. It is the sum of the sixteen indices of the *FrUni Ca egressPoolAvailableBandwidth* attribute.<br>It increments when a connection is released.<br>It decrements when a connection is accepted.<br>Both this attribute and the *availableDlcis* attribute must be non zero for this interface to receive calls on a hunt group. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrUni Dna HgM availabilityDelta (ad)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the net change in the available aggregate CIR since the last Availability Message Packet (AMP) was sent to the Hunt Group. Once the absolute value of this attribute |

reaches the *availabilityUpdateThreshold* an AMP is sent to the hunt group server(s) and the *availabilityDelta* is re-computed.

Values: Signed (-16777216..16777215)

Units: bit/s

Default: No default

### ATTRIBUTE FrUni Dna HgM availableDlcis (adl)

Access: Read only

Description: This attribute indicates the number of DLCIs available for SVCs on the interface associated with this DNA. If this value reaches 0, an AMP with zero availability is sent to the hunt group server(s). Both this attribute and the *availableAggregateCir* attribute must be non zero for this DNA to receive calls on the hunt group.

Values: Decimal (0..4096)

Default: No default

### COMPONENT FrUni Dna HgM HuntGroupAddress (HgAddr)

Instance: Decimal (0..1)

Groups: "GROUP FrUni Dna HgM HgAddr Address (Addr)"

Scope: Application

Description: *FrUni/n Dna HgM HuntGroupAddress/n*
This component specifies a hunt group address to which this member belongs. A hunt group member belongs to at least one hunt group.

### GROUP FrUni Dna HgM HgAddr Address (Addr)

Properties: Provisioned

| | |
|---|---|
| Description | This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes. |

### ATTRIBUTE FrUni Dna HgM HgAddr numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the *DNA*. The address may belong to X.121 or E.164 plans. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE FrUni Dna HgM HgAddr dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains digits which form the unique identifier of the customer interface. It can be compared (approximation only) to a telephone number where the phone number identifies a unique telephone set. *DNA* digits are selected and assigned by network operators. |
| Values | BCD (1..15) |
| Default | No default |

### COMPONENT FrUni Dna SpareDna (SDna)

| | |
|---|---|
| Groups | "GROUP FrUni Dna SDna Address (Addr)" |
| Scope | Application |
| Description | *FrUni/n Dna SpareDna*<br>This component represents the Data Network Address associated with the FrUni on the *spareCard* when the ***frUniPvcSparingDprs*** feature is provisioned. When this component is provisioned, the spare Dna is supported by the *spareCard* and the main Dna is supported by the *mainCard*.<br><br>The remote *FrUni* must have a *SpareDc* component provisioned, otherwise hot standby sparing will not be provided by this DNA. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrUni Dna SDna Address (Addr)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes. |

## ATTRIBUTE FrUni Dna SDna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the Numbering Plan Indicator (NPI) of the *dna*. The address may belong to X.121 or E.164 plans. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE FrUni Dna SDna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies digits which form the alternate identifier of the customer interface used for hot standby sparing. This spare *dna* is supported by the *spareCard*.<br>It is the equivalent of a telephone number in the telephone network. DNA digits are selected and assigned by network operators. |
| Values | BCD (1..15) |

Default No default

## COMPONENT FrUni Framer

Groups "GROUP FrUni Framer Provisioned (Prov)"
"GROUP FrUni Framer LinkOptions (Link)"
"GROUP FrUni Framer OsiState (State)"
"GROUP FrUni Framer Statistics (Stats)"
"GROUP FrUni Framer LinkUtilization (Util)"

"COLLECTED STATS FrameRelayUni Framer"

Scope Application

Description *FrUni/n Framer*
*FrNni/n Framer*
*FrAtm/n Framer*
This component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Common Verbs Help

## GROUP FrUni Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups. |

## ATTRIBUTE FrUni Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

## GROUP FrUni Framer LinkOptions (Link)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes defining the framing of data on the link interface. |

## ATTRIBUTE FrUni Framer dataInversion

| | |
|---|---|
| Access | Read and write |
| Description | This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed.<br><br>This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density. |

Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.

This attribute may only take its default value for non-MSA cards.

Values
off
on

Default
off

### ATTRIBUTE FrUni Framer frameCrcType

Access
Read and write

Description
This attribute defines the type of CRC used.

The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used.

This attribute may take only its default value for non-MSA cards.

Values
crc16
crc32
noCrc

Default
crc16

### ATTRIBUTE FrUni Framer flagsBetweenFrames

Access
Read and write

Description
This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP.

Values
Decimal (1..16)

Default
1

## GROUP FrUni Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE FrUni Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE FrUni Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrUni Framer usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP FrUni Framer Statistics (Stats)

Properties
Operational

Description
This group contains the operational statistics data for a Framer component.

### ATTRIBUTE FrUni Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of aborts received. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames that were non octet aligned. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Framer overruns

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the total number of frames received from the link for which overruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames transmitted to the link for which underruns occurred. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Framer frmModeErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Framer frmToIf

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni Framer ingressFrameDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames discarded at ingress PQC. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrUni Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE FrUni Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE FrUni Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

## COLLECTED STATS FrameRelayUni Framer

| | |
|---|---|
| Description | The statistics record generated by the FrameRelayUni Framer component. |

### ATTRIBUTE FrUni Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE FrUni Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE FrUni Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE FrUni Framer txFrames

| | |
|---|---|
| Description | This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE FrUni Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |
| Values | Decimal (0..100) |

## COMPONENT FrUni LocalManagementInterface (Lmi)

| | |
|---|---|
| Groups | "GROUP FrUni Lmi ProtocolParameters (Parms)"<br>"GROUP FrUni Lmi OsiState (State)"<br>"GROUP FrUni Lmi ProtocolStatusInfo (Psi)"<br>"GROUP FrUni Lmi Statistics (Stats)"<br>"GROUP FrUni Lmi UspProtocolParameters (UspParms)" |
| Scope | Application |
| Description | *FrUni/n LocalManagementInterface*<br>*FrNni/n LocalManagementInterface*<br>*FrAtm/n LocalManagementInterface* |

This component defines the parameters for implementing the Local Management Interface protocol.

## GROUP FrUni Lmi ProtocolParameters (Parms)

Properties: Provisioned

Description: This group contains the provisionable attributes of the *LMI* component.

## ATTRIBUTE FrUni Lmi procedures (proc)

Access: Read and write

Criticality: Process

Description: This attribute selects the procedures to be used for the Local Management Interface. The following procedures are supported:

***none:*** no Local Management Interface procedures are running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures. The remaining attributes of this group are ignored.

For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrUni* is set to ***none***, only ***none*** is permitted for the *procedures* attribute of this *Lmi* component.

***vendorForum***: Local Management Interface procedures from the Vendor Forum specification are supported on this interface. *DLCI 1023* is used for the LMI protocol. This value cannot be used if the side attribute is both.

***ansi***: Local Management Interface procedures from the ANSI specification are supported. *DLCI 0* is used for the LMI protocol.

***itu***: Local Management Interface procedures from the ITU-T specification are supported. *DLCI 0* is used for the LMI protocol.

Was previously ***ccitt***.

***autoConfigure***: The interface determines automatically which Local Management Interface procedures to use. This value cannot be used if the side attribute is user.

The procedures currently in use can be seen in the operational attribute *opProcedures*.

Values
none
vendorForum
ansi
itu (ccitt)
autoConfigure

Default
autoConfigure

### ATTRIBUTE FrUni Lmi asyncStatusReport (asr)

Access
Read and write

Description
This attribute selects the use of asynchronous PVC status report procedures as specified in ANSI, CCITT, and Vendor Forum.

This attribute can be set to ***on*** or ***off***. If *procedure*s is set to ***none***, this attribute is ignored.

Values
off
on

Default
off

### ATTRIBUTE FrUni Lmi errorEventThreshold (n392)

Access
Read and write

Description
An event is defined as follows: (1) receipt of a STATUS ENQUIRY message; or (2) expiration of timer T392. An error event is (1) nonreceipt of STATUS ENQUIRY in T392 seconds; (2) invalid contents of a LMI message; (3) invalid receive sequence number. This attribute specifies the number of error events which, if they occur within *eventCount* events, cause a protocol error condition. The condition is cleared after *eventCount* sequential correct events occur. This attribute

| | |
|---|---|
| | corresponds to the nN2 parameter described in the Vendor Forum Specification.<br><br>It must be less than or equal to *eventCount*. |
| Values | Decimal (1..10) |
| Default | 3 |

### ATTRIBUTE FrUni Lmi eventCount (n393)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed. This attribute corresponds to the nN3 parameter described in the Vendor Forum Specification.<br><br>It must be greater than or equal to *errorEventThreshold*. |
| Values | Decimal (1..10) |
| Default | 4 |

### ATTRIBUTE FrUni Lmi checkPointTimer (t392)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute selects the time (in seconds) within which a STATUS ENQUIRY message is expected. This attribute corresponds to the nT2 parameter described in the Vendor Forum Specification.<br><br>It must be less than *messageCountTimer.* |
| Values | Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30) |
| Units | seconds |
| Default | 15 |

### ATTRIBUTE FrUni Lmi messageCountTimer (nt3)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute selects the time (in seconds) within which at most five (this is a fixed value and corresponds to maximum message count in VendorForum) STATUS ENQUIRY messages are expected. This attribute applies only when the *lmiProcedures* is set to ***vendorForum***.<br><br>*messageCountTimer* must always be greater than *checkPointTimer.* |
| Values | Decimal (5; 10; 15; 20; 25; 30) |
| Units | seconds |
| Default | 20 |

### ATTRIBUTE FrUni Lmi ignoreActiveBit (inab)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether the Frame Relay LMI Active Bit (A-bit) has a bearing on the transfer of user data across this Frame Relay interface for both directions of traffic flow.<br><br>When this attribute is set to ***yes***, the A-bit status of a user DLCI connection does not affect data transfer.<br><br>When this attribute is set to ***no,*** data received from the local interface will be discarded if an A-bit =0 condition exists towards the local user. Data being sent to the local interface is discarded if an A-bit = 0 condition exists towards the subnet. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE FrUni Lmi side

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

Description

This attribute can be set to ***user, network,*** or ***both***.

When this attribute is set to ***user***, USP LMI procedures are running. When this attribute is set to ***network***, NSP LMI procedures are running. When this attribute is set to ***both***, USPNSP LMI procedures are running.
When the value is ***both***, the *procedures* attribute must not be set to ***vendorForum***.
Setting the value to ***user*** when the *procedures* attribute is set to ***autoConfigure*** is disallowed semantically.

Values

network
user
both

Default

network

## ATTRIBUTE FrUni Lmi pvcConfigParmsInFsr (pvcConfig)

Access

Read and write

Description

When this attribute is set to ***yes***, additional Q.933 information elements are included in the LMI Full Status message to facilitate CPE PVC parameter configuring.

When set to ***yes***, the *Check Prov* command fails if the *Lmi side* is not set to ***network***.

When set to ***yes***, *Check Prov* fails if the number of DLCIs on the *FrUni* is greater than 300.

This attribute should be set to ***no*** if the *BnxProtocol* component is provisioned under this *FrUni* for BNX Frame Relay interworking.

If the service is not a *FrUni* this attribute is ignored.

Values

no
yes

Default

no

## ATTRIBUTE FrUni Lmi pvcAlarmsReporting (pvcAlarms)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if alarms are generated when PVCs change state in the local network, an adjacent network or in remote networks.<br><br>When the value is ***internal***, PVCs operational status change in the local network are reported in alarms. When the value is ***external***, PVCs operational status change in an adjacent or remote networks are reported in alarms. When the value is ***both***, PVCs status change in local and adjacent or remote networks are reported in alarms. When the value is ***none***, no alarms are issued for PVCs status change.<br><br>There are four kinds of alarms controlled by the attribute.<br>Alarm 7007 200x reports PVCs that have lost connectivity in an adjacent or remote networks.<br>Alarm 7007 201x reports PVCs that have reached the data transfer state in an adjacent or remote networks.<br>Alarm 7007 202x reports PVCs that have lost connectivity in the local network.<br>Alarm 7007 203x reports PVCs that have reached the data transfer state in the local network.<br><br>Each alarm can report a maximum of 112 DLCIs. Up to nine alarms of the same kind may be required to report all PVCs that have changed state if all these PVCs have experienced the same condition at the *FrUni* interface. |
| Values | external<br>internal<br>both<br>none |
| Default | external |

## GROUP FrUni Lmi OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE FrUni Lmi adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE FrUni Lmi operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE FrUni Lmi usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP FrUni Lmi ProtocolStatusInfo (Psi)

Properties: Operational

Description: This group provides the protocol status of the Local Management Interface.

### ATTRIBUTE FrUni Lmi protocolStatus

Access: Read only

Description

This attribute indicates whether the LMI is in an error condition or whether the LMI procedures are behaving normally. When operating with no LMI protocol, this attribute is always set to ***normalCondition***. When operating with LMI procedures, this attribute is set to ***errorCondition*** after n392 of the last n393 events are in error. The consequence of an ***errorCondition*** is that all DLCIs on this interface will become inactive in both directions. The ***errorCondition*** is cleared and a ***normalCondition*** is indicated when a sufficient number of events have occurred without error. In ANSI, this occurs when n393 consecutive good events take place.

If the *procedures* attribute is set to ***autoConfigure***, this attribute is set to ***configuring*** while adaptive LMI determines which LMI procedures are running on the link. A single LMI error event during auto configuration causes the attribute value to change to ***errorCondition***. If during ***configuring*** no LMI message is received, an LMI ***errorCondition*** is raised after n392 x t392 seconds.

Values

errorCondition
normalCondition
configuring

Default

No default

## ATTRIBUTE FrUni Lmi opProcedures (opproc)

Access

Read only

Criticality

Process

Description

The *opProcedures* attribute indicates the procedures being used for the Local Management Interface. This attribute should be ignored if *protocolStatus* is not ***normalCondition***. The following procedures are supported:

***none:*** Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures.

***vendorForum***: Local Management Interface procedures from the Vendor Forum specification are running on this interface. *DLCI*

*1023* is used for the LMI protocol.

***ansi***: Local Management Interface procedures from the ANSI specification are running. *DLCI 0* is used for the LMI protocol.

***itu***: Local Management Interface procedures from the ITU-T specification are running. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***.

***unknown***: Local Management Interface procedures have yet to be determined by Adaptive LMI.

Values
none
vendorForum
ansi
itu
unknown

Default
No default

## GROUP FrUni Lmi Statistics (Stats)

Properties
Operational

Description
This group contains the operational statistics for the Frame Relay Local Management Interface.

## ATTRIBUTE FrUni Lmi keepAliveStatusToIf (kasti)

Access
Read only

Description
This attribute counts the number of Local Management Interface keep alive status messages sent to the external user device in response to a status enquiry for keep alive status. When the maximum count is exceeded it wraps to zero.

Values
Decimal (0..4294967295)

Default
0

## ATTRIBUTE FrUni Lmi fullStatusToIf (fsti)

Access
Read only

| | |
|---|---|
| Description | This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi keepAliveStatusEnqFromIf (kafi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface valid keep alive status enquiry messages received from the external user device. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi fullStatusEnqFromIf (fsfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface valid full status enquiry messages received from the external user device. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi networkSideEventHistory (nsh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Local Management Interface network side procedure event history in order of occurrence. An event is represented by a single symbol. A ‘+’ symbol indicates a good event. An ‘X‘ symbol indicates a protocol error event. The leftmost event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status enquiry message. An error event is one of three possibilities, |

| | |
|---|---|
| | either a nT2/T392 timer expiry, receipt of a status enquiry message with bad sequence numbers, or when *lmiProcedures* is provisioned to vendorForum and we receive more than nN4 status enquiry messages within the provisioned *messageCountTimer* (nT3). |
| Values | String (1..10, ASCII) |
| Default | No default |

### ATTRIBUTE FrUni Lmi protocolErrors (proto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface protocol errors. It is the sum of the sequence (*sequenceErrors*), timeout (*pollingVerifTimeouts*) and too many status enquiry messages received within the *messageCountTimer* (nT3) errors. The too many status enquiries error only applies when *lmiProcedures* is set to ***vendorForum***. When the maximum count is exceeded it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi unexpectedIes (uie)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface frames received with an Information Element identifier that is unknown or unexpected. An unexpected Information Element is not a protocol error. When the maximum count is reached, this counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi sequenceErrors (seq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface Status Enquiry message sequence errors. A sequence error is |

| | |
|---|---|
| | receipt of a Status Enquiry message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi unexpectedReports (ur)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface frames received with an unknown or unexpected report type. An unexpected report type is not a protocol error. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi pollingVerifTimeouts (tmo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of *checkPointTImer* (t392) timer expiries occurring on the Local Management Interface. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi keepAliveEnqToIf (kaeti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface keep alive enquiry status messages sent to the external user device for keep alive status. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi fullStatusEnqToIf (fseti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi userSideEventHistory (ush)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Local Management Interface user side procedure event history in order of occurrence. An event is represented by a single symbol. A ‘+’ symbol indicates a good event. An ‘X‘ symbol indicates a protocol error event. The left most event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status message. An error event is either a nT1/T391 timer expiry or receipt of a status message with bad sequence numbers. |
| Values | String (1..10, ASCII) |
| Default | No default |

### ATTRIBUTE FrUni Lmi statusSequenceErrors (stseq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface Status message sequence errors. A sequence error is receipt of a Status message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lmi noStatusReportCount (nsrc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented in two cases:<br>i) after a status enquiry is sent out and T391 timer expires without having a status report received.<br>ii) an invalid status report is received.<br><br>When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP FrUni Lmi UspProtocolParameters (UspParms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the Local Management Interface user side procedure. |

### ATTRIBUTE FrUni Lmi fullStatusPollingCycles (n391)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how frequently the Frame Relay UNI service should initiate a Status Enquiry for a full PVC status report. A polling cycle is a Status Enquiry and Status Report exchange.<br><br>This attribute is used only if the *side* attribute is either ***user*** or ***both***. |
| Values | Decimal (1..255) |
| Default | 6 |

### ATTRIBUTE FrUni Lmi linkVerificationTimer (t391)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how frequently the Frame Relay UNI service should initiate a Status Enquiry for link integrity |

verification. It must be less than *checkPointTimer (t392)*.

When the Lmi *side* is ***network***, this attribute is ignored.

Values: Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30)

Units: seconds

Default: 10

## COMPONENT FrUni DataLinkConnectionIdentifier (Dlci)

Instance: Decimal (16..1007)

Groups:
"GROUP FrUni Dlci OsiState (State)"
"GROUP FrUni Dlci ABitStatus (Abit)"
"GROUP FrUni Dlci CallData (Calld)"
"GROUP FrUni Dlci ServiceParametersOp (SpOp)"
"GROUP FrUni Dlci Statistics (Stats)"
"GROUP FrUni Dlci IntervalData (Int)"

Scope: Application

Description: *FrUni/n DataLinkConnectionIdentifier/n*
This component represents a Data Link Connection Identifier. It is responsible for the Frame Relay U-plane (User-plane) protocol for the specified instance. There can be many instances of *Dlci* for each *FrUni*. The instance value is used to identify the logical connection, multiplexed within the physical channel, with which a frame is associated. All frames carried within a particular physical channel and having the same DLCI value are associated with the same logical connection.

A DLCI instance can be a permanent virtual circuit (PVC) or switched permanent virtual circuit (P-SPVC) added through provisioning, or a switched virtual circuit (SVC) which is created dynamically through signaling.

The *lock* and *unlock* commands apply to permanent (PVC and P-SPVC) DLCIs. The *clear* command applies to switched (SVC) DLCIs.

For the ***4pDS3Ch*** card, when the *timeslot* of the *channel*

component linked to this *FrUni* is set to ***none***, no *Dlci* component is allowed under this *FrUni*.

A *Dlci* must have one (and only one) instance of *DirectCall*, *IpConnection*, or *BnxInterworkingFunction* under it.

A *DirectConnection* can not be provisioned on a *FrUni* with an *IpConnection* or *BnxInterworkingFunction* component provisioned under any of its *Dlci subcomponents*.

| | |
|---|---|
| Subcomponents | "COMPONENT FrUni Dlci ServiceParametersProv (Sp)"<br>"COMPONENT FrUni Dlci EgressServiceParameters (EgressSp)" |
| Opt. Subcomp. | "COMPONENT FrUni Dlci DirectCall (Dc)"<br>"COMPONENT FrUni Dlci SpareDirectCall (SpareDc)"<br>"COMPONENT FrUni Dlci BnxInterworkingFunction (BnxIwf)"<br>"COMPONENT FrUni Dlci IpConnection (IpConn)" |
| Dyn. Subcomp. | "COMPONENT FrUni Dlci Vc"<br>"COMPONENT FrUni Dlci LoopBack (Lb)"<br>"COMPONENT FrUni Dlci StandbyVc (StbyVc)"<br>"COMPONENT FrUni Dlci Frf12Stats (Frf12)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## VERB CLEAR FrUni Dlci

| | |
|---|---|
| Impact | Service |
| Description | This command is used to clear a Frame Relay switched (SVC) connection. |

## VERB LOCK FrUni Dlci

| | |
|---|---|
| Impact | Service |
| Description | *Lock [-force] <component name>*<br>This verb will cause the specified component to enter the OSI ***shuttingDown*** administrative state. While shutting down, the component continues to provide service to existing clients but rejects any new requests for service. In some cases, locking a component causes all its subcomponents to shut down also.<br><br>When the component is no longer providing service, it enters the OSI ***locked*** administrative state.<br><br>**Options:**<br>*-force*<br>If this option is present, service to current clients is terminated and the ***locked*** state is entered immediately (that is, without first going through the ***shuttingDown*** state). Without this option, *Lock* behaves as described above. |

## VERB UNLOCK FrUni Dlci

| | |
|---|---|
| Impact | Service |
| Description | This command is used to unlock a Frame Relay PVC DLCI. |

## GROUP FrUni Dlci OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE FrUni Dlci adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE FrUni Dlci operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrUni Dlci usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE FrUni Dlci availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE FrUni Dlci proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been

initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)

## ATTRIBUTE FrUni Dlci controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is

administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE FrUni Dlci alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or

***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE FrUni Dlci standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)

providingService (serv)
notSet (nSet)

Default notSet

### ATTRIBUTE FrUni Dlci unknownStatus (osiUnknw)

Access Read only

Description This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values false
true

Default false

### GROUP FrUni Dlci ABitStatus (Abit)

Properties Operational

Description This group contains the A-Bit status information for this Data Link Connection Identifier.

### ATTRIBUTE FrUni Dlci aBitStatusToIf (abti)

Access Read only

Description This attribute is the most recent A-bit status sent to the interface. The A-bit status is part of the LMI protocol, and indicates willingness to accept data from the local interface.

***inactive*** - the Frame Relay service discards all data offered from the local interface.

***active*** - the Frame Relay service tries to process all data offered from the local interface.

***notApplicable*** - the DLCI is switched, so this attribute is ignored.

| | |
|---|---|
| Values | inactive<br>active<br>notApplicable |
| Default | inactive |

### ATTRIBUTE FrUni Dlci aBitReasonToIf (abrti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the reason (if any) for an ***inactive*** status to be sent to the interface. This reason is ***notApplicable*** for an ***active*** status. |
| Values | notApplicable<br>remoteUserSignaled<br>localLmiError<br>remoteLmiError<br>localLinkDown<br>remoteLinkDown<br>pvcSpvcDown<br>userNotAuthorized<br>resourceNotAvailable<br>dlciCollisionAtNni |
| Default | notApplicable |

### ATTRIBUTE FrUni Dlci aBitStatusFromIf (abfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the most recent A-Bit status received from the interface.<br><br>***inactive*** - the Frame Relay service informs the remote DLCI not to send user data to this interface.<br><br>***active*** - the Frame Relay service informs the remote DLCI that it is okay to send user data to this interface.<br><br>***notApplicable*** - the DLCI is switched, so this attribute is ignored. |

| | |
|---|---|
| Values | inactive<br>active<br>notApplicable |
| Default | inactive |

### ATTRIBUTE FrUni Dlci aBitReasonFromIf (abrfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the reason (if any) for an ***inactive*** status to be sent to the subnet. This reason is ***notApplicable*** for an ***active*** status. |
| Values | notApplicable<br>remoteUserSignaled<br>localLmiError<br>localLinkDown<br>missingFromLmiReport |
| Default | notApplicable |

### ATTRIBUTE FrUni Dlci loopbackState

| | |
|---|---|
| Access | Read only |
| Description | This attribute has the value ***on*** when the DLCI is in loopback mode and ***off*** otherwise. The loopback command verbs *start* and *stop* are used to initiate and terminate the loopback mode for a DLCI. While *loopbackState* is ***on***, the local LMI will report to the interface the A-bit status as active. Also an active A-bit signal will be reliably propagated across the subnet to the remote DLCI. |
| Values | off<br>on |
| Default | off |

### GROUP FrUni Dlci CallData (CallId)

| | |
|---|---|
| Properties | Operational |
| Description | This group of attributes describes the characteristics of the call such as call type and call state. |

## ATTRIBUTE FrUni Dlci callType (ct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether this DLCI is a permanent virtual circuit (PVC), a switched virtual circuit (SVC) or a switched permanent virtual circuit (SPVC). |
| Values | pvc<br>svc<br>spvc |
| Default | No default |

## ATTRIBUTE FrUni Dlci callState

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the FRF.4 state of an SVC call. The value of this attribute for a permanent (PVC and P-SPVC) DLCI is always ***notApplicable***. In the description that follows, “local” refers to the user who has initiated the SETUP request, and “remote” refers to the user to whom the local user wishes to connect.<br><br>State description:<br>In the ***null*** state, the network has neither received nor sent call setup requests for this DLCI.<br><br>In the ***callInitiated*** state, the network has received a SETUP message from the local user.<br><br>In the ***outgoingCallProceeding*** state, the network has sent a CALL PROCEEDING message to the local user in response to the SETUP message.<br><br>In the ***callPresent*** state, the network has sent a SETUP message to the remote user.<br><br>In the ***incomingCallProceeding*** state, the network has received a CALL PROCEEDING message from the remote user in response to a SETUP message. |

In the ***active*** state, either the network has sent a CONNECT message to the local user, or the network has received a CONNECT from the remote user.

In the ***disconnectRequest*** state, the network has received a DISCONNECT message from the local user.

In the ***disconnectIndication*** state, the network has sent a DISCONNECT to the local user.

In the ***releaseRequest*** state, the network has sent out a RELEASE message to the local user.

In the ***restartRequest*** state, the network has sent a RESTART request to the local user and is waiting for an acknowledgement.

In the ***restart*** state, the network has received a request for a restart from the local user and the network has not returned an acknowledgement.

Values

null
callInitiated
callProceedingSent
callPresent
callProceedingReceived
active
disconnectRequest
disconnectIndication
releaseRequest
restartRequest
restart
notApplicable

Default

No default

## ATTRIBUTE FrUni Dlci callReference (callref)

Access

Read only

Description

This attribute indicates the FRF.4 call reference number associated with this DLCI. The value of this attribute for a provisioned (PVC or P-SPVC) DLCI is always ***0***.

| | |
|---|---|
| Values | Decimal (0..32767) |
| Default | No default |

### GROUP FrUni Dlci ServiceParametersOp (SpOp)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines the service and traffic parameters specific to this instance of DLCI. For permanent (PVC and P-SPVC) DLCIs, the values of attributes with the exception of the *measurementInterval* should be identical to those in the group *FrsDataLinkConnectionProv* under the *FrsUniServiceParametersProv* component. For switched (SVC) DLCIs, the values of attributes may be different from the values provisioned under the *FrUni Sig* component, if signaling negotiations have occurred to alter the service parameters. |

### ATTRIBUTE FrUni Dlci maximumFrameSize (n203)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification. |
| Values | Decimal (1..8187) |
| Units | octets |
| Default | No default |

### ATTRIBUTE FrUni Dlci committedInformationRate (cir)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the committed information rate (CIR) in bits per second (bit/s). When *rateEnforcement* is set to ***on***, *cir* is the rate at which the network agrees to transfer information under normal conditions. This rate is measured over a measurement interval (*t*) that is determined internally based on CIR and the committed burst size (Bc). An exception to this occurs when CIR is provisioned to be zero, in which case the measurement interval |

| | |
|---|---|
| | (*t*) must be provisioned explicitly.<br><br>This attribute should be ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrUni Dlci committedBurstSize (bc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc.<br><br>This attribute should be ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | No default |

### ATTRIBUTE FrUni Dlci excessBurstSize (be)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here.<br><br>This attribute should be ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | No default |

### ATTRIBUTE FrUni Dlci measurementInterval (t)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured.<br><br>This attribute should be ignored when *rateEnforcement* is ***off***. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### ATTRIBUTE FrUni Dlci accounting (ac)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***accountingOn*** bit and at least one of the ***accountCollection*** bits in the ***DataNetworkAddress*** component must be set to on. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE FrUni Dlci emissionPriorityToIf (epToIf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the emission priority of frames sent to the interface. A larger value denotes a higher priority. |
| Values | Decimal (0; 1; 2; 3) |
| Default | No default |

### ATTRIBUTE FrUni Dlci transferPriorityToNetwork (tpToNwk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the priority at which data is transferred to the network. |

The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 indices from 0 to 15.

Each transfer priority n, where n specifies the transfer priority index, contains a default setting for routing class of service (***multimedia***, ***delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.

Values Decimal (0..15)

Default No default

### ATTRIBUTE FrUni Dlci transferPriorityFromNetwork (tpFromNwk)

Access Read only

Description This attribute indicates the priority at which data is transferred from
the network.

The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 indices from 0 to 15.

Each transfer priority n, where n specifies the transfer priority index, contains a default setting for routing class of service (***multimedia***, ***delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user

if required.

| | |
|---|---|
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Dlci correlationTag (ctag)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the unique string which identifies this connection. The value of this attribute is provisioned under the *correlationTag* attribute under *Service Parameters* subcomponent. If required for correlation purposes, the attribute is provisioned with the same value at both endpoints of the connection.<br><br>An empty string value for this attribute indicates that the user either does not want to use the correlation tag functionality, or wants the correlation tag string to be an empty string.<br><br>This attribute can be used for off-switch data correlation purposes. Downstream processing uses this attribute to correlate data records (accounting etc.) issued at different nodes in the network. In accounting, the value of this attribute appears as the *circuitId* (circuit identifier) for the endpoint.<br><br>There is no system-generated value for the correlationTag. Therefore, this attribute does not appear for SVC DLCIs. |
| Values | String (0..32, ASCII) |
| Default | "" |

### GROUP FrUni Dlci Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the Frame Relay Data Link Connection Identifier.<br><br>When the DLCI is in local loopback mode, the DLCI statistics do not increment. |

### ATTRIBUTE FrUni Dlci frmToIf (fti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent out the interface. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci fecnFrmToIf (fecnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci becnFrmToIf (becnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci bciToSubnet (bcits)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent into the local network with the Backward Congestion Indication (BCI) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci deFrmToIf (deti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent to the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discCongestedToIf (discardcti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the interface. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discDeCongestedToIf (discarddecti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion in the direction toward the interface. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci frmFromIf (ffi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface. It includes the frames that are discarded due to error or excess. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrUni Dlci fecnFrmFromIf (fecnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci becnFrmFromIf (becnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci fciFromSubnet (fcifs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the network with the Forward Congestion Indication (FCI) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci bciFromSubnet (bcifsb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the network with the Backward Congestion Indication (BCI) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrUni Dlci deFrmFromIf (defi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci excessFrmFromIf (excess)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discExcessFromIf (discardefi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames which were discarded due to rate enforcement. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discFrameAbit (discfab)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay Service, due to an inactive PVC status, in the direction toward the local network. When this count reaches maximum, it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discCongestedFromIf (discardcfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the network. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discDeCongestedFromIf (discarddecfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion, in the direction toward the local network. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci errorShortFrmFromIf (shortfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received with 0 octets in the information field. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci errorLongFrmFromIf (longfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received with number of octets in the information field greater than the subscribed maximum. |

When the count reaches maximum it wraps to zero. Frames whose lengths are greater than the hardware receive buffer are ignored by the hardware and are therefore not included in this count.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrUni Dlci becnFrmSetByService (becnset)

Access: Read only

Description: This attribute counts the number of frames with BECN set by the Frame Relay service. It is incremented whenever the Frame Relay service sets BECN on a frame upon detecting local congestion. This count is incremented regardless of whether the frame already bears a set BECN bit since its use is to determine the place of congestion. When the count reaches maximum, it wraps to zero.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrUni Dlci bytesToIf (bti)

Access: Read only

Description: This attribute counts the bytes sent out the interface. When the maximum count is reached the count wraps to zero.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrUni Dlci deBytesToIf (debti)

Access: Read only

Description: This attribute counts the bytes sent to the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.

Values: Decimal (0..4294967295)

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrUni Dlci discCongestedToIfBytes (discardctib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the link. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discDeCongestedToIfBytes (discarddectib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the link. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci bytesFromIf (bfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received from the interface. Bytes that are discarded due to error or excess are not counted. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci deBytesFromIf (debi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci excessBytesFromIf (excessb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discExcessFromIfBytes (discardebi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes which were discarded due to rate enforcement. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discByteAbit (discbab)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes which were discarded due to aBit turned off. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discCongestedFromIfBytes (discardcbib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the network. When this count reaches maximum, it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci discDeCongestedFromIfBytes (discarddecbib)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the network. When the maximum count is reached the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci errorShortBytesFromIf (shortbi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received with 0 octets in the information field. When the count reaches maximum it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci errorLongBytesFromIf (longbi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received with number of octets in the information field greater than the subscribed maximum. When the count reaches maximum it wraps to zero. Bytes whose lengths are greater than the hardware receive buffer are ignored by the hardware and are therefore not included in this count. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci rateAdaptReduct (rar)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of rate reductions due to rate adaptation. Rate adaptation causes the allowed rate to be reduced in steps. After each reduction, a period of time is awaited before further action is taken. At the end of this period, the allowed rate is further reduced if congestion is still prevalent. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci rateAdaptReductPeriod (rarp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides a cumulative count of the amount of time that rate adaptation procedures have been in effect. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE FrUni Dlci cirPresent

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the actual Committed Information Rate (CIR) enforced for this DLCI. This number is in units of 800 bits/sec, since that is the internal resolution of Passport rate enforcement. If *rateEnforcement* is **off**, then this number does not have meaning. Normally, this attribute matches the provisioned CIR for the DLCI. But when Rate Adaptation is active, then this number will vary to represent the actual Allowed CIR at the moment that this attribute is collected. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE FrUni Dlci eirPresent

| | |
|---|---|
| Access | Read only |
| Description | This attribute provides the actual Excess Information Rate (EIR) enforced for this DLCI. This number is in units of 800 bits/sec, since that is the internal resolution of Passport rate enforcement. If *rateEnforcement* is **off**, then this number does not have meaning. Normally, this attribute matches the provisioned EIR for the DLCI. But when Rate Adaptation is active, then this number will vary to represent the actual Allowed EIR at the moment that this attribute is collected. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### GROUP FrUni Dlci IntervalData (Int)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the Frame Relay Data Link Connection Identifier interval data (accounting data). |

### ATTRIBUTE FrUni Dlci startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. A new interval period is started each time an accounting record is generated. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrUni Dlci totalIngressBytes (tib)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the total bytes received from the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni Dlci totalEgressBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total bytes sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni Dlci eirIngressBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total bytes with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni Dlci eirEgressBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total bytes with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni Dlci discardedBytes

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total bytes in invalid frames received from the interface and discarded at the DLCI since the start of the interval period. This count is a sum of octets in frames discarded due to the number of octets in the information field greater than the subscribed maximum or equal to 0, due to aBit turned off, or due to rate enforcement. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni Dlci totalIngressSegFrm

| | |
|---|---|
| Access | Read only |
| Description | If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the total number of segments in frames received from the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the total number of frames received from the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci totalEgressSegFrm

| | |
|---|---|
| Access | Read only |
| Description | If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the total number of |

segments in frames sent to the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the total number of frames sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrUni Dlci eirIngressSegFrm

Access: Read only

Description: If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in frames with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrUni Dlci eirEgressSegFrm

Access: Read only

Description: If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in frames with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. The start of the interval period is captured

in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrUni Dlci discardedSegFrm

Access: Read only

Description: If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in invalid frames received from the interface and discarded at the DLCI. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of invalid frames received from the interface and discarded at the DLCI. Segments of frames are counted since the start of the interval period. The count is reset to zero when an accounting record is generated. The count is a sum of segments in frames or frames discarded due to the number of octets in the information field greater than the subscribed maximum or equal to 0, due to aBit turned off, or due to rate enforcement.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrUni Dlci localRateAdaptOccurred

Access: Read only

Description: This attribute indicates whether rate adaptation has occurred on this user Data Link Connection on this Frame Relay interface. The value is reset to ***no*** when an accounting record is generated.

Values: yes
no

Default: no

### ATTRIBUTE FrUni Dlci elapsedDifference

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since the call started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci callRefNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT FrUni Dlci DirectCall (Dc)

| | |
|---|---|
| Groups | "GROUP FrUni Dlci Dc Options" |
| Scope | Application |
| Description | *FrUni/n Dlci/n DirectCall*<br>*FrNni/n Dlci/n DirectCall*<br>This component defines direct call options for calls issued without operator intervention. Connection is complete and can be initiated automatically. Frequency of connection tries is controlled by retry timer.<br><br>If no BnxProtocol component is provisioned under a FrUni or FrNni, a DirectCall component is automatically added to all the Dlci components added to the FrUni or FrNni.<br><br>If a BnxProtocol component is provisioned under a FrUni or FrNni, no DirectCall is automatically added under the Dlci component. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrUni Dlci Dc Options

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines attributes associated with a direct call. It defines connection in terms of path and call option parameters. This connection can be permanent (PVC), switched (SVC), or switched permanent (SPVC). It can have four facilities:<br>- CCITT Facilities<br>- DTE Facilities<br>- National Facilities<br>- International Facilities<br>The total number of bytes of facilities including the facility codes and all of the facility data from all of the four classes of facilities must not exceed 512 bytes. |

## ATTRIBUTE FrUni Dlci Dc remoteNpi (rnpi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Numbering Plan Indicator (NPI) of the *remoteDna.* |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE FrUni Dlci Dc remoteDna (rdna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Data Network Address (DNA) of the service at the remote end of the DLCI. This is the called (destination) DCE address (DNA) of this PVC. |

| | |
|---|---|
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Dc remoteDlci (rdlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the remote DLCI of the PVC connection. |
| Values | Decimal (16..1007) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Dc type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the type of VC call.<br><br>If the value is set to ***permanentMaster,*** then a permanent connection will be established between two ends. The remote end must be defined as a ***permanentSlave, permanentBackupSlave,*** or ***permanentSlaveWithBackup***. The connection cannot be established if the remote end is defined as anything else. The end defined as ***permanentMaster*** always initiates the calls. It attempts to call once per minute.<br><br>If the value is set to ***permanentSlave*** then a permanent connection will be established between two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote end is defined as anything else. The ***permanentSlave*** end attempts to call once per minute.<br><br>If the value is set to ***permanentSlaveWithBackup*** then a permanent connection will be established between the two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote interface is defined as anything else. The ***permanentSlaveWithBackup*** attempts to call once per minute. When *type* is set to ***permanentSlaveWithBackup,*** the connection is cleared if the interface becomes unavailable. This enables a retry of the connection which can be redirected to the ***permanentBackupSlave***. |

If the value is set to ***permanentBackupSlave*** then a permanent connection is established between the two ends only if the ***permanentMaster*** end is disconnected from the ***permanentSlaveWithBackup*** end and a backup call is established by the call redirection system. If the ***permanentSlaveWithBackup*** interface becomes available again, the ***permanentBackupSlave*** end is disconnected and the ***permanentSlaveWithBackup*** end is reconnected to the ***permanentMaster*** end. The ***permanentBackupSlave*** end does not try to establish a call.

Values

permanentMaster (master)
permanentSlave (slave)
permanentBackupSlave (backSl)
permanentSlaveWithBackup (slavWB)
spvcMaster (spvcM)
spvcSlave (spvcS)
spvcBackupSlave (spvcBackS)
spvcSlaveWithBackup (spvcSWBack)

Default

permanentMaster

## ATTRIBUTE FrUni Dlci Dc transferPriority (tp)

Access

Read and write

Description

This attribute specifies the transfer priority to the local network for the outgoing calls using this particular DLCI. It overrides the *defaultTransferPriority* provisioned in its associated *Dna* component.

The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Each transfer priority n, where n is the transfer priority index, has a default setting for routing class of service (multimedia, delay, or throughput) and Frame Relay egress queue (depending on the

number of supported egress queues on the remote end interface). These settings are specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned under the *Mod Frs DprsNet Tpm/n* component.

Specifying ***useDnaDefTP*** means using the value given by *defaultTransferPriority* in the associated *Dna* for this DLCI.

Values

3
4
5
6
7
8
9
10
11
12
13
14
15
useDnaDefTP

Default

useDnaDefTP

## ATTRIBUTE FrUni Dlci Dc discardPriority (dp)

Access

Read and write

Description

This attribute specifies the discard priority for outgoing call using this DLCI.

The discard priority has three provisioning values: ***normal***, ***high***, and ***useDnaDefPriority***. Under congestion conditions, traffic with ***normal*** priority is discarded before traffic with ***high*** priority. The *Dna* default value (provisioned by *outDefaultPriority*) is taken if this attribute is set to the value ***useDnaDefPriority***.

| | |
|---|---|
| Values | normal<br>high<br>useDnaDefPriority |
| Default | useDnaDefPriority |

### ATTRIBUTE FrUni Dlci Dc deDiscardPriority (ddp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the *discardPriority* applies to DE frames for this DLCI.<br><br>When set to ***determinedByDiscardPriority***, traffic with DE bit set will be discarded according to the setting of the *discardPriority.*<br><br>When set to ***lowest***, all traffic with DE bit set is treated the same and is sent to the subnet at the lowest discard priority. |
| Values | lowest<br>determinedByDiscardPriority |
| Default | determinedByDiscardPriority |

### ATTRIBUTE FrUni Dlci Dc dataPath (dpa)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the data path to be used by Virtual Circuits on this interface. The value of the *dataPath* attribute in the *Dna* component is overridden by this attribute if the value is not ***useDnaValue***.<br><br>This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.<br><br>The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.<br><br>A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value. |

***dprsOnly*** - The dynamic packet routing system is used.

***dprsMcsOnly*** - The DPRS Multi-Service Cut-Through Switching path is used.

***dprsMcsFirst*** - The DPRS Multi-Service Cut-Through Switching path is used if it is available. If it is not available, ***dprsOnly*** is used.

***useDnaValue*** - The routing system used is based on the value provisioned in the *Dna* component.

Values
dprsOnly (dpOnly)
dprsMcsOnly (mcOnly)
dprsMcsFirst (mcFrst)
useDnaValue (dnaVal)

Default
useDnaValue

### ATTRIBUTE FrUni Dlci Dc cugIndex (ci)

Access
Read and write

Description
This attribute specifies the CUG index which is to be signaled in PVC and SPVC call requests to the remote end.

The type of CUG signaling is defined in attribute *cugType* in this component.

Values
Decimal (0..255)

Default
0

### ATTRIBUTE FrUni Dlci Dc cugType (ct)

Access
Read and write

Description
This attribute specifies the type of CUG signaling to be used in PVC and SPVC call requests. Index of CUG to be used is defined in attribute *cugIndex* in this component.

Possible values are:
***cug*** - signal CUG

***cugOa* -** signal CUG with outgoing access
***doNotSignal* -** no CUG in call request

Values
cug
cugOa
doNotSignal

Default
doNotSignal

## ATTRIBUTE FrUni Dlci Dc mapIpCosToFrQos (mapctof)

Access
Read and write

Description
This attribute specifies whether an IP TOS value is mapped to an FR QOS. The mapping used is provisioned in the *Mod Frs IpCosToFrQos* component.

When this attribute is set to ***yes***, at Frame Relay egress, the IP TOS byte in each frame is checked. The TOS value determines the egress emission queue and the discard priority for that frame.

When this attribute is set to ***no***, FR QOS is determined by the provisioned discard priority and transfer priority.

When this attribute is set to ***protocolDependent*** at Frame Relay egress, the IP version field in each frame is checked. If the IP version is IP version Four, the TOS value determines the egress emission queue and the discard priority for that frame. If not, the FR QOS is determined by the provisioned discard priority and transfer priority.

A semantic check error is generated when this attribute is set to either ***yes*** or ***protocolDependent***, and a *FrUni DirectConnection* component is provisioned under the same *FrUni* component.

Values
no
yes
protocolDependent

Default
no

## COMPONENT FrUni Dlci Vc

| | |
|---|---|
| Groups | "GROUP FrUni Dlci Vc CallData (Cad)"<br>"GROUP FrUni Dlci Vc IntervalData (Intd)"<br>"GROUP FrUni Dlci Vc FrameRelayData (Frd)" |
| Scope | Application |
| Description | This component defines attributes collected by Frame Relay *Vc*. |
| Common Verbs | Help<br>List<br>Display |

## VERB Ping FrUni Dlci Vc

| | |
|---|---|
| Impact | Passive |
| Description | *Ping [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] FrUni/<n> Dlci/<n> Vc* |

*Ping* causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the *ping* query packet will be the same as that of the Frame Relay data except at the source and destination module. The *ping* packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path of the VC

associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the *roundTripDelay* option is specified, the command reports the time taken to reach the destination and back. For the *roundTripDelay* option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the *ping* packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The *ping* command supports the following options:

-*roundTripDelay (-rtd):* If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

-*sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -*rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

## GROUP FrUni Dlci Vc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application. |

## ATTRIBUTE FrUni Dlci Vc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***. |
| Values | pvc<br>svc<br>spvc<br>frf10spvc |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc diagnosticCode

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc calledLcn

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc callingNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc accountingEnabled

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc fastSelectCall

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc segmentSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum packet size allowed on the *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc rcosToNetwork (rcosto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the routing metric routing class of service to<br>the network. |
| Values | throughput<br>delay<br>multimedia |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc rcosFromNetwork (rcosfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the routing metric Routing Class of Service from the Network. |
| Values | throughput<br>delay<br>multimedia |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc emissionPriorityToNetwork (epto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority to the<br>network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc emissionPriorityFromNetwork (epfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority from the network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc dataPath (dapa)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value.<br><br>If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system)<br><br>If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed.<br><br>If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc dprsMcsEndPoint (dmep)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components.<br><br>If the connection is using ***dprsOnly*** data path, this attribute is empty.<br><br>If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint. |
| List of | The name of the component |
| Default | No default |

### GROUP FrUni Dlci Vc IntervalData (Intd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued. |

### ATTRIBUTE FrUni Dlci Vc elapsedTimeTillNow

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc segmentsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc segmentsSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet. |

| | |
|---|---|
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc callReferenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrUni Dlci Vc FrameRelayData (Frd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines Frame Relay attributes collected by Frame Relay *Vc*.<br>The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.<br>Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is |

disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.
Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers

### ATTRIBUTE FrUni Dlci Vc frmCongestedToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc cannotForwardToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc notDataXferToSubnet

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc outOfRangeFrmFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc combErrorsFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc* |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc duplicatesFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased. |

| | |
|---|---|
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc notDataXferFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc frmLossTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc ooSeqByteCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc peakOoSeqPktCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc sendSequenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame. |
| Values | Decimal (0..1048575) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc pktRetryTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc subnetRecoveries

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of successful *Vc* recovery attempts. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Vc ooSeqPktCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered |

properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.

Values: Decimal (0..255)

Default: No default

### ATTRIBUTE FrUni Dlci Vc peakOoSeqByteCount

Access: Read only

Description: This attribute displays the frame relay peak byte count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.

Values: Decimal (0..50000)

Default: No default

### COMPONENT FrUni Dlci ServiceParametersProv (Sp)

Groups: "GROUP FrUni Dlci Sp ServiceParametersProv (Parms)"

Scope: Application

Description: *FrUni/n Dlci/n ServiceParametersProv*
This component contains the provisionable traffic control attributes for its parent *Dlci* component.

Common Verbs:
- Help
- List
- Display

### GROUP FrUni Dlci Sp ServiceParametersProv (Parms)

Properties: Provisioned

Description: This group contains the provisionable attributes for the Data Link Connection Identifier. These attributes reflect the service parameters specific to this instance of DLCI. The congestion control attributes in this group are defined in T1.606 Addendum 1.

### ATTRIBUTE FrUni Dlci Sp maximumFrameSize (n203)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification. |
| Values | Decimal (1..8187) |
| Units | octets |
| Default | 2100 |

### ATTRIBUTE FrUni Dlci Sp rateEnforcement (re)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether rate enforcement is in effect for this user Data Link Connection on this Frame Relay interface. Turning on rate enforcement means that CIR and DE=1 traffic will be measured and enforced. Turning off rate enforcement means that all frames from the user will be accepted and no modifications to the frame with respect to the DE bit will be made. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE FrUni Dlci Sp committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed information rate (CIR) in bits per second (bit/s). When *rateEnforcement* is set to ***on***, *cir* is the rate at which the network agrees to transfer information under normal conditions. This rate is measured over a measurement interval (*t*) that is determined internally based on CIR and the committed burst size (Bc). An exception to this occurs when CIR is provisioned to be zero, in which case the measurement interval (*t*) must be provisioned explicitly. |

| | |
|---|---|
| | This attribute is ignored when *rateEnforcement* is ***off***. If *rateEnforcement* is ***on*** and this attribute is ***0***, *Bc* must also be ***0***. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE FrUni Dlci Sp committedBurstSize (bc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc.<br><br>This attribute is ignored when *rateEnforcement* is ***off***. If *rateEnforcement* is ***on*** and this attribute is ***0***, *cir* must also be ***0***. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 64000 |

### ATTRIBUTE FrUni Dlci Sp excessBurstSize (be)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here.<br><br>CIR, Bc, and Be cannot all be zero when rateEnforcement is on. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Sp measurementInterval (t)

| | |
|---|---|
| Access | Read and write |
| Description | When *cir* and *bc* are zero and *rateEnforcement* is on, this attribute must be provisioned to specify the time interval (in milliseconds) over which rates and burst sizes are measured.<br><br>When *cir* and *bc* are non-zero, the time interval is internally calculated and is *not shown*. In that situation, this field is ignored, and is not representative of the time interval.<br><br>This attribute is ignored when *rateEnforcement* is ***off***, or when *cir* and *bc* are ***non-zero***. If *rateEnforcement* is ***on*** and both *cir* and *bc* are ***zero***, this field must be ***non-zero***. |
| Values | Decimal (0..25500) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Sp rateAdaptation (ra)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether rate adaptation is in effect for this user Data Link Connection on this Frame Relay interface. Rate adaptation is a feature that, in periods of congestion, adapts the rate at which the user is allowed to send data into the network to that which the network is able to handle at that time. This pro-active measure of handling congestion optimizes network resources by causing the ingress to discard frames that would otherwise be discarded in the network.<br><br>If this attribute is set to ***on***, then, at the onset of congestion, the excess information rate (EIR) is reduced to a very low rate. If congestion persists, then the allowed CIR is reduced geometrically by 25% of the current value at that time. The minimum to which CIR can be reduced is 1/16th (6.25%) of the provisioned value. As congestion alleviates, CIR is increased linearly by 6.25% of the provisioned value specified in *committedInformationRate*. |

If set to ***eirOnly***, then rate adaptation will only apply to the excess information rate (EIR). At the onset of congestion, the allowed EIR is reduced by 25% of its provisioned value. If congestion persists, EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR.

If set to ***cirProportionate***, then rate adaptation will also only apply to the excess information rate (EIR). At the onset of congestion the initial allowed EIR is set to a multiple of the provisioned CIR. If congestion persists, the allowed EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. Note that the allowed EIR may be set higher than the provisioned EIR, since it is calculated initially using another parameter, the provisioned CIR. If the allowed EIR at the moment is higher than the provisioned EIR, then the provisioned EIR is used instead.

This attribute can only be set to ***on eirOnly*** or ***cirProportionate*** if *rateEnforcement* is turned ***on***.

This attribute must be set to ***off*** if the *BnxIwf* component is provisioned under this *Dlci*.

Values
off
on
eirOnly
cirProportionate

Default
off

## ATTRIBUTE FrUni Dlci Sp accounting (ac)

Access
Read and write

Description
This attribute specifies whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***accountingOn*** bit and at least one of the ***accountCollection*** bits in the ***DataNetworkAddress*** component must be set to on.

| | |
|---|---|
| Values | off<br>on |
| Default | on |

### ATTRIBUTE FrUni Dlci Sp raSensitivity (rasens)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sensitivity of the rate adaptation system. A higher number indicates a higher sensitivity and therefore a quicker reaction time to network conditions. A quicker reaction time allows the network to discard frames at the access and protect network resources, but can lead to false alarms and a greater fluctuation of the allowed rate. A higher setting therefore tends to favour the protection of the network over the allowed throughput of the user.<br><br>A lower number indicates a lower sensitivity and therefore a slower reaction to network conditions. A slower reaction time results in a greater amount of user traffic allowed into the network, but can lead to a waste of network bandwidth since the traffic may be discarded at the congested resource. A lower setting therefore tends to favour the allowed throughput of the user over the protection of the network.<br><br>This attribute is applicable for adapting EIR when *rateAdaptation* is ***eirOnly*** or ***cirProportionate***, or CIR when *rateAdaptation* is ***on***.<br><br>This attribute is ignored if *rateAdaptation* is turned ***off***. |
| Values | Decimal (1..20) |
| Default | 7 |

### ATTRIBUTE FrUni Dlci Sp updateBCI (updBCI)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether internal Backward Congestion Indication (BCI) bits will report congestion external to the Passport network, as communicated through incoming BECN bits. |

If *updateBCI* is set to ***on***, then BCI bits for incoming frames will be set if the BECN on the frame is set. If *updatBCI* is set to ***off***, then incoming BECN bits will have no effect.

Setting *updateBCI* ***on*** for a DLCI means that the remote end of the DLCI, which is specified by the *remotedna* and *remotedlci* attributes of the *dc* component of the *dlci*, may perform Rate Adaptation using the flow of incoming BECN bits, in addition to internal Passport congestion management systems.

If the *rateAdaptation* attribute of the remote dlci is provisioned as ***eirOnly***, ***cirProportionate***, or ***on***, then congestion from another network connected to a Passport network may trigger dynamic congestion management. If the *rateAdaptation* attribute of the remote dlci is provisioned to ***off***, then the setting of *updateBCI* attribute here will have no effect.

Values
off
on

Default
off

## ATTRIBUTE FrUni Dlci Sp correlationTag (ctag)

Access
Read and write

Description
This attribute specifies the unique string which identifies each end of a connection.

If required for correlation purposes, the attribute must be provisioned with the same value at both ends of the connection. This attribute can be left as an empty string when the functionality is not required, or when the user requires an empty circuit identifier string against the DLCI.

This attribute can be used for off-switch data correlation purposes. Downstream processing uses this attribute to correlate data records (accounting etc.) issued at different nodes in the network. In the accounting record, the value for the

*correlationTag* attribute appears as the attribute *circuitId* (circuit identifier) for the endpoint.

Values: String (0..32, ASCII)

Default: ""

### ATTRIBUTE FrUni Dlci Sp frf12EndToEnd (frf12)

Access: Read and write

Criticality: Component

Description: This attribute specifies whether FRF.12 End-to-End fragmentation is turned on for this *Dlci* component.

When this attribute is set to ***on***, ingress End-to-End FRF.12 fragments are reassembled to frame relay packets, and egress frame relay packets are fragmented to End-to-End FRF.12 fragments.

Values: off
on

Default: off

### ATTRIBUTE FrUni Dlci Sp frf12FragmentSize (fragSize)

Access: Read and write

Description: This attribute specifies the maximum payload in octets for a FRF.12 fragment on this *Dlci* component. The frame relay header, FRF.12 header and CRC octets are not included.

Values: Decimal (40; 48; 60; 80; 120; 240; 480)

Units: octets

Default: 60

### COMPONENT FrUni Dlci LoopBack (Lb)

Groups: "GROUP FrUni Dlci Lb Statistics (Stats)"

Scope: Application

| | |
|---|---|
| Description | *FrUni/n Dlci/n LoopBackFrNni/n Dlci/n LoopBack*This component is the data loopback tool for the parent *DLCI*. |
| Common Verbs | Help<br>List<br>Display |

### VERB START FrUni Dlci Lb

| | |
|---|---|
| Impact | Service |
| Description | *start FrUni/n Dlci/n LoopBack*<br>*start FrNni/n Dlci/n LoopBack*This command resets the *LoopbackStatistics* and initiates the loopback mode. The *loopbackState* for this *DLCI* is set to ***on*** for the duration of the loopback mode. When a *DLCI* is in loopback mode, frames coming from the link are returned to the link, incrementing the local loopback statistics. Also, frames coming from the VC are returned to the VC, incrementing the remote loopback statistics. The loopback mode is ended using the stop command. |

### VERB STOP FrUni Dlci Lb

| | |
|---|---|
| Impact | Service |
| Description | *stop FrUni/n Dlci/n LoopBack stop FrNni/n Dlci/n LoopBack*<br>This command terminates the loopback mode and displays the loopback statistics. |

### GROUP FrUni Dlci Lb Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics for the data loopback tool. |

### ATTRIBUTE FrUni Dlci Lb localTotalFrm (ltf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames looped back to the link since loopback was last started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb localTotalBytes (ltb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of bytes looped back to the link since loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb localFecnFrm (lff)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames with the Forward Explicit Congestion Notification (FECN) bit set, looped back to the link since the loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb localBecnFrm (lbf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames with the Backward Explicit Congestion Notification (BECN) bit set, looped back to the link since the loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb localDeFrm (ldf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames with the Discard Eligibility (DE) bit set, looped back to the link since the loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb localDeBytes (ldb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of bytes in frames with the Discard Eligibility (DE) bit set, looped back to the link since the loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb remoteTotalFrm (rtf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames looped back to the subnet since loopback was last started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb remoteTotalBytes (rtb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of bytes looped back to the subnet since loopback was last started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb remoteFecnFrm (rff)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames with the Forward Explicit Congestion Notification (FECN) bit set, looped back to the subnet since the loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb remoteBecnFrm (rbf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames with the Backward Explicit Congestion Notification (BECN) bit set, looped back to the subnet since the loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb remoteDeFrm (rdf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames with the Discard Eligibility (DE) bit set, looped back to the subnet since the loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Lb remoteDeBytes (rdb)

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of bytes in frames with the Discard Eligibility (DE) bit set, looped back to the subnet since the loopback mode was started. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT FrUni Dlci EgressServiceParameters (EgressSp)

| | |
|---|---|
| Groups | "GROUP FrUni Dlci EgressSp Provisioned (Prov)" |
| Scope | Application |

| | |
|---|---|
| Description | *FrNni/n Dlci/n EgressServiceParameters*<br>This component contains the provisionable attributes of the egress direction for the parent *Dlci* component. |
| Common Verbs | Help<br>List<br>Display |

### GROUP FrUni Dlci EgressSp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for this component. |

### ATTRIBUTE FrUni Dlci EgressSp committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed information rate (CIR) for the egress direction. It is used for Call Admission Control (CAC) at the egress link.<br>If the value is set to ***sameAsSp***, the value of this attribute is the same as the *committedInformationRate* attribute under the *ServiceParameters* component. |
| Values | Decimal (0..50000000)<br>sameAsServiceParameters (sameAsSp) |
| Units | bit/s |
| Default | sameAsServiceParameters |

### ATTRIBUTE FrUni Dlci EgressSp committedBurstSize (bc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed burst size (Bc) for the egress direction. It is used for performing Call Admission Control (CAC) at the egress link.<br>If the value is set to ***sameAsSp***, the value of this attribute is the same as the *committedBurstSize* attribute under the *ServiceParameters* component. |

| | |
|---|---|
| Values | Decimal (0..50000000)<br>sameAsServiceParameters (sameAsSp) |
| Units | bits |
| Default | sameAsServiceParameters |

### ATTRIBUTE FrUni Dlci EgressSp excessBurstSize (be)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the excess burst size (Be) for the egress direction. It is used for Call Admission Control (CAC) function towards the egress link.<br>If the value is set to ***sameAsSp***, the value of this attribute is the same as the *excessBurstSize* attribute under the *ServiceParameters* component. |
| Values | Decimal (0..50000000)<br>sameAsServiceParameters (sameAsSp) |
| Units | bits |
| Default | sameAsServiceParameters |

### ATTRIBUTE FrUni Dlci EgressSp measurementInterval (t)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval over which rates and burst sizes are measured in the egress direction. It is used for bandwidth reservation for Call Admission Control (CAC) towards the egress link.<br>If the value is set to ***sameAsSp***, the value of this attribute is the same as the *measurementInterval* attribute under the *ServiceParameters* component. |
| Values | Decimal (0..25500)<br>sameAsServiceParameters (sameAsSp) |
| Units | msec |
| Default | sameAsServiceParameters |

## COMPONENT FrUni Dlci StandbyVc (StbyVc)

| | |
|---|---|
| Groups | "GROUP FrUni Dlci StbyVc CallData (Cad)" |
| Scope | Application |
| Description | *FrUni/n Dlci/n StandbyVc*<br>This component represents the call data of the Standby Frame Relay Vc on the active FP. This is the Vc that will become active if the FP of the remote FrUni fails and a switchover occurs. |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrUni Dlci StbyVc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to Frame Relay *StandbyVc* on the active FP. |

## ATTRIBUTE FrUni Dlci StbyVc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc calledNpi

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete the *StandbyVc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Logical Channel Number of the called end. It is valid only after both ends of the *StandbyVc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc callingNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc callingDna

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the active Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE FrUni Dlci StbyVc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### COMPONENT FrUni Dlci SpareDirectCall (SpareDc)

| | |
|---|---|
| Groups | "GROUP FrUni Dlci SpareDc Options" |
| Scope | Application |
| Description | *FrUni/n Dlci/n SpareDirectCall*<br>This component defines the Remote Data Network Address of the *SpareDirectCall*, all other direct call options will be the same as the *FrUni/n Dlci/n DirectCall*. The provisioning of this component will create a standby permanent (PVC) call, used for the ***frUniPvcSparingDprs*** feature.<br>This *SpareDirectCall* should only be provisioned when the remote *FrUni* is provisioned with a *SpareDna*.<br>If this component is provisioned, the value of *FrUni Dc type* must be ***pemanentMaster*** or ***permanentSlave***. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrUni Dlci SpareDc Options

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains attributes associated with a *SpareDirectCall*. It defines the connection path. This connection can only be permanent (PVC). |

### ATTRIBUTE FrUni Dlci SpareDc spareRemoteNpi (srnpi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Numbering Plan Indicator (NPI) of the *spareRemoteDna*. This should be set to the *SpareDna npi* of the remote *FrUni*. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE FrUni Dlci SpareDc spareRemoteDna (srdna)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Spare Data Network Address (SDNA) of the service at the remote end of the DLCI. This is the called (destination) DCE address (DNA) of this PVC.<br>This should be set to the *SpareDna dna* of the remote *FrUni*. |
| Values | BCD (1..15) |
| Default | No default |

### COMPONENT FrUni Dlci Frf12Stats (Frf12)

| | |
|---|---|
| Groups | "GROUP FrUni Dlci Frf12 Frf12Stats (Stats)" |
| Scope | Application |
| Description | *FrUni/n Dlci/n Frf12Stats*<br>This component represents the End-to-End FRF.12 statistics of a Data Link Connection Identifier. FRF.12 provides the capability to fragment frames that are sent to the link, and reassemble fragments that arrive from the link. The *Frf12Stats* component may be used to monitor the functioning of the End-to-End FRF.12 feature when the feature is enabled. |

This component is only visible when the feature is enabled.

### GROUP FrUni Dlci Frf12 Frf12Stats (Stats)

Properties: Operational

Description: This group contains the operational attributes for the *Frf12Stats* component.

### ATTRIBUTE FrUni Dlci Frf12 fragFromIf (ffi)

Access: Read only

Description: This attribute counts the End-to-End FRF.12 fragments received from the link.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE FrUni Dlci Frf12 peakFragSizeFromIf (pkSize)

Access: Read only

Description: This attribute indicates the size of the largest fragment received from the link. It is reset on every accounting collection period.

Values: Decimal (0..65535)

Default: 0

### ATTRIBUTE FrUni Dlci Frf12 expectedSequenceNumber (expSeq)

Access: Read only

Description: This attribute indicates the expected sequence number in the next fragment received from the link. The attribute is set to the sequence number of the last fragment received plus one.

Values: Decimal (0..4095)

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrUni Dlci Frf12 outOfSequenceEvent (outOfSeq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the times an out of sequence number event occurs. An out of sequence number event occurs when a fragment received from the link has a sequence number that is different from the one indicated by the *expectedSequenceNumber* attribute. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Frf12 headerErrorEvent (hdrErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the times an End-to-End FRF.12 header error event occurs. The header must comply with the End-to-End FRF.12 Implementation Agreement. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Frf12 cpuExhaustionFromIfEvent (extnfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the times a CPU exhaustion event occurs. A CPU exhaustion event occurs when ingress fragments requiring reassembly are discarded due to CPU exhaustion. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Frf12 discFragFromIf (discfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts fragments received from the link that have been discarded. Fragments are discarded when header error, out of sequence number or CPU exhaustion event occurs. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Frf12 fragToIf (fti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the End-to-End FRF.12 fragments sent to the link. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Frf12 sendSequenceNumber (sndSeq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the sequence number of the next fragment to be sent to the link. |
| Values | Decimal (0..4095) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Frf12 cpuExhaustionToIfEvent (extnti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the times a CPU exhaustion event occurs. A CPU exhaustion event occurs when egress frames requiring fragmentation are discarded due to CPU exhaustion. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Frf12 longFrameToIfEvent (longti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the times a long frame event occurs. A long frame event occurs when an egress frame requiring fragmentation is discarded because it will generate more than fourty fragments. |
| Values | Decimal (0..4294967295) |

Default 0

## COMPONENT FrUni Dlci BnxInterworkingFunction (BnxIwf)

Groups "GROUP FrUni Dlci BnxIwf Provisioned (Prov)"
"GROUP FrUni Dlci BnxIwf Operational (Op)"

Scope Application

Description *FrUni/n Dlci/n BnxInterworkingFunction*
*FrNni/n Dlci/n BnxInterworkingFunction*
This component specifies that the parent DLCI uses BNX frame relay over an IP network as its networking mechanism. It contains the networking parameters specific to BNX networking.

DELete

## VERB Redirect FrUni Dlci BnxIwf

Impact Service

Description *Redirect [-**force**] -**destination**(<**destination**>) FrUni/n Dlci/n BnxInterworkingFunction*
or
*Redirect [-**force**] -**destination**(<**destination**>) FrNni/n Dlci/n BnxInterworkingFunction*

This verb is used to manually select the PVC destination between the primary and backup destinations, or to enable the automatic redirection. The primary destination and the backup destination are specified by the *BnxInterworkingFunction* component.

The ***-destination*** option indicates the destination of PVC redirection. The value of this option can be ***primary***, ***backup,*** or ***onDemand***.

The value ***primary*** means that the destination for this PVC has been manually selected to be the primary destination, automatic

redirection is disabled. This redirect action corresponds to the "Redirect to Primary" redirect action in the BNX implementation.

The value ***backup*** means that the destination for this PVC has been manually selected to be the backup destination, and automatic redirection is disabled. The backup destination must be provisioned. This redirect action corresponds to the "Redirect to Backup" redirect action in the BNX implementation.

The value ***onDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The *crossNetListenEnabled* attribute of the *BnxProtocol* component must be ***yes*** and the backup destination must be provisioned. This redirect action corresponds to the "Switch on Demand" redirect action in the BNX implementation.

The ***-force*** option specifies that the PVC is redirected to either the primary destination or the backup destination indicated by the ***-destination*** option even if the destination is not active. When the value of ***-destination*** is ***onDemand***, this option is ignored.

## GROUP FrUni Dlci Bnxlwf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the provisioning attributes associated with a PVC using BNX frame relay interworking. |

## ATTRIBUTE FrUni Dlci Bnxlwf calledIpAddress (cia)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address of the primary destination which receives the datagrams. |
| Values | IP address |
| Default | 0.0.0.0 |

## ATTRIBUTE FrUni Dlci Bnxlwf calledDlci (cdlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the DLCI of the primary destination which receives the datagrams. |
| Values | Decimal (16..1007) |
| Default | No default |

## ATTRIBUTE FrUni Dlci Bnxlwf trafficPriority (tp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the user control on traffic priority. The value is transmitted in the traffic priority field of the BNX header. Possible values are:<br>***1*** - High Priority<br>***2*** - Normal Priority<br>***3*** - Low Priority<br>***useBpDefault*** - use the *defaultTrafficPriority* attribute value from the *BnxProtocol* component. |
| Values | 1<br>2<br>3<br>useBpDefault |
| Default | useBpDefault |

## ATTRIBUTE FrUni Dlci Bnxlwf backupCalledIpAddress (bcia)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address of the backup destination which receives the datagrams. A value of ***0.0.0.0*** for this attribute and a value of ***undefined*** for the *backupCalledDlci* attribute specify that there is no backup destination. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE FrUni Dlci Bnxlwf backupCalledDlci (bcdlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the DLCI of the backup destination which receives the datagrams. A value of ***undefined*** for this attribute and a value of ***0.0.0.0*** for the *backupCalledIpAddress* attribute specify that there is no backup destination. |
| Values | Decimal (16..1007)<br>undefined |
| Default | undefined |

### ATTRIBUTE FrUni Dlci Bnxlwf redirectType (rtype)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the type of DTE notification when a PVC redirection between primary and backup destinations occurs.<br><br>***transparent*** means no notification is sent to the DTE.<br><br>***aIntrusive*** means that an asynchronous update with the A-bit not set is sent to the DTE.<br><br>***nIntrusive*** means that an asynchronous update with the N-bit set is sent to the DTE. |
| Values | transparent<br>aIntrusive<br>nIntrusive |
| Default | aIntrusive |

### ATTRIBUTE FrUni Dlci Bnxlwf minActiveIntervals (mai)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum number of consecutive time intervals for which the primary destination must be active before the PVC is redirected back to the primary destination from the backup destination in ***switchOnDemand*** mode. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. This attribute is ignored if the |

*BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***.

If the value of this attribute is ***0***, the PVC is redirected back to the primary destination as soon as an active cross-net message is received from the primary destination.

Values: Decimal (0..4)

Default: 0

### ATTRIBUTE FrUni Dlci Bnxlwf redirectAction (ra)

Access: Read and write

Description: This attribute indicates the redirect action for a PVC. The Redirect command can be used to override this redirect action.

***switchOnDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The *crossNetListenEnabled* attribute of the *BnxProtocol* component must be ***yes*** and the backup destination must be provisioned. This redirect action corresponds to the “Switch on Demand” redirect action in the BNX implementation.

***manualPrimary*** means that the destination for this PVC has been manually selected to be the primary destination, automatic redirection is disabled. This redirect action corresponds to the “Redirect to Primary” redirect action in the BNX implementation.

***manualBackup*** means that the destination for this PVC has been manually selected to be the backup destination, and automatic redirection is disabled. The backup destination must be provisioned. This redirect action corresponds to the “Redirect to Backup” redirect action in the BNX implementation.

Values:
switchOnDemand
manualPrimary
manualBackup

| | |
|---|---|
| Default | manualPrimary |

### GROUP FrUni Dlci Bnxlwf Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational status of the BNX frame relay interworking functionality. |

### ATTRIBUTE FrUni Dlci Bnxlwf timeOfLastStateChange (tlsc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time at which the state of the DLCI last changed. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE FrUni Dlci Bnxlwf crossNetSent (cnsent)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if a cross-net status message was sent to the primary destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. |
| Values | unsent<br>sent |
| Default | No default |

### ATTRIBUTE FrUni Dlci Bnxlwf crossNetStatus (cns)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the PVC when the remote end is the primary destination. If the *crossNetListenEnabled* attribute of the *BnxProtocol* component is set to ***yes***, this attribute reflects the state as reported by the remote end. If the *crossNetListenEnabled* attribute is set to ***no***, the PVC is assumed to be up and this attribute has a value of ***active***. |

| | |
|---|---|
| Values | inactive<br>active |
| Default | inactive |

### ATTRIBUTE FrUni Dlci Bnxlwf crossNetReceived (cnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the DLCI has received a cross-net status message from the primary destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***. |
| Values | unrecv<br>recv |
| Default | unrecv |

### ATTRIBUTE FrUni Dlci Bnxlwf crossNetErrors (cne)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many polling intervals have elapsed without receiving an error free cross-net status message from the primary destination of the PVC. Errors are generally caused by time-outs. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Bnxlwf ipAddressMismatches (iam)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the received datagrams which were dropped because the source IP address in the IP header did not match the value of *calledIpAddress* or *backupCalledIpAddress* attribute. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrUni Dlci Bnxlwf lastMismatchedIpAddress (lmia)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the source IP address in the IP header of the most recently received datagram which was dropped because this IP address did not match the value of *calledIpAddress* or *backupCalledIpAddress* attribute. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE FrUni Dlci Bnxlwf backupCrossNetSent (bcnsent)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if a cross-net status message was sent to the backup destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. |
| Values | unsent<br>sent |
| Default | No default |

### ATTRIBUTE FrUni Dlci Bnxlwf backupCrossNetStatus (bcns)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the PVC when the remote end is the backup destination. If the *crossNetListenEnabled* attribute of the *BnxProtocol* component is set to ***yes***, this attribute reflects the state as reported by the remote end. If the *crossNetListenEnabled* attribute is set to ***no***, the PVC is assumed to be up and this attribute has a value of ***active***. |
| Values | inactive<br>active |
| Default | inactive |

## ATTRIBUTE FrUni Dlci Bnxlwf backupCrossNetReceived (bcnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if the DLCI has received a cross-net status message from the backup destination of the PVC during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol*. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***. |
| Values | unrecv<br>recv |
| Default | unrecv |

## ATTRIBUTE FrUni Dlci Bnxlwf backupCrossNetErrors (bcne)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts how many polling intervals have elapsed without receiving an error free cross-net status message from the backup destination of the PVC. Errors are generally caused by time-outs. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE FrUni Dlci Bnxlwf redirectMode (rmode)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the mode of the PVC redirection.<br><br>The value ***switchOnDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination.<br><br>The value ***manual*** means that the destination for this PVC has been manually selected and automatic redirection is disabled. |

When the value is ***noBackup***, the PVC does not have a backup destination provisioned.

Values
switchOnDemand
manual
noBackup

Default
No default

### ATTRIBUTE FrUni Dlci Bnxlwf currentDestination (cdest)

Access
Read only

Description
This attribute indicates if the current destination is the primary destination or the backup destination.

Values
primary
backup

Default
No default

### ATTRIBUTE FrUni Dlci Bnxlwf remoteIpAddress (ria)

Access
Read only

Description
This attribute indicates the IP address of the current destination.

Values
IP address

Default
No default

### ATTRIBUTE FrUni Dlci Bnxlwf remoteDlci (rdlci)

Access
Read only

Description
This attribute indicates the DLCI of the current destination.

Values
Decimal (16..1007)

Default
No default

### ATTRIBUTE FrUni Dlci Bnxlwf ipFragFromSubnet (fragfs)

Access
Read only

| | |
|---|---|
| Description | This attribute counts the IP fragments received from subnet by this Dlci. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Bnxlwf discardedIpFragments (discFrag)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the IP fragments that are dropped by this Dlci. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Bnxlwf discMisorderedFrm (dmfrm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames from subnet that are dropped due to misordered fragments. A misordered fragment occurs when the offset in the IP header is not equal to the expected offset, or the timer expires before the last fragment is received. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Dlci Bnxlwf lastDroppedIpFragmentId (lastid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Id of the last misordered frame that was dropped. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT FrUni Dlci IpConnection (IpConn)

| | |
|---|---|
| Groups | "GROUP FrUni Dlci IpConn Provisioned (Prov)" |
| Scope | Application |
| Description | *FrUni/n Dlci/n IpConnection*<br>This component represents direct frame relay access to IP (IPoFR) for this *Dlci*. This *Dlci* must be linked to an *IpDlciGroup FrConnection*. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrUni Dlci IpConn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *IpConnection* component. |

## ATTRIBUTE FrUni Dlci IpConn linkToIpDlciGrp (dlcGrp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *IpDlciGroup FrConnection* associated with this component. |
| Values | Link (Service, linkToFrDlci) |
| Default | No default |

## ATTRIBUTE FrUni Dlci IpConn de0DiscardPriority (de0Dp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the discard priority for frames received on this DLCI whose DE bit is not set after being processed by the frame relay service.<br><br>***low*** specifies that the packet is least likely to be discarded. This value should be used for traffic that requires a high probability of |

being forwarded.

***high*** specifies that the packet is most likely to be discarded. This value should be used for traffic that is given a low probability of being forwarded.

The value of this attribute must not be higher than the value of the *de1DiscardPriority* attribute.

Values
low
medium
high

Default
medium

### ATTRIBUTE FrUni Dlci IpConn de1DiscardPriority (de1Dp)

Access
Read and write

Description
This attribute specifies the discard priority for frames received on this DLCI whose DE bit is set after being processed by the frame relay service.

***low*** specifies that the packet is least likely to be discarded. This value should be used for traffic that requires a high probability of being forwarded.

***high*** specifies that the packet is most likely to be discarded. This value should be used for traffic that is given a low probability of being forwarded.

The value of this attribute must not be lower than the value of the *de0DiscardPriority* attribute.

Values
low
medium
high

Default
high

### ATTRIBUTE FrUni Dlci IpConn dpToDeMapLevel (dpToDe)

Access
Read and write

Description

This attribute specifies the lowest discard priority that will be mapped to a set DE bit.

All frames with a discard priority of this level or higher, sent on this DLCI, will have the DE bit set to 1 after being processed by the frame relay service.

If the value is ***notApplicable*** then all frames sent on this DLCI will have the DE bit set to 0, after being processed by the frame relay service.

Values

low
medium
high
notApplicable

Default

notApplicable

## COMPONENT FrUni Signaling (Sig)

Groups

"GROUP FrUni Sig DlciRange (Range)"
"GROUP FrUni Sig ServiceParameters (ServParms)"
"GROUP FrUni Sig SystemParameters (SysParms)"
"GROUP FrUni Sig LapfSystemParameters (LapfSys)"
"GROUP FrUni Sig OsiState (State)"
"GROUP FrUni Sig Statistics (Stats)"

## GROUP FrUni Sig DlciRange (Range)

Properties: Provisioned

Description: This group contains the provisionable attribute to define the range of DLCIs for PVCs and SVCs. The purpose of this range is to prevent DLCI collisions between the provisioned PVCs and the dynamic SVCs.

## ATTRIBUTE FrUni Sig highestPvcDlci

Access: Read and write

Criticality: Process

Description: This attribute specifies the highest DLCI value that can be provisioned for a permanent connection. It partitions the DLCI space into permanent and switched connections. Permanent DLCI numbers higher than this value cannot be provisioned. The value ***0*** is used to indicate that no permanent connections are allowed on this interface. The value ***1007*** indicates that no switched connections are allowed on this interface.

Values: Decimal (0; 16..1007)

Default: 500

## GROUP FrUni Sig ServiceParameters (ServParms)

Properties: Provisioned

Description: This group contains the provisionable FRF.4 service parameters.

## ATTRIBUTE FrUni Sig maximumFrameSize (dn1)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the maximum number of octets that may be included in the information field of the user DLCI of any switched connections using this interface. Its value must not be smaller than the value of *defaultMaximumFrameSize*. |
| Values | Decimal (1..8187) |
| Units | octets |
| Default | 4096 |

### ATTRIBUTE FrUni Sig defaultMaximumFrameSize (defaultdn1)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default maximum number of octets that may be included in the information field of the user DLCI assigned for any switched connections using this interface. This value is used during call parameter negotiation for switched calls on this interface when the maximum frame size is not specified in the user's SETUP message. The value of this attribute must not exceed the value of the *maximumFrameSize* attribute. |
| Values | Decimal (1..8187) |
| Units | octets |
| Default | 2100 |

### ATTRIBUTE FrUni Sig defaultCommittedInformationRate (defaultCir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default user to network direction CIR. This value is used during call parameter negotiation for switched calls on this interface when the CIR is not specified in the user's SETUP message. |
| Values | Decimal (0..52000000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE FrUni Sig defaultCommittedBurstSize (defaultBc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default user to network direction Bc. This value is used during call parameter negotiation for switched calls on this interface when the Bc is not specified in the user's SETUP message. |
| Values | Decimal (0..52000000) |
| Units | bits |
| Default | 64000 |

### ATTRIBUTE FrUni Sig defaultExcessBurstSize (defaultBe)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default user to network direction Be. This value is used during call parameter negotiation for switched calls on this interface when the Be is not specified in the user's SETUP message. |
| Values | Decimal (0..52000000) |
| Units | bits |
| Default | 0 |

### ATTRIBUTE FrUni Sig rateEnforcement (re)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether rate enforcement is in effect for SVCs on this interface. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE FrUni Sig rateAdaptation (ra)

| | |
|---|---|
| Access | Read and write |

Description

This attribute specifies whether closed-loop rate adaptation is in effect for SVCs on this interface. Rate adaptation is a feature that, in periods of congestion, adapts the rate at which the user is allowed to send data into the network to that which the network is able to handle at that time. This proactive measure of handling congestion optimizes network resources by causing the ingress to discard frames that would otherwise be discarded in the network.

If this attribute is set to ***on***, then, at the onset of congestion, the excess information rate (EIR) is reduced to a very low rate. If congestion persists, then the allowed CIR is reduced geometrically by 25% of the current value at that time. The minimum to which CIR can be reduced is 1/16th (6.25%) of the provisioned value. As congestion alleviates, CIR is increased linearly by 6.25% of the provisioned value specified in *committedInformationRate*.

If set to ***eirOnly***, then rate adaptation will only apply to the excess information rate (EIR). At the onset of congestion, the allowed EIR is reduced by 25% of its provisioned value. If congestion persists, EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR.

If set to ***cirProportionate***, then rate adaptation will also only apply to the excess information rate (EIR). At the onset of congestion the initial allowed EIR is set to a multiple of the provisioned CIR. If congestion persists, the allowed EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. Note that the allowed EIR may be set higher than the provisioned EIR, since it is calculated initially using another parameter, the provisioned CIR. If the allowed EIR at the moment is higher than the provisioned EIR, then the provisioned EIR is used instead.

This attribute can only be set to ***on*** or ***eirOnly*** if *rateEnforcement* is set to ***on***.

Values

off
on

| | |
|---|---|
| | eirOnly<br>cirProportionate |
| Default | off |

### ATTRIBUTE FrUni Sig x213IeHandling (x213)

| | |
|---|---|
| Access | Read and write |
| Description | The *x213IeHandling* attribute specifies how Frame Relay handles the X.213 Priority IE when it is in the FRF.4 setup message.<br><br>When the attribute is set to ***notSupported***, the X.213 Priority IE will not be recognized in the setup message. A FRF.4 status message will be sent to the calling DTE, with the indication that an unrecognized IE was encountered. The call setup then proceeds as normal, and the X.213 Priority IE does not appear in the setup message at the called end.<br><br>When the attribute is set to ***proprietary***, and the X.213 Priority IE is present in the FRF.4 setup message, it will be recognized. If there is no Frame Transfer Priority IE in the setup message, the first data byte of the X.213 Priority IE is used to select the transfer and discard priority values for the connection and the X.213 Priority IE is signaled to the called end in the setup message. If the Frame Transfer Priority IE is present in the FRF.4 setup message, its value is used to select the transfer priority, the discard priority is taken from the *FRUNI Dna* component, and the X.213 Priority IE is ignored.<br><br>Refer to the related Application Note for further details before setting the attribute value to ***proprietary***. |
| Values | notSupported<br>proprietary |
| Default | notSupported |

### ATTRIBUTE FrUni Sig raSensitivity (rasens)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sensitivity of the rate adaptation system for all switched connections on this interface. |

A higher number indicates a higher sensitivity and therefore a quicker reaction time to network conditions. A quicker reaction time allows the network to discard frames at the access and protect network resources, but can lead to false alarms and a greater fluctuation of the allowed rate. A higher setting therefore tends to favor the protection of the network over the allowed throughput of the user.

A lower number indicates a lower sensitivity and therefore a slower reaction to network conditions. A slower reaction time results in a greater amount of user traffic allowed into the network, but can lead to a waste of network bandwidth since the traffic may be discarded at the congested resource. A lower setting therefore tends to favour the allowed throughput of the user over the protection of the network.

This attribute is applicable for adapting EIR when *rateAdaptation* is ***eirOnly*** or ***cirProportionate***, or CIR when *rateAdaptation* is ***on***.

This attribute is ignored if *rateAdaptation* is ***off***.

Values — Decimal (1..20)

Default — 7

### ATTRIBUTE FrUni Sig updateBCI (updBCI)

Access — Read and write

Description — This attribute specifies whether internal Backward Congestion Indication (BCI) bits will report congestion external to the Passport network, as communicated through incoming BECN bits.

If *updateBCI* is set to ***on***, then BCI bits for incoming frames will be set if the BECN on the frame is set. If *updateBCI* is set to ***off***, then incoming BECN bits has no effect.

Setting *updateBCI* ***on*** for a DLCI means that the remote end of the DLCI, which is specified by the *remoteDna* and *remoteDlci*

attributes of the *Dc* component of the *Dlci*, may perform Rate Adaptation using the flow of incoming BECN bits, in addition to internal Passport congestion management systems.

If the *rateAdaptation* attribute of the remote DLCI is provisioned as ***eirOnly***, ***cirProportionate***, or ***on***, then congestion from another network connected to a Passport network may trigger dynamic congestion management. If there is no rate adaptation at the other end, then the setting of *updateBCI* attribute here will have no effect.

Values: off, on

Default: off

### ATTRIBUTE FrUni Sig defaultLocCheck (defLoc)

Access: Read and write

Criticality: Process

Description: This attribute specifies whether Passport needs to check the location of Cause IE in a Release or a Disc message issued by local DTE. If this bit is set to on, then Passport will check the location of Cause IE issued by the local DTE and overwrite it by "user". If it is set to off, then Passport will not check the location in Cause IE.

Values: off, on

Default: on

### GROUP FrUni Sig SystemParameters (SysParms)

Properties: Provisioned

Description: This group contains the provisionable FRF.4 system parameters.

### ATTRIBUTE FrUni Sig callSetupTimer (t303)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the time the network waits for a response to the SETUP message sent to the called user. Upon timer expiry, the SETUP message is retransmitted. The second expiry of this timer causes the call to be cleared. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE FrUni Sig disconnectTimer (t305)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time the network waits for a response to the DISCONNECT message sent to the user. Upon timer expiry, the RELEASE message is sent. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE FrUni Sig releaseTimer (t308)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time the network waits for a response to the RELEASE message sent to the user. Upon timer expiry, the RELEASE message is retransmitted. The second expiry of the timer causes the call to be released. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE FrUni Sig callProceedingTimer (t310)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time the network waits for the CONNECT message from the called user after the network has |

received the optional CALL PROCEEDING message from the called user. Upon timer expiry, the call is cleared.

Values: Decimal (1..255)

Units: seconds

Default: 10

### ATTRIBUTE FrUni Sig networkType (type)

Access: Read and write

Description: This attribute specifies whether this Frame Relay service is running on a public or a private network. This value is used solely in populating applicable information elements within those FRF.4 messages that require a public or private network indication.

Values: private
public

Default: private

### ATTRIBUTE FrUni Sig restartReqTimer (t316)

Access: Read and write

Description: This attribute specifies the time the network waits for the RESTART ACKNOWLEDGE message from the adjacent network after sending a first RESTART message. Upon timer expiry, another RESTART message is sent. After the second expiry, the interface is treated as idle.

If the *restartReqTimer* attribute is set to the default value, then the interface is treated as idle when it receives an indication that the link is up and does not send a RESTART message.

Values: Decimal (0..255)

Units: seconds

Default: 0

### ATTRIBUTE FrUni Sig restartRcvTimer (t317)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the time the local network waits for the processing of a RESTART message received by the interface. Upon expiry of this timer, an alarm will be displayed to report the problem. The timer value must be less than the *restartReqTimer* provisioned value at the adjacent node. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 110 |

### ATTRIBUTE FrUni Sig statusEnqTimer (t322)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time the network waits for the requested STATUS message from the adjacent network. Upon expiry of this timer, another STATUS ENQUIRY message will be sent. |
| Values | Decimal (1..255) |
| Units | seconds |
| Default | 4 |

### GROUP FrUni Sig LapfSystemParameters (LapfSys)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the SVC data link layer. The data link layer is governed primarily through ITU specification Q.922, and operates over DLCI 0.. |

### ATTRIBUTE FrUni Sig windowSize (ws)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the window size. This is the maximum number of unacknowledged sequenced frames that may be outstanding from or to this interface at any one time. |
| Values | Decimal (1..127) |
| Default | 7 |

### ATTRIBUTE FrUni Sig retransmitLimit (rtl)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of times a frame can be retransmitted by the SVC data link layer before appropriate recovery action is taken. |
| Values | Decimal (0..20) |
| Default | 3 |

### ATTRIBUTE FrUni Sig ackTimer (at)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how long the layer 2 protocol waits for an acknowledgment to a sent frame. The value set for *ackTimer* must be less than the value set for *idleProbeTimer*. |
| Values | Decimal (1000..10000) |
| Units | msec |
| Default | 1500 |

### ATTRIBUTE FrUni Sig ackDelayTimer (adt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how long the network waits before sending an acknowledgment for a received in-sequence I-frame. A value of 0 means that every frame is acknowledged and there will be no delay in acknowledgment. A non-zero value means that one acknowledgement is sent for a number of frames. |
| Values | Decimal (0..10000) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE FrUni Sig idleProbeTimer (ipt)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies how long the link is permitted to remain idle (that is, no frames are exchanged on the data link). Upon expiry of this timer, the network side's link layer polls its peer for status. The value set for *idleProbeTimer* must be greater than the value set for *ackTimer.* |
| Values | Decimal (1000..65535000) |
| Units | msec |
| Default | 30000 |

### GROUP FrUni Sig OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE FrUni Sig adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE FrUni Sig operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE FrUni Sig usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP FrUni Sig Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics related to the SVC signaling layer at the interface level. |

### ATTRIBUTE FrUni Sig currentNumberOfSvcCalls (ncall)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of Frame Relay SVCs currently existing on this interface. |
| Values | Decimal (0..992) |
| Default | No default |

### ATTRIBUTE FrUni Sig inCalls (incall)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of incoming SVCs on this interface (that is, the number of SVCs for which this interface represents the destination end of the call). |
| Values | Decimal (0..992) |
| Default | No default |

### ATTRIBUTE FrUni Sig inCallsRefused (icr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the incoming SVC call requests that are rejected by either this interface or by the called user. When this count exceeds the maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig outCalls (outcall)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of outgoing SVCs on this interface (that is, the number of SVCs for which this interface represents the source end of the call). |
| Values | Decimal (0..992) |
| Default | No default |

### ATTRIBUTE FrUni Sig outCallsFailed (ocf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the outgoing SVC call requests that are rejected by either this interface, or by the network side of the destination end, or by the called user. When this count exceeds the maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig protocolErrors (pe)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times a FRF.4 protocol error has occurred. Any one of the following events constitutes a protocol error:<br>1. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir*, *Bc* and *Be* are all zero;<br>2. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir* is zero but *Bc* is non-zero, or *Bc* is zero but *Cir* is non-zero;<br>3. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, the *Minimum Acceptable CIR* is greater than *Cir*;<br>4. At the destination end, any of the destination to source direction<br>link layer core parameters has been increased in the CONNECT message from the called user;<br>5. At the destination end, the destination to source direction *Cir* |

in the CONNECT message is smaller than the corresponding *minimum acceptable Cir* signaled to the called user;
6. At the source end, any of the source to destination direction link layer core parameters in the CONNECT message from the destination end has been increased;
7. At the source end, the source to destination direction *Cir*, after negotiation, is smaller than the corresponding *minimum acceptable Cir*;
8. The network has received a STATUS message from the user with an incompatible FRF.4 state.

When this count reaches maximum, it wraps to zero.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig qualityOfServiceNotAvailable (qosna)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of incoming and outgoing SVCs that are rejected because the quality of service requested cannot be met by the network. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig setupTimeout (setupt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the T303 setup timer has expired. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig lastCauseInStatusMsgReceived (lcis)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the cause value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute.<br><br>The initial value of this attribute is **0** which means that no STATUS message has been received for an existing call yet. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE FrUni Sig lastStateInStatusMsgReceived (lsis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute.<br><br>The initial value of this attribute is **notApplicable**. |
| Values | null<br>callInitiated<br>outgoingCallProceeding<br>callPresent<br>incomingCallProceeding<br>active<br>disconnectRequest<br>disconnectIndication<br>releaseRequest<br>restartRequest<br>restart<br>notApplicable<br>2<br>4<br>5<br>7<br>8<br>13<br>14<br>15 |

### ATTRIBUTE FrUni Sig lastDlciReceivedStatus (ldrs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the value of the DLCI that has most recently received a STATUS message from the user.<br><br>The initial value of this attribute is **0**. |
| Values | Decimal (0; 16..1007) |
| Default | 0 |

### ATTRIBUTE FrUni Sig bandwidthNotAvailable

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of call failures for each bandwidth pool due to the requested bandwidth not being available. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (0..15) |
| Default | No default |

### GROUP FrUni Sig LapfStatus (LapfStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Q.922 SVC data link layer status. |

### ATTRIBUTE FrUni Sig currentState (currState)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the current state of the SVC data link layer interface. |

| | |
|---|---|
| Values | disconnected<br>linkSetup<br>disconnectRequest<br>informationTransfer<br>waitingAck |
| Default | No default |

### ATTRIBUTE FrUni Sig lastStateChangeReason (lscr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the reason for the most recent state change.<br>***notStarted*** - this is the default state after SVC data link has just been created.<br><br>***abmeEntered*** - SVC data link has entered Asynchronous Balanced Mode after SABME or UA has been received.<br>***abmeReset*** - the data link has been reset.<br>***dmReceived*** - DM response received.<br>***dmSent*** - DM sent.<br>***discReceived*** - DISC response received.<br>***discSent*** - DISC sent.<br>***frmrReceived*** - FRMR received.<br>***n200RetranTimeOut*** - *retransmitLimit* has been exceeded.<br>***other*** - unspecified state change reasons. The most likely reason for this is the transition from state ***waitingAck*** to state ***informationTransfer***. |
| Values | notStarted<br>abmeEntered<br>abmeReset<br>dmReceived<br>dmSent<br>discReceived<br>discSent<br>frmrReceived<br>n200RetranTimeOut<br>other |
| Default | notStarted |

### ATTRIBUTE FrUni Sig frmrReceive (frmrr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the information field of the Frame Reject (FRMR) most recently received. |
| Values | String (0..8, Hex) |
| Default | No default |

### ATTRIBUTE FrUni Sig currentQueueSize (queues)

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the current number of frames in the SVC data link layer transmit queue. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrUni Sig LapfStatistics (LapfStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics for the SVC data link layer. |

### ATTRIBUTE FrUni Sig stateChange

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the SVC data link layer interface has changed state. While the data link layer is in ***informationTransfer*** state, this counter will increment on each expiry of *idleProbeTimer* as its state goes from ***informationTransfer*** to ***waitingAck*** and back. When this count exceeds the maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig remoteBusy

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of times transmission of an I-frame was unsuccessful due to a perceived remote busy condition (window closed or remote busy). When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig receiveRejectFrame

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of REJ frames received by the interface. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig ackTimeout

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the *ackTimer* has expired. Frequent increments of this counter indicate a problem at the link or improper values have been chosen for *ackTimer* and *ackDelayTimer* between the local and remote sides. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig iFramesTransmitted

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVC I-frames transmitted to the interface on DLCI 0. An I-frame may be counted more than once if there are retransmissions at the SVC data link layer. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig iFramesTxDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVC I-frames that are bound for the link but have been discarded. Discard reasons may be one of the following:<br>1. the frame length is beyond the allowed limit.<br>2. the SVC data link layer is in ***disconnected*** state.<br>3. the transmit queue has been purged because the queue length has reached the reset threshold.<br>4. the transmit queue or the queue waiting for acknowledgment has been purged because the link cannot be re-established.<br><br>When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig iFramesReceived

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVC I-frames received from the interface. When this count reaches maximum, it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE FrUni Sig iFramesRcvdDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVC I-frames received but have been discarded. The discard reasons are:<br>1. incorrect frame size<br>2. frame is out of sequence<br>3. frame received while the network side of the SVC data link layer is not in the ***informationTransfer*** or ***waitingAck*** state.<br><br>When this count reaches maximum, it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP FrUni Sig FrsSvcAcc (Svcacc)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute which controls accounting for this interface. |

### ATTRIBUTE FrUni Sig defaultAccounting (defAcc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether accounting data collection and record generation is turned on for switched connections at this interface. For accounting data collection and record generation to occur, this attribute must be ***on*** and at least one of the *accountCollection* reasons in the *Dna* component must be present. |
| Values | off<br>on |
| Default | on |

### GROUP FrUni Sig LastSvcClearCodes (Codes)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the remote data network address, the last SVC clear cause and the last SVC diagnostic code coming from the subnet or the local VC. |

### ATTRIBUTE FrUni Sig lastClearRemoteDataNetworkAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Data Network Address (DNA) of the remote (the other end of the SVC connection) of the call which cleared last and whose clear and diagnostic codes were recorded. |
| Values | BCD (0..15) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrUni Sig lastClearCause

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last SVC clear cause signaled at the end of the connection or failure to connect. It is updated only if the clear request comes from the subnet or the call is rejected locally by the VC. The same set of possible values provides the clear cause field in the accounting record. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE FrUni Sig lastDiagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the last SVC diagnostic code signaled at the end of the connection or failure to connect. It is updated if the clear request comes from the subnet or the call is rejected locally by the VC. The same set of possible values provides the diagnostic code field in the accounting record. |
| Values | Decimal (0..255) |
| Default | 0 |

### COMPONENT FrUni VirtualFramer (VFramer)

| | |
|---|---|
| Groups | "GROUP FrUni VFramer Provisioned (Prov)"<br>"GROUP FrUni VFramer OsiState (State)"<br>"GROUP FrUni VFramer Statistics (Stats)" |
| Scope | Application |
| Description | *FrUni/n VirtualFramer*<br>*FrDte/n VirtualFramer*<br>The *VirtualFramer* component binds two services together to provide data transfer between them. It is mutually exclusive from *Framer* component. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrUni VFramer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *VirtualFramer* component. |

### ATTRIBUTE FrUni VFramer otherVirtualFramer (ovf)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the other *VirtualFramer* to which the service is linked, for example, *FrUni/n VirtualFramer*, *FrDte/n VirtualFramer*. |
| Values | Link (Service, otherVirtualFramer) |
| Default | No default |

### ATTRIBUTE FrUni VFramer logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the logical processor on which the service component will reside. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### GROUP FrUni VFramer OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE FrUni VFramer adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE FrUni VFramer operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE FrUni VFramer usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP FrUni VFramer Statistics (Stats)

Properties: Operational

Description: This group contains the operational statistics data for a *VirtualFramer* component.

### ATTRIBUTE FrUni VFramer frmToOtherVFramer

Access: Read only

| | |
|---|---|
| Description | This attribute counts the frames transmitted to the *otherVirtualFramer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni VFramer frmFromOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the *otherVirtualFramer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni VFramer octetFromOtherVFramer

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets received from the *otherVirtualFramer.* |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE FrUni VFramer discFrmFromOtherVFramer (discFrmFromOvf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded frames from the *otherVirtualFramer.* Incrementing of this counter indicates that some incoming traffic cannot be handled by the FP. |
| Values | Long Integer |
| Default | No default |

## COMPONENT FrUni LoadTestSystem (Lts)

| | |
|---|---|
| Groups | "GROUP FrUni Lts Setup (Setup)"<br>"GROUP FrUni Lts OperationalState (State)"<br>"GROUP FrUni Lts Results (Results)" |

| | |
|---|---|
| Scope | Application |
| Description | *FrUni/n LoadTestSystem*<br>*FrNni/n LoadTestSystem*<br>This component defines an instance of the Frame Relay Load Test System (UNI) service. The component instance value n is a unique positive integer within a module. |
| Subcomponents | "COMPONENT FrUni Lts Pattern (Pat)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### VERB START FrUni Lts

| | |
|---|---|
| Impact | Service |
| Description | *START FrUni/n Lts*<br>This verb starts the load generator. The load generator can be stopped by issuing the stop verb. |

### VERB STOP FrUni Lts

| | |
|---|---|
| Impact | Service |
| Description | *STOP FrUni/n Lts*<br>This verb stops the traffic generator. |

### VERB RESET FrUni Lts

| | |
|---|---|
| Impact | Service |
| Description | *RESET FrUni/n Lts*<br>This verb clears the TestStatistics |

### GROUP FrUni Lts Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the parameters used to configure the behavior of the Frame Relay Load Test System. |

## ATTRIBUTE FrUni Lts duration (dur)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duration of the test in milliseconds. The test will run until the duration expires or the STOP command is issued. A value of 0 is used to indicate infinity. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | 0 |

## ATTRIBUTE FrUni Lts algorithm (alg)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which algorithm is used to generate the frames.<br><br>**ContinuousBurst**<br>This mode of traffic generation creates traffic at the maximum rate possible until all of the frames have been sent. The generator then waits until the end of the timeInterval to begin again.<br><br>**IntervalBurst**<br>This algorithm attempts to generate 10 ms bursts of burstSize frames. It will generate as many of the burstSize frames as it can per sub-interval.<br><br>**DelayedBurst**<br>This algorithm generates bursts of burstSize frames separated by 10 ms delays.<br><br>**FixedBurst**<br>This aglorithm is similar to IntervalBurst, except a fixed burst size of 12 frames is used.<br><br>**delayMeasurement**<br>This algorithm is used to measure delay. The specified number of frames in the indicated pattern are generated, one at a time, with a |

| | |
|---|---|
| | maximum wait of maxDelay before sending the next frame. This algorithm is not implemented yet. |
| Values | continousBurst (cont)<br>intervalBurst (int)<br>delayBurst (delay)<br>fixedBurst (fixed) |
| Default | continousBurst |

### ATTRIBUTE FrUni Lts burstSize (fpb)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of frames per burst under the delayedBurst and intervalBurst algorithms. |
| Values | Decimal (1..250) |
| Default | 50 |

### ATTRIBUTE FrUni Lts timeInterval (tint)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval to the specified number of seconds. Granuality is in centiseconds. Maximum is 1 minute. |
| Values | Decimal (1..60000) |
| Units | csec |
| Default | 100 |

### GROUP FrUni Lts OperationalState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operation statistics of the load generator. |

### ATTRIBUTE FrUni Lts generatorState (gstate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the Lts is generating traffic. |

| | |
|---|---|
| Values | stopped<br>running |
| Default | stopped |

### ATTRIBUTE FrUni Lts cycleIncomplete (cycle)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the time required to generate all of the enabled patterns is more than timeInterval by a true value. Otherwise, this flag is set to false. Default is True. |
| Values | false<br>true |
| Default | true |

### ATTRIBUTE FrUni Lts lastActiveInterval (actInt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the actual time it took to generate all of the enabled patterns in the last cycle. If cycleIncomplete is true, this value should be zero. |
| Values | Decimal (0..4294967295) |
| Units | microsec |
| Default | No default |

### ATTRIBUTE FrUni Lts load

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the load being generated. This value represents that calculated using the set number of ticks. The actual burstTimeInterval may differ. One entire cycle of the patterns is completed in activeInterval and thus most of the load may be concentrated early in the set interval. |
| Values | Decimal (0.000..4294967.295) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE FrUni Lts elapsedGenerationTime (etime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates how many milliseconds have elapsed since the start of this test. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### GROUP FrUni Lts Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the frame counting attributes for the LTS component. |

### ATTRIBUTE FrUni Lts framesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the number of frames send to the network since the last time these statistics were cleared. This is similar to the framesToIf attribute of the FRAMER component. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE FrUni Lts bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of bytes sent. |
| Values | Decimal (0..4294967295) |
| Units | bytes |
| Default | 0 |

### ATTRIBUTE FrUni Lts bitRateTx

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the bit rate being sent to the link. It should only differ from the load if the burstTimeInterval would be >= the timeInterval or burstSize frames cannot be generated in 10ms (intervalBurst algorithm). |
| Values | Decimal (0.000..4294967.295) |
| Units | kbit/s |
| Default | 0.000 |

### ATTRIBUTE FrUni Lts frameRateTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the frame rate being sent to the link. It is calculated using the number of frames sent to the link in one cycle of the patterns. |
| Values | Decimal (0..4294967295) |
| Units | frame/s |
| Default | 0 |

### COMPONENT FrUni Lts Pattern (Pat)

| | |
|---|---|
| Instance | Decimal (0..29) |
| Groups | "GROUP FrUni Lts Pat Defaults (Defaults)"<br>"GROUP FrUni Lts Pat Setup (Setup)"<br>"GROUP FrUni Lts Pat OperationalData (OpData)"<br>"GROUP FrUni Lts Pat OperationalState (OpState)" |
| Scope | Application |
| Description | FrUni/n Lts Pattern<br>FrNni/n Lts Pattern<br>Each instance of this component specifies a pattern to be generated as part of each cycle. One cycle represents one pass through each pattern. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### VERB TRIGGER FrUni Lts Pat

| | |
|---|---|
| Impact | Service |
| Description | *TRIGGER FrUni/x Lts Pattern/y*<br>This verb triggers the single execution of the specified pattern. In order for this command to be executed, the Lts component cannot be generating traffic. |

### GROUP FrUni Lts Pat Defaults (Defaults)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the specifications of the pattern. |

### ATTRIBUTE FrUni Lts Pat defaultDlci (dDlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies for which dlci (on the local end) the frames are destined. |
| Values | Decimal (16..1007) |
| Default | 16 |

### ATTRIBUTE FrUni Lts Pat defaultNumFrames (dNum)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of frames in this pattern. This is the number of frames of this type which will be generated in one timeInterval. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 100 |

### ATTRIBUTE FrUni Lts Pat defaultDataSize (dSize)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the payload size of each frame in bytes. This is in excess to the header. |
| Values | Decimal (0..8200) |
| Units | octets |
| Default | 512 |

### ATTRIBUTE FrUni Lts Pat defaultHeaderBits (dBits)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the following bits are on/off in the header of each frame. The following bits can be set: BeCn, C/R, De, FeCn |
| Set of | becn<br>fecn<br>cr<br>de |
| Default | No default |

### ATTRIBUTE FrUni Lts Pat defaultHeaderLength (dLen)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the size of the frame relay header in bytes. Passport currently only supports a 2-byte header. |
| Values | Decimal (0; 2..4) |
| Units | octets |
| Default | 2 |

### ATTRIBUTE FrUni Lts Pat defaultEABits (dEABits)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies how the address field extension bits are set in the frame header. Consider the value to be a four bit binary number. For example, 4 = 0100. Only the first headerLength bits are used. For instance, suppose headerLength is 3, then the appropriate EABits is 2, or 0010. This attribute can be used to create a header of length greater than two bytes or to specify incorrect EABits in the header. |
| Values | Hex (H.0..H.f) |
| Default | H.4 |

### ATTRIBUTE FrUni Lts Pat defaultPayloadPattern (dPattern)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the payload of each frame. The value specified is in hexadecimal, where every two digits represent a byte. A maximum of 24 digits (12 bytes) may be set, after which the pattern will repeat in the payload (depending on repeatPattern attribute).<br>NOTE: If a RFC 1490 header is specified, via the 1490Header attribute, the specified pattern will begin following the header (i.e. at the 9th byte in the payload). |
| Values | String (1..12, Hex) |
| Default | 55 |

### ATTRIBUTE FrUni Lts Pat defaultRfc1490Header (d1490)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the appropriate RFC 1490 encapsulated header of the frame. A value of 0 indicates no 1490 header.<br>NOTE: This header resides in the first 8 bytes of the payload. If the specified value is non-zero, then the payload pattern provisioned will begin at the 9th byte. |
| Values | 0<br>1<br>2<br>3<br>4 |

5
6
7
8
9
10
11
12
13
14
15
16
17
none

Default none

### ATTRIBUTE FrUni Lts Pat defaultUseBadLrc (dBadLrc)

Access Read and write

Description This attribute specifies whether the frames from this pattern are to have a bad LRC prior to being sent to the framer. The LRC is checked while the frame is being put onto the link and the failure should cause an abort frame to be sent.

Values no
yes

Default no

### GROUP FrUni Lts Pat Setup (Setup)

Properties Operational

Description This attribute group contains the specifications of the pattern.

### ATTRIBUTE FrUni Lts Pat dlci

Access Read and write

Description This attribute specifies for which dlci (on the local end) the frames are destined.

Values Decimal (16..1007)

| | |
|---|---|
| Default | 16 |

### ATTRIBUTE FrUni Lts Pat numFrames (num)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of frames in this pattern. This is the number of frames of this type which will be generated in one timeInterval. |
| Values | Decimal (0..4294967295) |
| Default | 100 |

### ATTRIBUTE FrUni Lts Pat dataSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the payload size of each frame in bytes. This is in excess to the header. |
| Values | Decimal (0..8200) |
| Units | octets |
| Default | 512 |

### ATTRIBUTE FrUni Lts Pat headerBits (bits)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the following bits are on/off in the header of each frame. The following bits can be set: BeCn, C/R, De, FeCn |
| Set of | becn<br>fecn<br>cr<br>de |
| Default | No default |

### ATTRIBUTE FrUni Lts Pat headerLength (len)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the size of the frame relay header in bytes. Passport currently only supports a 2-byte header. Valid values are 0, 2, 3, 4. 0 indicates to use no header. That is, the frame will start with either the payload or rfc1490 header. |
| Values | Decimal (0; 2..4) |
| Units | octets |
| Default | 2 |

### ATTRIBUTE FrUni Lts Pat eaBits

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how the address field extension bits are set in the frame header. Consider the value to be a four bit binary number. For example, 4 = 0100. Only the first headerLength bits are used. For instance, suppose headerLength is 3, then the appropriate eaBits is 2, or 0010. This attribute can be used to create a header of length greater than two bytes or to specify incorrect eaBits in the header. |
| Values | Hex (H.0..H.f) |
| Default | H.4 |

### ATTRIBUTE FrUni Lts Pat payloadPattern (pattern)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the payload of each frame. The value specified is in hexadecimal, where every two digits represent a byte. A maximum of 24 digits (12 bytes) may be set, after which the pattern will repeat in the payload (depending on repeatPattern attribute).<br>NOTE: If a RFC 1490 header is specified, via the 1490Header attribute, the specified pattern will begin following the header (i.e. at the 9th byte in the payload). |
| Values | String (1..12, Hex) |
| Default | 55 |

### ATTRIBUTE FrUni Lts Pat rfc1490Header (rfc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the appropriate RFC 1490 encapsulated header of the frame. A value of 0 indicates no 1490 header. NOTE: This header resides in the first 8 bytes of the payload. If the specified value is non-zero, then the payload pattern provisioned will begin at the 9th byte. |
| Values | 0<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15<br>16<br>17<br>none |
| Default | none |

### ATTRIBUTE FrUni Lts Pat useBadLrc

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the frames from this pattern are to have a bad LRC prior to being sent to the framer. The LRC is checked while the frame is being put onto the link and the failure should cause an abort frame to be sent. |
| Values | no<br>yes |

| | |
|---|---|
| Default | no |

### GROUP FrUni Lts Pat OperationalData (OpData)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes which allow changing the pattern outside of provisioning mode. |

### ATTRIBUTE FrUni Lts Pat framePattern

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the first 20 to 24 bytes of the frame payload, depending on the frame relay header size selected. This attribute represents the frame if it were at least 20 to 24 bytes in size. That is, the actual frame may be smaller. |
| Values | String (20..24, Hex) |
| Default | No default |

### ATTRIBUTE FrUni Lts Pat hdlcBitsInserted (hdlc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays how many times a zero bit will be inserted after 5 consecutive 1 bits when a frame from this pattern is sent out. |
| Values | Decimal (0..65535) |
| Default | No default |

### GROUP FrUni Lts Pat OperationalState (OpState)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the attributes containing the operational statistics of the pattern. |

### ATTRIBUTE FrUni Lts Pat load

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the load due to this particular pattern. The loads associated with all of the provisioned patterns are summed to arrive at the FrLts load. |
| Values | Decimal (0.000..4294967.295) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE FrUni Lts Pat status

| | |
|---|---|
| Access | Read and write |
| Description | This attributes specifies the administrative state of the pattern. A disabled pattern will not be generated, although it can still be triggered. |
| Values | disabled<br>enabled |
| Default | enabled |

### COMPONENT FrUni DirectConnection (Dconn)

| | |
|---|---|
| Groups | "GROUP FrUni Dconn DirectFrDteConnData (DirData)" |
| Scope | Application |
| Description | ‘FrUni/n DirectConnection’<br><br>A *DirectConnection* can not be provisioned under a *FrUni* if any of its *Dlci* subcompoentents has an *IpConnection* or *BnxInterworkingFunction* component provisioned under it. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrUni Dconn DirectFrDteConnData (DirData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for creating a Direct Connection for IP over Frame Relay networking between FrUni and FrDte. |

### ATTRIBUTE FrUni Dconn directFrDteConnection (direct)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the FrUni to which the FrDte will be connected to via the Direct Connect feature.<br><br>This attribute must be linked to a *FrDte DirectConnection* component or a semantic check error is generated. |
| Values | Link (Service, directFrUniConnection) |
| Default | No default |

### COMPONENT FrUni ServiceTrace (SrvTrace)

| | |
|---|---|
| Groups | "GROUP FrUni SrvTrace Operational" |
| Scope | Application |
| Description | *FrUni/n ServiceTrace*<br>*FrNni/n ServiceTrace*<br>The *ServiceTrace* component of the Frame Relay service determines if the trace capability is allowed on this interface. If it is not provisioned, then a service trace session cannot be started on this service.<br><br>Frame Relay service trace is restricted to use FrameRelay, X25 or ATM service trace receiver. If the *SrvTrace rcvr* operational attribute is set to a string name of FrAtm service trace receiver, *Start* command will return a “Receiver Not Supported” response. |
| Dyn. Subcomp. | "COMPONENT FrUni SrvTrace Filter" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### VERB Start FrUni SrvTrace

| | |
|---|---|
| Impact | Service |
| Description | *Start FrUni/n ServiceTrace*<br>*Start FrNni/n ServiceTrace*<br>This command starts a Frame Relay service trace session. |

### VERB Stop FrUni SrvTrace

| | |
|---|---|
| Impact | Service |
| Description | *Stop FrUni/n ServiceTrace*<br>*Stop FrNni/n ServiceTrace*<br>This command stops a Frame Relay service trace session. |

### GROUP FrUni SrvTrace Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group provides the operational attributes for the *SrvTrace* component. |

### ATTRIBUTE FrUni SrvTrace receiverName (rcvr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started. |
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE FrUni SrvTrace duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active. |

| | |
|---|---|
| Values | Decimal (0..9999) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE FrUni SrvTrace queueLimit

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately. |
| Values | Decimal (1..100) |
| Units | Kbyte |
| Default | 20 |

### ATTRIBUTE FrUni SrvTrace session

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active. |
| Values | The name of the component |
| Default | No default |

### COMPONENT FrUni SrvTrace Filter

| | |
|---|---|
| Groups | "GROUP FrUni SrvTrace Filter Operational" |
| Scope | Application |
| Description | *FrUni/n SrvTrace Filter*<br>*FrNni/n SrvTrace Filter*<br>The *Filter* component defines the type of traced data that is sent to the receiver. The *Filter* component provides default values for all its attributes which are sufficient to start a trace session. If |

required, these attributes may be changed before or during a trace session.

Common Verbs

Help
List
Display

## GROUP FrUni SrvTrace Filter Operational

Properties: Operational

Description: This group provides the operational attributes for the Frame Relay *SrvTrace Filter* component.

## ATTRIBUTE FrUni SrvTrace Filter traceType (type)

Access: Read and write

Description: This attribute specifies the level of filtering required for this trace session. A value of ***lmi*** indicates that LMI frames are traced. A value of ***dlci*** indicates that frames from the *Dlci* specified by the *tracedDlci* attribute are traced. A value of ***badFrames*** indicates that bad received frames (overruns, CRC errors, aborts) are traced. The default is to trace all frames. This attribute can be set while a trace is active and takes effect immediately.

Set of:
lmi
dlci
badFrames

Default: (lmi, dlci, badFrames)

## ATTRIBUTE FrUni SrvTrace Filter tracedDlci (dlci)

Access: Read and write

Description: This attribute specifies a particular DLCI to trace. A value of ***0*** specifies that all DLCIs are to be traced. This attribute can be set while a trace is active and takes effect immediately.

Values: Decimal (0..1007)

Default: 0

## ATTRIBUTE FrUni SrvTrace Filter direction (dir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the direction of the data to be traced as viewed by the service. The values can be ***egress*** and ***ingress***. An ***egress*** value indicates frames outbound from the service. An ***ingress*** value indicates frames inbound to the service. This attribute can be set while a trace is active and takes effect immediately. |
| Set of | egress<br>ingress |
| Default | (egress, ingress) |

## ATTRIBUTE FrUni SrvTrace Filter tracedLength (len)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of octets to trace per frame starting from the octet following the frame flag. If the frame length is longer than the value specified by this attribute, then the traced frame is truncated. If set to ***disabled***, the traced frame is not truncated.<br><br>This attribute can be set while a trace is active and takes effect immediately.<br><br>If the Frame Relay *SrvTrace* is started with an ATM service trace receiver, the *tracedLength* attribute of ATM service trace receiver is ignored. |
| Values | Decimal (1..4000)<br>disabled |
| Units | octets |
| Default | 2000 |

## COMPONENT FrUni Isdn

| | |
|---|---|
| Groups | "GROUP FrUni Isdn Provisioned (Prov)"<br>"GROUP FrUni Isdn Operational (Oper)" |

| | |
|---|---|
| Scope | Application |
| Description | *FrUni/n Isdn*<br>This component defines the parameters associated with the ISDN B-<br>Channel interface. Adding this component makes the *FrUni* behave as an ISDN access to the Frame Relay Network. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrUni Isdn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the Isdn component. |

## ATTRIBUTE FrUni Isdn t320

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the waiting time for a silent B-Channel (no active VCs associated with the *FrUni*) to be disconnected and made available. Default is 60 seconds. 0 means t320 will never timeout. |
| Values | Decimal (0..255) |
| Units | seconds |
| Default | 60 |

## ATTRIBUTE FrUni Isdn addressSignalling (asig)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute defines whether the ISDN Calling Party Number is to be signaled to the remote DTE during an SVC call establishment. Otherwise, no changes to the current behavior of SVC call establishment(i.e., Passport Dna is used in the calling party number information element). |
| Values | IsdnDna<br>normalBehavior |
| Default | normalBehavior |

### GROUP FrUni Isdn Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Isdn* component. |

### ATTRIBUTE FrUni Isdn dataSigChan

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the instance number of the *dataSigChan* component controlling the allocation of this *FrUni Isdn* component. |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE FrUni Isdn bChannelState (bState)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state of the B-Channel. If the value is ***idle*** it means that no VCs are connected and this B-Channel is available. If the value is ***busy*** it means this B-Channel has been allocated and is not available. If the value is ***disabled*** it means the application interface or the port is locked or disabled. |
| Values | idle<br>busy<br>disabled |
| Default | No default |

### ATTRIBUTE FrUni Isdn lastUsedCgpn (lucgpn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the calling party number currently using the B-Channel. When the B-Channel is free, the null string is displayed. |
| Values | BCD (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Isdn bChanIntState (bInt)

| | |
|---|---|
| Access | Read only |
| Description | Debug information |
| Values | isdnInit<br>waitAccEnable<br>waitLnsResponse<br>waitFramerData<br>enabling<br>waitAccRegAck<br>up<br>down<br>releasing |
| Default | No default |

### ATTRIBUTE FrUni Isdn activeVirtualCircuitsCount (vcCount)

| | |
|---|---|
| Access | Read only |
| Description | Current number of virtual circuits (switched and permanent) in data transfer. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT FrUni ConnectionAdministrator (Ca)

| | |
|---|---|
| Groups | "GROUP FrUni Ca Provisioned (Prov)"<br>"GROUP FrUni Ca IngressCac" |

| | |
|---|---|
| | "GROUP FrUni Ca EgressCac"<br>"GROUP FrUni Ca Operational (Op)" |
| Scope | Application |
| Description | *FrNni/n ConnectionAdministrator*<br>The *Ca* component allows the network operator to specify common subscription options for the parent interface. It defines the call admission control parameters in the ingress and egress direction for the parent interface. |
| Opt. Subcomp. | "COMPONENT FrUni Ca TransferPriorityMapping (Tpm)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP FrUni Ca Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the common provisionable attributes of the *Ca* component. |

## ATTRIBUTE FrUni Ca overrideLinkRate (ovLinkRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute allows the link rate to be overridden for this interface. This allows the user to specify a value other than the actual physical link rate computed when a *Framer* component is provisioned. When a *VFramer* component is provisioned, this attribute overrides a link rate set to the maximum value supported by CAC .<br><br>This attribute serves to provide the user control on the amount of bandwidth available for performing CAC. |
| Values | Decimal (0..429496729) |
| Units | bit/s |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE FrUni Ca maximumBandwidthPerCall (maxBwCall)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum bandwidth that can be allocated per connection. |
| Values | Decimal (0..520000000) |
| Units | bit/s |
| Default | 520000000 |

### GROUP FrUni Ca IngressCac

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the common provisionable attributes for ingress call admission control. |

### ATTRIBUTE FrUni Ca ingressApplyToCos (ingCos)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies which Classes of Service (CoS) have ingress Call Admission Control (CAC) applied to them. Ingress CAC applies only to switched connections (SVCs and S-SPVCs).<br><br>***none*** - Ingress CAC is turned off for all classes of service.<br>***cirOnly*** - Ingress CAC is applied only to the CIR portion of a connection's bandwidth requirements for CIR>0 classes of service.<br>***cirAndEir*** - Ingress CAC is applied to both CIR and EIR portions of a connections bandwidth requirements for all classes of service. |
| Values | none<br>cirOnly<br>cirAndEir |

| | |
|---|---|
| Default | cirOnly |

### ATTRIBUTE FrUni Ca ingressMaximumEirOnlyCalls

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum number of connections in the ingress direction with EIR only traffic that can be up at a given time. |
| Values | Decimal (0..992) |
| Default | 992 |

### ATTRIBUTE FrUni Ca ingressCirBandwidthPool (ingCirBP)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | Port capacity is partitioned into 16 pools (pool 0 through pool 15) for the ingress CIR traffic. This attribute specifies the percentage of port capacity that is allowed for each pool. The percentage for each pool ranges from 0% to 1000% of the link rate. It allows for under or over subscription of the port. Under subscription occurs when the sum of the percentages assigned to the 16 pools is less than 100%. Over subscription occurs when the sum of the percentages for the 16 pools exceeds 100%.<br><br>The default is full sharing of port capacity with three pre-set partitions. |
| Vector of | Decimal (0..1000) |
| Units | % |
| Index | Decimal (0..15) |
| Default | (1000, 1000, 1000, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0) |

### ATTRIBUTE FrUni Ca ingressEirBandwidthPool (ingEirBp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | Port capacity is partitioned into 16 pools (pool 0 through pool 15) for the ingress EIR traffic. This attribute specifies the percentage of port capacity that is allowed for each pool. The percentage for each pool ranges from 0% to 1000% of the link rate. It allows for under or over subscription of the port. Under subscription occurs when the sum of the percentages assigned to the 16 pools is less than 100%. Over subscription occurs when the sum of the percentages for the 16 pools exceeds 100%.<br><br>The default is full sharing of port capacity with three pre-set partitions. |
| Vector of | Decimal (0..1000) |
| Units | % |
| Index | Decimal (0..15) |
| Default | (1000, 1000, 1000, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0) |

### GROUP FrUni Ca EgressCac

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the common provisionable attributes for egress call admission control. |

### ATTRIBUTE FrUni Ca egressApplyToCos (egCos)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies which Classes of Service (CoS) have egress Call Admission Control (CAC) applied to them. Egress CAC applies only to switched connections (SVCs and S-SPVCs).<br><br>***none*** - Egress CAC is turned off for all classes of service.<br>***cirOnly*** - Egress CAC is applied only to the CIR portion of a |

| | |
|---|---|
| | connection's bandwidth requirements for CIR>0 classes of service.<br>***cirAndEir*** - Egress CAC is applied to both CIR and EIR portions of a connections bandwidth requirements for all classes of service. |
| Values | none<br>cirOnly<br>cirAndEir |
| Default | none |

### ATTRIBUTE FrUni Ca egressMaximumEirOnlyCalls

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum number of connections in the egress direction with EIR only traffic that can be up at a given time. |
| Values | Decimal (0..992) |
| Default | 992 |

### ATTRIBUTE FrUni Ca egressCirBandwidthPool (egCirBp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | Port capacity is partitioned into 16 pools (pool 0 through pool 15) for the egress CIR traffic. This attribute specifies the percentage of port capacity that is allowed for each pool. The percentage for each pool ranges from 0% to 1000% of the link rate. It allows for under or over subscription of the port. Under subscription occurs when the sum of the percentages assigned to the 16 pools is less than 100%. Over subscription occurs when the sum of the percentages for the 16 pools exceeds 100%.<br><br>The default is full sharing of port capacity with three pre-set partitions. |
| Vector of | Decimal (0..1000) |

| | |
|---|---|
| Units | % |
| Index | Decimal (0..15) |
| Default | (1000, 1000, 1000, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0) |

### ATTRIBUTE FrUni Ca egressEirBandwidthPool (egEirBp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | Port capacity is partitioned into 16 pools (pool 0 through pool 15) for the egress EIR traffic. This attribute specifies the percentage of port capacity that is allowed for each pool. The percentage for each pool ranges from 0% to 1000% of the link rate. It allows for under or over subscription of the port. Under subscription occurs when the sum of the percentages assigned to the 16 pools is less than 100%. Over subscription occurs when the sum of the percentages for the 16 pools exceeds 100%.<br><br>The default is full sharing of port capacity with three pre-set partitions. |
| Vector of | Decimal (0..1000) |
| Units | % |
| Index | Decimal (0..15) |
| Default | (1000, 1000, 1000, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0) |

### GROUP FrUni Ca Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational status of the *Ca* component. |

### ATTRIBUTE FrUni Ca linkRate (linkRate)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the link rate used by both ingress and egress CAC to calculate the effective bandwidth pool sizes. |

| | |
|---|---|
| | If the provisionable attribute *overrideLinkRate* under this component is 0, then the link rate reported is the actual link rate of the port or channel. Otherwise, the link rate reported is the *overrideLinkRate* under this component. |
| Values | Decimal (0..520000000) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE FrUni Ca ingressCirPoolAdmittedBandwidth (ingCirPoolAdmitBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total admitted CIR bandwidth from each CIR bandwidth pool in the ingress direction. Each value is the sum of the equivalent bit rates of the admitted connections. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Ca ingressCirPoolAvailableBandwidth (ingCirPoolAvailBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remaining available CIR bandwidth in each ingress CIR bandwidth pool. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Ca egressCirPoolAdmittedBandwidth (egCirPoolAdmitBw)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total admitted CIR bandwidth from each CIR bandwidth pool in the egress direction. Each value is the sum of the equivalent bit rates of the admitted connections. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Ca egressCirPoolAvailableBandwidth (egCirPoolAvailBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remaining available CIR bandwidth in each egress CIR bandwidth pool. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Ca ingressEirPoolAdmittedBandwidth (ingEirPoolAdmitBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total admitted EIR bandwidth from each EIR bandwidth pool in the ingress direction. Each value is the sum of the equivalent bit rates of the admitted connections.<br><br>If the *ingressApplyToCos* attribute is set to ***none***, all ingress CIR bandwidth pools are set to 0. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Ca ingressEirPoolAvailableBandwidth (ingEirPoolAvailBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remaining available EIR bandwidth in each ingress EIR bandwidth pool.<br><br>If the *ingressApplyToCos* attribute is set to either ***none*** or ***cirOnly***, all ingress EIR bandwidth pools are set to 0. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Ca egressEirPoolAdmittedBandwidth (egEirPoolAdmitBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total admitted EIR bandwidth from each EIR bandwidth pool in the egress direction. Each value is the sum of the equivalent bit rates of the admitted connections.<br><br>If the *egressApplyToCos* attribute is set to ***none***, all egress CIR bandwidth pools are set to 0. |
| Vector of | Decimal (0..520000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Ca egressEirPoolAvailableBandwidth (egEirPoolAvailBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the remaining available EIR bandwidth in each egress EIR bandwidth pool. |

| | |
|---|---|
| | If the *egressApplyToCos* attribute is set to either ***none*** or ***cirOnly***, all egress EIR bandwidth pools are set to 0. |
| Vector of | Decimal (0..52000000) |
| Units | bit/s |
| Index | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE FrUni Ca numberRejectedEgressCirPermConn (numRegEgCirPerm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of permanent connections (that is, PVC and P-SPVC) that are rejected by egress CAC. A connection is rejected by egress CAC if it requests more egress CIR bandwidth than is available, and the *egressApplyToCos* attribute is set to either ***cirOnly*** or ***cirAndEir***. |
| Values | Decimal (0..992) |
| Default | No default |

### ATTRIBUTE FrUni Ca numberRejectedEgressEirPermConn (numRegEgEirPerm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of permanent connections (that is, PVC and P-SPVC) that are rejected by egress CAC. A connection is rejected by egress CAC if it requests more egress EIR bandwidth than is available, and the *egressApplyToCos* attribute is set to ***cirAndEir***. |
| Values | Decimal (0..992) |
| Default | No default |

### COMPONENT FrUni Ca TransferPriorityMapping (Tpm)

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP FrUni Ca Tpm Provisioned (Prov)" |
| Scope | Application |

| | |
|---|---|
| Description | *FrNni/n Ca TransferPriorityMapping/n*<br>The *Tpm* component defines the corresponding traffic management subscription options on a *FrNni* interface corresponding to a particular transfer priority. This component is needed only if there is a requirement to override the *Mod Frs DprsNet Tpm* component defaults. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP FrUni Ca Tpm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This attribute group contains the provisionable attributes of the *Tpm* component at this interface. |

### ATTRIBUTE FrUni Ca Tpm assignedIngressBandwidthPool (asgInBwPool)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the ingress bandwidth pool which is used to support this transfer priority at this interface. When this attribute is set to ***sameAsModule***, the bandwidth pool that is used is obtained from the *assignedIngressBandwidthPool* attribute under the *Mod Frs DprsNet Tpm/n* component. |
| Values | Decimal (0..15)<br>sameAsModule |
| Default | sameAsModule |

### ATTRIBUTE FrUni Ca Tpm assignedEgressBandwidthPool (asgEgBwPool)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the egress bandwidth pool which is used to support this transfer priority at this interface. When this attribute is set to ***sameAsModule***, the bandwidth pool that is used is obtained from the *assignedEgressBandwidthPool* attribute under the *Mod Frs DprsNet Tpm/n* component. |
| Values | Decimal (0..15)<br>sameAsModule |
| Default | sameAsModule |

## COMPONENT FrUni BnxProtocol (Bp)

| | |
|---|---|
| Groups | "GROUP FrUni Bp Provisioned (Prov)"<br>"GROUP FrUni Bp OsiState (State)"<br>"GROUP FrUni Bp Operational (Op)" |
| Scope | Application |
| Description | *FrUni/n BnxProtocol*<br>*FrNni/n BnxProtocol*<br>This component defines how the Frame Relay interface handles the BNX protocol. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP FrUni Bp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines the provisioning attributes to control the BNX protocol running on the Frame Relay interface. |

## ATTRIBUTE FrUni Bp linkToIpServer (linkToIp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the link to a Frame Relay IP server. |
| Values | Link (Service, linkToFrameRelayApps) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE FrUni Bp ipAddress (ipadd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the IP address associated with the Frame Relay interface. This address must be in the same subnet as the *ProtocolPort* associated with the *FrIpServer.* |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE FrUni Bp crossNetEnabled (cne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not cross-net status messages are sent from the Frame Relay interface. |
| Values | no<br>yes |
| Default | yes |

### ATTRIBUTE FrUni Bp crossNetPollingInterval (cnpi)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval between two cross-net status messages. This attribute is used for both sending and expecting status messages. The two ends of a PVC should be provisioned with values within a close range. Otherwise, it could result in PVC failure. |
| Values | Decimal (30..86400) |
| Units | seconds |
| Default | 120 |

### ATTRIBUTE FrUni Bp crossNetAsyncUpdate (cnau)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies when a cross-net status message is sent following a BNX DLCI state change. If set to ***enabled***, the status message is sent as soon as the state change occurs. If set to ***disabled***, the state of the BNX DLCI will be sent in a cross-net status message only at the next polling interval. The polling interval is determined by *crossNetPollingInterval* attribute. The *crossNetAsyncUpdate* attribute is ignored if *crossNetEnabled* is set to ***no***. |
| Values | disabled<br>enabled |
| Default | enabled |

### ATTRIBUTE FrUni Bp crossNetListenEnabled (cnle)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether or not to expect cross-net status messages. When set to ***yes***, this interface wait for a cross-net status message from the remote end to declare the PVCs up or down. When set to ***no***, the interface assumes the PVCs are always up. |
| Values | no<br>yes |
| Default | yes |

### ATTRIBUTE FrUni Bp crossNetErrorThreshold (cnet)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how many *crossNetPollingIntervals* without receiving a status message from the remote end are permitted to elapse before declaring the PVC down. |
| Values | Decimal (1..30) |
| Default | 3 |

### ATTRIBUTE FrUni Bp trafficPriorityEnabled (tpe)

| | |
|---|---|
| Access | Read and write |

Description — This attribute specifies how to set the "Priority Level" field of the BNX header. When set to ***no***, both the *defaultTrafficPriority* attribute of the *BnxProtocol* component and the *trafficPriority* attribute of the *BnxIwf* component are ignored, and the "Priority Level" field is set to ***2***. When set to ***yes***, the "Priority Level" field is set to the value of the *trafficPriority* attribute of the *BnxIwf*, unless the *trafficPriority* attribute has a value of ***useDefault***. In this case the “Priority Level” field is set to the value of the *defaultTrafficPriority* attribute.

Values — no
yes

Default — no

### ATTRIBUTE FrUni Bp defaultTrafficPriority (dtp)

Access — Read and write

Description — This attribute specifies the default traffic priority used to tag all the ingress traffic. This attribute is used when the *trafficPriority* attribute of the *BnxIwf* is set to ***useDefault***. A larger value denotes a lower priority. This attribute is ignored if the *trafficPriorityEnabled* is set to ***no***.

Values — Decimal (1..3)

Default — 2

### ATTRIBUTE FrUni Bp trafficDiscardLevel (tdl)

Access — Read and write

Description — This attribute specifies the discard level used to tag ingress traffic.This value is ignored when the attribute *discardLevelEnabled* is set to ***no***. In this case, the "Discard Level" field of BNX header is set to ***2*** for DE=1 datagrams and to ***4*** for DE=0 datagrams. When *discardLevelEnabled* is set to ***yes***, the "Discard Level" field is tagged with the value of *trafficDiscardLevel* attribute. The "Discard Level" value is used as follows:
Discard Level=***1***: drop datagrams when congestion level >= 1
Discard Level=***2***: drop datagrams when congestion level >= 2

Discard Level=***3***: drop datagrams when congestion level >= 3
Discard Level=***4***: drop datagrams when congestion level >= 4

Values: Decimal (1..4)

Default: 4

### ATTRIBUTE FrUni Bp discardLevelEnabled (dle)

Access: Read and write

Description: This attribute specifies how to use discard level to tag ingress traffic. When set to ***yes***, the provisioned *trafficDiscardLevel* is used. Otherwise ingress DE=1 datagrams are tagged with discard level ***2*** and DE=0 datagrams are tagged with discard level ***4***.

Values:
no
yes

Default: no

### GROUP FrUni Bp OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE FrUni Bp adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE FrUni Bp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE FrUni Bp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE FrUni Bp availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration

activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE FrUni Bp proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE FrUni Bp controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE FrUni Bp alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE FrUni Bp standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE FrUni Bp unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP FrUni Bp Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational status of the *BnxProtocol* component. |

### ATTRIBUTE FrUni Bp invalidBnxHeader (ibh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams dropped because the BNX header was invalid. It could be caused by a invalid header version, invalid protocol type, or that discard level or priority level is out of range. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp lastInvalidBnxHeader (libh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the BNX header of the datagram which was last dropped by the *BnxProtocol* because one or more fields |

| | |
|---|---|
| | of the BNX header are invalid. The invalid field could be any of the following: header version, protocol type, discard level out of range, priority level out of range. |
| Values | Hex (H.0..H.ffffffff) |
| Default | No default |

### ATTRIBUTE FrUni Bp invalidIpProtocolId (ipid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams dropped because the protocol ID in IP header was invalid. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp discardedIpFragment (dipf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of fragmented datagrams dropped by this interface. The case could be unknown Dlci, or unknown ID in IP header when misordering happened. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp sourceIpAddressLastDropped (ldsia)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the source IP address of the datagram that was last dropped by the *BnxProtocol* because one or more fields of the IP header are invalid. The invalid field could be any of the following: header version, protocol ID, or Identification of a fragmented datagram. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE FrUni Bp droppedUnknownDlci (dud)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the datagrams dropped because the DLCI was unknown. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp lastUnknownDlci (lud)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the DLCI of datagram last dropped. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp droppedUnknownDlciXnet (dudx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the received cross-net status messages that were dropped because the DLCI was unknown. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp lastUnknownDlciXnet (ludx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the DLCI of last received cross-net status message that was dropped because the DLCI was unknown. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp ipFragFromSubnet (fragfs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the IP fragments received from subnet by this frame relay interface. The value of this attribute wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp lastInvalidIpFragId (lastid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Id in the IP header of the last fragment dropped by the frame relay interface. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE FrUni Bp lastDlciWithIpFragment (lfdlci)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Dlci which last received IP fragment. This attribute is used for tracking fragmented IP traffic. |
| Values | Decimal (0..429496729) |
| Default | 0 |

# COMPONENT FileSystem (Fs)

| | |
|---|---|
| Groups | "GROUP Fs OsiState (State)"<br>"GROUP Fs Operational (Oper)" |
| Scope | Device |
| Description | *FILESYSTEM*<br>The *Filesystem* component provides and controls access to files and directories stored on one or two disks. It is automatically created and always present.<br><br>The Filesystem restricts files and directories names to 40 characters. It also restricts filenames including path to 128 characters. Directory names including the path cannot exceed 125 characters. There must be 112 or less directories and files at the root level on each partition. The maximum hierarchy depth is 10 directory levels.<br>The only characters that can appear in a filename are the alpha-numeric characters, the . (dot) and the _ (underscore). The names are case sensitive. A pathname is a sequence of zero to ten directory names along the path and separated by the / (slash) character. A pathname that begins with a slash is an absolute pathname, otherwise it is a relative pathname. Access to the standby disk is not allowed.<br><br>When there are two disks, the standby control processor disk is normally synchronized with the disk of the active control processor. After a crash or a disk failure the standby control processor disk becomes unsynchronized with respect to the disk |

on the active CP.

Dyn. Subcomp. "COMPONENT Fs Disk"
"COMPONENT Fs FsPartition (Part)"

Common Verbs

- List
- Display
- LOCK
- Unlock

## VERB SYNChronize Fs

Impact Configuration

Description synchronize Filesystem
The ***Synchronize*** command makes the standby disk an exact copy of the active disk. The operation also removes files and directories that exist only in the standby disk. Manual synchronization will set the standby disk volume name equal to the active disk. The synchronization process will fail if the capacity of the standby disk is smaller than the used space size in the active. At boot time, the filesystem selects the active control processor disk as the active disk and automatically attempts to synchronize the standby control processor disk. The automatic synchronization will fail if the volume names of the two disks are not identical. While the synchronization is running, disk testing and formatting are not allowed.

## VERB ListFile (LS) Fs

| | |
|---|---|
| Impact | Passive |
| Description | listFile -path<file or directory> [-status] [-newer<file>] filesystem<br><br>The ***List*** verb displays information about files and directories in a directory. For every entry found in the directory, it displays its name, modification time, size, type and write permission.<br>If the ***status*** option is specified, then the command displays the information about the directory and not its contents. The ***newer*** option tells the list command to display only entries that have been modified more recently than the argument of the option.<br><br>***Options***:<br>-***path***: The pathname of the file or directory that you want to ***List***.<br>-***status***: This option causes the ***List*** command to display information about the path not its content.<br>-***newer***: This option causes the ***List*** command to display only files newer than the argument of this option.<br>***Examples***:<br>list -path(“/tmp”) filesystem<br>list -path(“/spooled”) -newer(“/spooled/alarm.01”) fs<br>list -path(“/spooled”) -status filesystem |

## VERB Move (MV) Fs

| | |
|---|---|
| Impact | Configuration |
| Description | move -s <existing-file> -d <new-filename> Filesystem<br>move -s <existing-directory> -d <new-directory> Filesystem<br>move -s<existing-file> -d<existing-directory> Filesystem.<br>move -s<existing-directory> -d<existing-directory>Filesystem.<br><br>The ***Move*** command moves or renames files and directories. If the destination does not exist, ***Move*** renames the source. If the destination is a directory, the command moves the source into the destination directory. The ***Move*** command does not move files or directories from one disk to another. The Move command does not overwrite existing files.<br>***Options***:<br>-***source***: The pathname of the file or directory that ***Move*** is going to move.<br>-***destination***: The pathname of the file or directory where ***Move*** is going to place the source file or directory.<br>***Examples:***<br>move -source(“/spooled/alarm.01”) -destination(“/tmp”) fs<br>move -source(“/spooled”) -destination(“/tmp”) fs |

## VERB Copy (CP) Fs

| | |
|---|---|
| Impact | Configuration |
| Description | copy -s <file1> -d<file> Filesystem<br>copy -s<directory1> -d<directory2> -recursive Filesystem<br>copy -s<filename> -d<directory> Filesystem<br><br>The ***Copy*** command copies files or directories. The recursive option is required if the source is a directory. The new file is always unprotected. The Copy command does not overwrite existing files.<br>***Options***:<br>-***source***: The pathname of the file or directory that ***Copy*** is going to copy.<br>-***destination:*** The pathname of the file or directory that ***Copy*** places the resulting copied file or directory in.<br>-***recursive:*** When the source is a directory, this option causes the ***Copy*** to copy the contents of that directory and any of its subdirectories into the destination directory. The subdirectories themselves are copied as well as the files they contain.<br>***Examples***:<br>copy -source(“/tmp/log.01”) -destination(“/log.old”) fs<br>copy -s(“/spooled”) -d(“/tmp”) -recursive fs |

## VERB REMOVE Fs

Impact: Configuration

Description: remove -path <filename> [-force] Filesystem
remove -path <directory> [-recursive, -force] Filesystem

The REMOVE command deletes files and directories. The filesystem component releases the space the file occupied on disk for future use. The recursive option is required to remove any directory including an empty one. If the file or directory is write protected, the command returns an error. The force option causes the command to remove write protected files.

***Options***:

-***path*** The pathname of the file or directory ***Remove*** is to delete.

-***recursive*** This option causes ***Remove*** to delete the contents of the specified directory, including all its subdirectories, and the directory itself.

-***force*** This option causes ***Remove*** to delete files regardless of whether they are “protected”.

***Examples***:

remove -path(“/tmp/SCN.001”) filesystem
remove -path(“/tmp”) -recursive filesystem
remove -path(“/tmp/SCN.004”) -force filesystem

## VERB Protect Fs

Impact: Configuration

Description: protect -path< file> Filesystem

The ***Protect*** command protects the specified file against accidental deletion and modification. The REMOVE command will fail unless the ***force*** option is specified. The Protect command has no effect on a directory.

***Options***:

-path: The pathname of the file to be protected against accidental deletion and/or modification.

***Examples***:

protect -path(“/spooled/alarm.001”) filesystem
protect -path(“standby:/spooled”) filesystem

## VERB Unprotect Fs

| | |
|---|---|
| Impact | Configuration |
| Description | unprotect -path< file> Filesystem<br><br>The ***Unprotect*** command removes the protection against accidental deletion or modification of the specified file. The Unprotect command has no effect on a directory.<br>***Options***:<br>-path: The pathname of the file to be unprotected against accidental deletion or modification.<br>***Examples***:<br>unprotect -path(“/spooled/alarm.001”) filesystem |

## VERB Touch Fs

| | |
|---|---|
| Impact | Configuration |
| Description | touch -path <filename> Filesystem<br>The ***Touch*** command updates the file’s modification time. ***Touch*** creates the file if it does not exist. If the pathname is a directory, the creation time of the directory is updated.<br>***Options***:<br>-path: The pathname of the file or directory ***Touch*** is to update.<br>-date: The date and time specified by this option are used to update the file's modification time. If this option is not specified then the file's modification time is updated with the current date and time.<br>***Examples***:<br>touch -path(“/tmp/backup.074”) filesystem<br>touch -path("/tmp/backup.074") -date(1998-03-30 19:26:10) filesystem |

### VERB MakeDirectory (MKDIR) Fs

| | |
|---|---|
| Impact | Configuration |
| Description | makedirectory -path <directory> Filesystem<br>The ***MakeDirectory*** command creates a directory. The command returns an error if the parent directory does not exist.<br>***Options***:<br>-path : The pathname of directory that ***MakeDirectory*** creates.<br>Examples:<br>mkdir -path(“/tmp/temporary”) fs |

### VERB Chdir (CD) Fs

| | |
|---|---|
| Impact | Passive |
| Description | chdir -path <directory> Filesystem<br>The ***Chdir*** command makes the directory specified as argument of the ***path*** option the current working directory. If the directory does not exist, the command returns an error.<br>***Options***:<br>-path: The pathname of the directory that will become the working directory.<br>Examples:<br>cd -path(“/tmp/temporary”) filesystem |

### VERB WorkingDir (PWD) Fs

| | |
|---|---|
| Impact | Passive |
| Description | WorkingDir filesystem<br>The ***WorkingDir*** command displays the current working directory associated with the session. The initial working directory is a provisionable attribute of the *Userid* component which is a subcomponent of the *AccessControl* component. The ***Chdir*** command changes the current working directory to the specified directory.<br>***Examples***:<br>pwd filesystem |

### GROUP Fs OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Fs adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Fs operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Fs usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP Fs Operational (Oper)

Properties: Operational

Description: This group contains the filesystem operational data.

### ATTRIBUTE Fs volumeName

Access: Read only

Description: This attribute describes the volume name of the filesystem. This is the active disk volume name.

| | |
|---|---|
| Values | String (1..11, ASCII) |
| Default | No default |

### ATTRIBUTE Fs activeDisk

| | |
|---|---|
| Access | Read only |
| Description | The activeDisk attribute value is the Disk component instance value of the active disk. This is also the card number of the active control processor. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Fs syncStatus

| | |
|---|---|
| Access | Read only |
| Description | The synchronization status value indicates whether the file system is synchronized or not. |
| Values | synchronized<br>unSynchronized<br>synchronizing |
| Default | No default |

### ATTRIBUTE Fs syncProgress

| | |
|---|---|
| Access | Read only |
| Description | The synchronization progress value indicates the percentage of the standby disk already synchronized with the active disk. This value is equal to 100 if the two disks are synchronized or 0 if they are out of synchronization. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Fs capacity

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total size of the filesystem (in bytes). This value is equal to the smallest disk size in a synchronized filesystem; otherwise it is the capacity of the active disk. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *FileSystemPartition* subcomponent. |
| Values | Decimal (0..4294967295) |
| Units | bytes |
| Default | No default |

### ATTRIBUTE Fs freeSpace

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the free disk space (in bytes) currently available in the filesystem. It is equal to the smallest free disk space size of the active and standby disks in a synchronized filesystem.When the filesystem is unsynchronized it is the free disk space of the active disk. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *FileSystemPartition* subcomponent. |
| Values | Decimal (0..4294967295) |
| Units | bytes |
| Default | No default |

### ATTRIBUTE Fs usage

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the percentage of the free space available on the filesystem. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *FileSystemPartition* subcomponent. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

## COMPONENT Fs Disk

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Fs Disk OsiState (State)"<br>"GROUP Fs Disk Operational (Oper)" |
| Scope | Device |
| Description | *Fs Disk/n*<br>A disk component is an operational subcomponent of the filesystem. When the system is in dual-mode configuration, there will be two instances of the disk component. The 0 instance represents the disk on the card 0 and the instance 15 represents the disk on the card 15. |
| Dyn. Subcomp. | "COMPONENT Fs Disk Test"<br>"COMPONENT Fs Disk Partition (Part)" |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## VERB FORMAT Fs Disk

| | |
|---|---|
| Impact | Configuration |
| Description | format -v<volumeName> filesystem disk/<instance><br>This command formats the disk and prepares it to be a part of the filesystem. The disk component must be locked, before the format can start. All disks are formatted before delivery, but this command may be required if disk corruption occurs. A format destroys all the data in the disk. While formatting the disk , synchronizing and testing the disks are not allowed.<br>***Options***:<br>-volumeName: The argument of this option is the volume name of the disk.<br>-backward: format the disk to 256 MBytes format for backward compatibility. Older releases do not support disks larger than 256 MBytes.<br>***Examples***:<br>format -v(myDisk) filesystem disk/15<br>format -backward filesystem disk/15 |

## GROUP Fs Disk OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Fs Disk adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Fs Disk operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Fs Disk usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Fs Disk Operational (Oper)

Properties
Operational

Description
This group contains the disk component operational data.

### ATTRIBUTE Fs Disk volumeName

Access
Read and write

Description
This attribute describes the volume name of the disk. The volume names of the disks must be identical to be synchronized.

Values
String (1..11, ASCII)

Default
No default

### ATTRIBUTE Fs Disk capacity

Access
Read only

Description
This attribute describes the total formatted disk size (in bytes) on disk. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *Partition* subcomponent.

Values
Decimal (0..4294967295)

Units
bytes

Default
No default

### ATTRIBUTE Fs Disk freeSpace

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the available free disk space (in bytes) of the disk. Free space is reduced by bad blocks (if any). If there are different numbers of bad blocks on the disks in a dual-disk system, the reported free space will differ on the two disks.<br><br>Moreover, due to the DOS file system internal representation of directories and files, adding and deleting files may fragment the disks differently resulting in some disk space wasted. A small discrepancy (less than 1% of the disk size) in the disks free space is considered as normal. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *Partition* subcomponent. |
| Values | Decimal (0..4294967295) |
| Units | bytes |
| Default | No default |

### ATTRIBUTE Fs Disk badBlocksPercentage

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the percentage of the disk space lost because of defects. If this percentage is high, it is recommended to change the disk. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under *Partition* subcomponent |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Fs Disk unformattedCapacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the physical disk size (in bytes). The physical disk size may be different from the formatted disk size if |

there are bad blocks or the disk has been formatted to a smaller disk size for backward compatibility with older releases. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *Partition* subcomponent.

Values: Decimal (0..4294967295)

Units: bytes

Default: No default

## COMPONENT Fs Disk Test

Groups:
"GROUP Fs Disk Test OsiState (State)"
"GROUP Fs Disk Test Setup (Setup)"
"GROUP Fs Disk Test Results (Results)"

Scope: Device

Description:
*Test*
The Test component embodies logical and physical filesystem tests. It is an operational subcomponent of the Disk component.

Common Verbs:
Help
List
Display

## VERB Start Fs Disk Test

Impact: Configuration

Description:
This command invokes a test on the *Disk* component (this includes all underlying partitions). The *Disk* component must be locked before the test can start.
Examples:
start filesystem disk/15 test

### VERB Stop Fs Disk Test

| | |
|---|---|
| Impact | Configuration |
| Description | This command stops a test running on the *Disk* component (this includes all underlying partitions). The test stops only after completing the current pass.<br>***Example***:<br>stop filesystem disk/15 test |

### GROUP Fs Disk Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Fs Disk Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Fs Disk Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Fs Disk Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Fs Disk Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Test component operational data. The testCount, duration and type can be set to control the duration and the test type which will be run. |

### ATTRIBUTE Fs Disk Test testCount

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the number of times that the test will run. Note that the test will not run that many times if “duration” is not long enough to allow the test to complete. The test will execute at least one and then stop at the count where duration has just exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 1 |

### ATTRIBUTE Fs Disk Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the maximum duration (in minutes) that the test will run. The test can finish in less time if the number of tests, as recorded by testCount, is reached before this time. A test may take longer than the specified duration since a test cycle (or pass) is not interruptible. |
| Values | Decimal (0..35791394) |
| Units | minutes |
| Default | 60 |

### ATTRIBUTE Fs Disk Test type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of the test to be run. The diskRead test reads every sector on the disk once and reports bad sectors. The filesystemCheck does a sanity check and attempts to repair corruption. The flakyBitDetection test reads every sector on the disk twice and compares the two read results. The surfaceAnalysis test writes a magnetically hard to record pattern to the disk and reads back the pattern to determine the condition of the magnetic surface of the disk. The surface analysis test destroys all the data and disk should be formatted afterward. |
| Values | filesystemCheck<br>diskRead<br>flakyBitDetection<br>surfaceAnalysis |
| Default | filesystemCheck |

### GROUP Fs Disk Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the results of the test. |

### ATTRIBUTE Fs Disk Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the reason why the test was terminated. The reasons are:<br>***testCountReached:*** the test ran the number of times specified in the attribute testCount and ended normally.<br>***error***: the test was terminated by an error that is recorded in the natureOfError attribute.<br>***neverStarted***: the test was never started.<br>***stoppedByOperator***: the test was terminated by the Stop command.<br>***testTimeExpired***: the duration of the test expired.<br>***testRunning***: the test is still running.<br>***unknown***: the test terminated for unknown reasons.<br>***internalError***: An internal error terminated the test. |

| | |
|---|---|
| Values | testCountReached<br>testTimeExpired<br>stoppedByOperator<br>neverStarted<br>testRunning<br>error<br>internalError<br>unknown |
| Default | No default |

### ATTRIBUTE Fs Disk Test natureOfError

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the error found by a test. A logical error can be fixed by a filesystemCheck test followed eventually by a synchronization. A media error indicates that a fault in the disk hardware is suspected. A failedToComplete error indicates that the test was terminated. |
| Values | logical<br>media<br>noErrorDetected<br>failedToComplete |
| Default | No default |

### ATTRIBUTE Fs Disk Test severity

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the severity of the error found by a test. There are three types of severity**:** no data was lost, data was lost and hardware problem**.** If the test found no error(s), this will be reported as noError. If the test found error(s) but no data was lost, then noDataLost is reported. |
| Values | noDataLost<br>dataLost<br>hardwareProblem<br>noError |
| Default | No default |

### ATTRIBUTE Fs Disk Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the elapsed time (in minutes) since the test was started. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Fs Disk Test testExecutionCount

| | |
|---|---|
| Access | Read only |
| Description | The number of times the test had actually run. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Fs Disk Partition (Part)

| | |
|---|---|
| Instance | Decimal (1..4) |
| Groups | "GROUP Fs Disk Part OsiState (State)"<br>"GROUP Fs Disk Part Operational (Oper)" |
| Scope | Device |
| Description | *Fs Disk/m Part/n*<br>A *Partition* component is an operational subcomponent of *Disk*. Each instance of this component represents a partition. The instance is the partition number. The first instance is the first partition and fourth instance is the maximum number of partitions that could be defined in the system. The component is only visible on a partitioned disk. |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## GROUP Fs Disk Part OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Fs Disk Part adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Fs Disk Part operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Fs Disk Part usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Fs Disk Part Operational (Oper)

Properties
Operational

Description
This group contains the *Partition* component operational data. The group is only visible on a partitioned disk.

### ATTRIBUTE Fs Disk Part capacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the total formatted disk size (in Gbytes) of partition n on disk. The attribute is only visible on a partitioned disk. |
| Values | Decimal (0.000000..42.949672) |
| Units | Gbyte |
| Default | No default |

### ATTRIBUTE Fs Disk Part freeSpace

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the available free disk space (in Gbytes) on the partition n of the disk. Free space is reduced by bad blocks (if any). If there are different numbers of bad blocks on the disks in a dual-disk system, the reported free space will differ on the two disks. The attribute is only visible on a partitioned disk. |
| Values | Decimal (0.000000..42.949672) |
| Units | Gbyte |
| Default | No default |

### ATTRIBUTE Fs Disk Part badBlocksPercentage

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the percentage of the disk space lost because of defects. If this percentage is high, it is recommended to change the disk. The attribute is only visible on a partitioned disk. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

## COMPONENT Fs FsPartition (Part)

| | |
|---|---|
| Instance | Decimal (1..4) |
| Groups | "GROUP Fs Part OsiState (State)"<br>"GROUP Fs Part Operational (Oper)" |
| Scope | Device |
| Description | *Fs Part/n*<br>A *FileSystemPartition* component is an operational subcomponent of the *FileSystem* component. Each instance of this component represents a partition. The instance value is the partition number. The first instance is the first partition, and fourth instance is the maximum number of partitions that could be defined in the system. The component is only visible on a partitioned disk. |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## GROUP Fs Part OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Fs Part adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively |

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Fs Part operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Fs Part usageState (osiUsage)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Fs Part Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the *FileSystemPartition* component. The group is only visible on a partitioned disk. |

### ATTRIBUTE Fs Part capacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the total formatted disk size (in Gbytes) of partition n on disk. The attribute is only visible on a partitioned disk. |
| Values | Decimal (0.000000..42.949672) |
| Units | Gbyte |
| Default | No default |

### ATTRIBUTE Fs Part freeSpace

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the available free disk space (in Gbytes) on the partition n of the disk. Free space is reduced by bad blocks |

| | |
|---|---|
| | (if any). If there are different numbers of bad blocks on the disks in a dual-disk system, the reported free space will differ on the two disks. The attribute is only visible on a partitioned disk. |
| Values | Decimal (0.000000..42.949672) |
| Units | Gbyte |
| Default | No default |

### ATTRIBUTE Fs Part usage

| | |
|---|---|
| Access | Read only |
| Description | This attribute describes the percentage of the free space available on the filesystem for Partition n. The attribute is only visible on a partitioned disk. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

# COMPONENT GprsIpServer (Gips)

| | |
|---|---|
| Instance | Decimal (1..64) |
| Groups | "GROUP Gips CustomerIdentifierData (CidData)"<br>"GROUP Gips IfEntryProv (IfEntry)"<br>"GROUP Gips Provisioned (Prov)"<br>"GROUP Gips Statistics (Stats)" |
| Scope | Application |
| Description | *GprsIpServer/n*<br><br>This component represents the host GPRS IP Server on a Logical Processor. |
| Opt. Subcomp. | "COMPONENT Gips IpAddress (Ip)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Gips CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE Gips customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Gips IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Gips ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Gips ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Gips Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *GprsIpServer* component. |

### ATTRIBUTE Gips linkToProtocolPort (lToPp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Virtual Router Protocol Port that the *GprsIpServer* associates with. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Gips linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor that the *GprsIpServer* and its subcomponents are provisioned on. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Gips defaultTtl (defTtl)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the default value inserted into the Time-To-Live field of the IP header of datagrams originated at this entity.<br>This is the value used to build the IP header unless it is overridden by an application. |
| Values | Decimal (0..255) |
| Default | 64 |

### ATTRIBUTE Gips reasmTimeout (reasmTo)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum time that the received fragments of IP packets are held while awaiting reassembly at the *GprsIpServer*. |
| Values | Decimal (0..255) |
| Units | seconds |
| Default | 5 |

### ATTRIBUTE Gips performUdpChecksum (checksum)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether the UDP checksum is generated and checked. |
| Values | no<br>yes |
| Default | no |

### GROUP Gips Statistics (Stats)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the GPRS Internet Protocol (IP) related statistical attributes. |

### ATTRIBUTE Gips inPacketForUnknownAddr (inFr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts all the incoming datagrams destined to an address for which there is no *IpAddress* subcomponent. This includes fragmented packets. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips inErrors (inErrs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, address errors which have not already been filtered by the IP forwarder. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gips IpAddress (Ip)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP Gips Ip Statistics (Stats)" |
| Scope | Application |
| Description | *Gips/n IpAddress/<ipaddress>*<br><br>This component represents the Internet Protocol (IP) functionality supported by the GPRS for a particular address. The *IpAddress* provides best-effort delivery, inter network-wide addressing, fragmentation and reassembly, time-to-live control of |

datagrams and checksum verification of header contents. Each *IpAddress* should be unique among *GprsIpServer* Instances. In addition, the IP address should not be the virtual router protocol port logical interface address, the subnet address, or the subnet broadcast address.

### GROUP Gips Ip Statistics (Stats)

Properties: Operational

Description: This group contains the Internet Protocol (IP) related statistical attributes.

### ATTRIBUTE Gips Ip inReceives (inRcvs)

Access: Read: All
Write: Illegal

Description: This attribute counts all the incoming datagrams, including those counted in *inErrors* and *inUnknownProtocols*. The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gips Ip inErrors (inErrs)

Access: Read: All
Write: Illegal

Description: This attribute counts the input datagrams discarded due to errors in their IP headers, version number mismatch, other format errors, and time-to-live exceeded which have not already been

| | |
|---|---|
| | filtered by the Virtual Router's IP forwarder. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip inUnknownProtocols (inUnkProtos)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip inDelivers

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the input datagrams successfully delivered to the IP user-protocols (including Internet Control Message Protocol (ICMP)). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip outRequests (outReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the datagrams which the local IP user-protocols (including Internet Control Message Protocol (ICMP)) supplied to IP in requests for transmission. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gips Ip reasmTimeOuts (reasmTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IP packet reassembly time-outs at the receiving *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip reasmRequireds (reasmReqds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IP packets with the reassembly bit set. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip reasmOks

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IP packets successfully reassembled by the *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip reasmFails

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of times the *GprsIpServer* is unable to assemble IP-fragments for any reason. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Gips Ip Udp

| | |
|---|---|
| Groups | "GROUP Gips Ip Udp Statistics (Stats)" |
| Scope | Application |
| Description | *Gips/n Ip/<ipaddress> Udp*<br><br>This component represents the UDP functionality supported by the GPRS. |
| Opt. Subcomp. | "COMPONENT Gips Ip Udp Port" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gips Ip Udp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all UDP related statistical attributes supported by the *GprsIpServer.* |

## ATTRIBUTE Gips Ip Udp inDatagrams (inDg)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the UDP datagrams delivered to UDP users. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Udp outDatagrams (outDg)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the UDP datagrams sent from the UDP stack. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Udp inUnknownPorts (inUnkPorts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the UDP datagrams received for which there was no associated application at the destination port. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Udp inErrors (inErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gips Ip Udp Port

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Gips Ip Udp Port Provisioned (Prov)" |
| Scope | Application |

| | |
|---|---|
| Description | *Gips/n Ip/<ipaddress> Udp Port/n*<br><br>This component represents a UDP port. GPRS applications link to this port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Gips Ip Udp Port Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute to bind GPRS application to this UDP port. |

### ATTRIBUTE Gips Ip Udp Port linkToApplication (lToApp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the user of this UDP port. |
| Values | Link |
| Default | No default |

### COMPONENT Gips Ip Icmp

| | |
|---|---|
| Groups | "GROUP Gips Ip Icmp Statistics (Stats)" |
| Scope | Application |
| Description | *Gips/n Ip/<ipaddress> Icmp*<br><br>This component represents the Internet Control Message Protocol (ICMP) functionality supported by the GPRS. The ICMP provides feedback from an IP router or gateway to a source host. It can be used to report errors or verify the reachability of routers or end-systems. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP Gips Ip Icmp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Internet Control Message Protocol (ICMP) related statistical attributes. |

## ATTRIBUTE Gips Ip Icmp inMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) messages received by the *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gips Ip Icmp inErrors (inErrs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) messages received by the *GprsIpServer*, but determined as having ICMP specific errors such as bad ICMP checksums or bad length. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp inTimeExceeds (inTimeEx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) time exceeded messages received by the *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp outTimeExceeds (outTimeExcds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) time exceeded messages sent by the *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp inEchos (inEc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) echo request messages received by the *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp outEchoReplies (outEcRe)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the Internet Control Message Protocol (ICMP) echo reply messages sent by this *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp inTimestamps (inTiSta)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) timestamp request messages received by this *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp outTimestampReplies (outTsRep)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) timestamp reply messages sent by this *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp inDestUnreachs (inDestUnr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) destination unreachable messages received by the *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gips Ip Icmp outDestUnreachs (outDestUnr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) destination unreachable messages sent out by this *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp inParmProbs (inProb)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) parameter problem messages received by the *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Icmp outParmProbs (outProbs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) parameter problem messages sent by this *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gips Ip Icmp inSrcQuenchs (inSrcQ)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Internet Control Message Protocol (ICMP) source quench messages received by the *GprsIpServer*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Gips Ip Tcp

| | |
|---|---|
| Groups | "GROUP Gips Ip Tcp Statistics (Stats)" |
| Scope | Application |
| Description | *Gips/n Ip/<ipaddress> Tcp*<br><br>The component represents the TCP functionality supported by the GPRS. |
| Opt. Subcomp. | "COMPONENT Gips Ip Tcp Port" |
| Dyn. Subcomp. | "COMPONENT Gips Ip Tcp TcpEntry" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gips Ip Tcp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics for TCP. |

## ATTRIBUTE Gips Ip Tcp rToAlgorithm

| | |
|---|---|
| Access | Read only |
| Description | Indicate which algorithm was used to calculate the timeout value used for retransmitting unackowledged octet. |

| | |
|---|---|
| Values | other<br>constant<br>rsre<br>vanJacobson |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp rToMin

| | |
|---|---|
| Access | Read only |
| Description | Indicate the minimum value, measured in milliseconds, allowed for retransmission timeout. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | 0 |

### ATTRIBUTE Gips Ip Tcp rToMax

| | |
|---|---|
| Access | Read only |
| Description | Indicates the maximun value, measured in milliseconds, allowed for retransmission timeout. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp maxConn

| | |
|---|---|
| Access | Read only |
| Description | Limit on number of connections the TCP can support. The value is always -1 which indicates that the number of connections supported is dynamic (limited by memory in the system). |
| Values | Signed (-1) |
| Default | -1 |

### ATTRIBUTE Gips Ip Tcp activeOpens

| | |
|---|---|
| Access | Read only |
| Description | The number of times TCP connections have made a direct transition to the ***synSent*** state from the ***closed*** state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp passiveOpens

| | |
|---|---|
| Access | Read only |
| Description | The number of times TCP connections have made a direct transition to the ***synRcvd*** state from the ***listen*** state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp attemptFails

| | |
|---|---|
| Access | Read only |
| Description | The number of times TCP connections have made a direct transition to the ***closed*** state from either the ***synSent*** state or the ***synRcvd*** state, plus the number of times TCP connections have made a direct transition to the ***listen*** state from the ***synRcvd*** state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp estabResets

| | |
|---|---|
| Access | Read only |
| Description | The number of times TCP connections have made a direct transition to the ***closed*** state from either the ***established*** state or the ***closedWait*** state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp currEstab

| | |
|---|---|
| Access | Read only |
| Description | The number of TCP connections for which the current state is either ***established*** or ***closedWait***. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp inSegs

| | |
|---|---|
| Access | Read only |
| Description | The number of segments received, including those received in error. This count includes segments received on currently established connections. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp outSegs

| | |
|---|---|
| Access | Read only |
| Description | The number of segments sent, including those on current connections but excluding those containing only retransmitted octets. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp retransSegs

| | |
|---|---|
| Access | Read only |
| Description | The number of segments retransmitted that is, the number of TCP segments transmitted containing one or more previously transmitted octets. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp inErrs

| | |
|---|---|
| Access | Read only |
| Description | Total number of segments received in error, for example bad TCP checksum. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gips Ip Tcp outRsts

| | |
|---|---|
| Access | Read only |
| Description | Number of TCP segments sent containing the RST flag. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gips Ip Tcp Port

| | |
|---|---|
| Instance | Decimal (0..65535) |
| Groups | "GROUP Gips Ip Tcp Port Provisioned (Prov)" |
| Scope | Application |
| Description | *Gips/n Ip/<ipaddress> Tcp Port/n*<br><br>This component represents a TCP port. GPRS applications using TCP link to this port. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Gips Ip Tcp Port Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attribute to bind a GPRS application to this TCP port. |

### ATTRIBUTE Gips Ip Tcp Port linkToApplication (lToApp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the GPRS application which is to use this TCP port number. |
| Values | Link (Service, linkToPort) |
| Default | No default |

### COMPONENT Gips Ip Tcp TcpEntry

| | |
|---|---|
| Instance | localAddress [IP address]<br>localPort [Decimal (0..65535)]<br>remoteAddress [IP address]<br>remotePort [Decimal (0..65535)] |
| Groups | "GROUP Gips Ip Tcp TcpEntry Operational (Oper)" |
| Scope | Application |
| Description | *Gips/n Ip/<ipaddress> Tcp TcpEntry/<lA>, <lP>, <rA>, <rP>*<br><br>The component defines an entry in the TCP connection table. Each entry corresponds to TCP end-point identified by 4-tuples, *LocalAddress*, *LocalPort*, *RemoteAddress*, and *RemotePort*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Gips Ip Tcp TcpEntry Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains columnar entries for each end-point on the TCP. |

### ATTRIBUTE Gips Ip Tcp TcpEntry state

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute reflects the current state of this Tcp connection. |
| Values | closed<br>listen<br>synSent<br>synReceived<br>established<br>closeWait<br>finWait1<br>closing<br>lastAck<br>finWait2<br>timeWait<br>delete |
| Default | No default |

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Gsc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes to link this component to a Logical Processor and to set the engineering parameters for an instance of *GprsSubscriberControl (Gsc)*. |

## ATTRIBUTE Gsc linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the Logical Processor that the *GprsSubscriberControl (Gsc)* and its subcomponents are provisioned on. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Gsc sgsnNumber (sgsnNum)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the designated E.164 number in the international format for this Serving GPRS Support Node (SGSN). This is used to associate the SGSN in the Home Location Register (HLR) and in the MSC-VLR, to identify the SGSN in the SS7 network and to provide the routing capabilities. |
| Values | String (1..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Gsc maxAttachedSubscribers (maxAttSubs)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of attached subscribers for this instance of *GprsSubscriberControl (Gsc)*.<br><br>The current attached subscribers can be obtained from the attribute *currentlyAttached* defined in the *GprsMobilityManagement* component. Currently attached subscribers are unaffected by changes to this value.<br><br>The sum of the *maxAttachedSubscribers* provisioned on all the *Gsc instances should* not exceed the value of *maxSubscribers* provisioned on the *ServingGprsSupportNode (Sgsn)*.<br><br>Changing the value of this parameter requires a reset of the Gsc card. |

This attribute together with currentlyAttached are used to determine when subscriber count overload occurs (Refer to Gsc subCountOvldAttachesDiscarded).

Values: Decimal (1..1000000)

Default: 500

### ATTRIBUTE Gsc avgActivePdpCPerActiveSub (avgPdpC)

Access: Read: All
Write: All

Description: This attribute specifies the average number of Packet Data Protocol (PDP) contexts that can be active for an active subscriber in this *GprsSubscriberControl (Gsc)*.

Values: Decimal (1.0..16.0)

Default: 1.0

### ATTRIBUTE Gsc localPointCode (localPc)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies the point code of the node that the MAP layer manages.

The point code must be provisioned in one of the following formats:

***basic***: The point code is provisioned as a decimal number in the range ***1..16383*** if the value of the attribute *sccpVariant* in *Gsc/n MapClient* is set to ***itu***.

The point code is provisioned as a decimal number in the range ***1..16777215*** if the value of the attribute *sccpVariant* in *Gsc/n MapClient* is set to ***ansi*** or ***ituChinese***.

***segmented***: The point code is provisioned as three integers,

separated by dots.

If the value of the attribute *sccpVariant* in *Gsc/n MapClient* is set to ***itu***, the first integer must be in the range ***0..7***, the second integer must be in the range ***0..255***, and the third integer must be in the range ***0..7***. A value of ***0.0.0*** is not valid.

If the value of the attribute *sccpVariant* in *Gsc/n MapClient* is set to ***ansi*** or ***ituChinese***, all the three integers must be in the range ***0..255***.

Changing the value of this attribute causes the process to be restarted. When the process is restarted all traffic on the GSC is lost and the Map Client re-registers with the new point code.

| | |
|---|---|
| Values | Integer Sequence |
| Default | No default |

### ATTRIBUTE Gsc linkToLisp

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to the *LawfulInterceptAccessFunction (Liaf)* component that is resident on a *LawfulInterceptServiceProcessor (Lisp)* card and that is used by the *GprsSubscriberControl* entities. |
| Values | Link (Service, linkToLiClient) |
| Default | No default |

### GROUP Gsc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data of the *GprsSubscriberControl (Gsc)* that is needed by the related protocol layers. |

### ATTRIBUTE Gsc unknownRai

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the unknown Routing Area Identifiers (RAI) and their associated information, and lists them in the following format:<br>"<MCC>.<MNC>.<LAC>.<RAC> <Time>"<br><br>where<br><MCC> is the Mobile Country Code<br><MNC> is the Mobile Network Code<br><LAC> is the Location Area Code<br><RAC> is the Routing Area Code<br><Time> is the time at which this lookup failure occurred<br><br>When GPRS Subscriber Control (GSC) fails to look up an RAI while handling GPRS Mobility Management (GMM) procedures, the RAI is added to the list. The list is purged either when it gets full, by replacing the oldest entry, or when a previously unknown RAI gets provisioned. |
| List of | String (1..40, ASCII) |
| List Size | 100 |
| Default | No default |

### GROUP Gsc OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Gsc adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component. |

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Gsc operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Gsc usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Gsc availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal |

users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration

activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Gsc proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Gsc controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

| | |
|---|---|
| | The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Gsc alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. |

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Gsc standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Gsc unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Gsc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes for the Mobile Subscriber Purge functionality on the (UMTS) Serving GPRS Support Node (USGSN or SGSN). |

### ATTRIBUTE Gsc explicitDetachPurge (expDetPurge)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated due to an explicit mobile detach. Mobile Subscriber Purge requests are initiated upon explicit detach when the *purgeOnExplicitDetach* attribute in (U) SGSN MobileSubscriberPurge is enabled.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc operatorInitiatedPurge (opInitPurge)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated by the operator.<br><br>An operator initiated the Mobile Subscriber Purge request by issuing the *clear* command on an (U) SGSN *Imsi* component.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc contextReusePurge (crPurge)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated due to context reuse.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc periodicAuditPurge (auditPurge)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests initiated due to periodic audit. During a periodic audit, Mobile Subscribers whose age is greater than the value specified by the auditPurgeMinimumInactiveAge attribute in (U) SGSN MobileSubscriberPurge are considered candidates for purge.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc msPurgeAckFailures (ackFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge Acknowledgement Failures received from the Home Location Register (HLR).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc msPurgeSendFailures (sendFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Subscriber (MS) Purge requests that were not sent from the (UMTS) Serving GPRS Support Node (USGSN or SGSN) due to network related faults such as SIG failure.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc OvldScOper

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for overload controls for the *Gsc* and *Usc* components. |

### ATTRIBUTE Gsc cpuOvldAttachesDiscarded (cpuOvldAttDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of GPRS Mobility Management (GMM) attach request messages that are discarded due to a CPU overload condition on the GSC and USC applications.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc cpuOvldActivationsDiscarded (cpuOvldActDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Session Management (SM) session activate request messages that are discarded due to CPU overload on the GSC and USC applications.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc subCountOvldAttachesDiscarded (subOvldAttDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of GPRS Mobility Management (GMM) attach request messages that are discarded due to subscriber count overload, which occurs when the value of the *currentlyAttached* attribute is equal to the value of the *maxAttachedSubscribers* attribute.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc OvldOper

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational attributes for overload controls. |

### ATTRIBUTE Gsc cpuOvldMovingAvg (cpuOvldAvg)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the CPU moving average calculated from within the defined moving window, the size of which is determined by the value of *cpuOvldWindowSize attribute*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Gsc cpuOvldWindowSize (cpuOvldWinSz)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the CPU moving average window size. The window size is the duration over which the CPU usage measurements are taken before the average CPU usage is calculated. CPU measurements are separated by a fixed interval. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 60 |

### GROUP Gsc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS GprsSubscriberControl

| | |
|---|---|
| Description | The statistics record generated by the GprsSubscriberControl component. |

### ATTRIBUTE Gsc cpuOvldAttachesDiscarded (cpuOvldAttDisc)

| | |
|---|---|
| Description | This attribute counts the number of GPRS Mobility Management (GMM) attach request messages that are discarded due to a CPU |

overload condition on the GSC and USC applications.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc cpuOvldActivationsDiscarded (cpuOvldActDisc)

Description This attribute counts the number of Session Management (SM) session activate request messages that are discarded due to CPU overload on the GSC and USC applications.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc subCountOvldAttachesDiscarded (subOvldAttDisc)

Description This attribute counts the number of GPRS Mobility Management (GMM) attach request messages that are discarded due to subscriber count overload, which occurs when the value of the *currentlyAttached* attribute is equal to the value of the *maxAttachedSubscribers* attribute.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc cpuOvldMovingAvg (cpuOvldAvg)

Description This attribute indicates the CPU moving average calculated from within the defined moving window, the size of which is determined by the value of *cpuOvldWindowSize* attribute.

The value of the attribute is set at the end of the collection interval.

Values Decimal (0..100)

Units %

### ATTRIBUTE Gsc explicitDetachPurge

Description This attribute counts the Mobile Subscriber (MS) Purge requests initiated due to an explicit mobile detach. Mobile Subscriber

Purge request are initiated upon explicit detach when the *purgeOnExplicitDetach* attribute in (U) SGSN MobileSubscriberPurge is enabled.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc operatorInitiatedPurge

Description This attribute counts the number of Mobile Subscriber (MS) Purge requests initiated by the operator.

An operator initiates the Mobile Subscriber Purge request by issuing the *clear* command on an (U) SGSN *Imsi* component.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc contextReusePurge

Description This attribute counts the number of Mobile Subscriber (MS) Purge requests initiated due to memory reuse.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc periodicAuditPurge

Description This attribute counts the number of Mobile Subscriber (MS) Purge requests initiated due to periodic. During a periodic audit, detached Mobile Subscribers whose age is greater than the value specified by the auditPurgeMinimumInactiveAge attribute in (U) SGSN MobileSubscriberPurge are considered candidates for purge.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc msPurgeAckFailures

Description: This attribute counts the Mobile Subscriber (MS) Purge Acknowledgement Failures received by the (UMTS) Serving GPRS Support Node (USGSN or SGSN) from the Home Location Register (HLR).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc msPurgeSendFailures

Description: This attribute counts the Mobile Subscriber (MS) Purge requests that were not sent from the (UMTS) Serving GPRS Support Node (USGSN or SGSN) due to network related faults such as SIG failure and so on.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Gsc MapClient (Mc)

Groups:
"GROUP Gsc Mc Provisioned (Prov)"
"GROUP Gsc Mc Statistics (Stats)"
"GROUP Gsc Mc MapClientSccpUserInfo (McSccpUI)"
"GROUP Gsc Mc OsiState (State)"
"GROUP Gsc Mc WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS GprsSubscriberControl MapClient"

Scope: Application

Description: *Gsc/n MapClient*

This component represents the *MapClient* functionality of the *GprsSubscriberControl (Gsc)*. The *MapClient* component provides the Mobile Application Part (MAP) over SS7 to interact with the Home Location Register (HLR) via the SS7-IP Gateway.

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc Mc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes to specify the Port Number and the SS7-IP Gateway information that this *MapClient* uses. |

## ATTRIBUTE Gsc Mc mscE164Address (mscEAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute supplies the E.164 number associated with the local MSC SCCP subsystem on the SGSN. This E.164 number will be used in the global title address field of the Calling Party Address (CgPA) when the USC MAP Client attribute *mapCgpaRoutingIndicator* is set to ***globalTitle***.<br><br>If this attribute is changed after the MAP Client has registered with the MAP Stack, the MAP Client will need to deregister with the MAP Stack and then re-register. Any outstanding MAP transactions will be lost as a result of the re-registration.<br><br>If this attribute is empty, the value of the USC's or GSC's E.164 address specified in the *sgsnNumber* attribute is used for the MAP Client's E.164 address. |
| Values | String (0..17, NativeAddress) |
| Default | No default |

## ATTRIBUTE Gsc Mc linkToMapStack (mapLink)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the *MapStack* used by this *MapClient*. |
| Values | Link (Service, linkToMapStackUsers) |
| Default | No default |

### GROUP Gsc Mc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *MapClient* application. |

### ATTRIBUTE Gsc Mc currentTransactions (curTr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates how many MAP transactions are currently being handled by the MAP Client. *currentTransactions* is expressed as a percentage utilization of the number of MAP transactions the MAP Client is capable of handling concurrently.<br><br>A SET alarm is generated by the MAP Client when the percentage utilization reaches a high threshold. A CLEAR alarm is generated by the MAP Client when the percentage utilization reaches a low threshold and an outstanding SET alarm exists. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Gsc Mc uglMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-UPDATE GPRS LOCATION messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc uglResponseMsgs (uglResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the successful MAP-UPDATE GPRS LOCATION RESPONSE messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc isdMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc isdResponseMsgs (isdResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-INSERT SUBSCRIBER DATA RESPONSE messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc dsdMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the MAP-DELETE SUBSCRIBER DATA messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc dsdResponseMsgs (dsdResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-DELETE SUBSCRIBER DATA RESPONSE messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc clMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-CANCEL LOCATION messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc clResponseMsgs (clResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-CANCEL LOCATION RESPONSE messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Mc rstMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-RESET messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc saiMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-SEND AUTHENTICATION INFO messages sent to the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc saiResponseMsgs (saiResp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-SEND AUTHENTICATION INFO ACK messages received from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc transLimitDiscards (trDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the transactions rejected by the MAP Client when the maximum number of concurrent MAP transactions supported by the MAP Client has been exceeded. The maximum number of MAP transactions is constrained by the MAP Client internal memory available to store the transactions. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc tmrExpiries (tmrEx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the times the *mcTimer* (defined in component *Sgsn GprsSubscriberControl* and *Usgsn UmtsSubscriberControl*) expires before receiving a response from the Home Location Register (HLR). This can be used to determine if the provisionable attribute *mcTimer* must be changed, or a problem exists between the Serving GPRS Support Node (SGSN) or Umts Serving General Support Node (USGSN) and the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc ofsmMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-MO-FORWARD-SHORT-MESSAGE messages received by the Inter-working Mobile Switching Center (IWMSC) from the MAP Client. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc ofsmResMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-MO-FORWARD-SHORT-MESSAGE response messages received by the MAP Client from the Inter-working Mobile Switching Center (IWMSC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc tfsmMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-MT-FORWARD-SHORT-MESSAGE messages received by the MAP Client from the Inter-working Mobile Switching Center (IWMSC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc tfsmResMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-MT-FORWARD-SHORT-MESSAGE response messages received by the Inter-working Mobile Switching Center (IWMSC) from the MAP Client. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc rsmMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the MAP-READY-FOR-SM messages received by the Home Location Register (HLR) from the MAP Client. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc rsmResMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP-READY-FOR-SM response messages received by the MAP Client from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc sccpServiceRequestTimeouts

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the MAP Stack Service request timeouts. This could occur if the MAP Stack was not responding to Service requests from the MAP Clients, or if there was an SS7-IP Gateway (SIG) or IP network problem.<br><br>Retries of the Service request are infinite since the MAP Client can not send or receive MAP messages until it is successfully registered with the MAP Stack. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc decodeErrors

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the number of MAP messages received from the peer nodes that are not decodable. The inability to decode the MAP message is caused by the MAP Client receiving a message with invalid data. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc dataMissingRespSent

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “data missing” error responses sent to the peer nodes. This error may occur when optional data is missing from a MAP message received, when required data is missing from a MAP message received, or when an internal data structure is missing data. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc unexpectedDataValuesRespSent (unexpDataRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “unexpected data value” error responses sent to the peer nodes. This error may occur when the parameter type is correct in the MAP message received but contains data which is not relevant for the type of MAP service being invoked. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc systemFailuresRespSent (sysFailRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “system failure” error responses sent to the peer nodes. This error may occur when a task specified in MAP message received cannot be performed because of a problem with another entity. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc unidentifiedSubscribersRespSent (unidentSubRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “unidentified subscriber” error responses sent to the peer nodes. This error may occur when the subscriber is not contained in the subscriber database resulting in the failure to establish a call. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc facilityNotSupportedRespSent (facNotSuppRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “facility not supported” error responses sent to the peer nodes. This error may occur when the requested facility, such as SMS, is not supported. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc smDeliveryFailuresRespSent (smDelFailRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “short message delivery failure” error responses sent to the SMSC. This error may occur when the mobile runs out of memory to store short messages. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc illegalSubscribersRespSent (illegalSubRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “illegal subscriber” error responses sent to the peer nodes. This error may occur when an illegal access attempt is determined during the authentication process. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc illegalEquipmentRespSent

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “illegal equipment” error responses sent to the peer nodes. This error may occur when the International Mobile station Equipment Identity (IMEI) is either blacklisted or not whitelisted. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc subscriberBusyForMtSmsRespSent (subBusyMtSmsRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “subscriber busy for mobile-terminated short message service” error responses sent to the SMSC. This error may occur when mobile terminated short messages cannot be completed. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc absentSubscriberSmRespSent (absentSubSmRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “absent subscriber short message service” error responses sent to the SMSC. This error may occur when the mobile terminated short message transfer cannot be completed because the network cannot contact the subscriber. This may be caused by the mobile being turned off. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc dataMissingRespRecv

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of data missing errors received from the peer nodes. This error may occur when optional data is missing from a MAP message sent, when required data is missing from a MAP message sent, or when an internal data structure is missing data. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Mc unexpectedDataValuesRespRecv (unexpDataRespRecv)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “unexpected data value” error responses received from the peer nodes. This error may occur when the parameter type is correct in the MAP message sent but contains data which is not relevant for the type of MAP service being invoked. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc systemFailuresRespRecv (sysFailRespRecv)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “system failure” error responses received from the peer nodes. This error may occur when a task specified in a MAP message sent cannot be performed because of a problem with another entity. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc unknownSubscribersRespRecv (unkSubRespRecv)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “unknown subscriber” error responses received from the peer nodes. This error may occur when a message sent is processed for a subscription that does not exist. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Mc roamingNotAllowedRespRecv (noRoamRespRecv)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “roaming not allowed” error responses received from the peer nodes. This error may occur when a location update attempt is made in an area not covered by the subscription. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc facilityNotSupportedRespRecv (facNotSuppRespRecv)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “facility not supported” error responses received from the peer nodes. This error may occur when the requested facility, such as SMS, is not supported. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc smDeliveryFailuresRespRecv (smDelFailRespRecv)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of “short message delivery failure” error responses received from the SMSC. This error may occur when the Short Message Service Center returns a delivery error indication in response to a message sent by the MAP Client. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc invalidMessages

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of invalid messages received by the MAP Client. This may occur if the MAP Client receives an unsolicited message, a message with an invalid header, or an invalid dialogue ID. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc isdMsgsUpdateLocation (isdMsgsUpdLoc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) during a GPRS Update Location procedure. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc isdMsgsHlrSubUpdate (isdMsgsHlrSubUp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) due to an HLR operator intervention. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc isdFailures (isdFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-INSERT SUBSCRIBER DATA messages sent to the Home Location Register (HLR) that could not be processed due to one of the following errors:<br><br>Data Missing<br>Unexpected Data Value<br>Unidentified Subscriber<br>Decode errors<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc clMsgsHlrDetach (clMsgsHlrDetach)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) due to an HLR initiated Detach. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc clMsgsSgsnChange (clMsgsSgsnChg)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) due to a Service GPRS Support Node (SGSN) change. The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc clMsgsHlrOther (clMsgsHlrOther)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) with a cancellation type other than a Service GPRS Support Node (SGSN) change or an HLR initiated Detach. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc clFailures (clFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) that could not be processed due to one of the following errors:<br><br>Data Missing<br>Unexpected Data Value<br>Decode errors<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc dsdFailures (dsdFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP-DELETE SUBSCRIBER DATA messages sent to the Home Location |

| | |
|---|---|
| | Register (HLR) that could not be processed due to one of the following errors:<br><br>Data Missing<br>Unexpected Data Value<br>Unidentified Subscriber<br>Decode errors<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc uAbortMsgSent

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP USER ABORT messages sent by the MAP Client to the peer nodes. This message may be sent as a result of a resource limitation caused by congestion or as a result of the unavailability of resources. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc pAbortMsgRecv

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP PROVIDER ABORT messages received by the MAP Client from the peer nodes. This message indicates to the MAP service-user to abort a MAP dialogue. This message may be received due to a MAP service-provider malfunction, supporting dialogue/transaction release, resource limitation, maintenance activity, version incompatibility, or an abnormal MAP dialogue. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Mc uAbortMsgRecv

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of MAP USER ABORT messages received by the MAP Client from the peer nodes. This message indicates to the MAP service-provider to abort a MAP dialogue. This message may be received due to a resource limitation caused by congestion or by unavailability of resources. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc pmsMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Mobile Subscriber Purge messages sent to the Home Location Register (HLR).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc pmsResponseMsgs (pmsRes)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Mobile Subscriber Purge MS Response messages received from the Home Location Register (HLR).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc pslMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the MAP-PROVIDE SUBSCRIBER LOCATION messages received by the MAP Client from the Gateway Mobile Location Center (GMLC).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc pslRespMsgs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the MAP-PROVIDE SUBSCRIBER LOCATION response messages sent by the MAP Client to the Gateway Mobile Location Center (GMLC).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc unauthorizedReqNetworkRespSent (unauthReqNetRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of “Unauthorized Requested Network” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when a Location Request is denied due to the GMLC not being in the home country.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc unauthorizedLcsClientRespSent (unauthLcsCliRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of “Unauthorized LCS Client” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when a Location Request is denied due to privacy restrictions.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc positionMethodFailureRespSent (posMethFailRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of “Positioning Method Failure” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when the position of the mobile cannot be retrieved.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc absentSubscriberRespSent (absentSubRespSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of “Absent Subscriber” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when the subscriber is International Mobile Subscriber Identity (IMSI) detached, in a restricted area, or does not respond to paging.<br><br>The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Mc MapClientSccpUserInfo (McSccpUI)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes of the Sccp User Information of the *MapClient* application |

### ATTRIBUTE Gsc Mc mapCgpaRoutingIndicator (mapRtInd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies routing by global title or point code. If set to ***globalTitle*** the MAP Client sets the CgPA routing indicator to route on global title and supply global title information. If set to ***pointCode*** the MAP Client sets the CgPA routing indicator to route on SSN and supply point code and subsystem number in the CgPA. |
| Values | globalTitle (gt)<br>pointCode (pc) |
| Default | globalTitle |

### ATTRIBUTE Gsc Mc mapSgsnSubsystemNumber (msssn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the MAP SGSN SSN. This SSN is used by SCCP for subsystem routing. |
| Values | Decimal (1..255) |
| Default | 149 |

### ATTRIBUTE Gsc Mc sccpServiceRequestTimer

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the amount of time the MAP Client waits for a response after sending a Service Request primitive to the MAP Protocol Stack.<br><br>The count of timeouts is available in the *sccpServiceRequestTimeouts* attribute.<br><br>Retries of the Service request are infinite since the MAP Client can not send or receive MAP messages until it is successfully registered with the MAP Stack. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Gsc Mc sccpVariant

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SCCP variant used by the MAP Client on this SS7 network for the SCCP Called Party Address that is based on the E.212 or E.214 Mobile Subscriber number. |
| Values | itu<br>ansi<br>ituChinese |
| Default | itu |

### GROUP Gsc Mc OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Gsc Mc adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Gsc Mc operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Gsc Mc usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Gsc Mc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Mc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Mc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS GprsSubscriberControl MapClient

| | |
|---|---|
| Description | The statistics record generated by the GprsSubscriberControl MapClient component. |

### ATTRIBUTE Gsc Mc uglMsgs

| | |
|---|---|
| Description | This attribute indicates the MAP-UPDATE GPRS LOCATION messages sent to the Home Location Register (HLR) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Mc uglResponseMsgs (uglResp)

Description This attribute indicates the successful MAP-UPDATE GPRS LOCATION RESPONSE messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc isdMsgs

Description This attribute indicates the MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc isdResponseMsgs (isdResp)

Description This attribute indicates the MAP-INSERT SUBSCRIBER DATA RESPONSE messages sent to the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc dsdMsgs

Description This attribute indicates the MAP-DELETE SUBSCRIBER DATA messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc dsdResponseMsgs (dsdResp)

Description This attribute indicates the MAP-DELETE SUBSCRIBER DATA RESPONSE messages sent to the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc clMsgs

Description This attribute indicates the MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc clResponseMsgs (clResp)

Description This attribute indicates the MAP-CANCEL LOCATION RESPONSE messages sent to the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc rstMsgs

Description This attribute indicates the MAP-RESET messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc saiMsgs

Description This attribute indicates the MAP-SEND AUTHENTICATION INFO messages sent to the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc saiResponseMsgs (saiResp)

Description This attribute indicates the MAP-SEND AUTHENTICATION INFO RESPONSE messages received from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc transLimitDiscards (trDisc)

Description This attribute indicates the number of transactions rejected by the MAP Client when the maximum number of concurrent MAP transactions supported by the MAP Client has been exceeded. The maximum number of MAP transactions is constrained by the MAP Client internal memory available to store the transactions. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc tmrExpiries (tmrEx)

Description: This attribute indicates the times the *mcTimer* (defined in component *Sgsn GprsSubscriberControl* and *Usgsn UmtsSubscriberControl*) expires before receiving a response from the Home Location Register (HLR). This can be used to determine if the provisionable attribute *mcTimer* must be changed, or a problem exists between the Serving GPRS Support Node (SGSN) or the UMTS Serving General Support Node (USGSN) and the Home Location Register (HLR). This counter counts the value in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc ofsmMsgs

Description: This attribute indicates the MAP-MO-FORWARD-SHORT-MESSAGE messages received by the Inter-working Mobile Switching Center (IWMSC) from the MAP Client in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc ofsmResMsgs

Description: This attribute indicates the MAP-MO-FORWARD-SHORT-MESSAGE response messages received by the MAP Client from the Inter-working Mobile Switching Center (IWMSC) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc tfsmMsgs

Description: This attribute indicates the MAP-MT-FORWARD-SHORT-MESSAGE messages received by the MAP Client from the Inter-working Mobile Switching Center (IWMSC) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc tfsmResMsgs

Description: This attribute indicates the MAP-MT-FORWARD-SHORT-MESSAGE response messages received by the Inter-working

Mobile Switching Center (IWMSC) from the MAP Client in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc rsmMsgs

Description This attribute indicates the MAP-READY-FOR-SM messages received by the Home Location Register (HLR) from the MAP Client in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc rsmResMsgs

Description This attribute indicates the MAP-READY-FOR-SM response messages received by the MAP Client from the Home Location Register (HLR) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc currentTransactions (curTr)

Description This attribute indicates how many MAP transactions are currently being handled by the MAP Client. *currentTransactions* is expressed as a percentage utilization of the number of MAP transactions the MAP Client is capable of handling concurrently.

A SET alarm is generated by the MAP Client when the percentage utilization reaches a high threshold. A CLEAR alarm is generated by the MAP Client when the percentage utilization reaches a low threshold and an outstanding SET alarm exists.

The value reported is the value at the end of the collection interval.

Values Decimal (0..100)

### ATTRIBUTE Gsc Mc sccpServiceRequestTimeouts

Description This attribute indicates the MAP Stack Service request timeouts in the collection interval. This could occur if the MAP Stack was not responding to Service requests from the MAP Clients, or if there was an SS7-IP Gateway (SIG) or IP network problem.

Retries of the Service request are infinite since the MAP Client can not send or receive MAP messages until it is successfully registered with the MAP Stack.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc decodeErrors

Description This attribute indicates, over the collection interval, the number of MAP messages received from the peer nodes that are not decodable. The inability to decode the MAP message is caused by the MAP Client receiving a message with invalid data.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc dataMissingRespSent

Description This attribute indicates, over the collection interval, the number of “data missing” error responses sent to the peer nodes. This error may occur when optional data is missing from a MAP message received, when required data is missing from a MAP message received, or when an internal data structure is missing data.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc unexpectedDataValuesRespSent (unexpDataRespSent)

Description This attribute indicates, over the collection interval, the number of “unexpected data value” error responses sent to the peer nodes. This error may occur when the parameter type is correct in a MAP message received but contains data which is not relevant for the type of MAP service being invoked.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc systemFailuresRespSent (sysFailRespSent)

Description This attribute indicates, over the collection interval, the number of “system failure” error responses sent to the peer nodes. This error may occur when a task specified by a MAP message received cannot be performed because of a problem with another entity.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc unidentifiedSubscribersRespSent (unidentSubRespSent)

Description: This attribute indicates, over the collection interval, the number of “unidentified subscriber” error responses sent to the peer nodes. This error may occur when the subscriber is not contained in the subscriber database resulting in the failure to establish a call.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc facilityNotSupportedRespSent (facNotSuppRespSent)

Description: This attribute indicates, over the collection interval, the number of “facility not supported” error responses sent to the peer nodes. This error may occur when the requested facility, such as SMS, is not supported.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc smDeliveryFailuresRespSent (smDelFailRespSent)

Description: This attribute indicates, over the collection interval, the number of “short message delivery failure” error responses sent to the SMSC. This error may occur when the mobile runs out of memory to store short messages.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc illegalSubscribersRespSent (illegalSubRespSent)

Description: This attribute indicates, over the collection interval, the number of “illegal subscriber” error responses sent to the peer nodes. This error may occur when an illegal access attempt is determined during the authentication process.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc illegalEquipmentRespSent

Description: This attribute indicates, over the collection interval, the number of “illegal equipment” error responses sent to the peer nodes. This error may occur when the International Mobile station Equipment Identity (IMEI) is either blacklisted or not whitelisted.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc subscriberBusyForMtSmsRespSent (SubBusyMtSmsRespSent)

Description: This attribute indicates, over the collection interval, the number of “subscriber busy for mobile-terminated short message service” error responses sent to the SMSC. This error may occur when mobile terminated short messages cannot be completed.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc absentSubscriberSmRespSent (absentSubSmRespSent)

Description: This attribute indicates, over the collection interval, the number of “absent subscriber short message service” error responses sent to the SMSC. This error may occur when the mobile terminated short message transfer cannot be completed because the network cannot contact the subscriber. This may be caused by the mobile being turned off.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc dataMissingRespRecv

Description: This attribute indicates, over the collection interval, the number of “data missing” error responses received from the peer nodes. This error may occur when optional data is missing from a MAP message sent, when required data is missing from a MAP message sent, or when an internal data structure is missing data.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc unexpectedDataValuesRespRecv (unexpDataRespRecv)

Description: This attribute indicates, over the collection interval, the number of “unexpected data value” error responses received from the peer nodes. This error may occur when the parameter type is correct in a MAP message sent but contains data which is not relevant for the type of MAP service being invoked.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc systemFailuresRespRecv (sysFailRespRecv)

Description: This attribute indicates, over the collection interval, the number of “system failure” error responses received from the peer nodes. This error may occur when a task specified by a MAP message

sent cannot be performed because of a problem with another entity.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc unknownSubscribersRespRecv (unkSubRespRecv)

Description This attribute indicates, over the collection interval, the number of “unknown subscriber” error responses received from the peer nodes. This error may occur when a message sent is processed for a subscription that does not exist.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc roamingNotAllowedRespRecv (noRoamRespRecv)

Description This attribute indicates, over the collection interval, the number of “roaming not allowed” error responses received from the HLR or SMSC. This error may occur when a location update attempt is made in an area not covered by the subscription.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc facilityNotSupportedRespRecv (facNotSuppRespRecv)

Description This attribute indicates, over the collection interval, the number of “facility not supported” error responses received from the HLR or SMSC. This error may occur when the requested facility, such as SMS, is not supported.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc smDeliveryFailuresRespRecv (smDelFailRespRecv)

Description This attribute indicates, over the collection interval, the number of “short message delivery failure” error responses received from the SMSC. This error may occur when the Short Message Service Center returns a delivery error indication in response to a message sent by the MAP Client.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc invalidMessages

Description This attribute indicates, over the collection interval, the number of invalid messages received by the MAP Client. This may occur

if the MAP Client receives an unsolicited message, a message with an invalid header, or an invalid dialogue ID.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc isdMsgsUpdateLocation (isdMsgsUpdLoc)

Description This attribute indicates, over the collection interval, the number of MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) during a GPRS Update Location procedure.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc isdMsgsHlrSubUpdate (isdMsgsHlrSubUp)

Description This attribute indicates, over the collection interval, the number of MAP-INSERT SUBSCRIBER DATA messages received from the Home Location Register (HLR) due to an updated mobile subscription.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc isdFailures (isdFail)

Description This attribute indicates the number of MAP-INSERT SUBSCRIBER DATA messages sent to the Home Location Register (HLR) that could not be processed due to one of the following errors:

Data Missing
Unexpected Data Value
Unidentified Subscriber
Decode errors

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc clMsgsHlrDetach (clMsgsHlrDetach)

Description This attribute indicates, over the collection interval, the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) due to an HLR initiated Detach.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc clMsgsSgsnChange (clMsgsSgsnChg)

Description This attribute indicates, over the collection interval, the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) due to a Service GPRS Support Node (SGSN) change.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc clMsgsHlrOther (clMsgsHlrOther)

Description This attribute indicates, over the collection interval, the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) with a cancellation type other than a Service GPRS Support Node (SGSN) change or an HLR initiated Detach.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc clFailures (clFail)

Description This attribute indicates the number of MAP-CANCEL LOCATION messages received from the Home Location Register (HLR) that could not be processed due to one of the following errors:

Data Missing
Unexpected Data Value
Decode errors

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc dsdFailures (dsdFail)

Description This attribute indicates the number of MAP-DELETE SUBSCRIBER DATA messages sent to the Home Location Register (HLR) that could not be processed due to one of the following errors:

Data Missing

Unexpected Data Value
Unidentified Subscriber
Decode errors

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc uAbortMsgSent

Description This attribute indicates, over the collection interval, the number of MAP USER ABORT messages sent by the MAP Client to the peer nodes. This message may be sent as a result of a resource limitation caused by congestion or as a result of the unavailability of resources.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc pAbortMsgRecv

Description This attribute indicates, over the collection interval, the number of MAP PROVIDER ABORT messages received by the MAP Client from the peer nodes. This message indicates to the MAP service-user to abort a MAP dialogue. This message may be received due to a MAP service-provider malfunction, supporting dialogue/transaction release, resource limitation, maintenance activity, version incompatibility, or an abnormal MAP dialogue.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc uAbortMsgRecv

Description This attribute indicates, over the collection interval, the number of MAP USER ABORT messages received by the MAP Client from the peer nodes. This message indicates to the MAP service-provider to abort a MAP dialogue. This message may be received due to a resource limitation caused by congestion or by unavailability of resources.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc pmsMsgs

Description This attribute indicates the number of Mobile Subscriber Purge messages sent to the Home Location Register (HLR).

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc pmsResponseMsgs (pmsRes)

Description This attribute indicated the number of Mobile Subscriber Purge Response messages received from the Home Location Register (HLR).

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc pslMsgs

Description This attribute counts the MAP-PROVIDE SUBSCRIBER LOCATION messages received by the MAP Client from the Gateway Mobile Location Center (GMLC).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc pslRespMsgs

Description This attribute counts the MAP-PROVIDE SUBSCRIBER LOCATION response messages sent by the MAP Client to the Gateway Mobile Location Center (GMLC).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc unauthorizedReqNetworkRespSent (unauthReqNetRespSent)

Description This attribute counts the number of “Unauthorized Requested Network” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when a Location Request is denied due to the GMLC not being in the home country.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc unauthorizedLcsClientRespSent (unauthLcsCliRespSent)

Description: This attribute counts the number of “Unauthorized LCS Client” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when a Location Request is denied due to privacy restrictions.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc positionMethodFailureRespSent (posMethFailRespSent)

Description: This attribute counts the number of “Positioning Method Failure” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when the position of the mobile cannot be retrieved.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mc absentSubscriberRespSent (absentSubRespSent)

Description: This attribute counts the number of “Absent Subscriber” error responses sent to the Gateway Mobile Location Center (GMLC). This error may occur when the subscriber is International Mobile Subscriber Identity (IMSI) detached, in a restricted area, or does not respond to paging.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Gsc GtpMgmt (GtpM)

Groups:
"GROUP Gsc GtpM Provisioned (Prov)"
"GROUP Gsc GtpM Operational (Oper)"
"GROUP Gsc GtpM WlcCustomCounters (WlcCustomCntr)"
"GROUP Gsc GtpM OsiState (State)"

"COLLECTED STATS GprsSubscriberControl GtpMgmt"

Scope: Application

| | |
|---|---|
| Description | *Gsc/n GtpMgmt*<br><br>This component represents the signaling part of the GPRS Tunneling Protocol (GTP) protocol layer which is used to send the control messages. |
| Dyn. Subcomp. | "COMPONENT Gsc GtpM GtpPath (Path)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc GtpM Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attribute of the GPRS Tunneling Protocol (GTP) protocol layer. |

## ATTRIBUTE Gsc GtpM maxTransactions (maxTr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of outstanding GPRS Tunneling Protocol (GTP) messages that can be simultaneously waiting for responses or acknowledgments from the peer GPRS Support Nodes (GSNs).<br><br>The peak number of transactions can be obtained from the attribute *peakTransactions*. |
| Values | Decimal (10..65535) |
| Default | 100 |

## ATTRIBUTE Gsc GtpM maxIncomingRequests (maxInReq)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies the maximum number of outstanding incoming GPRS Tunnelling Protocol (GTP) requests that can be handled. Changing the value changes the amount of memory allocated for these requests. Requests rejected because this maximum is reached are counted by the attribute *incomingRequestsRejected*. |
| Values | Decimal (10..100) |
| Default | 56 |

### ATTRIBUTE Gsc GtpM linkToPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the IP address and the UDP port numbers that the GPRS Tunneling Protocol (GTP) version 0 and version 1 use to communicate with the Gateway GPRS Support Node (GGSN).<br><br>The IP address and UDP ports are specified by setting this attribute to link to the correct *Gips IpAddress Udp Port* components.<br><br>The standards recommend the value of one member of this list (used by GTP Version 0) to be set to *Gips/n IpAddress/ <ipaddress> Udp Port/3386.*<br><br>The standards recommend the value of the other member of this list (used by GTP Version 1) to be set to *Gips/n IpAddress/ <ipaddress> Udp Port/2123.* |
| List of | Link (Service, linkToApplication) |
| List Size | 2 |
| Default | No default |

### GROUP Gsc GtpM Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational data of the GPRS Tunneling Protocol (GTP) protocol layer. |

### ATTRIBUTE Gsc GtpM peakTransactions (peakTr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the peak number of concurrent transactions of the GPRS Tunneling Protocol (GTP).<br><br>The maximum value is provisioned in the attribute *maxTransactions*. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Gsc GtpM peakGgsnPaths (peakGgsnP)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the peak number of managed paths that have been setup between this Serving GPRS Support Node (SGSN)<br>and the Gateway GPRS Support Nodes (GGSNs).<br><br>The maximum value is provisioned in the attribute *maxGgsnPaths* (defined in *Sgsn GprsSubscriberControl*). |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Gsc GtpM sgsnContextReqAttempts (sgsnCntxReqAtt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the SGSN CONTEXT REQUEST messages sent from the new Serving GPRS Support Node (SGSN) to the old SGSN. This counter is incremented in the SGSN acting as the new SGSN. |

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc GtpM sgsnContextReqExhaust (sgsnCntxReqE)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of times *n3SgsnContextRequest* is exhausted and the SGSN CONTEXT REQUEST message is not successful. This attribute is incremented in the Serving GPRS Support Node (SGSN) acting as the new SGSN.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc GtpM updatePdpReqAttempts (uPdpReq)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of UPDATE PDP CONTEXT REQUEST messages that are sent from this Serving GPRS Support Node (SGSN), acting as the new SGSN, to the GGSN.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc GtpM updatePdpReqExhaust (uPdpReqRetE)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of times the retry attribute, *n3UpdatePdpRequest*, is exhausted and the UPDATE PDP CONTEXT REQUEST message is not successful. This attribute

is incremented in the Serving GPRS Support Node (SGSN) acting as the new SGSN.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc GtpM sgsnContextRespAttempts (sgsnCnxtRespAtt)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of SGSN CONTEXT RESPONSE messages which are sent to the new Serving GPRS Support Node (SGSN). This counter is incremented in the SGSN which is acting as the old SGSN. This counter is incremented only the first time the message is sent out per SGSN CONTEXT REQUEST received.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc GtpM sgsnContextRespExhaust (sgsnCntxRespExh)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of times *n3SgsnContextRequest* is exhausted and the SGSN CONTEXT RESPONSE message is not successful. This attribute is incremented in the Serving GPRS Support Node (SGSN) acting as the old SGSN.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc GtpM sgsnContextAcks (sgsnCntxAcks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of SGSN CONTEXT ACK messages sent from the new Serving GPRS Support Node (SGSN) to the old SGSN. This counter is incremented in the SGSN acting as the new SGSN.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc GtpM echoRequestsTransmitted (echoReqTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Echo Request Messages sent over the Gn interface. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc GtpM echoResponsesTransmitted (echoRspTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Echo Response Messages sent over the Gn interface. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc GtpM pathFailures (pathFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the path failures detected by the GPRS Tunnelling Protocol (GTP), based on the attribute *strictPathSupervision*, provisioned in the *Sgsn Gsc* component.<br><br>If the attribute *strictPathSupervision* has a value ***enabled***, failure of the remote end to respond to any GTP request will result in a path failure being declared.<br><br>If the attribute *strictPathSupervision* has a value ***disabled***, then failure of the remote end to respond to an echo request will be marked as a path failure, but all other failures will not be detected.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc GtpM incomingRequestsRejected (inReqReject)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of the incoming GPRS Tunnelling Protocol (GTP) requests that were rejected because the maximum number of outstanding incoming requests was exceeded. This maximum is based on the attribute *maxIncomingRequests*.<br><br>The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc GtpM WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc GtpM customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc GtpM customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc GtpM customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc GtpM OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Gsc GtpM adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Gsc GtpM operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Gsc GtpM usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## COLLECTED STATS GprsSubscriberControl GtpMgmt

Description
The statistics record generated by the GprsSubscriberControl GtpMgmt component.

### ATTRIBUTE Gsc GtpM echoRequestsTransmitted (echoReqTx)

Description
This attribute counts the number of Echo Request Messages sent over the collection interval.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc GtpM echoResponsesTransmitted (echoRspTx)

Description This attribute counts the number of Echo Response Messages sent on the Gn Interface over the collection interval.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc GtpM pathFailures

Description This attribute counts the number of path failures detected by the GPRS Tunnelling Protocol (GTP), based on the attribute *strictPathSupervision*, provisioned in the *Sgsn Gsc* component, over the collection interval.

If the attribute *strictPathSupervision* has a value ***enabled***, failure of the remote end to respond to any GTP request will result in path failure being declared.

If the attribute *strictPathSupervision* has a value ***disabled***, then failure of the remote end to respond to an echo request will be marked as a path failure, but all other failures will not be detected.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc GtpM incomingRequestsRejected (inReqReject)

Description This attribute counts the number of the incoming GPRS Tunnelling Protocol (GTP) requests that were rejected during the collection interval because the maximum number of outstanding incoming requests was exceeded. This maximum is based on the attribute *maxIncomingRequests*.

The count is taken at the end of the collection interval.

Values Decimal (0..4294967295)

## COMPONENT Gsc GtpM GtpPath (Path)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP Gsc GtpM Path OsiState (State)"<br>"GROUP Gsc GtpM Path WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Usc/n GtpC GtpPath/<ipaddress>*<br>*Gsc/n GtpMgmt GtpPath/<ipaddress>*<br><br>This component represents paths managed by the signaling part of the GPRS Tunneling Protocol (GTP) protocol layer. Paths are set up between this (UMTS) Serving GPRS Support Node ((U) SGSN) and the GPRS Support Nodes (GSNs). |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc GtpM Path OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Gsc GtpM Path adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Gsc GtpM Path operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Gsc GtpM Path usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Gsc GtpM Path WlcCustomCounters (WlcCustomCntr)

Properties
Operational

Description
This group contains the spare counters that can be dynamically patched.

### ATTRIBUTE Gsc GtpM Path customCounter1 (customCntr1)

Access
Read: All
Write: Illegal

Description
This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Gsc GtpM Path customCounter2 (customCntr2)

Access
Read: All
Write: Illegal

Description
This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc GtpM Path customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gsc GprsMobilityManagement (Gmm)

| | |

| Groups | "GROUP Gsc Gmm Provisioned (Prov)"<br>"GROUP Gsc Gmm GmmStatistics (GmmStats)"<br>"GROUP Gsc Gmm StatusRxStatistics (StStats)"<br>"GROUP Gsc Gmm GmmCircuitSwStats (CktSwStats)"<br>"GROUP Gsc Gmm GmmAttRejStatistics (GmmAttRejStats)"<br>"GROUP Gsc Gmm WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS GprsSubscriberControl GprsMobilityManagement"

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n GprsMobilityManagement*<br><br>This component represents the GPRS Mobility Management (GMM) protocol layer of the GPRS. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsc Gmm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains provisionable attribute of GPRS Mobility Management (GMM). |

### ATTRIBUTE Gsc Gmm radioPriorityLevel (rpLevel)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the priority level that the Mobile Station (MS) uses for transmission of data related to Mobile Originated Short Message Service (SMS) transmission.<br><br>The Radio Priority Level ***1*** represents the highest priority and ***4*** represents the lowest priority. |
| Values | Decimal (1..4) |
| Default | 4 |

### GROUP Gsc Gmm GmmStatistics (GmmStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *GprsMobilityManagement (Gmm)*. |

### ATTRIBUTE Gsc Gmm authenticationRequests (authReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the AUTHENTICATION AND CIPHERING REQUEST messages sent to the MS requiring only authentication and messages requiring both authentication and ciphering. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm cipheringRequests (ciphReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the AUTHENTICATION AND CIPHERING REQUEST messages sent to the Mobile Stations (MS) requiring only ciphering. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm identityRequests (idReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the IDENTITY REQUEST messages sent to the Mobile Stations (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm ptmsiReallocationRequests (relReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the implicit and explicit P-TMSI REALLOCATION messages sent to the Mobile Stations (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm bssgpSuspendMsgs (bssgpSus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the SUSPEND messages received by the Serving GPRS Support Node (SGSN) from the Base Station System (BSS). The BSS sends this message when a mobile subscriber switches from the packet-switched mode to the circuit-switched mode. The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm bssgpResumeMsgs (bssgpRes)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the RESUME messages received by the Serving GPRS Support Node (SGSN) from the Base Station System (BSS). The BSS sends this message when a mobile subscriber switches from the circuit-switched mode to the packet-switched mode. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm readyStateSubscribers (readySub)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the mobile subscribers that are GPRS-attached and in Ready state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm currentlyAttached (curAtt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Mobile Stations (MS) that are currently GPRS-attached and in Ready or Standby state.<br><br>The maximum subscribers that can be GPRS-attached is provisioned in the *maxAttachedSubscribers* attribute of the parent *GprsSubscriberControl (Gsc) component*.<br><br>This attribute together with maxAttachedSubscribers are used to |

| | |
|---|---|
| | determine when subscriber count overload occurs (Refer to Gsc subCountOvldAttachesDiscarded). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachesSuccessful (attSuc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were successful. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachesWithKnownTlli (knownTlliAtt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ATTACH REQUEST messages received with a Temporary Logical Link Identifier (TLLI) previously assigned by this Serving GPRS Support Node (SGSN). This includes all successful and unsuccessful attempts. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachesWithUnknownTlli (unkTlliAtt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ATTACH REQUEST messages received with a Temporary Logical Link Identifier (TLLI) not assigned by this Serving GPRS Support Node (SGSN). This includes all successful and unsuccessful attempts. The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachesWithImsi (attWithImsi)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ATTACH REQUEST messages received with an International Mobile Subscriber Identity (IMSI) as an identifier. This includes all successful and unsuccessful attempts. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachesWithInfoAttempts (attWithInfo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ATTACH attempts by mobile subscribers with the GPRS Mobility Management (GMM) context held in the Serving GPRS Support Node (SGSN). This includes all successful and unsuccessful attempts. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm detachesSuccessful (detSuc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the successful DETACHes that are either mobile or network initiated. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm msDetachRequests (msDetReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated DETACH REQUEST messages received by this Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm msDetachRejected (msDetRej)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Mobile Station (MS) initiated GPRS-DETACH REQUEST messages which have been rejected by this Serving GPRS Support Node (SGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm nwkDetachRequests (nwkDetReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the network initiated DETACH REQUEST messages sent to a mobile subscriber. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm authenticationsRejected (authRej)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the AUTHENTICATION AND CIPHERING REJECT messages sent to the Mobile Station (MS) due to authentication failures. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm normalIntraSgsnRaUpdate (norIntraSgsnRau)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the normal intra-Serving GPRS Support Node (SGSN) ROUTING AREA UPDATE REQUEST messages received from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm periodicIntraSgsnRaUpdate (perIntraSgsnRau)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the periodic intra-Serving GPRS Support Node (SGSN) ROUTING AREA UPDATE REQUEST messages from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm normalInterSgsnRaUpdate (interSgsnRau)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the inter-Serving GPRS Support Node (SGSN) ROUTING AREA UPDATE REQUEST messages from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm intraRaCellChange (intraRaCellCh)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the intra-Serving GPRS Support Node (SGSN) intra-Routing Area Update cell changes performed by the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm initialPsPageRequests (initPgReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the initial PS (Packet-Switched) PAGE REQUEST messages sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm reattemptPsPageRequests (rePgReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the re-attempt PS (Packet-Switched) PAGE REQUEST messages sent to the Mobile Station (MS) after the initial page request. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm interSgsnRaUpdateAccepts (irauAccepts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ROUTING AREA UPDATE ACCEPT messages sent from this SGSN, while acting as the new SGSN, to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm t3Timeouts (t3To)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *t3TunnelTimer* (defined in *Sgsn GprsSubscriberControl*) expires in this SGSN, while acting as the old SGSN, and the CANCEL LOCATION message has been received. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm msPresentAttempts (msPresentAtt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the SGSN detects that the Mobile Station (MS) has recovered operation such as responded to a paging request via the SGSN. If the MS has alerted the SGSN and the HLR that its memory has exceeded, then the HLR will not notify the Service Center that the MS is ready for Short Message Services (SMS).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Gmm nwkDetachReachableTimer (nwkDetReach)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of network initiated detaches due to the expiration of reachable timer. The *mobileReachableTimer* attribute is provisioned in the *Sgsn Gsc* component.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm nwkDetachCancelLocation (nwkDetCancelLoc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of network initiated detaches in the specified cell due to the receipt of CANCEL LOCATION Messages from the Home Location Register (HLR).<br><br>This counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm nwkDetachDuplicateAttach (nwkDetDupAtt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of network initiated detaches due to mobile reattaches with a new random Packet Temporary (PTMSI) without first performing a detach. This is an implicit detach and no detach message is sent to the mobile.<br><br>The counter counts the events in the collection interval. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm nwkDetachTempNetworkFailure (nwkDetNetFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of network initiated detaches in this cell due to temporary network problems.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm nwkDetachForReattach (nwkDetReatt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of network initiated detaches with a detach type of "reattach required".<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Gmm StatusRxStatistics (StStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *GprsMobilityManagement (Gmm)*. |

### ATTRIBUTE Gsc Gmm retriesUponEntry (nEntry)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a status message from a Mobile |

| | |
|---|---|
| | Station (MS) to indicate a retry upon entry into a new cell. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm incorrectMsgs (incorrMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a status message from a Mobile Station (MS) indicating that a semantically incorrect message was received by the MS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm invalidMandatoryInfos (invMandInfos)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of mobile originated messages containing invalid mandatory information that are received by the Serving GPRS Support Node (SGSN).<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm unimplementedMsgs (uniMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a status message from a Mobile Station (MS) indicating an unimplemented or unrecognized |

| | |
|---|---|
| | message was received by the MS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm incompatibleMsgsType (incMsgsT)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a status message from a Mobile Station (MS) indicating a message type received by the MS was not compatible with the protocol state of the MS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm unimplementedInfos (uniInfos)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a status message from a Mobile Station (MS) indicating an unimplemented or unrecognized information element inside a message was received by the MS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm conditionalIeErrors (condIeErrs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a status message from a Mobile Station (MS) indicating that a message containing a conditional |

| | |
|---|---|
| | information element error was received by the MS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm incompatibleMsgs (incMsgs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a status message from a Mobile Station (MS) indicating a message received by the MS was not compatible with the protocol state of the MS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm unspecifiedProtocolErrors (unPerrs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a status message from the Mobile Station (MS) indicating that the MS received a message containing an unspecified protocol error. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm miscStatusRx (mStRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) received a miscellaneous status message from a Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Gmm GmmCircuitSwStats (CktSwStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *GprsMobilityManagement (Gmm) circuit switched services*. |

### ATTRIBUTE Gsc Gmm circuitAttachedCurrent (cktAttCur)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of Mobile Stations (MSs) that are currently attached to the *GprsSubscriberControl* for circuit switched services. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm circuitAttachTotal (cktAttTot)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the successful mobile attaches to the *GprsSubscriberControl* for circuit switched services. Every time a mobile attaches (or re-attaches) for circuit switched services, the count is incremented.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm vlrUnreliableMobileCurrent (vlrUnMobCur)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the number of Mobile Stations (MSs) currently attached for circuit switched services that have set *vlrReliable* (defined in *Sgsn Imsi/<imsi> Bssap* or *Gsc/n Imsi/<imsi> Bssap*) to ***false***. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Gmm GmmAttRejStatistics (GmmAttRejStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the Attach rejects for *GprsMobilityManagement (Gmm)*. |

### ATTRIBUTE Gsc Gmm attachRejIllegalMs (attRejIllMs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause Illegal Ms. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachRejGprsServNotAllowed (attRejGprsServ)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause Gprs Service not allowed. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachRejGprsServNotAllowedInPlmn (attRejGprsServPlmn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause "Gprs Service not allowed in this PLMN".<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachRejPlmnNotAllowed (attRejPlmn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause PLMN not allowed. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachRejPacketNetworkFailure (attRejNetFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause Network Failure. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachRejSgsnCongestion (attRejCongest)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause Congestion. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachRejMsgError (attRejMsgErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of one of the following reject causes:<br>Semantically incorrect message,<br>Invalid mandatory information,<br>Message type non-existence or not implemented,<br>Message type not compatible with the protocol state,<br>Information element non-existent or not implemented,<br>Conditional IE error,<br>Message not compatible with the protocol state,<br>Protocol error, unspecified.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm attachRejRoamNotAllowedInLocArea (attRejRoam)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause "roaming not allowed in location area". |

| | |
|---|---|
| | This counter is incremented when a Unit Data Transfer Service message (UDTS) is received from the SS7/IP Gateway (SIG) for a Update GPRS Location (UGL) or a Send Authentication Info (SAI), or when the global title translation failure occurs in the MapClient component.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Gmm WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Gmm customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Gmm customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE Gsc Gmm customCounter3 (customCntr3)

Access Read: All
Write: Illegal

Description This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS GprsSubscriberControl GprsMobilityManagement

Description The statistics record generated by the GprsSubscriberControl GprsMobilityManagement component.

### ATTRIBUTE Gsc Gmm authenticationRequests (authReqs)

Description This attribute counts the AUTHENTICATION AND CIPHERING REQUEST messages sent to the MS requiring only authentication and messages requiring both authentication and ciphering. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm cipheringRequests (ciphReqs)

Description This attribute counts the AUTHENTICATION AND CIPHERING REQUEST messages sent to the Mobile Stations (MS) requiring only ciphering in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm identityRequests (idReqs)

Description This attribute counts the IDENTITY REQUEST messages sent to the Mobile Stations (MS) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm ptmsiReallocationRequests (relReqs)

| | |
|---|---|
| Description | This attribute counts the implicit and explicit P-TMSI REALLOCATION messages sent to the Mobile Stations (MS) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm bssgpSuspendMsgs (bssgpSus)

| | |
|---|---|
| Description | This attribute counts the SUSPEND messages received by the Serving GPRS Support Node (SGSN) from the Base Station System (BSS). The BSS sends this message when a mobile subscriber switches from packet-switched mode to circuit-switched mode. This counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm bssgpResumeMsgs (bssgpRes)

| | |
|---|---|
| Description | This attribute counts the RESUME messages received by the Serving GPRS Support Node (SGSN) from the Base Station System (BSS). The BSS sends this message when a mobile subscriber switches from circuit-switched mode to packet-switched mode. This counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm readyStateSubscribers (readySub)

| | |
|---|---|
| Description | This attribute indicates the mobile subscribers that are GPRS-attached and in Ready state. This value reported is the value at the end of the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm currentlyAttached (curAtt)

| | |
|---|---|
| Description | This attribute indicates the Mobile Stations (MS) that are currently GPRS-attached and in Ready or Standby state. This value reported is the value at the end of the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm attachesSuccessful (attSuc)

Description: This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were successful in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachesWithKnownTlli (knownTlliAtt)

Description: This attribute counts the ATTACH REQUEST messages received with a Temporary Logical Link Identifier (TLLI) previously assigned by this Serving GPRS Support Node (SGSN). This includes all successful and unsuccessful attempts. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachesWithUnknownTlli (unkTlliAtt)

Description: This attribute counts the ATTACH REQUEST messages received with a Temporary Logical Link Identifier (TLLI) not assigned by this Serving GPRS Support Node (SGSN). This includes all successful and unsuccessful attempts. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachesWithImsi (attWithImsi)

Description: This attribute counts the ATTACH REQUEST messages received with an International Mobile Subscriber Identity (IMSI) as an identifier. This includes all successful and unsuccessful attempts. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachesWithInfoAttempts (attWithInfo)

Description: This attribute counts the ATTACH attempts by mobile subscribers with the GPRS Mobility Management (GMM) context held in the Serving GPRS Support Node (SGSN). This includes all successful and unsuccessful attempts. This counter counts the events in the collection interval.

| | |
|---|---|
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm detachesSuccessful (detSuc)

| | |
|---|---|
| Description | This attribute counts the successful mobile or network initiated DETACHes in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm msDetachRequests (msDetReqs)

| | |
|---|---|
| Description | This attribute counts the Mobile Station (MS) initiated DETACH REQUEST messages received by this Serving GPRS Support Node (SGSN) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm msDetachRejected (msDetRej)

| | |
|---|---|
| Description | This attribute counts the Mobile Station (MS) initiated GPRS-DETACH REQUEST messages which have been rejected by this Serving GPRS Support Node (SGSN) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm nwkDetachRequests (nwkDetReqs)

| | |
|---|---|
| Description | This attribute counts the network initiated DETACH REQUEST messages sent to a mobile subscriber in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm authenticationsRejected (authRej)

| | |
|---|---|
| Description | This attribute counts the AUTHENTICATION AND CIPHERING REJECT messages sent to the Mobile Station (MS) due to authentication failures in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm normalIntraSgsnRaUpdate (norIntraSgsnRau)

| | |
|---|---|
| Description | This attribute counts the normal intra-Serving GPRS Support Node (SGSN) ROUTING AREA UPDATE REQUEST messages received from the Mobile Station (MS) in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm periodicIntraSgsnRaUpdate (perIntraSgsnRau)

Description This attribute counts the periodic intra-Serving GPRS Support Node (SGSN) ROUTING AREA UPDATE REQUEST messages from the Mobile Station (MS) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm normalInterSgsnRaUpdate (interSgsnRau)

Description This attribute counts the inter-Serving GPRS Support Node (SGSN) ROUTING AREA UPDATE REQUEST messages from the Mobile Station (MS) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm intraRaCellChange (intraRaCellCh)

Description This attribute counts the intra-Serving GPRS Support Node (SGSN) intra-Routing Area cell changes performed by the Mobile Station (MS) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm initialPsPageRequests (initPgReq)

Description This attribute counts the initial PS (Packet-Switched) PAGE REQUEST messages sent to the Mobile Station (MS) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm reattemptPsPageRequests (rePgReq)

Description This attribute counts the re-attempt PS (Packet-Switched) PAGE REQUEST messages sent to the Mobile Station (MS) after the initial page request in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm interSgsnRaUpdateAccepts (irauAccepts)

Description This attribute counts the ROUTING AREA UPDATE ACCEPT messages sent from this SGSN, while acting as the new SGSN, to the Mobile Station (MS) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm t3Timeouts (t3To)

Description This attribute counts the number of times the *t3TunnelTimer* (defined in *Sgsn GprsSubscriberControl*) expires in this SGSN, while acting as the old SGSN, and the CANCEL LOCATION message has been received. The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm msPresentAttempts (msPresentAtt)

Description This attribute indicates, for the collection interval, the number of times the SGSN detects that the Mobile Station (MS) has recovered operation such as responded to a paging request via the SGSN. If the MS has alerted the SGSN and the HLR that its memory has exceeded, then the HLR will not notify the Service Center that the MS is ready for Short Message Services (SMS).

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm nwkDetachReachableTimer (nwkDetReach)

Description This attribute counts the number of network initiated detaches due to the expiration of reachable timer. The *mobileReachableTimer* attribute is provisioned in the *Sgsn Gsc* component.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm nwkDetachCancelLocation (nwkDetCancelLoc)

Description This attribute counts the number of network initiated detaches due to the receipt of CANCEL LOCATION Messages from the Home Location Register (HLR).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm nwkDetachDuplicateAttach (nwkDetDupAtt)

| | |
|---|---|
| Description | This attribute counts the number of network initiated detaches due to mobile reattaches with a new random Packet Temporary Mobile Subscriber Identity (PTMSI) without first performing a detach.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm nwkDetachTempNetworkFailure (nwkDetNetFail)

| | |
|---|---|
| Description | This attribute counts the number of network initiated detaches due to temporary network problems.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm nwkDetachForReattach (nwkDetReatt)

| | |
|---|---|
| Description | This attribute counts the number of network initiated detaches with a detach type of "reattach required".<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm attachRejIllegalMs (attRejIllMs)

| | |
|---|---|
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected during the collection interval because of the reject cause “Illegal Ms”. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm attachRejGprsServNotAllowed (attRejGprsServ)

| | |
|---|---|
| Description | This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected during the collection interval because of the reject cause “Gprs Service not allowed”. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Gmm attachRejGprsServNotAllowedInPlmn (attRejGprsServPlmn)

Description: This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause "Gprs Service not allowed in this PLMN".

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachRejPlmnNotAllowed (attRejPlmn)

Description: This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected during the collection interval because of the reject cause “PLMN not allowed”.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachRejPacketNetworkFailure (attRejNetFail)

Description: This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected during the collection interval because of the reject cause “Network Failure”.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachRejSgsnCongestion (attRejCongest)

Description: This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected during the collection interval because of the reject cause “Congestion”.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachRejMsgError (attRejMsgErr)

Description: This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected during the collection interval because of one of the following reject causes:
Semantically incorrect message,
Invalid mandatory information,
Message type non-existence or not implemented,
Message type not compatible with the protocol state,
Information element non-existent or not implemented,
Conditional IE error,

Message not compatible with the protocol state,
Protocol error, unspecified.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Gmm attachRejRoamNotAllowedInLocArea (attRejRoam)

Description This attribute counts the GPRS-attaches to this Serving GPRS Support Node (SGSN) that were rejected because of the reject cause "roaming not allowed in location area".

This counter is incremented when a Unit Data Transfer Service message (UDTS) is received from the SS7/IP Gateway (SIG) for a Update GPRS Location (UGL) or a Send Authentication Info (SAI), or when the global title translation failure occurs in the MapClient component.

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### COMPONENT Gsc SessionManagement (Sm)

Groups "GROUP Gsc Sm Provisioned (Prov)"
"GROUP Gsc Sm SmStatistics (SmStats)"
"GROUP Gsc Sm MsInitPdpCfailStats (MsInitStats)"
"GROUP Gsc Sm NwkInitPdpCdeactStats (NwkInitStats)"
"GROUP Gsc Sm WlcCustomCounters (WlcCustomCntr)"
"GROUP Gsc Sm PdpModOper"

"COLLECTED STATS GprsSubscriberControl SessionManagement"

Scope Application

Description *Gsc/n SessionManagement*

This component represents the Session Management (SM) protocol layer of the GPRS.

Common Verbs Help
List
Display

### GROUP Gsc Sm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attribute to specify the *DnsAgent* that this S*essionManagement (Sm)* uses. |

### ATTRIBUTE Gsc Sm linkToDnsAgent (lToDns)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the *DnsAgent* to be used by the *SessionManagement*. |
| Values | Link (Service, linkToDnsClient) |
| Default | No default |

### GROUP Gsc Sm SmStatistics (SmStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *SessionManagement (Sm) protocol layer.* |

### ATTRIBUTE Gsc Sm currentPdpContexts (curPdpc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of currently active Packet Data<br>Protocol (PDP) contexts. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm mobileInitActivations (mia)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the successful Mobile-Initiated Packet Data Protocol (PDP) context activations for this *SessionManagement* |

| | |
|---|---|
| | *(Sm)* component. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm mobileInitDeacts (mid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Packet Data Protocol (PDP) context deactivations initiated by the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm ggsnInitDeacts (nwkD)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Packet Data Protocol (PDP) context deactivations initiated by the Gateway GPRS Support Node (GGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm sgsnInitDeacts (sgsnD)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Packet Data Protocol (PDP) context deactivations initiated locally from the Serving GPRS Support Node (SGSN) (for example, an implicit session deactivation as a result of a Gateway GPRS Support Node (GGSN) restart or path failure).<br><br>The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm hlrInitDeacts (hlrD)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Packet Data Protocol (PDP) context deactivations initiated by the Home Location Register (HLR), for example, Delete Subscriber Data (DSD) withdrawing subscription for an active session. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm currentRoamers (curR)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the current roamers that are currently being serviced by the SGSN. A roamer is a mobile that is not in its H-PLMN. This attribute is incremented whenever a PDP context is activated and is decremented whenever a PDP context is de-activated. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm nwkPdpModifyInitiated (nwkPdpMi)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the NWK PDP MODIFY CONTEXT REQUEST messages sent to the Mobile Station (MS). This counter is incremented in the SGSN acting as the new SGSN. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE Gsc Sm nwkPdpModifyRetriesExhausted (nwkPdpMRetE)

Access Read: All
Write: Illegal

Description This attribute counts the number of times the *nwkPdpModifyRetires* attribute is exhausted. This counter is incremented in the SGSN acting as the new SGSN. The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Gsc Sm currentQosReliability (curQosRel)

Access Read: All
Write: Illegal

Description This attribute indicates the currently active Packet Data Protocol (PDP) contexts for each Quality of Service (QoS) Reliability Class.

The Reliability values have the following meaning:

| RelClass | GTP | LLC | RLC | Data |
|---|---|---|---|---|
| 1 | Acked | Acked | Acked | Protected |
| 2 | UnAcked | Acked | Acked | Protected |
| 3 | UnAcked | UnAcked | Acked | Protected |
| 4 | UnAcked | UnAcked | UnAcked | Protected |
| 5 | UnAcked | UnAcked | UnAcked | UnProtected |

where GTP is GPRS Tunnelling Protocol, LLC is Logical Link Control, and RLC is Radio Link Control.

Vector of Decimal (0..4294967295)

Index Decimal (0..5)

Default No default

### ATTRIBUTE Gsc Sm totalQosReliability (totQosRel)

Access
Read: All
Write: Illegal

Description
This attribute counts the Packet Data Protocol (PDP) contexts that were activated for each Quality of Service (QoS) Reliability Class. The counter wraps to zero when it exceeds the maximum value.

The Reliability values have the following meaning:

| RelClass | GTP | LLC | RLC | Data |
|---|---|---|---|---|
| 1 | Acked | Acked | Acked | Protected |
| 2 | UnAcked | Acked | Acked | Protected |
| 3 | UnAcked | UnAcked | Acked | Protected |
| 4 | UnAcked | UnAcked | UnAcked | Protected |
| 5 | UnAcked | UnAcked | UnAcked | UnProtected |

where GTP is GPRS Tunnelling Protocol, LLC is Logical Link Control, and RLC is Radio Link Control.

### GROUP Gsc Sm MsInitPdpCfailStats (MsInitStats)

Properties
Operational

Description
This group contains the statistical attributes that display the Mobile
Station (MS) initiated Packet Data Protocol (PDP) Context activations rejected by the Serving GPRS Support Node (SGSN).

### ATTRIBUTE Gsc Sm insufficientResources (insufRes)

Access
Read: All
Write: Illegal

Description
This attribute counts the Mobile Station (MS) initiated activations rejected by the Serving GPRS Support Node (SGSN) due to the cause code NO RESOURCES AVAILABLE. This counter is

| | |
|---|---|
| | incremented either due to the SGSN having insufficient resources for the session, or the Gateway GPRS Support Node (GGSN) returning a cause code of NO RESOURCES AVAILABLE in the CREATE PDP CONTEXT RESPONSE message. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm missingOrUnknownApn (mOrUn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the requested service being rejected by the external packet data network. The service is rejected because the Access Point Name (APN) was not included although required or if the APN was not resolved. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm unknownPdpAddrOrPdpType (unPdpAorT)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a CREATE PDP CONTEXT RESPONSE message was received from the Gateway GPRS Support Node (GGSN) with the cause code SERVICE NOT SUPPORTED. This can be due to the requested service being rejected by the external packet data network because the Packet Data Protocol (PDP) address or the PDP type was not recognized. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm userAuthenticationsFailed (userAuthFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times a CREATE PDP CONTEXT REQUEST message was received from the Gateway GPRS Support Node (GGSN) with the cause code USER AUTHENTICATION FAILED. This can be due to the requested service being rejected by the external packet data network due to a failed user authentication. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm activationsRejectedByGgsn (actRej)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the requested service being rejected by the Gateway GPRS Support Node (GGSN) with a cause code that is not mappable to a cause code in the ACTIVATE PDP CONTEXT REJECT message. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm activationsRejectedUnspecified (actRejUn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to unspecified reasons. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Sm reqServiceOptionsNotSubscribed (reqOp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the MS requesting a service for which it has no subscription. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm serviceOptionsTempOutOfOrder (serOp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to temporary outage of one or more functions required for supporting the service. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm nsapiAlreadyUsed (nsapiUsed)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the MS requesting a Network-Service Access Point Identifier (N-SAPI) in the Packet Data Protocol (PDP) context activation, which is already used by another active PDP context of this MS. The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm semanticallyIncorrectMesages (inMsg)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the receipt of a message with semantically incorrect contents. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm invalidMandatoryInfoElements (invInfo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the receipt of a message with errors in a mandatory Information Element (IE). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm msgTypeNotCompWithProtState (notComp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the receipt of a message type not compatible with the current protocol state. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE Gsc Sm protocolErrorUnspecified (proErr)

Access Read: All
Write: Illegal

Description This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to a protocol error event which does not fit into any specific protocol error class. The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### GROUP Gsc Sm NwkInitPdpCdeactStats (NwkInitStats)

Properties Operational

Description This group contains statistical attributes that display the abnormal Network-initiated Packet Data Protocol (PDP) context deactivations sent to the Mobile Station (MS).

### ATTRIBUTE Gsc Sm networkFailures (nwkFail)

Access Read: All
Write: Illegal

Description This attribute counts the number of times the Serving GPRS Support Node (SGSN) sent a Packet Data Protocol (PDP) CONTEXT DEACTIVATION REQUEST message to the Mobile Station (MS) with a cause code of NETWORK FAILURE. This cause code is sent due to an error situation in the network. The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Gsc Sm reactivationsRequested (reactReq)

Access Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute counts the number of times the Serving GPRS Support Node (SGSN) sent a Packet Data Protocol (PDP) CONTEXT DEACTIVATION REQUEST message to the Mobile Station (MS) with a cause code of REACTIVATE REQUEST. This<br>cause code is sent to MS to request session reactivation. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Sm WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Sm customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Sm PdpModOper

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes of the Session Management (SM) protocol layer associated with the Packet Data Protocol (PDP) context modification. |

### ATTRIBUTE Gsc Sm sgsnInitModifyAttempts (sgsnInitMod)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN), for example, as a result of QoS renegotiations with the Mobile Station (MS). This counter is pegged only during SGSN Initiated PDP Context Modification.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sm sgsnInitFailAtMs (sgsnInitMsFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS |

Support Node (SGSN) that failed at the Mobile Station (MS).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sm sgsnInitFailAtGgsn (sgsnInitGgsnFail)

Access: Read: All
Write: Illegal

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the Gateway GPRS Support Node (GGSN).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sm sgsnInitFailAtSgsn (sgsnInitSgsnFail)

Access: Read: All
Write: Illegal

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the SGSN.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sm msInitModifyAttempts (msInitMod)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sm msInitFailAtGgsn (msInitGgsnFail)

Access: Read: All
Write: Illegal

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the Gateway GPRS Support Node (GGSN).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sm msInitFailAtSgsn (msInitSgsnFail)

Access: Read: All
Write: Illegal

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the Serving GPRS Support Node (SGSN).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

## COLLECTED STATS GprsSubscriberControl SessionManagement

Description: The statistics record generated by the GprsSubscriberControl SessionManagement component.

### ATTRIBUTE Gsc Sm currentPdpContexts (curPdpc)

Description: This attribute indicates the number of currently active Packet Data Protocol (PDP) contexts in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm mobileInitActivations (mia)

Description: This attribute counts the successful Mobile-initiated Packet Data Protocol (PDP) context activations for this *SessionManagement (Sm)* component in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm mobileInitDeacts (mid)

Description: This attribute counts the Packet Data Protocol (PDP) context deactivations initiated by the Mobile Station (MS) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm ggsnInitDeacts (nwkD)

Description: This attribute counts the Packet Data Protocol (PDP) context deactivations initiated by the Gateway GPRS Support Node (GGSN) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm sgsnInitDeacts (sgsnD)

Description: This attribute counts the Packet Data Protocol (PDP) context deactivations initiated locally from the Serving GPRS Support Node (SGSN) (for example, an implicit session deactivation as a result of a Gateway GPRS Support Node (GGSN) restart or path failure).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm hlrInitDeacts (hlrD)

Description

This attribute counts the Packet Data Protocol (PDP) context deactivations initiated by the Home location Register (HLR), for example, Delete Subscriber Data (DSD) withdrawing subscription for an active session. This counter counts the events in the collection interval.

Values

Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm currentQosReliability (curQosRel)

Description

This attribute indicates the currently active Packet Data Protocol (PDP) contexts for each Quality of Service (QoS) Reliability Class. This value reported is the value at the end of the collection interval.

The Reliability values have the following meaning:

| RelClass | GTP | LLC | RLC | Data |
|---|---|---|---|---|
| 1 | Acked | Acked | Acked | Protected |
| 2 | UnAcked | Acked | Acked | Protected |
| 3 | UnAcked | UnAcked | Acked | Protected |
| 4 | UnAcked | UnAcked | UnAcked | Protected |
| 5 | UnAcked | UnAcked | UnAcked | UnProtected |

where GTP is GPRS Tunnelling Protocol, LLC is Logical Link Control, and RLC is Radio Link Control.

Vector of

Decimal (0..4294967295)

Index

Decimal (0..5)

### ATTRIBUTE Gsc Sm totalQosReliability (totQosRel)

Description

This attribute counts the Packet Data Protocol (PDP) contexts that were activated for each Quality of Service (QoS) Reliability Class. This counter counts the events in the collection interval.

The Reliability values have the following meaning:

| RelClass | GTP | LLC | RLC | Data |
|---|---|---|---|---|
| 1 | Acked | Acked | Acked | Protected |
| 2 | UnAcked | Acked | Acked | Protected |

| | | | | |
|---|---|---|---|---|
| 3 | UnAcked | UnAcked | Acked | Protected |
| 4 | UnAcked | UnAcked | UnAcked | Protected |
| 5 | UnAcked | UnAcked | UnAcked | UnProtected |

where GTP is GPRS Tunnelling Protocol, LLC is Logical Link Control, and RLC is Radio Link Control.

Vector of Decimal (0..4294967295)

Index Decimal (0..5)

### ATTRIBUTE Gsc Sm currentRoamers (curR)

Description This attribute indicates the current number of roamer sessions that are currently being serviced by the SGSN. A roamer is a mobile that is not in its H-PLMN. This attribute is incremented whenever a PDP context is activated and is decremented whenever a PDP context is de-activated. This counter counts the events at the end of the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm nwkPdpModifyInitiated (nwkPdpMi)

Description This attribute counts the NWK PDP MODIFY CONTEXT REQUEST messages sent to the Mobile Station (MS). This counter is incremented in the SGSN acting as the new SGSN. The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm nwkPdpModifyRetriesExhausted (nwkPdpMRetE)

Description This attribute counts the number of times the *nwkPdpModifyRetires* attribute is exhausted. This counter is incremented in the SGSN acting as the new SGSN. The counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm insufficientResources (insufRes)

Description This attribute counts the Mobile Station (MS) initiated activations rejected by the Serving GPRS Support Node (SGSN) due to

insufficient resources. This counter is incremented either due to the SGSN having insufficient resources for the session, or the Gateway GPRS Support Node (GGSN) returning a cause code of “No resources available” in the CREATE PDP CONTEXT RESPONSE message. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm missingOrUnknownApn (mOrUn)

Description This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the requested service being rejected by the external packet data network because the Access Point Name (APN) was not included although required or if the APN was not resolved. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm unknownPdpAddrOrPdpType (unPdpAorT)

Description This attribute counts the number of times a CREATE PDP CONTEXT RESPONSE message was received from the Gateway GPRS Support Node (GGSN) with the cause “Service not supported”. This can be due to the requested service being rejected by the external packet data network because the Packet Data Protocol (PDP) address or the PDP type was not recognized. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm userAuthenticationsFailed (userAuthFail)

Description This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the requested service being rejected by the external packet data network due to a failed user authentication. The SGSN increments this counter when a cause code of “User Authentication Failed” is received from the Gateway GPRS Support Node (GGSN) in the CREATE PDP CONTEXT REQUEST message. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm activationRejectedByGgsn (actRej)

Description This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the requested service being rejected by the Gateway GPRS Support Node (GGSN) with a cause code that is not mappable to a cause code in the ACTIVATE PDP CONTEXT REJECT message. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm activationRejectedUnspecified (actRejUn)

Description This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to unspecified reasons. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm reqServiceOptionNotSubscribed (reqOp)

Description This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the MS requesting a service for which it has no subscription. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm serviceOptionTempOutOfOrder (serOp)

Description This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to temporary outage of one or more functions required for supporting the service. The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm nsapiAlreadyUsed (nsapiUsed)

Description: This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the MS requesting a Network-Service Access Point Identifier (N-SAPI) in the Packet Data Protocol (PDP) context activation, which is already used by another active PDP context of this MS. The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm semanticallyIncorrectMesage (inMsg)

Description: This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the receipt of a message with semantically incorrect contents. The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm invalidMandatoryInfoElement (invInfo)

Description: This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the receipt of a of a message with errors in a mandatory Information Element (IE). The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm msgTypeNotCompWithProtState (notComp)

Description: This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to the receipt of a message type not compatible with the current protocol state. The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm protocolErrorUnspecified (proErr)

Description: This attribute counts the number of times the Serving GPRS Support Node (SGSN) rejected a Mobile Station (MS) initiated activation due to a protocol error event which does not fit into any specific protocol error class values. The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm networkFailure (nwFail)

Description: This attribute counts the number of times the Serving GPRS Support Node (SGSN) sent a Packet Data Protocol (PDP) CONTEXT DEACTIVATION REQUEST message to the Mobile Station (MS) with a cause code of NETWORK FAILURE. This cause code is sent due to an error situation in the network. The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm reactivationRequested (reactReq)

Description: This attribute counts the number of times the Serving GPRS Support Node (SGSN) sent a Packet Data Protocol (PDP) CONTEXT DEACTIVATION REQUEST message to the Mobile Station (MS) with a cause code of REACTIVATE REQUEST. This
cause code is sent to MS to request session reactivation. The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm sgsnInitModifyAttempts

Description: This attribute counts the number of Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN), for example, as a result of QoS renegotiations with the Mobile Station (MS). This counter is pegged only during SGSN Initiated PDP Context Modification.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm sgsnInitFailAtMs

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the Mobile Station (MS).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm sgsnInitFailAtGgsn

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the Gateway GPRS Support Node (GGSN).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm sgsnInitFailAtSgsn

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Serving GPRS Support Node (SGSN) that failed at the SGSN.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm msInitModifyAttempts

Description: This attribute counts the number of Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm msInitFailAtGgsn

Description: This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the Gateway GPRS Support Node (GGSN).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sm msInitFailAtSgsn

Description This attribute counts the unsuccessful Packet Data Protocol (PDP) context modifications initiated by the Mobile Station (MS) that failed at the SGSN.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### COMPONENT Gsc HlrCache (HlrC)

### GROUP Gsc HlrC Provisioned (Prov)

Properties Provisioned

Description This group contains provisionable attributes to provide the *HlrCache* functionality.

### ATTRIBUTE Gsc HlrC avgPdpContextPerRecord (pdpPerRec)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the average number of Packet Data Protocol (PDP) context subscription data records that can be stored with an *HlrCache* record. This value can be different from the value of the *avgActivePdpCPerActiveSub* attribute *(*defined in the parent *GprsSubscriberControl* component) since the value of the *maxRecords* attribute can be greater than the value of the *maxAttachedSubscribers* attribute and is computed by the HlrcCache process after receiving the value of the *maxAttachedSubscribers* attribute.<br><br>Changing the value of this attribute causes the card to be reset and all outstanding transactions will be affected. |
| Values | Decimal (0..50) |
| Default | 1 |

### GROUP Gsc HlrC Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *HlrCache*. |

### ATTRIBUTE Gsc HlrC cacheHits

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *HlrCache* had the subscriber information locally and did not need to retrieve information from the Home Location Register (HLR). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc HlrC cacheMisses (cacheMiss)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *HlrCache* does not have the subscriber information locally and must retrieve information from the HLR. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc HlrC WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc HlrC customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc HlrC customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE Gsc HlrC customCounter3 (customCntr3)

Access Read: All
Write: Illegal

Description This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS GprsSubscriberControl HlrCache

Description The statistics record generated by the GprsSubscriberControl HlrCache component.

### ATTRIBUTE Gsc HlrC cacheHits

Description This attribute counts the number of times the *HlrCache* had the subscriber information locally and did not need to retrieve information from the Home Location Register (HLR). This counter counts the value in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc HlrC cacheMisses (cacheMiss)

Description This attribute counts the number of times the *HlrCache* does not have the subscriber information locally and must retrieve information from the HLR. This counter counts the value in the collection interval.

Values Decimal (0..4294967295)

|---|---|
| Scope | Application |
| Description | *Gsc/n Hlrc RefreshAudit*<br>*Usc/n Hlrc RefreshAudit*<br><br>This component represents the subscriber refresh audit functionality of the *HlrCache (HlrC)* component. The purpose of the audit is to request new subscriber profile data from the Home Location Register (HLR). The audit initiates the Update GPRS Location Dialogue to the HLR for all attached subscribers. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Gsc HlrC RefreshAudit

| | |
|---|---|
| Impact | Service |
| Description | *start Gsc/n Hlrc RefreshAudit*<br>*start Usc/n Hlrc RefreshAudit*<br><br>This command starts the refresh audit to request subscriber information from the Home Location Register for all the attached subscribers. |

### VERB STOP Gsc HlrC RefreshAudit

| | |
|---|---|
| Impact | Service |
| Description | *stop Gsc/n Hlrc RefreshAudit*<br>*stop Usc/n Hlrc RefreshAudit*<br><br>This command stops the refresh audit in progress. If the audit is currently running, it is immediately stopped. If the audit has not started or has already finished running, this command does nothing. |

### GROUP Gsc HlrC RefreshAudit WlcRefreshAuditProv (AuditProv)

| | |
|---|---|
| Properties | Provisioned |

Description This group contains the provisionable attributes for the *RefreshAudit* component.

### ATTRIBUTE Gsc HlrC RefreshAudit autoStart

Access Read: All
Write: All

Description This attribute specifies whether the refresh audit function is ***enabled*** or ***disabled.*** When enabled, the *HlrCache* component will automatically initiate a process to refresh subscriber profiles whenever certain optional supplementary services, such as Location Services and Short Message Services, are provisioned. When disabled, the *HlrCache* component will not start the audit automatically.

Values enabled
disabled

Default enabled

### GROUP Gsc HlrC RefreshAudit WlcRefreshAuditOper (AuditOper)

Properties Operational

Description This group contains the operational attributes for the *RefreshAudit* component.

### ATTRIBUTE Gsc HlrC RefreshAudit auditPercentComplete (percentComplete)

Access Read: All
Write: Illegal

Description This attribute indicates the current completion percentage of the refresh audit.

A value of ***0%*** means the refresh audit is not currently running but may need to run due to recent activation of a feature that normally triggers the audit. The refresh audit is not running because the value of the *autoStart* attribute is ***disabled*** or the audit was manually interrupted by the *stop* command.
A value of ***1-99%*** means the refresh audit is currently running.
A value of ***100%*** means the refresh audit has been completed.

Values Decimal (0..100)

List
Display

## GROUP Gsc Imsi Mc Operational (Oper)

Properties: Operational

Description: This group contains the GPRS Mobility Management (GMM) information for a subscriber.

## ATTRIBUTE Gsc Imsi Mc temporaryLogicalLinkId (tlli)

Access: Read: All
Write: Illegal

Description: This attribute indicates the Temporary Logical Link Identifier (TLLI) used to identify the context of the Mobile Station (MS) within the Serving GPRS Support Node (SGSN). This is one of the main reference keys that is used to identify an MS in the SGSN.

Values: String (4, Hex)

Default: No default

## ATTRIBUTE Gsc Imsi Mc gmmState (gmmSt)

Access: Read: All
Write: Illegal

Description: This attribute indicates the GPRS Mobility Management (GMM) state for a mobile. Upon initialization, this attribute value is in ***idle*** state. The states have the following meaning:
***idle*** - The Mobile Station (MS) is not attached to the GPRS Mobility Management (GMM). The MS and the SGSN context hold no valid location or routing area information for the mobile.
***standby*** - The MS is attached to the GMM.
***ready*** - MS is attached and can be sending or receiving the Point To Point Protocol Data Units (PTP PDUs).

| | |
|---|---|
| Values | idle<br>standby<br>ready |
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc routingAreaIdentifier (rai)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current routing area of the Mobile Station (MS). The routing area is transmitted to the Serving GPRS Support Node (SGSN) during a Routing Area Update procedure or Attach procedure. The routing area identifier includes the Mobile Country Code (MCC as first 3 digits), the Mobile Network Code (MNC as next 2 digits), the Location Area Code (LAC as next 4 digits), and the Routing Area Code (RAC as last 2 digits). |
| Values | String (5..6, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc cellId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current cell location of the Mobile Station (MS). |
| Values | String (2, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc cellEntryTime (cellEntry)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates when the Mobile Station (MS) entered the cell indicated by the *cellId*. |
| Values | Time (DHMS) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc sgsnClassmark (sgsnCm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network portion of the Mobile Station (MS) classmark. The classmark contains specific information about a Mobile Station (MS). |
| Values | String (1..2, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc drxParameters (drxParms)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates if the Mobile Station (MS) supports discontinuous reception or not. The DRX parameter is transmitted by the MS during an Attach Request procedure and a Routing Area Update procedure. |
| Values | supported<br>unsupported |
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc readyTimer (t3314)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the negotiated value of the Ready Timer (T3314) for the GPRS Mobility Management (GMM) state transition. The Ready Timer is restarted whenever a signaling or a data Protocol Data Unit (PDU) is received from the Mobile Station (MS). In the event of the Ready Timer expiry, the attribute *gmmState* changes to ***standby***.<br><br>The negotiation of this value is based on the *readyTimer* provisioned in the *Sgsn GprsSubscriberControl* component. |

| | |
|---|---|
| Values | Decimal (1..11160)<br>forceStandby |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc pagingProceedFlag (ppf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the paging proceed flag. The flag indicates whether paging can be initiated. |
| Values | false<br>true |
| Default | No default |

### GROUP Gsc Imsi Mc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Imsi Mc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Mc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gsc Imsi SessionContext (Sc)

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Gsc Imsi Sc SessionContextOp (ScOp)"<br>"GROUP Gsc Imsi Sc WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Gsc/n Tlli/<tlli> SessionContext/<nsapi>*<br>*Gsc/n Imsi/<imsi> SessionContext/<nsapi>*<br><br>This component represents the Session Context information for a subscriber. The Session Contexts are created for each activated Packet Data Protocol (PDP) context of a subscriber. The instance value identifies a session for a mobile subscriber. |

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Gsc Imsi Sc RequestedQos (ReqQos)"<br>"COMPONENT Gsc Imsi Sc NegotiatedQos (NegQos)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsc Imsi Sc SessionContextOp (ScOp)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Session Context information for a subscriber. The Session Contexts are created for each activated Packet Data Protocol (PDP) context of a subscriber. |

### ATTRIBUTE Gsc Imsi Sc selectedApnNetworkId (selApnNwkId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the selected Access Point Name (APN) Network Identifier.<br><br>The APN Network Identifier can be the one received from the mobile as part of the ACTIVATE PDP CONTEXT REQUEST message or it can be selected from the subscription record against which this session has been activated or it can be the *defaultApnNetworkId* (defined in *Sgsn Gsc*) for the requested PDP type provisioned on the Serving GPRS Support Node (SGSN). |
| Values | String (1..63, ASCII) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc selectedApnOperatorId (selApnOpId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the selected Access Point Name (APN) Operator Identifier.<br><br>The APN Operator Identifier can be the one received from the Mobile Station (MS) as part of the ACTIVATE PDP CONTEXT REQUEST message or it can be the one constructed from the subscriber's IMSI as mnc<3 MNC digits>.mcc<3 MCC digits>.gprs. |
| Values | String (1..37, ASCII) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc dataPathGgsnAddress (dGgsnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the IP address of the Gateway GPRS Support Node (GGSN) for the data path that is currently used by the activated Packet Data Protocol (PDP) context. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc signalingGgsnAddress (sGgsnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the IP address of the Gateway GPRS Support Node (GGSN) for the signaling path that is currently used by the activated Packet Data Protocol (PDP) context. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc pdpContextIdentifier (pdpCid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the subscription record against which this session has been activated. |

| | |
|---|---|
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc pdpType (pdpT)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute defines the end user protocol to be used between the external packet data network and the Mobile Station (MS) such as, X.25, IP, PPP.<br>For X.25 currently defined address format is X.121, for IP protocol currently defined address formats are IPV4, IPV6, and PPP protocol has no address format. |
| Values | x25<br>ip<br>ppp |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc ipv4PdpAddress (ipv4Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is IPv4. The address conforms to the standard addressing scheme of the IP version 4 address. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc x121PdpAddress (x121Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is X.121. |
| Values | BCD (1..14) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc otherPdpAddress (otherAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. The Packet Data Protocol (PDP) protocol type for the *otherPdpAddress* can be obtained from the attribute *pdpType* and the addressing type from *pdpAddressFormat*. |
| Values | String (1..16, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc pdpAddressFormat (pdpTnum)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the addressing type, such as, X.121, IPv4, IPv6. |
| Values | x121<br>ipv4<br>ipv6 |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc ggsnRemoteTeid (ggsnRemTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg that originates at the GPRS Serving GPRS Support Node (SGSN) and terminates at the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc ggsnLocalTeid (ggsnLocTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg that originates at the Gateway GPRS Support Node (GGSN) and terminates at the GPRS Serving GPRS Support Node (SGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc signallingGgsnTeid (sGgsnTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg endpoint of the control tunnel that runs between the GPRS Serving GPRS Support Node (SGSN) and the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Imsi Sc WlcCustomCounters (WlcCustomCntr)

| | |

| Default | No default |

### ATTRIBUTE Gsc Imsi Sc ReqQos deliveryOfErroneousSdus (delErrSdus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.<br><br>The erroneous SDUs can be handled in one of the following ways:<br><br>***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.<br><br>***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.<br><br>***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded. |
| Values | noDetect<br>errSdusDelivered<br>errSdusNotDelivered |

Default No default

### ATTRIBUTE Gsc Imsi Sc ReqQos trafficClass (traffClass)

Access
Read: All
Write: Illegal

Description
This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). This is characterized by the destination not expecting the data within a certain time.

Values
conversational (conv)
streaming (strm)
interactive (int)
background (bkgr)

Default No default

### ATTRIBUTE Gsc Imsi Sc ReqQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc ReqQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc ReqQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc ReqQos residualBitErrorRate (resBer)

Access
Read: All
Write: Illegal

Description
This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.

This attribute can take up values ranging from 1 through 9, representing:

***1*** -> 5*10 -2
***2*** -> 1*10 -2
***3*** -> 5*10 -3
***4*** -> 4*10 -3
***5*** -> 1*10 -3
***6*** -> 1*10 -4
***7*** -> 1*10 -5
***8*** -> 1*10 -6
***9*** -> 6*10 -8

Values
Decimal (1..9)

Default
No default

### ATTRIBUTE Gsc Imsi Sc ReqQos sduErrorRatio (sduErrRatio)

Access
Read: All
Write: Illegal

Description
This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4

5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values Decimal (1..7)

Default No default

### ATTRIBUTE Gsc Imsi Sc ReqQos trafficHandlingPriority (traffHndlPr)

Access Read: All
Write: Illegal

Description This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***

A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest.

Values Decimal (0..3)

Default No default

### ATTRIBUTE Gsc Imsi Sc ReqQos transferDelay (transfDelay)

Access Read: All
Write: Illegal

Description This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP.

Values Decimal (10..4100)

Units msec

Default No default

### ATTRIBUTE Gsc Imsi Sc ReqQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc ReqQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### COMPONENT Gsc Imsi Sc NegotiatedQos (NegQos)

| | |
|---|---|
| Groups | "GROUP Gsc Imsi Sc NegQos QosProfile (Qos)" |
| Scope | Application |
| Description | *Sgsn Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos*<br>*Gsc/n Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos* |

This component represents the negotiated Quality of Service (QoS) profile received by a mobile subscriber for this session.

## GROUP Gsc Imsi Sc NegQos QosProfile (Qos)

Properties: Operational

Description: This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group.

## ATTRIBUTE Gsc Imsi Sc NegQos deliveryOrder (delOrd)

Access: Read: All
Write: Illegal

Description: This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed.

Values: withDeliveryOrder
withoutDeliveryOrder

Default: No default

## ATTRIBUTE Gsc Imsi Sc NegQos deliveryOfErroneousSdus (delErrSdus)

Access: Read: All
Write: Illegal

Description: This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.

The erroneous SDUs can be handled in one of the following ways:

***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.

***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.

***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded.

Values
noDetect
errSdusDelivered
errSdusNotDelivered

Default
No default

### ATTRIBUTE Gsc Imsi Sc NegQos trafficClass (traffClass)

Access
Read: All
Write: Illegal

Description
This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). This is characterized by the destination not expecting the data within a certain time.

| | |
|---|---|
| Values | conversational (conv)<br>streaming (strm)<br>interactive (int)<br>background (bkgr) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc NegQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc NegQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc NegQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |

| | |
|---|---|
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc NegQos residualBitErrorRate (resBer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.<br><br>This attribute can take up values ranging from 1 through 9, representing:<br><br>***1*** -> 5*10 -2<br>***2*** -> 1*10 -2<br>***3*** -> 5*10 -3<br>***4*** -> 4*10 -3<br>***5*** -> 1*10 -3<br>***6*** -> 1*10 -4<br>***7*** -> 1*10 -5<br>***8*** -> 1*10 -6<br>***9*** -> 6*10 -8 |
| Values | Decimal (1..9) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc NegQos sduErrorRatio (sduErrRatio)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.<br><br>This attribute can take up values between the numbers 1 - 7 |

representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4
5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values: Decimal (1..7)

Default: No default

### ATTRIBUTE Gsc Imsi Sc NegQos trafficHandlingPriority (traffHndlPr)

Access: Read: All
Write: Illegal

Description: This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***

A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Gsc Imsi Sc NegQos transferDelay (transfDelay)

Access: Read: All
Write: Illegal

Description: This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP.

| | |
|---|---|
| Values | Decimal (10..4100) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc NegQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Sc NegQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

## COMPONENT Gsc Imsi HlrCacheRecord (HlrcRec)

| | |

## GROUP Gsc Imsi HlrcRec Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains subscription information downloaded from the Home Location Register (HLR). |

## ATTRIBUTE Gsc Imsi HlrcRec internationalMobileSubscriberId (imsi)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the International Mobile Subscriber Identity (IMSI) of the Mobile Station (MS). |
| Values | BCD (5..15) |
| Default | No default |

### ATTRIBUTE Gsc Imsi HlrcRec hlrNumber (hlrNo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the HLR Number of the Home Location Register (HLR) to which the *HlrCache* record is currently associated. It is used to retrieve the *HlrCache* records to be restored after receipt of the RESET message from the HLR. |
| Values | String (1..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Gsc Imsi HlrcRec msIsdnNumber (msIsdn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Integrated Service Digital Network (ISDN) number of the mobile subscriber. This is represented as an E.164 number in international format. |
| Values | String (1..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Gsc Imsi HlrcRec subscriptionConfirmedByHlr (subsCByHlr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the subscription information in the Serving GPRS Support Node (SGSN) is known to be in agreement with the Home Location Register (HLR) when the SGSN successfully performs an UPDATE GPRS LOCATION to the HLR. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE Gsc Imsi HlrcRec locationInfoConfirmedInHlr (locCInHlr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Home Location Register (HLR) record of the Serving GPRS Support Node (SGSN) address for the Mobile Station (MS) has been confirmed by radio contact.<br><br>It is initially set to, ***no***, when the SGSN receives a ROUTING AREA UPDATE REQUEST, or an IMSI and a GPRS ATTACH-REQUEST, or if a RESET message is received from the HLR with which the MS is registered. The indicator is set to, ***yes***, when a successful UPDATE GPRS LOCATION is performed for the MS. |
| Values | no<br>yes |
| Default | No default |

### GROUP Gsc Imsi HlrcRec WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Imsi HlrcRec customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Imsi HlrcRec customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

### GROUP Gsc Imsi HlrcRec PdpC Operational (Oper)

Properties Operational

Description This group contains the Packet Data Protocol (PDP) subscription data downloaded from the Home Location Register (HLR).

### ATTRIBUTE Gsc Imsi HlrcRec PdpC pdpContextIdentifier (pdpCid)

Access
Read: All
Write: Illegal

Description This attribute indicates a Packet Data Protocol (PDP) Context in a subscription record.

Values Decimal (1..255)

Default No default

### ATTRIBUTE Gsc Imsi HlrcRec PdpC pdpType (pdpT)

Access
Read: All
Write: Illegal

Description This attribute defines the end user protocol to be used between the external packet data network and the Mobile Station (MS) such as, X.25, IP, PPP.
For X.25 currently defined address format is X.121, for IP protocol currently defined address formats are IPV4, IPV6, and PPP protocol has no address format.

Values
x25
ip
ppp

Default No default

### ATTRIBUTE Gsc Imsi HlrcRec PdpC ipv4PdpAddress (ipv4Addr)

Access Read: All
Write: Illegal

Description This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is IPv4. The address conforms to the standard addressing scheme of the IP version 4 address.

Values IP address

Default No default

### ATTRIBUTE Gsc Imsi HlrcRec PdpC x121PdpAddress (x121Addr)

Access Read: All
Write: Illegal

Description This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is X.121.

Values BCD (1..14)

Default No default

### ATTRIBUTE Gsc Imsi HlrcRec PdpC otherPdpAddress (otherAddr)

Access Read: All
Write: Illegal

Description This attribute indicates the network layer address of the packet data network. The Packet Data Protocol (PDP) protocol type for the *otherPdpAddress* can be obtained from the attribute *pdpType* and the addressing type from *pdpAddressFormat*.

Values String (1..16, Hex)

Default No default

### ATTRIBUTE Gsc Imsi HlrcRec PdpC pdpAddressFormat (pdpTnum)

Access Read: All
Write: Illegal

## ATTRIBUTE Gsc Imsi Bssap vlrNumber (vlrNo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the E.164 number of the VLR that the Mobile Station (MS) uses for non-GPRS services. If there is no associated VLR, the value is empty. |
| Values | BCD (0..15) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Bssap gsState

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of the Gs interface in the SGSN. The states have the following meaning:<br>***null*** - There is no associated VLR for the Mobile station (MS).<br>***laUpdate*** - The SGSN has sent a BSSAP+_LOCATION_UPDATE_REQUEST to the VLR.<br>***associated*** - The MS is attached to both GPRS and non-GPRS services. |
| Values | null<br>laUpdate<br>associated |
| Default | No default |

### ATTRIBUTE Gsc Imsi Bssap vlrReliable (vlrRel)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the reset status of the VLR that provides non-GPRS services to the MS.<br><br>If the value is ***false***, upon reception of any Routing Area Update or Combined Routing and Location Update, the SGSN requests the mobile to re-attach to non-GPRS services. If the value is ***true***, the SGSN proceeds with the Routing Area Update or Combined Routing and Location Update.<br><br>This value is set to ***true*** when the SGSN receives a BSSAP+_LOCATION_UPDATE_ACCEPT from the VLR. It is set to ***false***, when the SGSN has received a reset indication from the VLR. |
| Values | false<br>true |
| Default | No default |

### ATTRIBUTE Gsc Imsi Bssap nonGprsAlertFlag (ngaf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the non-GPRS alert flag. If the value is ***true***, the VLR is notified of any activity on the mobile and if the value is ***false***, the VLR is not notified.<br><br>This value is set to ***true*** when the SGSN replies to a BSSAP+-ALERT-REQUEST with an ACK. It is set to ***false***, when the SGSN sends an BSSAP+-MS_ACTIVITY_INDICATION message to the VLR. |
| Values | false<br>true |
| Default | No default |

### GROUP Gsc Imsi Bssap WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Imsi Bssap customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Bssap customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Imsi Bssap customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gsc TemporaryLogicalLinkId (Tlli)

| | |
|---|---|
| Instance | String (4, Hex) |
| Groups | "GROUP Gsc Tlli WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Gsc/n TemporaryLogicalLinkId/<tlli>*<br><br>This component represents an instance of the Temporary Logical Link Identity (TLLI). The information includes subscription context, mobility management context and session contexts. Each instance is indexed by the TLLI of the mobile subscriber. A list of all current TLLI instances is not possible, but it is possible to display a specific instance of TLLI. |

| | |

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gsc Tlli customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Gsc Tlli MobilityContext (Mc)

| | |
|---|---|
| Groups | "GROUP Gsc Tlli Mc Operational (Oper)"<br>"GROUP Gsc Tlli Mc WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Sgsn Tlli/<tlli> MobilityContext*<br>*Sgsn Imsi/<imsi> MobilityContext*<br>*Gsc/n Tlli/<tlli> MobilityContext*<br>*Gsc/n Imsi/<imsi> MobilityContext*<br><br>This component represents the GPRS Mobility Management (GMM) context created for each mobile subscriber that is GPRS-Attached. The Mobility Context is an instance of the *InternationalMobileSubscriberId (Imsi)* and the *TemporaryLogicalLinkId (Tlli)* of the Serving GPRS Support Node (SGSN). |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc Tlli Mc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the GPRS Mobility Management (GMM) information for a subscriber. |

### ATTRIBUTE Gsc Tlli Mc temporaryLogicalLinkId (tlli)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Temporary Logical Link Identifier (TLLI) used to identify the context of the Mobile Station (MS) within the Serving GPRS Support Node (SGSN). This is one of the main reference keys that is used to identify an MS in the SGSN. |
| Values | String (4, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc gmmState (gmmSt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the GPRS Mobility Management (GMM) state for a mobile. Upon initialization, this attribute value is in ***idle*** state. The states have the following meaning:<br>***idle*** - The Mobile Station (MS) is not attached to the GPRS Mobility Management (GMM). The MS and the SGSN context hold no valid location or routing area information for the mobile.<br>***standby*** - The MS is attached to the GMM.<br>***ready*** - MS is attached and can be sending or receiving the Point To Point Protocol Data Units (PTP PDUs). |
| Values | idle<br>standby<br>ready |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc routingAreaIdentifier (rai)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current routing area of the Mobile Station (MS). The routing area is transmitted to the Serving GPRS Support Node (SGSN) during a Routing Area Update procedure or Attach procedure. The routing area identifier |

| | |
|---|---|
| | includes the Mobile Country Code (MCC as first 3 digits), the Mobile Network Code (MNC as next 2 digits), the Location Area Code (LAC as next 4 digits), and the Routing Area Code (RAC as last 2 digits). |
| Values | String (5..6, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc cellId

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current cell location of the Mobile Station (MS). |
| Values | String (2, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc cellEntryTime (cellEntry)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates when the Mobile Station (MS) entered the cell indicated by the *cellId*. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc sgsnClassmark (sgsnCm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network portion of the Mobile Station (MS) classmark. The classmark contains specific information about a Mobile Station (MS). |
| Values | String (1..2, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc drxParameters (drxParms)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates if the Mobile Station (MS) supports discontinuous reception or not. The DRX parameter is transmitted by the MS during an Attach Request procedure and a Routing Area Update procedure. |
| Values | supported<br>unsupported |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc readyTimer (t3314)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the negotiated value of the Ready Timer (T3314) for the GPRS Mobility Management (GMM) state transition. The Ready Timer is restarted whenever a signaling or a data Protocol Data Unit (PDU) is received from the Mobile Station (MS). In the event of the Ready Timer expiry, the attribute *gmmState* changes to ***standby***.<br><br>The negotiation of this value is based on the *readyTimer* provisioned in the *Sgsn GprsSubscriberControl* component. |
| Values | Decimal (1..11160)<br>forceStandby |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc pagingProceedFlag (ppf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the paging proceed flag. The flag indicates whether paging can be initiated. |

| | |
|---|---|
| Values | false<br>true |
| Default | No default |

### GROUP Gsc Tlli Mc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Tlli Mc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Mc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Gsc Tlli SessionContext (Sc)

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Gsc Tlli Sc SessionContextOp (ScOp)"<br>"GROUP Gsc Tlli Sc WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Gsc/n Tlli/<tlli> SessionContext/<nsapi>*<br>*Gsc/n Imsi/<imsi> SessionContext/<nsapi>*<br><br>This component represents the Session Context information for a subscriber. The Session Contexts are created for each activated Packet Data Protocol (PDP) context of a subscriber. The instance value identifies a session for a mobile subscriber. |
| Dyn. Subcomp. | "COMPONENT Gsc Tlli Sc RequestedQos (ReqQos)"<br>"COMPONENT Gsc Tlli Sc NegotiatedQos (NegQos)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc Tlli Sc SessionContextOp (ScOp)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Session Context information for a subscriber. The Session Contexts are created for each activated Packet Data Protocol (PDP) context of a subscriber. |

### ATTRIBUTE Gsc TIli Sc selectedApnNetworkId (selApnNwkId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the selected Access Point Name (APN) Network Identifier.<br><br>The APN Network Identifier can be the one received from the mobile as part of the ACTIVATE PDP CONTEXT REQUEST message or it can be selected from the subscription record against which this session has been activated or it can be the *defaultApnNetworkId* (defined in *Sgsn Gsc*) for the requested PDP type provisioned on the Serving GPRS Support Node (SGSN). |
| Values | String (1..63, ASCII) |
| Default | No default |

### ATTRIBUTE Gsc TIli Sc selectedApnOperatorId (selApnOpId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the selected Access Point Name (APN) Operator Identifier.<br><br>The APN Operator Identifier can be the one received from the Mobile Station (MS) as part of the ACTIVATE PDP CONTEXT REQUEST message or it can be the one constructed from the subscriber's IMSI as mnc<3 MNC digits>.mcc<3 MCC digits>.gprs. |
| Values | String (1..37, ASCII) |
| Default | No default |

### ATTRIBUTE Gsc TIli Sc dataPathGgsnAddress (dGgsnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the IP address of the Gateway GPRS Support Node (GGSN) for the data path that is currently used by the activated Packet Data Protocol (PDP) context. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc signalingGgsnAddress (sGgsnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the IP address of the Gateway GPRS Support Node (GGSN) for the signaling path that is currently used by the activated Packet Data Protocol (PDP) context. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc pdpContextIdentifier (pdpCid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the subscription record against which this session has been activated. |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc pdpType (pdpT)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute defines the end user protocol to be used between the external packet data network and the Mobile Station (MS) such as, X.25, IP, PPP.<br>For X.25 currently defined address format is X.121, for IP protocol currently defined address formats are IPV4, IPV6, and PPP protocol has no address format. |

| | |
|---|---|
| Values | x25<br>ip<br>ppp |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ipv4PdpAddress (ipv4Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is IPv4. The address conforms to the standard addressing scheme of the IP version 4 address. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc x121PdpAddress (x121Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is X.121. |
| Values | BCD (1..14) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc otherPdpAddress (otherAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. The Packet Data Protocol (PDP) protocol type for the *otherPdpAddress* can be obtained from the attribute *pdpType* and the addressing type from *pdpAddressFormat*. |
| Values | String (1..16, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc pdpAddressFormat (pdpTnum)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the addressing type, such as, X.121, IPv4, IPv6. |
| Values | x121<br>ipv4<br>ipv6 |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ggsnRemoteTeid (ggsnRemTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg that originates at the GPRS Serving GPRS Support Node (SGSN) and terminates at the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ggsnLocalTeid (ggsnLocTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg that originates at the Gateway GPRS Support Node (GGSN) and terminates at the GPRS Serving GPRS Support Node (SGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc signallingGgsnTeid (sGgsnTeid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the Tunnel End point Identifier that is associated with a tunnel leg endpoint of the control tunnel that runs between the GPRS Serving GPRS Support Node (SGSN) and the Gateway GPRS Support Node (GGSN). |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc TIli Sc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc TIli Sc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc TIli Sc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gsc Tlli Sc RequestedQos (ReqQos)

| | |
|---|---|
| Groups | "GROUP Gsc Tlli Sc ReqQos QosProfile (Qos)" |
| Scope | Application |
| Description | *Sgsn Imsi/<imsi> SessionContext/<nsapi> RequestedQos*<br>*Gsc/n Imsi/<imsi> SessionContext/<nsapi> RequestedQos*<br><br>This component represents the Quality of Service (QoS) profile requested by a mobile subscriber for this session. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsc Tlli Sc ReqQos QosProfile (Qos)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group. |

### ATTRIBUTE Gsc Tlli Sc ReqQos deliveryOrder (delOrd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed. |

| | |
|---|---|
| Values | withDeliveryOrder<br>withoutDeliveryOrder |
| Default | No default |

### ATTRIBUTE Gsc TIli Sc ReqQos deliveryOfErroneousSdus (delErrSdus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.<br><br>The erroneous SDUs can be handled in one of the following ways:<br><br>***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.<br><br>***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.<br><br>***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded. |
| Values | noDetect<br>errSdusDelivered<br>errSdusNotDelivered |
| Default | No default |

### ATTRIBUTE Gsc TIli Sc ReqQos trafficClass (traffClass)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.<br><br>The different traffic classes are:<br>***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of |

the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). This is characterized by the destination not expecting the data within a certain time.

| | |
|---|---|
| Values | conversational (conv)<br>streaming (strm)<br>interactive (int)<br>background (bkgr) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ReqQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ReqQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ReqQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ReqQos residualBitErrorRate (resBer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.<br><br>This attribute can take up values ranging from 1 through 9, representing:<br><br>***1*** -> 5*10 -2 |

***2*** -> 1*10 -2
***3*** -> 5*10 -3
***4*** -> 4*10 -3
***5*** -> 1*10 -3
***6*** -> 1*10 -4
***7*** -> 1*10 -5
***8*** -> 1*10 -6
***9*** -> 6*10 -8

Values — Decimal (1..9)

Default — No default

### ATTRIBUTE Gsc Tlli Sc ReqQos sduErrorRatio (sduErrRatio)

Access — Read: All
Write: Illegal

Description — This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4
5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values — Decimal (1..7)

Default — No default

### ATTRIBUTE Gsc Tlli Sc ReqQos trafficHandlingPriority (traffHndlPr)

Access — Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***<br><br>A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest. |
| Values | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ReqQos transferDelay (transfDelay)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP. |
| Values | Decimal (10..4100) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ReqQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |

| | |
|---|---|
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc ReqQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### COMPONENT Gsc Tlli Sc NegotiatedQos (NegQos)

| | |
|---|---|
| Groups | "GROUP Gsc Tlli Sc NegQos QosProfile (Qos)" |
| Scope | Application |
| Description | *Sgsn Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos*<br>*Gsc/n Imsi/<imsi> SessionContext/<nsapi> NegotiatedQos*<br><br>This component represents the negotiated Quality of Service (QoS) profile received by a mobile subscriber for this session. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsc Tlli Sc NegQos QosProfile (Qos)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group. |

### ATTRIBUTE Gsc Tlli Sc NegQos deliveryOrder (delOrd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed. |
| Values | withDeliveryOrder<br>withoutDeliveryOrder |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc NegQos deliveryOfErroneousSdus (delErrSdus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| Default | No default |

### ATTRIBUTE Gsc Tlli Sc NegQos trafficClass (traffClass)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description

This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.

The different traffic classes are:
***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.

***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.

***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.

***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). This is characterized by the destination not expecting the data within a certain time.

Values

conversational (conv)
streaming (strm)
interactive (int)
background (bkgr)

Default

No default

## ATTRIBUTE Gsc Tlli Sc NegQos maxSduSize (maxSduSize)

Access

Read: All
Write: Illegal

Description

This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing.

| | |
|---|---|
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc NegQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc NegQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc NegQos residualBitErrorRate (resBer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs. |

This attribute can take up values ranging from 1 through 9, representing:

***1*** -> 5*10 -2
***2*** -> 1*10 -2
***3*** -> 5*10 -3
***4*** -> 4*10 -3
***5*** -> 1*10 -3
***6*** -> 1*10 -4
***7*** -> 1*10 -5
***8*** -> 1*10 -6
***9*** -> 6*10 -8

Values — Decimal (1..9)

Default — No default

### ATTRIBUTE Gsc Tlli Sc NegQos sduErrorRatio (sduErrRatio)

Access — Read: All
Write: Illegal

Description — This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4
5 -> 1*10 -5
6 -> 1*10 -6
7 -> 1*10 -1

Values — Decimal (1..7)

Default — No default

### ATTRIBUTE Gsc Tlli Sc NegQos trafficHandlingPriority (traffHndlPr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***<br><br>A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest. |
| Values | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc NegQos transferDelay (transfDelay)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP. |
| Values | Decimal (10..4100) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Gsc Tlli Sc NegQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period. |

The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s.

Values: Decimal (0..8640)

Default: No default

### ATTRIBUTE Gsc Tlli Sc NegQos guaranteedDownlinkBitRate (guarDnBr)

Access: Read: All
Write: Illegal

Description: This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.

The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s.

Values: Decimal (0..8640)

Default: No default

### COMPONENT Gsc Tlli HlrCacheRecord (HlrcRec)

Groups: "GROUP Gsc Tlli HlrcRec Operational (Oper)"
"GROUP Gsc Tlli HlrcRec WlcCustomCounters (WlcCustomCntr)"

Scope: Application

Description: *Sgsn Tlli/<tlli> HlrCacheRecord*
*Sgsn Imsi/<imsi> HlrCacheRecord*
*Gsc/n Tlli/<tlli> HlrCacheRecord*
*Gsc/n Imsi/<imsi> HlrCacheRecord*

This component represents a subscription record downloaded from the Home Location Register (HLR). The *HlrCache* on the *GprsSubscriberControl (Gsc)* contains the active subscriber data.

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Gsc Tlli HlrcRec PdpContext (PdpC)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsc Tlli HlrcRec Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains subscription information downloaded from the Home Location Register (HLR). |

### ATTRIBUTE Gsc Tlli HlrcRec internationalMobileSubscriberId (imsi)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the International Mobile Subscriber Identity (IMSI) of the Mobile Station (MS). |
| Values | BCD (5..15) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec hlrNumber (hlrNo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the HLR Number of the Home Location Register (HLR) to which the *HlrCache* record is currently associated. It is used to retrieve the *HlrCache* records to be restored after receipt of the RESET message from the HLR. |
| Values | String (1..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Gsc TIli HlrcRec msIsdnNumber (msIsdn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Integrated Service Digital Network (ISDN) number of the mobile subscriber. This is represented as an E.164 number in international format. |
| Values | String (1..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Gsc TIli HlrcRec subscriptionConfirmedByHlr (subsCByHlr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the subscription information in the Serving GPRS Support Node (SGSN) is known to be in agreement with the Home Location Register (HLR) when the SGSN successfully performs an UPDATE GPRS LOCATION to the HLR. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE Gsc TIli HlrcRec locationInfoConfirmedInHlr (locCInHlr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Home Location Register (HLR) record of the Serving GPRS Support Node (SGSN) address for the Mobile Station (MS) has been confirmed by radio contact.<br><br>It is initially set to, ***no***, when the SGSN receives a ROUTING AREA UPDATE REQUEST, or an IMSI and a GPRS ATTACH-REQUEST, or if a RESET message is received from the HLR with which the MS is registered. The indicator is set to, ***yes***, when a successful UPDATE GPRS LOCATION is performed for the MS. |

| | |
|---|---|
| Values | no<br>yes |
| Default | No default |

### GROUP Gsc Tlli HlrcRec WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Tlli HlrcRec customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Gsc Tlli HlrcRec PdpContext (PdpC)

| | |
|---|---|
| Instance | Decimal (0..50) |
| Groups | "GROUP Gsc Tlli HlrcRec PdpC Operational (Oper)"<br>"GROUP Gsc Tlli HlrcRec PdpC WlcCustomCounters (WlcCustomCntr)" |

It indicates the different PDP profiles (that is, Quality of Service) the subscriber has. |
| Dyn. Subcomp. | "COMPONENT Gsc Tlli HlrcRec PdpC SubscribedQos (SubsQos)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc Tlli HlrcRec PdpC Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Packet Data Protocol (PDP) subscription data downloaded from the Home Location Register (HLR). |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC pdpContextIdentifier (pdpCid)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates a Packet Data Protocol (PDP) Context in a subscription record. |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC pdpType (pdpT)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute defines the end user protocol to be used between the external packet data network and the Mobile Station (MS) such as, X.25, IP, PPP.<br>For X.25 currently defined address format is X.121, for IP protocol currently defined address formats are IPV4, IPV6, and PPP protocol has no address format. |
| Values | x25<br>ip<br>ppp |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC ipv4PdpAddress (ipv4Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is IPv4. The address conforms to the standard addressing scheme of the IP version 4 address. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC x121PdpAddress (x121Addr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. This attribute is displayed when the Packet Data Protocol (PDP) address is X.121. |
| Values | BCD (1..14) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC otherPdpAddress (otherAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the network layer address of the packet data network. The Packet Data Protocol (PDP) protocol type for the *otherPdpAddress* can be obtained from the attribute *pdpType* and the addressing type from *pdpAddressFormat*. |
| Values | String (1..16, Hex) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC pdpAddressFormat (pdpTnum)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the addressing type, such as, X.121, IPv4, IPv6. |
| Values | x121<br>ipv4<br>ipv6 |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC apnNetworkIdentifier (apnNwkId)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates an Access Point Name (APN) Network Identifier which is the Logical Name of the access point to the external packet data network. A Logical Name is a label or a fully qualified domain name according to the Domain Name System (DNS) naming conventions. |
| Values | String (1..63, ASCII) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC vplmnAddressAllowed (vplmnAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Mobile Station (MS) is allowed to use the Access Point Name (APN) in the Visiting Public Land Mobile Network (VPLMN). |
| Values | no<br>yes |
| Default | No default |

### GROUP Gsc Tlli HlrcRec PdpC WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gsc Tlli HlrcRec PdpC SubscribedQos (SubsQos)

| | |
|---|---|
| Groups | "GROUP Gsc Tlli HlrcRec PdpC SubsQos QosProfile (Qos)" |
| Scope | Application |
| Description | *Sgsn Imsi/<imsi> HlrcRec PdpContext/n SubscribedQos*<br>*Gsc/n Imsi/<imsi> HlrcRec PdpContext/n SubscribedQos*<br><br>This component represents the Quality of Service (QoS) profile of the subscriber downloaded from the Home Location Register (HLR). |
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsc Tlli HlrcRec PdpC SubsQos QosProfile (Qos)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Quality of Service (QoS) profile. It contains either the requested QoS, the negotiated QoS, or the subscribed QoS based on which component contains this group. |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos deliveryOrder (delOrd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the Signalling Data Units' (SDUs) order of delivery is guaranteed. |
| Values | withDeliveryOrder<br>withoutDeliveryOrder |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos deliveryOfErroneousSdus (delErrSdus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates how erroneous Signaling Data Units (SDUs) are handled by the network.<br><br>The erroneous SDUs can be handled in one of the following ways:<br><br>***noDetect:*** The Signalling Data Units (SDUs) are delivered without considering error detection.<br><br>***errSdusDelivered:*** The erroneous Signalling Data Units (SDUs) are delivered together with an error indication.<br><br>***errSdusNotDelivered:*** The erroneous Signalling Data Units (SDUs) are discarded. |
| Values | noDetect<br>errSdusDelivered<br>errSdusNotDelivered |
| Default | No default |

## ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos trafficClass (traffClass)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the type of application for which the bearer service is optimized. By including the traffic class itself as an attribute, GPRS can make assumptions about the traffic source and optimize the transport for that traffic type.<br><br>The different traffic classes are:<br>***conversational -*** This class includes real time conversation, characterized by low transfer delay and a strict preservation of the time relation between information entities of the stream. Examples of this class are telephony speech and video conferencing.<br><br>***streaming -*** This class consists of real time video/audio applications, characterized by a strict preservation of the time relation between the information entities of the stream, but not necessarily a low transfer delay.<br><br>***interactive -*** This class includes applications where a human or machine requests data from remote equipment, characterized by a request-response pattern of the end-user and the preservation of payload content.<br><br>***background -*** This class includes applications where the end-user, typically a computer, sends and receives data files in the background (for example: emails, SMS and database downloads). ### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos maxSduSize (maxSduSize)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum allowed size of the Signalling Data Unit (SDU). It is used for admission control and policing. |
| Values | Decimal (1..1502) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos maxUplinkBitRate (maxUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered to GPRS in the uplink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos maxDownlinkBitRate (maxDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the maximum number of bits delivered by GPRS in the downlink direction within a period of time, divided by the duration of the period. This is the upper limit in kilobits per second allowed for a specific context. |
| Values | Decimal (0..8640) |
| Units | kbit/s |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos residualBitErrorRate (resBer)

Access
Read: All
Write: Illegal

Description
This attribute indicates the undetected bit error ratio in the delivered Signalling Data Units (SDUs). If no error detection is requested, this attribute indicates the bit error ratio in the delivered SDUs.

This attribute can take up values ranging from 1 through 9, representing:

***1*** -> 5*10 -2
***2*** -> 1*10 -2
***3*** -> 5*10 -3
***4*** -> 4*10 -3
***5*** -> 1*10 -3
***6*** -> 1*10 -4
***7*** -> 1*10 -5
***8*** -> 1*10 -6
***9*** -> 6*10 -8

Values
Decimal (1..9)

Default
No default

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos sduErrorRatio (sduErrRatio)

Access
Read: All
Write: Illegal

Description
This attribute indicates the fraction of Signalling Data Units (SDUs) lost or detected as erroneous. It is defined only for conforming traffic.

This attribute can take up values between the numbers 1 - 7 representing the following:
1 -> 1*10 -2
2 -> 7*10 -3
3 -> 1*10 -3
4 -> 1*10 -4
5 -> 1*10 -5

6 -> 1*10 -6
7 -> 1*10 -1

Values: Decimal (1..7)

Default: No default

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos trafficHandlingPriority (traffHndlPr)

Access: Read: All
Write: Illegal

Description: This attribute indicates the traffic handling priority. The traffic handling priority attribute is used to prioritize the traffic when the *trafficClass* attribute has the value ***interactive.***

A value of ***0*** is reserved when this attribute is displayed for the negotiated Quality of Service (QoS) and the subscribed QoS. When displayed for the requested QoS, it indicates that the value in the subscribed QoS is to be used. Values of ***1***, ***2***, or ***3*** indicate the traffic priority, with ***1*** indicating the highest priority and ***3*** the lowest.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos transferDelay (transfDelay)

Access: Read: All
Write: Illegal

Description: This attribute indicates the maximum delay for 95th percentile of the distribution of delay for all delivered Signalling Data Units (SDUs) during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer data from one Service Access Point (SAP) to another SAP.

Values: Decimal (10..4100)

Units: msec

Default: No default

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos guaranteedUplinkBitRate (guarUpBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the uplink (Mobile Station to network) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxUplinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### ATTRIBUTE Gsc Tlli HlrcRec PdpC SubsQos guaranteedDownlinkBitRate (guarDnBr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the guaranteed number of bits delivered at a Service Access Point (SAP) in the downlink (network to Mobile Station) direction within a period of time, divided by the duration of the period.<br><br>The value of this attribute is ignored if the *trafficClass* attribute has one of the following values: ***interactive*** or ***background***, or if the *maxDownlinkBitRate* is set to ***0*** kbits/s. |
| Values | Decimal (0..8640) |
| Default | No default |

### COMPONENT Gsc BaseStationSystemApplPart (Bssap)

| | |
|---|---|
| Groups | "GROUP Gsc Bssap Provisioned (Prov)"<br>"GROUP Gsc Bssap OsiState (State)"<br>"GROUP Gsc Bssap SigRegistrationOp"<br>"GROUP Gsc Bssap Statistics (Stats)"<br>"GROUP Gsc Bssap WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS GprsSubscriberControl BaseStationSystemApplPart"

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n BaseStationSystemApplPart*<br><br>This component represents the Base Station System Application Part+ (BSSAP+) protocol layer of the SGSN. The BSSAP+ layer is responsible for encoding and decoding the BSSAP messages to the VLR. |
| Subcomponents | "COMPONENT Gsc Bssap Ss7IpInterface (Ss7IpIf)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc Bssap Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes to provide the Base Station System Application Part+ (BSSAP+) functionality. |

## ATTRIBUTE Gsc Bssap globalTitle (gt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute supplies the E.164 number associated with the local Signaling Connection Control Part (SCCP) subsystem on the Serving GPRS Support Node (SGSN). This E.164 number will be used in the global title address field of the Calling Party Address (CgPA) when the value of the *bssapCgpaRoutingIndicator* attribute of the *Sgsn Gsc* component is ***gt***.<br><br>A distinct E.164 number for Base Station System Application Part (BSSAP) is mandatory. If this attribute is empty, the value of the *sgsnNumber* attribute of the *Gsc* component will be used as the global title for BSSAP messages. |
| Values | String (0..17, NativeAddress) |
| Default | No default |

### ATTRIBUTE Gsc Bssap vlrSubsystemNumber (vlrSsn)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the subsystem number used by BSSAP to address the Visitor Location Register (VLR). By default BSSAP uses the standard subsystem number of 7 to address the VLR. The operator may desire to change this value if the VLR in his network is configured with a subsystem number other than the standard subsystem number of 7. The value set here must match the subsystem number specified by the VLR. |
| Values | Decimal (7; 151..254) |
| Default | 7 |

### GROUP Gsc Bssap OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Gsc Bssap adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Gsc Bssap operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Gsc Bssap usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Gsc Bssap SigRegistrationOp

Properties
Operational

Description
This group contains operational attributes for any component that monitors SS7 IP Gateway (SIG) registration statistics.

### ATTRIBUTE Gsc Bssap sigRegisterAttempts (regAttempts)

Access
Read: All
Write: Illegal

Description
This attribute counts the number of SCIP registrations attempted with the SIG. The counter wraps to 0 when it exceeds its maximum value.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Gsc Bssap sigRegisterSuccessAcks (regAcks)

Access
Read: All
Write: Illegal

Description
This attribute counts the number of successful registration responses received from the SIG. The counter wraps to 0 when it exceeds its maximum value.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Gsc Bssap sigRegisterFailures (regFail)

Access
Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute counts the number of unsuccessful registration responses received from the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap sigDeregisterAttempts (deregAttempts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of SCIP deregistrations attempted with the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap sigDeregisterSuccessAcks (deregAcks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of successful deregistration responses received from the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap sigDeregisterFailures (deregFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of unsuccessful deregistration responses received from the SIG. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap sigSccpNoticeIndications (sccpNotice)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of SCCP Notice Indications that have been received from the SIG. SCCP Notice Indications are received from the SIG when there are errors in the messages being sent to it. The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Bssap Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *BaseStationSystemApplPart*. |

### ATTRIBUTE Gsc Bssap gsAssociatedCurrent (gsAss)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates how many Mobile Stations (MSs) are currently in the Gs Associated state. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap gsAssociatedTotal (gsassTot)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts successful Gs association attempts from all the<br>Mobile Stations (MSs).<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Bssap csPage

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSAP+_PAGING_REQUEST messages received by the BSSAP+ entity from all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap csPageRejects (csPgRejs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSAP+_PAGING_REJECT messages sent by the BSSAP+ entity to all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap csPageMsUnreachable (csPgMsUnr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSAP+_MS_UNREACHABLE messages sent by the BSSAP+ entity to all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap locationUpdateRequests (luReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the BSSAP+_LOCATION_UPDATE_REQUEST messages sent by the BSSAP+ entity to all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap locationUpdateRejects (luRejs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSAP+_LOCATION_UPDATE_REJECT messages received by the BSSAP+ entity from all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap alertRequests (alertReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSAP+_ALERT_REQUEST messages received by the BSSAP+ entity from all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap alertRejects (alertRejs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSAP+ALERT_REJECT messages sent by the BSSAP+ entity to all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Bssap gprsDetachIndications (gprsDetInds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSAP+_GPRS_DETACH_INDICATION messages sent by the BSSAP+ entity to all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap t8Timeouts (t8Touts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *explicitGprsDetachTimer* (defined in *Sgsn GprsSubscriberControl*) expires before receiving a response from the VLR.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap gprsDetachMaxAttempts (n8MaxAtts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the BSSAP+ entity stopped retransmitting the explicit BSSAP+_GPRS_DETACH_INDICATIONs because the maximum number of retries *n8* (defined in S*gsn GprsSubscriberControl*) was reached.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc Bssap imsiDetachIndications (imsiDetInds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of BSSAP+_IMSI_DETACH_INDICATION messages sent by the BSSAP+ entity to all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap t9Timeouts (t9Touts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *explicitImsiDetachTimer* (defined in *Sgsn GprsSubscriberControl*) expires before receiving a response from the VLR.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap explicitImsiDetachMaxAttempts (n9MaxAtts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number times the BSSAP+ entity stopped retransmitting the explicit the BSSAP+_IMSI_DETACH_INDICATIONs because the maximum number of retries *n9* (defined in S*gsn GprsSubscriberControl*) was reached.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap t10Timeouts (t10Touts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *implicitImsiDetachTimer* (defined in *Sgsn GprsSubscriberControl*) expires before receiving a response from the VLR.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap implicitImsiDetachMaxAttempts (n10MaxAtts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the BSSAP+ entity stopped retransmitting the implicit BSSAP+_IMSI_DETACH_INDICATIONs because the maximum number of retries *n10* (defined in S*gsn GprsSubscriberControl*) was reached.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap vlrFailures (vlrF)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of BSSAP+_RESET_INDICATION messages received by the BSSAP+ entity from all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap sgsnResetsSent (sgsnRsts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of BSSAP+_RESET_INDICATION messages (including retransmissions) sent by the BSSAP+ entity to the VLRs. This type of message is sent to each associated VLR when a *Gsc* recovers following a card failure.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap t12Timeouts (t12Touts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *sgsnResetTimer* (defined in *Sgsn GprsSubscriberControl*) expires before receiving a response from the VLR.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap sgsnResetMaxAttempts (n12MaxAtts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the BSSAP+ entity stopped retransmitting the BSSAP+_RESET_INDICATIONs because the maximum number of retries *n12* (defined in Sgsn GprsSubscriberControl) was reached.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap msInfoRequests (msInfoReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of BSSAP+_MS_INFORMATION_REQUEST messages received by the BSSAP+ entity from all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap mmInfoRequests (mmInfoReqs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of BSSAP+_MM_INFORMATION_REQUEST messages received by the BSSAP+ entity from all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap statusFromVlr (stFrVlr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of BSSAP+_MOBILE_STATUS messages received by the BSSAP+ entity from all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap statusToVlr (stToVlr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of BSSAP+_MOBILE_STATUS messages sent by the BSSAP+ entity to all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap msActivityIndications (msActInds)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the BSSAP+_MS-ACTIVITY-INDICATION messages sent by the BSSAP+ entity to all the VLRs.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap sccpRegistrationRequestTimeouts (regTimeouts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of timeouts that have occurred while waiting for a REGISTRATION_ACK message from the SCCP layer. The *serviceRequestTimer* attribute of the *Sgsn Gsc* component specifies the length of time to wait for a REGISTRATION_ACK after sending a REGISTRATION_REQUEST to the SCCP layer.<br><br>This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Gsc Bssap WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Bssap customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Bssap customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS GprsSubscriberControl BaseStationSystemApplPart

Description The statistics record generated by the GprsSubscriberControl BaseStationSystemApplPart component.

### ATTRIBUTE Gsc Bssap registerAttempts (regAttempts)

Description This attribute indicates the number of SCIP registrations attempted with the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Bssap registerSuccessAcks (regAcks)

Description This attribute indicates the number of successful registration responses received from the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Bssap registerFailures (regFail)

Description This attribute indicates the number of unsuccessful registration responses received from the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Bssap deregisterAttempts (deregAttempts)

Description This attribute indicates the number of SCIP deregistrations attempted with the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Bssap deregisterSuccessAcks (deregAcks)

Description This attribute indicates the number of successful deregistration responses received from the SIG during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Bssap deregisterFailures (deregFail)

Description This attribute indicates the number of unsuccessful deregistration responses received from the SIG during the collection interval.

Values Decimal (0..4294967295)

## ATTRIBUTE Gsc Bssap sigSccpNoticeIndications (sccpNotice)

| | |
|---|---|
| Description | This attribute indicates the number of SCCP Notice Indications that have been received from the SIG during the collection interval. SCCP Notice Indications are received from the SIG when there are errors in the messages being sent to it. |
| Values | Decimal (0..4294967295) |

## COMPONENT Gsc Bssap Ss7IpInterface (Ss7IpIf)

| | |
|---|---|
| Instance | Decimal (1..1) |
| Groups | "GROUP Gsc Bssap Ss7IpIf Provisioned (Prov)"<br>"GROUP Gsc Bssap Ss7IpIf OsiState (State)"<br>"GROUP Gsc Bssap Ss7IpIf WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Tcap/n Ss7IpIf/n*<br>*Gsc/n Bssap Ss7IpIf/n*<br><br>This component represents an interface to the HP or USP SS7-IP Gateway (SIG). The HP SIG and Universal Signalling Point (USP) SIG are referred to generically as the SIG.<br><br>The SIG is a “stateless” message routing gateway used by many wireless components to communicate with other SS7 nodes in the wireless network such as the Home Location Register (HLR) and Visitor Location Register (VLR).<br><br>A single instance of the *Ss7IpIf* provides connectivity to the SIG, but an additional instance can be added for redundancy. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Gsc Bssap Ss7Ipif Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *Ss7IpIf* component. |

### ATTRIBUTE Gsc Bssap Ss7Ipif linkToPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to a *Gips/n Ip/address Tcp Port/n* component. This determines the IP Address and port used by this component for communication with the SIG. |
| Values | Link (Service, linkToApplication) |
| Default | No default |

### ATTRIBUTE Gsc Bssap Ss7Ipif ss7IpGatewayAddress (sigIpAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SS7-IP Gateway (SIG) IP address.<br><br>The value must match the IP address specified on the SIG and must not be set to 0.0.0.0.<br><br>Changing this value causes the *Ss7IpIf* to redirect data using the new IP address. Current transactions being processed using this interface may be affected. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc Bssap Ss7Ipif ss7IpGatewayTcpPort (sigTcpPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the SS7-IP Gateway (SIG) TCP port number. |

The value must match the TCP port number specified on the SIG.

Changing this value causes the *Ss7IpIf* to redirect data using the new TCP Port number. Current transactions being processed using this interface may be affected.

Values: Decimal (0..65535)

Default: No default

### ATTRIBUTE Gsc Bssap Ss7Ipif heartbeatTimer (heartBTmr)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time between heartbeat messages sent to the SIG by the *Ss7IpIf*. Specifying ***disabled*** indicates that the heartbeat timer is disabled, that is, heartbeat messages are not sent to the SIG.

The value specified by this attribute should be less than the keep-alive timer specified on the SIG. It is recommended that this attribute specify a value that is one-third the value of that specified by the keep-alive timer on the SIG.

Values: Decimal (1..100)
disabled

Units: seconds

Default: 20

### ATTRIBUTE Gsc Bssap Ss7Ipif keepAliveTimer (keepAliveTmr)

Access: Read: All
Write: All

Description: This attribute specifies the amount of time the *Ss7IpIf* waits to receive heartbeat messages from the USP SIG before timing out. If the *Ss7IpIf* does not receive a heartbeat message from the SIG within the amount of time specified, it transitions into the OSI ***disabled*** operational state until connectivity with the SIG can be reestablished.

If the *Ss7IpIf* is provisioned to connect to an HP SIG, this attribute should be set to ***disabled***. Setting this attribute to ***disabled*** indicates that the *Ss7IpIf* will not monitor heartbeat messages from the SIG.

This attribute should specify a value greater than that specified by the heartbeat timer on the SIG. It is recommended that this attribute specify a value that is three times the value specified by the heartbeat timer on the SIG.

| | |
|---|---|
| Values | Decimal (1..300)<br>disabled |
| Units | seconds |
| Default | 60 |

## GROUP Gsc Bssap Ss7Iplf OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Gsc Bssap Ss7Iplf adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Gsc Bssap Ss7Iplf operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Gsc Bssap Ss7Iplf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Gsc Bssap Ss7Iplf WlcCustomCounters (WlcCustomCntr)

Properties
Operational

Description
This group contains the spare counters that can be dynamically patched.

### ATTRIBUTE Gsc Bssap Ss7Iplf customCounter1 (customCntr1)

Access
Read: All
Write: Illegal

Description
This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Gsc Bssap Ss7Iplf customCounter2 (customCntr2)

Access
Read: All
Write: Illegal

Description
This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values
Decimal (0..4294967295)

Default
No default

## ATTRIBUTE Gsc Bssap Ss7Iplf customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Gsc RemoteApplicationConnection (RaConn)

| | |
|---|---|
| Instance | appType [String (1..8, ASCII)]<br>shelfId [Decimal (0..50)]<br>instance (n) [Decimal (1..15)] |
| Groups | "GROUP Gsc RaConn OsiState (State)"<br>"GROUP Gsc RaConn WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | ... *RemoteApplicationConnection/<appType, shelfId, n>*<br><br>This component represents the Remote Application Connection information of an application that talks to applications on other shelves. For each application that it can communicate with, one of these connection components is created and is instantiated with the name of the remote application, the Id of the shelf on which the application runs, and the instance number of the application. ShelfId ***0*** represents the Master shelf. |

| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc RaConn OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Gsc RaConn adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

### ATTRIBUTE Gsc RaConn operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Gsc RaConn usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Gsc RaConn WlcCustomCounters (WlcCustomCntr)

Properties
Operational

Description
This group contains the spare counters that can be dynamically patched.

### ATTRIBUTE Gsc RaConn customCounter1 (customCntr1)

Access
Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc RaConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc RaConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gsc RaConn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Gsc RaConn AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsc RaConn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE Gsc RaConn AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

### COMPONENT Gsc ShortMessageService (Sms)

| | |
|---|---|
| Groups | "GROUP Gsc Sms Statistics (Stats)"<br>"GROUP Gsc Sms WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS GprsSubscriberControl ShortMessageService"

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n ShortMessageService*<br><br>This component represents the Short Message Service (SMS) functionality of the Serving GPRS Support Node (SGSN). |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsc Sms Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *ShortMessageService (Sms).* |

## ATTRIBUTE Gsc Sms cpResponseExhaust (cpRespExh)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *cpResponseTimer* expires and the *cpResponseRetries* has been reached before receiving a CP-ACK or CP-ERROR message from the Mobile Station (MS).<br><br>This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gsc Sms rpResponseTimeouts (rpRespTouts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *rpResponseTimer* expires before receiving a RP-ACK or RP-ERROR message from the Mobile Station (MS).<br><br>This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gsc Sms iwmscResponseTimeouts (iwmscRespTouts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the *iwmscResponseTimer* expires before receiving a MOBILE ORIGINATED FORWARD SHORT MESSAGE ACK message |

from the Service Center.

This counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms moAttempts (moAtt)

Access: Read: All
Write: Illegal

Description: This attribute counts the MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* component from the Mobile Station (MS).

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms mtAttempts (mtAtt)

Access: Read: All
Write: Illegal

Description: This attribute counts the MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent to the *ShortMessageService (Sms) component* from the Service Center.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms mmaAttempts (mmaAtt)

Access: Read: All
Write: Illegal

Description: This attribute counts the MORE MEMORY AVAILABLE messages sent to the *ShortMessageService (Sms)* from the Mobile

Station (MS). The value includes the failures counted by *mmaFailures*.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms mmaFailures (mmaFail)

Access: Read: All
Write: Illegal

Description: This attribute counts the MORE MEMORY AVAILABLE messages sent to the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed due to one of the following conditions:

Network Out of Order
Protocol Error
Congestion
Unidentified Subscriber
Unknown Subscriber
Invalid Transaction Identifier Value
Message Type non-existence
Invalid mandatory information
Invalid short message transfer reference value
Message not compatible with short message protocol state
Requested Facility not implemented

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms moFailUnidentifiedSubscriber (moFailUnidSub)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Mobile Station (MS) that

failed because the MS is not registered in the Public Land Mobile Network (PLMN), the MS is not subscribed in a Service Center (SC) or the MS Prepaid Mobile Originated SMS account is depleted.

This counter is incremented when the SGSN sends a CP-Data(RP-Error) message to the MS with error cause "unidentifiedSubscriber" selected. The value of this attribute is included in the count of *moFailures*.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms moFailNetworkFailures (moFailNetFailures)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed because the network is not functioning correctly, a task cannot be performed because of a problem with the network, Prepaid Service Control Point (SCP) does not respond to the *Sms*, *iwmscResponseTimer* expired or an equipment protocol error occurs. The value of this attribute is included in the count of *moFailures.*

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms moFailFacilityNotSupp (moFailFaciNoSupp)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the

*ShortMessageService (Sms)* from the Service Center (SC) that failed because the network is unable to provide the requested short message services.

This counter is incremented when the SGSN receives a MOForwardMessageAckRsp message with "facilityNotSupported" error cause selected. The value of this attribute is included in the count of *moFailures*.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms moFailCongestion (moFailCong)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed because the short message service cannot be serviced because of high traffic.

This counter is incremented when the SGSN receives a Mobile Originated message with "SC-congestion" error cause selected from the SMS-IWMSC (Short Message Service-InterWorking MSC). The value of this attribute is included in the count of the *moFailures*.

The counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Sms moFailUnknownServiceCenter (moFailUnkServC)

Access: Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute counts the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Mobile Station (MS) that failed because the destination requested by the MS is not currently assigned or allocated.<br><br>This counters is incremented when the SGSN receives a MOForwardShortMessageAckRsp message with “unknownServiceCenter” error cause selected. The value of this attribute is included in the count of the *moFailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms moFailInvalidSmeAddress (moFailInvSmeAdd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed because the Service Center (SC) received an invalid Short Message Entity address.<br><br>This counter is incremented when the SGSN receives a MOForwardShortMessageAckRsp message with "invalidSMEAddress” error cause selected. The value of this attribute is included in the count of the *moFailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms moFailMissingSmsSubscription (moFailMissSmsSub)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Mobile Station (MS) that failed because the Mobile Subscriber subscription information does not include Mobile Originated Short Message Services.<br><br>This counter is incremented when the SGSN sends a CP-Data (RP-Error) message to the MS with error cause “RequestedFacilityNotSubscribed” selected. The value of this attribute is included in the count of the *moFailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms moFailOdbSubscriber (moFailOdbSub)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages sent from the ShortMessageService (Sms) to the Mobile Station (MS) that failed because the MS is forbidden from originating Short Message Services (SMS) messages.<br><br>This counter is incremented when the SGSN sends a CP-Data (RP-Error) message to the MS with error cause “Operator Determined Barring” selected. The value of this attribute is included in the count of the *moFailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms mtFailUnidentifiedSubscriber (mtFailUnidSub)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because the Mobile Station (MS) is not known within the SGSN or the MS location is not confirmed in the HLR.<br><br>This counter is incremented when the SGSN sends a negative MTForwardShortMessageAckRsp message to the SIG (SS7 Ip Gateway) with “unidentified Subscriber” error cause selected. The value of this attribute is included in the count of *mtFailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms mtFailSubscriberAbsent (mtFailSubAbs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because a Mobile Station (MS) did not respond to a Packet Paging Request or a MS is detached from the network.<br><br>This counter is incremented when the SGSN sends a negative MTForwardShortMessageAckRsp message to the SIG (SS7 IP Gateway) with “Absent Subscriber_SM” error cause and “Gprs Detached” or “No Paging Response from GPRS” diagnostic information selected. The value of this attribute is included in the count of the *mtFailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms mtFailSubscriberBusy (mtFailSubBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because an another mobile terminated short message transfer is going on and the Mobile Terminated SMS Message Buffer Queue has reached its capacity limit, the message was buffered but it is not possible to deliver the message before the expiry of the buffering time or the Mobile Station (MS) is performing an inter SGSN routing area update. The value of this attribute is included in the *mtFailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms mtFailSubscriberNotSmEquipped (mtFailSubNotSmEquip)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because the Mobile Station did not support Short Message Services (SMS) messages.<br><br>This counter is incremented when the SGSN sends a negative MTForwardShortMessageAckRsp message to the SIG (SS7 Ip Gateway) with “equipmentNotSM-Equipped” user error selected. The value of this attribute is included in the count of *mtfailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms mtFailNetworkFailures (mtFailNetFailures)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because the network is not functioning correctly, a task cannot be performed because of a problem with the network or an equipment protocol error occurs. The value of this attribute is included in the count of *mtFailures.*<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms mtFailMemCapExceed (mtFailMemCapExc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Mobile Subscriber (MS) that failed because the MS cannot store the incoming short message due to lack of storage capacity.<br><br>This counter is incremented when the SGSN sends a negative MTForwardShortMessageAckRsp message to the SIG (SS7 Ip Gateway) with “SM-DeliveryFailure cause: MemoryCapacityExceeded” user error selected. The value of this attribute is included in the count of *mtFailures*.<br><br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gsc Sms moFailOthers

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* component from the Mobile Station (MS) that failed due to one of the following conditions:<br><br>Unknown Subscriber<br>Invalid Transaction Identifier Value<br>Message Type non-existence<br>Invalid mandatory information<br>Invalid short message transfer reference value<br>Message not compatible with short message protocol state<br>Unassigned number<br>Short Message transfer reject<br><br>The counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| | The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Sms WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Sms customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Sms customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description — This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values — Decimal (0..4294967295)

Default — No default

## COLLECTED STATS GprsSubscriberControl ShortMessageService

Description — The statistics record generated by the GprsSubscriberControl ShortMessageService component.

### ATTRIBUTE Gsc Sms cpResponseExhaust (cpRespExh)

Description — This attribute indicates the number of times the *cpResponseTimer* expires and the *cpResponseRetries* has been reached before receiving a CP-ACK or CP-ERROR message from the Mobile Station (MS) in the collection interval.

Values — Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms rpResponseTimeouts (rpRespTouts)

Description — This attribute indicates the number of times the *rpResponseTimer* expires before receiving a RP-ACK or RP-ERROR message from the Mobile Station (MS) in the collection interval.

Values — Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms iwmscResponseTimeouts (iwmscRespTouts)

Description — This attribute indicates the number of times the *iwmscResponseTimer* expires before receiving a MOBILE ORIGINATED FORWARD SHORT MESSAGE message from the Service Center in the collection interval.

Values — Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moAttempts (moAtt)

Description — This attribute indicates the MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the

*ShortMessageService (Sms)* component from the Mobile Station (MS) in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mtAttempts (mtAtt)

Description: This attribute indicates the MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent to the *ShortMessageService (Sms) component* from the Service Center in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mmaAttempts (mmaAtt)

Description: This attribute indicates the MORE MEMORY AVAILABLE messages sent to the *ShortMessageService (Sms)* from the Mobile Station (MS) in the collection interval. The value includes the failures counted by *mmaFailures*.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mmaFailures (mmaFail)

Description: This attribute indicates the MORE MEMORY AVAILABLE messages sent to the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed due to one of the following conditions:

Network Out of Order
Protocol Error
Congestion
Unidentified Subscriber
Unknown Subscriber
Invalid Transaction Identifier Value
Message Type non-existence
Invalid mandatory information
Invalid short message transfer reference value
Message not compatible with short message protocol state
Requested Facility not implemented

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailUnidentifiedSubscriber (moFailUnidSub)

Description: This attribute indicates, for the collection interval, the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed because the MS is not registered in the Public Land Mobile Network (PLMN), the MS is not subscribed in a Service Center (SC) or the MS Prepaid Mobile Originated SMS account is depleted. The value of this attribute is included in the count of *moFailures*.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailNetworkFailures (moFailNetFailures)

Description: This attribute indicates, for the collection interval, the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed because the network is not functioning correctly, a task cannot be performed because of a problem with the network, Prepaid Service Control Point (SCP) does not respond to the *Sms*, *iwmscResponseTimer* expires or an equipment protocol error occurs. The value of this attribute is included in the count of *moFailures.*

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailFacilityNotSupp (moFailFaciNoSupp)

Description: This attribute indicates, for the collection interval, the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Service Center (SC) that failed because the network is unable to provide the requested short message services. The value of this attribute is included in the count of *moFailures*.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailCongestion (moFailCong)

Description: This attribute indicates, for the collection interval, the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed because the short message

service cannot be serviced because of high traffic. The value of this attribute is included in the count of *moFailures*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailUnknownServiceCenter (moFailUnkServC)

Description This attribute indicates, for the collection interval, the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Mobile Station (MS) that failed because the destination requested by the MS is not currently assigned or allocated. The value of this attribute is included in the count of *moFailures*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailInvalidSmeAddress (moFailInvSmeAdd)

Description This attribute indicates, for the collection interval, the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* from the Mobile Station (MS) that failed because the Service Center (SC) received an invalid Short Message Entity address. The value of this attribute is included in the count of *moFailures*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailMissingSmsSubscription (moFailMissSmsSub)

Description This attribute indicates, for the collection interval, the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Mobile Station (MS) that failed because the Mobile Subscriber subscription information did not include Mobile Originated Short Message Services. The value of this attribute is included in the count of *moFailures*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailOdbSubscriber (moFailOdbSub)

Description This attribute indicates, for the collection interval, the number of MOBILE ORIGINATED FORWARD SHORT MESSAGE messages sent from the ShortMessageService (Sms) to the Mobile Station (MS) that failed because the MS is forbidden

from originating short message services (SMS) messages. The value of this attribute is included in the count of *moFailures*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mtFailUnidentifiedSubscriber (mtFailUnidSub)

Description This attribute indicates, for the collection interval, the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because the Mobile Station (MS) is not known within the SGSN or the MS location is not confirmed in the HLR. The value of this attribute is included in the count of *mtFailures*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mtFailSubscriberAbsent (mtFailSubAbs)

Description This attribute indicates, for the collection interval, the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because a Mobile Station (MS) did not respond to a Packet Paging Request or a MS is detached from the network. The value of this attribute is included in the count of *mtFailures*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mtFailSubscriberBusy (mtFailSubBusy)

Description This attribute indicates, for the collection interval, the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because another mobile terminated short message transfer is going on and the Mobile Terminated SMS Message Buffer Queue has reached its capacity limit, the message was buffered but it is not possible to deliver the message before the expiry of the buffering time or the Mobile Station (MS) is performing an inter SGSN routing area update. The value of this attribute is included in the count of *mtFailures*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mtFailSubscriberNotSmEquipped (mtFailSubNotSmEquip)

Description: This attribute indicates, for the collection interval, the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because the Mobile Station does not support Short Message Service messages. The value of this attribute is included in the count of *mtFailures.*

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mtFailNetworkFailures (mtFailNetFailures)

Description: This attribute indicates, for the collection interval, the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Service Center that failed because the network is not functioning correctly, a task cannot be performed because of a problem with the network or an equipment protocol error occurs. The value of this attribute is included in the count of *mtFailures.*

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mtFailMemCapExceed (mtFailMemCapExc)

Description: This attribute indicates, for the collection interval, the number of MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* to the Mobile Subscriber (MS) that failed because the MA cannot store the incoming short message due to lack of storage capacity. The value of this attribute is not included in the count of *mtFailures.*

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms moFailOthers

Description: This attribute indicates the MOBILE ORIGINATED FORWARD SHORT MESSAGE messages received by the *ShortMessageService (Sms)* component from the Mobile Station (MS) that failed due to one of the following conditions:

Unknown Subscriber
Invalid Transaction Identifier Value
Message Type non-existence

Invalid mandatory information
Invalid short message transfer reference value
Message not compatible with short message protocol state
Unassigned number
Short Message transfer reject

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Sms mtFailOthers

Description: This attribute indicates the MOBILE TERMINATED FORWARD SHORT MESSAGE messages sent from the *ShortMessageService (Sms)* component to the Service Center that failed due to one of the following conditions:

Unexpected Data Value
Data Missing
Message Type non-existence
Invalid mandatory information
Invalid short message transfer reference value
Message not compatible with short message protocol state
Semantically incorrect message
System Failures

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Gsc PrepaidShortMessageService (PSms)

Groups: "GROUP Gsc PSms Statistics (Stats)"
"GROUP Gsc PSms WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS GprsSubscriberControl PrepaidShortMessageService"

Scope: Application

Description: *Gsc/n PrepaidShortMessageService*

This component represents the Prepaid Short Message Service (PSMS) functionality of the Serving GPRS Support Node

(SGSN). This component is to be added if PSMS feature is required.

Opt. Subcomp. "COMPONENT Gsc PSms ServiceControlPoint (Scp)"

## GROUP Gsc PSms Statistics (Stats)

Properties Operational

Description This group contains statistical attributes of the *PrepaidShortMessageService (PSms)*.

## ATTRIBUTE Gsc PSms peakConcurrentTransactions (peakCTran)

Access Read: All
Write: Illegal

Description This attribute indicates the peak number of concurrent Prepaid Short Message Service (PSMS) transactions that have occurred on this *GprsSubscriberControl (Gsc)*.

Values Decimal (0..4294967295)

Default No default

## ATTRIBUTE Gsc PSms activeConnections (actCon)

Access Read: All
Write: Illegal

Description This attribute indicates the connections that are currently active between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs). This reflects only those connections that are currently in the Network Connection Control Protocol (NCCP) data exchange state.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Gsc PSms totalSuccessfulConnections (sucCon)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total connections between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs) that have successfully reached the Network Connection Control Protocol (NCCP) data exchange state. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms totalFailedConnections (failCon)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total connection attempts between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs) that have failed to reach the Network Connection Control Protocol (NCCP) data exchange state. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms totalTransactionSuccesses (succTran)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have successfully completed between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs). Specifically, this indicates the Prepaid-CTP INCREMENT DECREMENT RESPONE messages that have been successfully received before *transactionTimer* has expired.<br><br>This counter wraps to zero when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms totalTransactionFailures (failTran)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have failed between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs). This includes failures due to failed connections, late responses, resource limitations and protocol errors. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms totNwkRelatedTransactionFailures (netTranFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have failed due to network related events. This includes transactions rejected due to connection failures, network congestion, and local network resource limitations. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc PSms WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc PSms customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS GprsSubscriberControl PrepaidShortMessageService

Description The statistics record generated by the GprsSubscriberControl PrepaidShortMessageService component.

### ATTRIBUTE Gsc PSms peakConcurrentTransactions (peakCTran)

Description This attributes indicates the peak number of concurrent Prepaid Short Message Service (PSMS) transactions that have occurred on this *GprsSubscriberControl (Gsc)*.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms activeConnections (actCon)

Description This attribute indicates the connections that are currently active between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs). This reflects only those connections that are currently in the Network Connection Control Protocol (NCCP) data exchange state.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms totalSuccessfulConnections (totCon)

Description This attribute counts the total connections between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs) that have successfully reached the Network Connection Control Protocol (NCCP) data exchange state. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms totalFailedConnections (failCon)

Description This attribute counts the total connection attempts between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs) that have failed to reach the Network Connection Control Protocol (NCCP) data exchange state. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms totalTransactionSuccesses (succTran)

Description: This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have successfully completed between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs). Specifically, this indicates the Prepaid-CTP INCREMENT DECREMENT RESPONSE messages that have been successfully received before *transactionTimer* has expired.

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms totalTransactionFailures (failTran)

Description: This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have failed between the *GprsSubscriberControl (Gsc)* and the external Service Control Points (SCPs). This includes failures due to failed connections, late responses, resource limitations and protocol errors.

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms totNwkRelatedTransactionFailures (netTranFail)

Description: This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have failed between the GprsSubscriberControl (Gsc) and this external Service Control Point (SCP) due to network related events. This includes transactions rejected due to connection failures, network congestion, and local network resource limitations. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Gsc PSms ServiceControlPoint (Scp)

Instance: Decimal (1..32)

| | |
|---|---|
| Groups | "GROUP Gsc PSms Scp Provisioned (Prov)"<br>"GROUP Gsc PSms Scp Operational (Oper)"<br>"GROUP Gsc PSms Scp WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS GprsSubscriberControl PrepaidShortMessageService ServiceControlPoint"

| | |
|---|---|
| Scope | Application |

## GROUP Gsc PSms Scp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes of the external Service Control Point (SCP) to which the *GprsSubscriberControl (Gsc)* connects. |

## ATTRIBUTE Gsc PSms Scp clusterId (cId)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Cluster Identifier which is used by the *GprsSubscriberControl (Gsc)* when it connects to the external Service Control Point (SCP). This value must be unique within the domain of the SCP. |
| Values | Decimal (0..255)<br>undefined |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp linkToPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to the *GprsIpServer IpAddress TcpPort* component. The IP address specified becomes the source IP address and the TCP port specified becomes the source port used for communication with this external Service Control Point (SCP).<br><br>Changing this value causes the SGSN to reset its communication links with the *GprsIpServer*. Transactions being processed may be affected. |
| Values | Link (Service, linkToApplication) |
| Default | No default |

### GROUP Gsc PSms Scp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *ServiceControlPoint (Scp)*. |

### ATTRIBUTE Gsc PSms Scp transactionSuccesses (succTran)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have successfully completed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). Specifically, this indicates the number of Prepaid-CTP INCREMENT DECREMENT TRANSACTION RESPONSE messages that have been successfully received before *transactionTimer* has expired.<br><br>This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp transactionFailures (failTran)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have failed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). This includes failures due to failed connections, late responses, resource limitations and protocol errors. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp networkRelatedTransactionFailures (netTranFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have failed between the GprsSubscriberControl (Gsc) and this external Service Control Point (SCP) due to network related events. This includes transactions rejected due to connection failures, network congestion, and local network resource limitations. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp prepaidCtpLocalProtocolErrors (locPErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Prepaid-CTP protocol errors that have been committed locally that the external Service Control Point (SCP) has detected and has reported back to the *GprsSubscriberControl (Gsc)*.<br><br>The count consists of the transaction portion, component portion, |

and parameter error categories. This counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc PSms Scp prepaidCtpRemoteGeneralErrors (remGErr)

Access: Read: All
Write: Illegal

Description: This attribute counts the total Prepaid-CTP general errors that have occurred on the external Service Control Point (SCP) and that have been reported back to the *GprsSubscriberControl (Gsc)*. The count consists of the general error category as described in the Prepaid-CTP specification. This counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc PSms Scp prepaidCtpRemoteProtocolErrors (remPErr)

Access: Read: All
Write: Illegal

Description: This attribute counts the total Prepaid-CTP protocol errors that have been committed remotely by the external Service Control Point (SCP) that have been detected by the *GprsSubscriberControl (Gsc)*. The count consists of the transaction portion, component portion, and parameter error categories as described in the Prepaid-CTP specification. This counter wraps to zero when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc PSms Scp nccpState

Access: Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute contains the current Network Connection Control Protocol (NCCP) state of the connection as described in the NCCP protocol specification. |
| Values | null<br>idle<br>connecting<br>dataExchange<br>releasing |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpLoginSuccesses (nccpLiSucc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Network Connection Control Protocol (NCCP) logins that have successfully completed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). Specifically, this indicates the NCCP LOGIN RESPONSE messages received from this SCP before the *nccpLoginResponseTimer* has expired. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpLoginFailures (nccpLiFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Network Connection Control Protocol (NCCP) logins that have failed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). This count includes failures due to rejected logins as well as late or lost responses. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpLoginResponseTimeouts (nccpRTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the *nccpLoginResponseTimer* expiries before receiving a response from the external Service Control Point (SCP) for the Network Connection Control Protocol (NCCP) LOGIN REQUEST message sent. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpLogoutSuccesses (nccpLoSucc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Network Connection Control Protocol (NCCP) logouts that have successfully completed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). Specifically, this indicates the NCCP LOGOUT RESPONSE messages received from this SCP before the *nccpLogoutResponseTimer* has expired. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpLogoutFailures (nccpLoFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Network Connection Control Protocol (NCCP) logouts that have failed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). Specifically, this counts the *nccpLogoutResponseTimer* expirations that have occurred. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpRemoteAborts (nccpRemAbt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Network Connection Control Protocol (NCCP) ABORT messages that have been received from this external Service Control Point (SCP). This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpLocalAborts (nccpLocAbt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Network Connection Control Protocol (NCCP) ABORT messages that have been sent to this external Service Control Point (SCP). This counter also includes the NCCP ABORT messages sent due to the aborts caused by the expiration of the NCCP KeepAlive timer. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpKeepAliveTimeouts (nccpKpAlTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Network Connection Control Protocol (NCCP) KeepAlive timer expirations that have occurred while communicating with this external Service Control Point (SCP). This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpKeepAliveAborts (nccpKpAlAbt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total aborts caused by the Network Connection Control Protocol (NCCP) KeepAlive timer expiry. Specifically, this counts the number of NCCP Abort messages that have been sent to this external Service Control Point (SCP) due to aborts caused by KeepAlive timer expirations. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpRoundRobinTimeouts (nccpRrTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts number of times the *nccpRoundRobinTimer* expires before the SGSN could establish a connection with any of the Service Processors (SPs) of this external Service Control Point (SCP). This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpReconnectTimeouts (nccpRecTo)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total *nccpReconnectTimer* expirations that have occurred while communicating with this external Service Control Point (SCP). This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpLocalProtocolErrors (nccpLocPErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Network Connection Control Protocol (NCCP) protocol errors that have been committed locally that this external Service Control Point (SCP) has detected and has reported back to the *GprsSubscriberControl (Gsc)*. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp nccpRemoteProtocolErrors (nccpRemPErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total Network Connection Control Protocol (NCCP) protocol errors that have been committed remotely by this external Service Control Point (SCP) that have been detected by the *GprsSubscriberControl (Gsc)*. This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp tcpRemoteIpAddress (tcpRemIpAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute reflects the IP address on this external Service Control Point (SCP) that the *GprsSubscriberControl (Gsc)* has established or is currently attempting to establish a connection. This address will be one of the two provisioned addresses of the Service Processors (*spAddress1* and *spAddress2*). |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp tcpConnectSuccesses (tcpConnSucc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total TCP connections that have been successfully established between the *GprsSubscriberControl (Gsc)* and this Service Control Point (SCP). This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc PSms Scp tcpConnectFailures (tcpConnFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total TCP connections that have failed to successfully establish between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). This counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc PSms Scp WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc PSms Scp customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

### ATTRIBUTE Gsc PSms Scp customCounter2 (customCntr2)

Access Read: All
Write: Illegal

Description This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

### ATTRIBUTE Gsc PSms Scp customCounter3 (customCntr3)

Access Read: All
Write: Illegal

Description This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS GprsSubscriberControl PrepaidShortMessageService ServiceControlPoint

Description The statistics record generated by the GprsSubscriberControl PrepaidShortMessageService ServiceControlPoint component.

### ATTRIBUTE Gsc PSms Scp transactionSuccesses (succTran)

Description This attribute counts the total prepaid Prepaid Short Message Service (PSMS) transactions that have successfully completed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). Specifically, this indicates the number of Prepaid-CTP INCREMENT DECREMENT TRANSACTION RESPONSE messages that have been successfully received before *transactionTimer* has expired.

This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp transactionFailures (failTran)

Description This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have failed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). This includes failures due to failed connections, late responses, resource limitations and protocol errors. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp networkRelatedTransactionFailures (netTranFail)

Description This attribute counts the total Prepaid Short Message Service (PSMS) transactions that have failed between the GprsSubscriberControl (Gsc) and this external Service Control Point (SCP) due to network related events. This includes transactions rejected due to connection failures, network congestion, and local network resource limitations. This counter wraps to zero when it exceeds the maximum value.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp prepaidCtpLocalProtocolErrors (locPErr)

Description This attribute counts the total Prepaid-CTP protocol errors that have been committed locally that the external Service Control Point (SCP) has detected and has reported back to the *GprsSubscriberControl (Gsc)*.

This count consists of the transaction portion, component portion, and parameter error categories. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp prepaidCtpRemoteGeneralErrors (remGErr)

Description This attribute counts the total Prepaid-CTP general errors that have occurred on the external Service Control Point (SCP) and

that have been reported back to the *GprsSubscriberControl (Gsc)*. This count consists of the general error category as described in the Prepaid-CTP specification. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp prepaidCtpRemoteProtocolErrors (remPErr)

Description: This attribute counts the total Prepaid-CTP protocol errors that have been committed remotely by the external Service Control Point (SCP) that have been detected by the *GprsSubscriberControl (Gsc)*. This count consists of the transaction portion, component portion, and parameter error categories as described in the Prepaid-CTP specification. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpLoginSuccesses (nccpLiSucc)

Description: This attribute counts the total Network Connection Control Protocol (NCCP) logins that have successfully completed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). Specifically, this indicates the NCCP LOGIN RESPONSE messages received from this SCP before the *nccpLoginResponseTimer* has expired. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpLoginFailures (nccpLiFail)

Description: This attribute counts the total Network Connection Control Protocol (NCCP) logins that have failed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). This count includes failures due to rejected logins as well as late or lost responses. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpLoginResponseTimeouts (nccpRTo)

Description: This attribute counts the *nccpLoginResponseTimer* expiries before receiving a response from the external Service Control Point (SCP) for the Network Connection Control Protocol (NCCP) LOGIN REQUEST message sent. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpLogoutSuccesses (nccpLoSucc)

Description: This attribute counts the total Network Connection Control Protocol (NCCP) logouts that have successfully completed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). Specifically, this indicates the NCCP LOGOUT RESPONSE messages received from this SCP before the *nccpLogoutResponseTimer* has expired. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpLogoutFailures (nccpLoFail)

Description: This attribute counts the total Network Connection Control Protocol (NCCP) logouts that have failed between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). Specifically, this counts the *nccpLogoutResponseTimer* expirations that have occurred. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpRemoteAborts (nccpRemAbt)

Description: This attribute counts the total Network Connection Control Protocol (NCCP) ABORT messages that have been received from this external Service Control Point (SCP). This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpLocalAborts (nccpLocAbt)

Description: This attribute counts the total Network Connection Control Protocol (NCCP) NCCP ABORT messages that have been sent to this external Service Control Point (SCP). This counter also includes the NCCP ABORT messages sent due to the aborts caused by the expiration of the NCCP KeepAlive timer. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpKeepAliveTimeouts (nccpKpAlTo)

Description: This attribute counts the total Network Connection Control Protocol (NCCP) KeepAlive timer expirations that have occurred while communicating with this external Service Control Point (SCP). This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpKeepAliveAborts (nccpKpAlAbt)

Description: This attribute counts the total aborts caused by the Network Connection Control Protocol (NCCP) KeepAlive timer expiry. Specifically, this counts the number of NCCP Abort messages that have been sent to this external Service Control Point (SCP) due to aborts caused by KeepAlive timer expirations. This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpRoundRobinTimeouts (nccpRrTo)

Description: This attribute counts number of times the *nccpRoundRobinTimer* expires before the SGSN could establish a connection with any of the Service Processors (SPs) of this external Service Control Point (SCP). This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpReconnectTimeouts (nccpRecTo)

Description: This attribute counts the total *nccpReconnectTimer* expirations that have occurred while communicating with this external

Service Control Point (SCP). This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpLocalProtocolErrors (nccpLocPErr)

Description This attribute counts the Network Connection Control Protocol (NCCP) protocol errors that have been committed locally that the external Service Control Point (SCP) has detected and has reported back to the *GprsSubscriberControl (Gsc)*. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp nccpRemoteProtocolErrors (nccpRemPErr)

Description This attribute counts the total Network Connection Control Protocol (NCCP) protocol errors that have been committed remotely by the external Service Control Point (SCP) that have been detected by the *GprsSubscriberControl (Gsc)*. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp tcpConnectSuccesses (tcpConnSucc)

Description This attribute counts the total TCP connections that have been successfully established between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc PSms Scp tcpConnectFailures (tcpConnFail)

Description This attribute counts the total TCP connections that have failed to successfully establish between the *GprsSubscriberControl (Gsc)* and this external Service Control Point (SCP). This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

## COMPONENT Gsc ServiceSwitchingFunction (Ssf)

Groups
"GROUP Gsc Ssf Provisioned (SsfProv)"
"GROUP Gsc Ssf OsiState (State)"
"GROUP Gsc Ssf Operational (SsfOp)"
"GROUP Gsc Ssf WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS GprsSubscriberControl ServiceSwitchingFunction"

Scope
Application

Description
*Gsc/n ServiceSwitchingFunction*
*Usc/n ServiceSwitchingFunction*

This component represents the Service Switching Function (SSF) functionality of the SGSN (2G) and USGSN (3G). The Service Switching Function is responsible for handling communication between the SGSN (2G and 3G) and one or more Service Control Points (SCP). An SCP is an external entity present in a wireless network supporting CAMEL (Customized Application for Mobile Network Enhanced Logic). It provides prepaid services.

The SSF maintains the state of the CAMEL dialogues between the SGSN and the external SCPs with which it communicates.

Common Verbs

List
Display

## GROUP Gsc Ssf Provisioned (SsfProv)

Properties
Provisioned

Description
This group contains provisioning data for the *Ssf* component.

## ATTRIBUTE Gsc Ssf maxCamelDialogues (maxDialogues)

Access
Read: All
Write: All

Criticality
Process

Description
This attribute specifies the maximum number of CAMEL dialogs that can be active at any time.

The current number of active CAMEL dialogs is indicated by the *currentCamelDialogues* attribute, and the total number of dialogues created since the creation of this component is counted by *totalCamelDialogues*.

Values: Decimal (1..150000)

Default: 20000

### ATTRIBUTE Gsc Ssf linkToTcapStack (tcapLink)

Access: Read: All
Write: All

Description: This attribute specifies the TCAP (Transaction Capabilities Application Part) Stack used by this *Ssf*. The TCAP Stack provides services to the CAMEL Application Part (CAP) and facilitates network communication required by CAMEL.

Values: Link (Service, linkToTcapStackUsers)

Default: No default

### GROUP Gsc Ssf OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Gsc Ssf adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component.

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Gsc Ssf operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Gsc Ssf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Gsc Ssf Operational (SsfOp)

Properties
Operational

Description
This group contains the operational data of the *Ssf* component.

### ATTRIBUTE Gsc Ssf currentCamelDialogues (currDialogues)

Access
Read: All
Write: Illegal

Description
This attribute indicates the number of CAMEL dialogues that are currently active.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Gsc Ssf pdpContextsRedirected (pdpRedir)

Access
Read: All
Write: Illegal

Description
This attribute counts the number of PDP (Packet Data Protocol) Contexts redirected to a different APN (Access Point Name) by the SCP (Service Control Point).

If the counter is increasing rapidly, the operator may want to examine the network configuration to determine why so many PDP contexts are being redirected. It is possible that the current

network configuration is not optimal and that the SCP is redirecting PDP contexts to avoid undesirable or expensive network access paths.

The counter wraps to zero when its maximum value is exceeded.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Ssf attemptedCamelDialogues (attDialogues)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of CAMEL dialogue establishments attempted by this *Ssf* component. The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Ssf unsuccessfulCamelDialogues (unsuccDialogues)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of unsuccessful CAMEL dialogue establishment attempts caused by errors or reject messages received from an SCP. The counter wraps to zero when it exceeds it maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Ssf totalTssfTimeouts (totTssfTimeouts)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of Tssf timeouts for this *Ssf* component. The timeout period is specified by the *ssfTimer* attribute of the *Sgsn Gsc* component.

The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Ssf totalDefaultGprsHandlings (totDefHand)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of times the SSF (Service Switching Function) detected an error and had to refer to the Default Gprs Handing field of the related mobile's CAMEL Subscriber Information (CSI) to determine whether to continue or fail the PDP (Packet Data Protocol) Context.

If this counter is rapidly increasing, the *totalProtocolErrors* and *totalNoCopFailures* attributes can be examined for information about why the Default Gprs Handling field is so often referenced. The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Ssf totalProtocolErrors (totProtoErr)

Access: Read: All
Write: Illegal

Description: This attribute counts the total number of protocol errors detected in CAP (CAMEL Application Part) messages from the SCP (Service Control Point).

If this counter is rapidly increasing, there may be a mismatch in the protocol version being used by the SCP and the version being used by the SGSN. The counter wraps to zero when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Ssf totalNoCopFailures (totNoCopFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of PDP (Packet Data Protocol) Contexts that have failed because an IRAU (Inter Routing Area Updates) occurred when the Change Of Position (COP) trigger was not in the TDP (Trigger Detection Point) list of the subscriber for which the PDP Context was requested.<br><br>If this value is rapidly increasing, it may indicate that roaming should be disabled for CAMEL users or that Camel Subscriber Information (CSI) is not properly specified in the HLR for some users. The counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Ssf WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsc Ssf customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Ssf customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Ssf customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS GprsSubscriberControl ServiceSwitchingFunction

| | |
|---|---|
| Description | The statistics record generated by the GprsSubscriberControl ServiceSwitchingFunction component. |

### ATTRIBUTE Gsc Ssf pdpContextsRedirected (pdpRedir)

Description

This attribute indicates the number of PDP (Packet Data Protocol) Contexts that have been redirected to a different APN (Access Point Name) by an SCP (Service Control Point) during the collection interval.

If this attribute is continuously reporting a high value during each collection interval, the operator may want to examine the network configuration to determine why so many PDP contexts are being redirected. It is possible that the current network configuration is

not optimal and that the SCP is redirecting PDP contexts to avoid undesirable or expensive network access paths.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Ssf attemptedCamelDialogues (attDialogues)

Description This attribute indicates the total number of CAMEL dialogues that this *Ssf* component has attempted to establish during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Ssf unsuccessfulCamelDialogues (unsuccDialogues)

Description This attribute indicates the total number of unsuccessful CAMEL dialogues establishment attempts caused by errors or reject messages received from an SCP during the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Ssf totalTssfTimeouts (totTssfTimeouts)

Description This attribute indicates the total number of Tssf timeouts during the collection interval. The timeout period is specified by the *ssfTimer* attribute of the *Sgsn Gsc* component.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Ssf totalDefaultGprsHandlings (totDefHand)

Description This attribute indicates the number of times during the collection interval the SSF (Service Switching Function) detected an error and had to refer to the Default Gprs Handing field of the related mobile's CAMEL Subscriber Information (CSI) to determine whether to continue or fail the PDP (Packet Data Protocol) Context.

If this attribute is continuously reporting a high value during each collection interval, the *totalProtocolErrors* and *totalNoCopFailures* attributes can be examined for information about why the Default Gprs Handling field is so often referenced.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Ssf totalProtocolErrors (totProtoErr)

Description: This attribute indicates the total number of protocol errors detected in CAP (CAMEL Application Part) messages from an SCP (Service Control Point) during the collection interval.

If this attribute is continuously reporting a high number of errors during each collection interval, there may be a mismatch in the protocol version being used by the SCP and the version being used by the SGSN.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Ssf totalNoCopFailures (totNoCopFail)

Description: This attribute indicates the total number of PDP (Packet Data Protocol) Contexts that have failed during the collection interval because an IRAU (Inter Routing Area Updates) occurred when the Change Of Position (COP) trigger was not in the TDP (Trigger Detection Point) list of the subscriber for which the PDP Context was requested.

If this attribute is continuously reporting a high number of errors during each collection interval, it may indicate that roaming should be disabled for CAMEL users or that Camel Subscriber Information (CSI) is not properly specified in the HLR for some users.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Ssf currentCamelDialogues (currDialogues)

Description: This attribute indicates the number of CAMEL dialogues active at the end of the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Gsc MobileCountryCode (Mcc)

Instance: BCD (3)

Scope: Application

Description: *Gsc/n MobileCountryCode/<Mcc>*

This component represents a Mobile Country Code (MCC) where mobile station is present. The instance value is the 3 digit MCC.

| Description | This attribute counts the number of Packet Data Protocol (PDP) activations rejected by this SGSN in this cell due to reject cause "requested service option not subscribed". The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid svcOptionTempOutOfOrderPerCell (serOp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Packet Data Protocol (PDP) activations rejected by this SGSN in this cell due to reject cause "service option temporarily out of order". The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid protocolErrorPerCell (protErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attributes counts the number of Packet Data Protocol (PDP) activations rejected by this SGSN in this cell currently because of one of the following reject causes:<br>Semantically incorrect message, |

| | |
|---|---|
| | Invalid mandatory information,<br>Message not compatible with the protocol state,<br>Protocol error, unspecified.<br>The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid currentPdpContextPerCell (curPdpCtx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of currently active Packet Data Protocol (PDP) contexts in this cell. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |
| Default | COLLECTED STATS GprsSubscriberControl MobileCountryCode MobileNetworkCode LocationAreaCode RoutingAreaCode CellId |
| Description | The statistics record generated by the GprsSubscriberControl MobileCountryCode MobileNetworkCode LocationAreaCode RoutingAreaCode CellId component. |

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid msAttachAttemptsPerCell (attAtt)

| | |
|---|---|
| Description | This attribute counts the number of attach requests received from the mobile subscribers in this cell.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid attachRejIllegalMsPerCell (attRejIllMs)

| | |
|---|---|
| Description | This attribute counts the GPRS-attaches to this cell that were rejected because of the reject cause "Illegal Ms".<br><br>The counter counts the events in the collection interval. |

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid attachRejGprsSvcNotAllowedPerCell (attRejGprsSvc)

Description This attribute counts the GPRS-attaches to this cell that were rejected because of the reject cause “Gprs Service not allowed”.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid attachRejPlmnNotAllowedPerCell (attRejPlmn)

Description This attribute counts the GPRS-attaches to this cell that were rejected because of the reject cause “PLMN not allowed”.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid attachRejPacketNetFailurePerCell (attRejNetFail)

Description This attribute counts the GPRS-attaches to this cell that were rejected because of the reject cause “Network Failure”.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid attachRejSgsnCongestionPerCell (attRejCongest)

Description This attribute counts the GPRS-attaches to this cell that were rejected because of the reject cause “Congestion”.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid attachRejMsgErrorPerCell (attRejMsgErr)

Description This attribute counts the GPRS-attaches to this cell that were rejected during the collection interval because of one of the following reject causes:
Semantically incorrect message,
Invalid mandatory information,

Message type non-existence or not implemented,
Message type not compatible with the protocol state,
Information element non-existent or not implemented,
Conditional IE error,
Message not compatible with the protocol state,
Protocol error, unspecified.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid nwkDetachReachableTimerPerCell (nwkDetTmr)

Description: This attribute counts the number of network initiated detaches in this cell due to the expiration of reachable timer. The *mobileReachableTimer* attribute is provisioned in the *Sgsn Gsc* component.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid nwkDetachCancelLocationPerCell (nwkDetCanLoc)

Description: This attribute counts the number of network initiated detaches in the specified cell due to the receipt of CANCEL LOCATION Messages from the HLR.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid nwkDetachDuplicateAttachPerCell (nwkDetDupAtt)

Description: This attribute counts the number of network initiated detaches in this cell due to mobile reattaches with a new random Packet Temporary (PTMSI) without first performing a detach. This is an implicit detach and no detach message is sent to the mobile.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid nwkDetachTempNwkFailurePerCell (nwkDetTNwkFail)

Description: This attribute counts the number of network initiated detaches or termination of mobility contexts in this cell due to temporary network problems.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid nwkDetachForReattachPerCell (nwkDetReatt)

Description: This attribute counts the number of network initiated detaches in this cell with a detach cause of "reattach required".

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid attachRejSvcNotAllowInPlmnPerCell (attRejGprsSvcPlmn)

Description: This attribute counts the GPRS-attaches to this cell that were rejected because of the reject cause "Gprs Service not allowed in this PLMN".

This counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid attachRejRoamNotAllowedInLocAreaPerCell (attRejRoam)

Description: This attribute counts the GPRS-attaches to this cell that were rejected because of the reject cause “roaming not allowed in location area”.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid msActivationAttemptsPerCell (msAttAct)

Description: This attribute counts the number of Activate PDP context request message received by this SGSN from Mobile Station (MS) in this

cell.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid insufficientResourcesPerCell (insufRes)

Description This attribute counts the number of PDP activations rejected by this SGSN in this cell due to reject cause “insufficient resources”.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid missingOrUnknownApnPerCell (mOrUn)

Description This attribute counts the number of PDP activations rejected by this SGSN in this cell due to reject cause “missing or unknown APN”.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid unkPdpAddrOrPdpTypePerCell (unPdpAorT)

Description This attribute counts the number of PDP activations rejected by this SGSN in this cell due to reject cause "unknown PDP address or PDP type".

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid activationsRejByGgsnPerCell (actRejGgsn)

Description This attribute counts the number of Packet Data Protocol (PDP) activations rejected by this SGSN in this cell due to reject cause "activation rejected by GGSN".

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid activationRejUnspecifiedPerCell (actRejUnsp)

Description: This attribute counts the number of Packet Data Protocol (PDP) activations rejected by this SGSN in this cell due to reject cause "unspecified reason".

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid serviceOptionNotSupportedPerCell (servOp)

Description: This attribute counts the number of Packet Data Protocol (PDP) activations rejected by this SGSN in this cell due to reject cause "service option not supported".

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid reqSvcOptionNotSubscribedPerCell (reqOpt)

Description: This attribute counts the number of Packet Data Protocol (PDP) activation rejected by this SGSN in this cell due to reject cause "requested service option not subscribed".

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid svcOptionTempOutOfOrderPerCell (serOp)

Description: This attribute counts the number of Packet Data Protocol (PDP) activation reject by this SGSN in this cell due to reject cause "service option temporarily out of order".

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid protocolErrorPerCell (protErr)

Description: This attributes counts the number of Packet Data Protocol (PDP) activation reject by this SGSN in this cell currently because of one of the following reject causes:
Semantically incorrect message,

Invalid mandatory information,
Message not compatible with the protocol state,
Protocol error, unspecified.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Mcc Mnc Lac Rac Cid currentPdpContextPerCell (curPdpCtx)

Description This attribute counts the number of currently active Packet Data Protocol (PDP) contexts in this cell.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### COMPONENT Gsc LocationServices (Lcs)

Groups "GROUP Gsc Lcs WlcLcsProv (Prov)"
"GROUP Gsc Lcs OsiState (State)"
"GROUP Gsc Lcs WlcLcsOper (Oper)"
"GROUP Gsc Lcs GprsLcsOper (GprsOper)"

"COLLECTED STATS GprsSubscriberControl LocationServices"

Scope Application

Description *Gsc/n LocationServices*

This component represents the *LocationServices* functionality of the *GprsSubscriberControl (Gsc)* component. The LCS functions include LCS coordination, managing the location request, and authorization and operation of the LCS services. LCS furnishes its clients with information about the physical location of a mobile terminal. This positioning information is typically used for value-added services, charging, law enforcement, or emergency services.

The LCS function is not available for all LCS-enabled subscribers until the audit represented by the *Gsc/n Hlrc RefreshAudit* component has completed.

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Gsc Lcs WlcLcsProv (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *LocationServices* component. |

### ATTRIBUTE Gsc Lcs maxLcsSubscribers (maxLcsSubs)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of subscribers that can have Location Services capabilities.<br><br>When this attribute is set to a lower value, the new value will not take effect until the card is reset.<br><br>This attribute value must be less than or equal to the value specified by the *maxAttachedSubscribers* attribute. |
| Values | Decimal (1..1000000) |
| Default | No default |

### ATTRIBUTE Gsc Lcs privacyProfileAlarmsThreshold (priProfileThreshold)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the percentage threshold at which the warning PrivacyProfileUsage alarm is set. The memory for storing the privacy profile information is allocated based on the value of the *maxLcsSubscribers* attribute. |

A SET major PrivacyProfileUsage alarm is set when the memory usage for privacy profile information reaches 100%. This alarm is cleared when the usage drops by 5%.

A SET warning PrivacyProfileUsage alarm is set when the memory usage for privacy profile information reaches the value of the *privacyProfileAlarmsThreshold* attribute. This alarm is cleared when the usage drops by 5% below the value of the *privacyProfileAlarmsThreshold* attribute.

Values: Decimal (50..95)

Units: %

Default: 90

### ATTRIBUTE Gsc Lcs maxCurrentTransactions (maxlcsTrans)

Access: Read: All
Write: All

Description: This attribute specifies the number of maximum Location Services (LCS) subscribers that can concurrently use the LCS functionality on the SGSN/USGSN.

When this attribute is set to a lower value, the new value will not take effect until the card is reset.

This attribute value must be less than or equal to the value specified by *maxLcsSubscribers* attribute.

Values: Decimal (1..1000000)

Default: No default

### ATTRIBUTE Gsc Lcs lcsContextAlarmsThreshold (lcsContextThreshold)

Access: Read: All
Write: All

Description: This attribute specifies the percentage threshold at which the warning LcsContextUsage alarm is set. The memory for storing the location services context information is allocated based on the value of the *maxCurrentTransactions* attribute.

A SET major LcsContextUsage alarm is set when the memory usage for location services context information reaches 100%. This alarm is cleared when the usage drops by 5%.

A SET warning LcsContextUsage alarm is set when the memory usage for location services context information reaches the value of the *lcsContextAlarmsThreshold* attribute. This alarm is cleared when the usage drops by 5% below the value of the *lcsContextAlarmsThreshold* attribute.

Values: Decimal (50..95)

Units: %

Default: 90

### ATTRIBUTE Gsc Lcs maxLcsExternalClientBlocks (maxlcsExtClientBk)

Access: Read: All
Write: All

Description: This attribute specifies the maximum number of memory blocks used for storing lists of external clients in the Subscriber Location Privacy Profiles. Each block holds data for up to five external clients. A minimum of one block is needed per list (session related or session unrelated) per Location Services (LCS) subscriber.

When this attribute is set to a lower value, the new value will not take effect until the card is reset.

This attribute value must be less than or equal to 14 times the value specified by the *maxLcsSubscribers* attribute.

Values: Decimal (1..14000000)

Default: No default

### ATTRIBUTE Gsc Lcs externalClientAlarmsThreshold (extClientThreshold)

Access: Read: All
Write: All

| | |
|---|---|
| Description | This attribute specifies the percentage threshold at which the warning ExternalClientUsage alarm is set. The memory for storing the external client index information is allocated based on the value of the *maxLcsExternalClientBlocks* attribute.<br><br>A SET major ExternalClientUsage alarm is set when the memory usage for external client index information reaches 100%. This alarm is cleared when the usage drops by 5%.<br><br>A SET warning ExternalClientUsage alarm is set when the memory usage for external client index information reaches the value of the *externalClientAlarmsThreshold* attribute. This alarm is cleared when the usage drops by 5% below the value of the *externalClientAlarmsThreshold* attribute. |
| Values | Decimal (50..95) |
| Units | % |
| Default | 90 |

### GROUP Gsc Lcs OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Gsc Lcs adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Gsc Lcs operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Gsc Lcs usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Gsc Lcs WlcLcsOper (Oper)

Properties
Operational

Description
This group contains the operational attributes for the *LocationServices* component.

### ATTRIBUTE Gsc Lcs lcsCurrentEnabledSubscribers (enabledSubs)

Access
Read: All
Write: Illegal

Description
This attribute indicates the current number of location services enabled subscribers.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Gsc Lcs lcsCurrentTransactions (currentTrans)

Access
Read: All
Write: Illegal

Description
This attribute indicates the current number of location transactions that are being processed.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Gsc Lcs lcsCurrentExternalClientBlocks (currentExtClientBks)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current number of external client blocks that are being utilized for storing the external client index information. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsMtRequests (mtReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total mobile terminated location requests.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsMtFailures (mtFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total unsuccessful mobile terminated location requests.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsPagingRequests (pagingReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total paging requests sent by the *LocationServices* component.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsPagingFailures (pagingFail)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total unsuccessful paging requests sent by the *LocationServices* component.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsRequestTypeNotSupported (reqTypeNotSupp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to a requested location that is not supported.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsDataMissing (dataMiss)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to missing information. For example, Imsi or Msisdn is missing in the location request message. |

The counter wraps to 0 when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Lcs lcsSubscriberNotAttached (subNotAttach)

Access: Read: All
Write: Illegal

Description: This attribute counts the total failed location requests due to the subscriber not currently attached.

The counter wraps to 0 when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Lcs lcsUnauthorizedGmlc (unauthGmlc)

Access: Read: All
Write: Illegal

Description: This attribute counts the total failed location requests due to location requests messages received from an unauthorized Gateway Mobile Location Center.

The counter wraps to 0 when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Gsc Lcs lcsUnauthorizedClient (unauthClient)

Access: Read: All
Write: Illegal

Description: This attribute counts the total failed location requests due to location requests messages received from an unauthorized client.

The counter wraps to 0 when it exceeds the maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsServiceBusy (servBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to another location request already in progress for the same subscriber.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsNotificationNotPossible (notifyNotPossible)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to the reason that it is impossible to send a notification message to the mobile.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsGadShapeNotSupported (gadShapeNotSupp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to the obtained location estimates using a Geographical Area Description (GAD) shape, that is not supported in the Location Request message.<br><br>The counter wraps to 0 when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsInterrupted (interrupted)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to information received from the Radio Network Controller (RNC) showing that the Location Services (LCS) entity has been interrupted. For example, LCS can be interrupted by an Inter-SGSN Routing Area Update (IRAU).<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsc Lcs lcsQosNotAttained (qosNotAttained)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total failed location requests due to the quality of service information not matching the requested quality of service in the Provide Subscriber Location (PSL) message from the Gateway Mobile Location Center (GMLC).<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsc Lcs GprsLcsOper (GprsOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *LocationServices* component of the *GprsSubscriberControl* component. |

### ATTRIBUTE Gsc Lcs lcsCellInfoMissing (cellInfoMissing)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total unsuccessful location requests due to the cell information missing in the local cell database.<br><br>The counter wraps to 0 when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS GprsSubscriberControl LocationServices

| | |
|---|---|
| Description | The statistics record generated by the GprsSubscriberControl LocationServices component. |

### ATTRIBUTE Gsc Lcs lcsMaxCurrentEnabledSubscribers (maxEnabledSubs)

| | |
|---|---|
| Description | This attribute indicates the current number of location services enabled subscribers.<br><br>The value reported is the peak value for the duration of the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Lcs lcsMtRequests (mtReq)

| | |
|---|---|
| Description | This attribute counts the total mobile terminated location requests.<br><br>The counter counts the events in the collection interval. |
| Values | Decimal (0..4294967295) |

### ATTRIBUTE Gsc Lcs lcsMtFailures (mtFail)

| | |
|---|---|
| Description | This attribute counts the total unsuccessful mobile terminated location requests.<br><br>The counter counts the events in the collection interval. |

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsPagingRequests (pagingReq)

Description This attribute counts the total paging requests sent by the *LocationServices* component.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsPagingFailures (pagingFail)

Description This attribute counts the total unsuccessful paging requests sent by the *LocationServices* component.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsRequestTypeNotSupported (reqTypeNotSupp)

Description This attribute counts the total failed location requests due to a requested location that is not supported.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsDataMissing (dataMiss)

Description This attribute counts the total failed location requests due to missing information. For example, Imsi or Msisdn is missing in the location request message.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsSubscriberNotAttached (subNotAttach)

Description This attribute counts the total failed location requests due to the subscriber not currently attached.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsUnauthorizedGmlc (unauthGmlc)

Description This attribute counts the total failed location requests due to location requests messages received from an unauthorized Gateway Mobile Location Center.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsUnauthorizedClient (unauthClient)

Description This attribute counts the total failed location requests due to location requests messages received from an unauthorized client.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsServiceBusy (servBusy)

Description This attribute counts the total failed location requests due to another location request already in progress for the same subscriber.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsNotificationNotPossible (notifyNotPossible)

Description This attribute counts the total failed location requests due to the reason that it is impossible to send a notification message to the mobile.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsGadShapeNotSupported (gadShapeNotSupp)

Description This attribute counts the total failed location requests due to the obtained location estimates using a Geographical Area

Description (GAD) shape that are not supported in the Location Request message.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsInterrupted (interrupted)

Description This attribute counts the total failed location requests due to information received from the Radio Network Controller (RNC) showing that the Location Services (LCS) entity has been interrupted. For example, LCS can be interrupted by an Inter-SGSN Routing Area Update (IRAU).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsQosNotAttained (qosNotAttained)

Description This attribute counts the total failed location requests due to the quality of service information not matching the requested quality of service in the Provide Subscriber Location (PSL) message from the Gateway Mobile Location Center (GMLC).

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsc Lcs lcsCellInfoMissing (cellInfoMissing)

Description This attribute counts the total unsuccessful location requests due to the cell information missing in the local cell database.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

# COMPONENT GprsSubscriberDataPath (Gsd)

| | |
|---|---|
| Instance | Decimal (1..15) |
| Groups | "GROUP Gsd Provisioned (Prov)"<br>"GROUP Gsd Operational (Oper)"<br>"GROUP Gsd OsiState (State)"<br>"GROUP Gsd WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *GprsSubscriberDataPath/n*<br><br>This component represents the related data path layers such as the Logical Link Control (LLC), the SubNetwork Data Convergence Protocol (SNDCP), and the GPRS Tunneling Protocol (GTP). Only one *Gsd* root component can be provisioned on a Logical Processor. |

| | |
|---|---|
| Subcomponents | "COMPONENT Gsd LogicalLinkControl (Llc)"<br>"COMPONENT Gsd SubNetworkDataConvergenceProtocol (Sndcp)"<br>"COMPONENT Gsd GprsTunnelingProtocol (Gtp)"<br>"COMPONENT Gsd MemoryPoolManager (Mpm)" |
| Opt. Subcomp. | "COMPONENT Gsd DownlinkBuffer (DBuff)" |
| Dyn. Subcomp. | "COMPONENT Gsd TemporaryLogicalLinkId (Tlli)"<br>"COMPONENT Gsd RemoteApplicationConnection (RaConn)"<br>"COMPONENT Gsd TieredSubscription (Ts)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Gsd Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes of the *GprsSubscriberDataPath (Gsd)*. |

## ATTRIBUTE Gsd linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP Address and the UDP port number that the *GprsSubscriberDataPath (Gsd)* associates with. Changing this value causes the outstanding transactions to be affected. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Gsd maxLlcActiveSubscribers (maxLlcActSubs)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the maximum number of Mobile Stations (MS) that can be attached for this instance of *GprsSubscriberDataPath (Gsd)*. This gives the number of mobile subscribers that the *LogicalLinkControl (Llc)* and the *SubNetworkDataConvergenceProtocol (Sndcp)* is to support per *Gsd*.<br><br>The current attached subscribers can be obtained from the attribute *currentLlcActiveSubscribers*. Currently attached subscribers are unaffected by changes to this value.<br><br>Changing the value of this parameter requires a reset of the card that has a Gsd. |
| Values | Decimal (1..50000) |
| Default | 100 |

### GROUP Gsd Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data of *GprsSubscriberDataPath (Gsd)*. |

### ATTRIBUTE Gsd currentLlcActiveSubscribers (curLlcActSubs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Mobile Stations (MS) with an active Logical Link Control layer that are currently attached on the *GprsSubscriberDataPath (Gsd)*.<br><br>The maximum value is provisioned in the attribute *maxLlcActiveSubscribers.* |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### GROUP Gsd OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Gsd adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Gsd operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Gsd usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Gsd availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Gsd proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of: initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

### ATTRIBUTE Gsd controlStatus (osiCntrl)

Access: Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Gsd alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Gsd standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Gsd unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Gsd WlcCustomCounters (WlcCustomCntr)

Properties
Operational

| | |
|---|---|
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsd customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Gsd LogicalLinkControl (Llc)

| | |
|---|---|
| Groups | "GROUP Gsd Llc LleStatistics (LleStats)"<br>"GROUP Gsd Llc LlcStatistics (LlcStats)"<br>"GROUP Gsd Llc WlcCustomCounters (WlcCustomCntr)" |

"COLLECTED STATS GprsSubscriberDataPath LogicalLinkControl"

| | |
|---|---|
| Scope | Application |
| Description | *Gsd/n LogicalLinkControl*<br><br>This component represents the Logical Link Control (LLC) protocol layer. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsd Llc LleStatistics (LleStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the Logical Link Entity (LLE) of *LogicalLinkControl (Llc)*. |

## ATTRIBUTE Gsd Llc uiFramesToMs (uiFrTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Unconfirmed Information (UI) frames sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gsd Llc uiFramesFromMs (uiFrRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the Unconfirmed Information (UI) frames received from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc iFramesToMs (iFrTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the confirmed Information (I) frames sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc iFramesFromMs (iFrRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the confirmed Information (I) frames received from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc iFramesRetransmittedToMs (iFrRetx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the confirmed Information (I) frames retransmitted to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc framesProtectedToMs (frProtTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the protected frames sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc framesProtectedFromMs (frProtRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the protected frames received from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc framesCipheredToMs (frCiphTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ciphered frames sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc framesCipheredFromMs (frCiphRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the ciphered frames received from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc crcErrorsFromMs (crcErrsRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the frames received from Mobile Station (MS) that contained Cyclic Redundancy Check (CRC) errors. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsd Llc LlcStatistics (LlcStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of the Logical Link Control (LLC) protocol layer. |

### ATTRIBUTE Gsd Llc unknownTllis (unTllis)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the frames received from the Mobile Station (MS) for an unmapped Temporary Logical Link Identity (TLLI). An unmapped TLLI is one for which no Logical Link Context (LLC) mobile context exists on the TLLI specified in the Protocol Data Unit (PDU).The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsd Llc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsd Llc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Llc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |

Default No default

## COLLECTED STATS GprsSubscriberDataPath LogicalLinkControl

Description The statistics record generated by the GprsSubscriberDataPath LogicalLinkControl component.

### ATTRIBUTE Gsd Llc currentLlesForUserData (curLles)

Description This attribute indicates the current number of Logical Link Entities (LLEs) used to handle the user data SAPs (Service Access Points) for the *GprsSubscriberDataPath (Gsd)*. This value reported is the peak value in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Llc unknownTllis (unTllis)

Description This attribute counts the frames received from the Mobile Station (MS) for an unmapped Temporary Logical Link Identity (TLLI). An unmapped TLLI is one for which no Logical Link Context (LLC) mobile context exists. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Llc currentLlesForSms

Description This attribute indicates the current number of Logical Link Entities (LLEs) used to handle the Short Message Service (SMS) Service Access Points (SAPs) for the *GprsSubscriberDatapath (Gsd)*. This value reported is the peak value in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Llc framesRetransmitted (frRetx)

Description This attribute counts the number of total frames retransmitted by the LLC layer.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Llc crcErrorsFromMs (crcErrsRx)

Description: This attribute counts the frames received from the Mobile Station (MS) that contained Cyclic Redundancy Check (CRC) errors.

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### COMPONENT Gsd SubNetworkDataConvergenceProtocol (Sndcp)

Groups: "GROUP Gsd Sndcp Provisioned (Prov)"
"GROUP Gsd Sndcp Statistics (Stats)"
"GROUP Gsd Sndcp WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS GprsSubscriberDataPath SubNetworkDataConvergenceProtocol"

Scope: Application

Description: *Gsd/n SubNetworkDataConvergenceProtocol*

This component represents the Sub Network Data Convergence Protocol (SNDCP) protocol layer.

Common Verbs:
Help
List
Display

### GROUP Gsd Sndcp Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisionable attributes for the SubNetwork Data Convergence Protocol (SNDCP) protocol layer.

### ATTRIBUTE Gsd Sndcp maxRfc1144Entities (maxRfc1144)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies the maximum number of RFC 1144 header compression entities for this instance of GprsSubscriberDataPath (Gsd).If the value is 0, RFC 1144

compression is not performed. The current RFC 1144 entities can be obtained from the attribute currentRfc1144Entities.

Values: Decimal (0..65535)

Default: 0

### ATTRIBUTE Gsd Sndcp maxV42bisEntities (maxV42bis)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies the maximum number of V.42bis compression entities for this instance of GprsSubscriberDataPath (Gsd).If the value is 0, V.42bis compression is not performed. The current V.42bis entities can be obtained from the attribute currentV42bisEntities.

Values: Decimal (0..65535)

Default: 0

### ATTRIBUTE Gsd Sndcp v42bisCompressionDirection (p0)

Access: Read: All
Write: All

Description: This attribute specifies the V.42bis data compression direction to be supported. The value for compression direction is negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P0 (compression direction).
During XID negotiation of parameter P0, both sides (the SGSN to the Mobile Station (MS) or the Mobile Station (MS) to the SGSN) agree on the compression direction.
Valid values are:
***none***, No compression is present.
***fromMs***, The data received from the other entity is compressed.
***toMs***, The data sent to the other entity is compressed.
***both***, The data sent and received by the SGSN is compressed.

The negotiated value can be viewed in the component *SessionContext* attribute *v42bisCompressionDirection.*

Values
none
fromMs
toMs
both

Default
both

## GROUP Gsd Sndcp Statistics (Stats)

Properties
Operational

Description
This group contains the statistical attributes of the SubNetwork Data Convergence Protocol (SNDCP) layer.

## ATTRIBUTE Gsd Sndcp snPdusToMs (snPdusTx)

Access
Read: All
Write: Illegal

Description
This attribute counts the SNDCP-Protocol Data Units (SN-PDUs) sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value.

Values
Decimal (0..4294967295)

Default
No default

## ATTRIBUTE Gsd Sndcp snPdusFromMs (snPdusRx)

Access
Read: All
Write: Illegal

Description
This attribute counts the SNDCP-Protocol Data Units (SN-PDUs) received from the Mobile Station (MS), that is, the total number of LL-UNITDATA-PDU and LL-DATA-PDU received from the Logical Link Context (LLC). The counter wraps to zero when it exceeds the maximum value.

Values
Decimal (0..4294967295)

Default
No default

### ATTRIBUTE Gsd Sndcp discardedNpdusFromMs (discNpdusRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Network-Protocol Data Units (N-PDUs) that originated from the Mobile Station (MS) which could not be re-assembled. This could result from N-PDUs lost or re-ordered. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsd Sndcp WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsd Sndcp customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |

Default No default

### ATTRIBUTE Gsd Sndcp customCounter3 (customCntr3)

Access Read: All
Write: Illegal

Description This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch.

Values Decimal (0..4294967295)

Default No default

## COLLECTED STATS GprsSubscriberDataPath SubNetworkDataConvergenceProtocol

Description The statistics record generated by the GprsSubscriberDataPath SubNetworkDataConvergenceProtocol component.

### ATTRIBUTE Gsd Sndcp currentNsapis (curNsapis)

Description This attribute indicates the current number of Network-Service Access Point Identifiers (N-SAPIs) for this instance of *GprsSubscriberDataPath (Gsd)*. This value reported is the peak value in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Sndcp currentV42bisEntities (curV42bis)

Description This attribute indicates the current number of RFC 1144 header compression entities in the last collection interval for this instance of *GprsSubscriberDataPath (Gsd)*. This value reported is the peak
value in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Sndcp currentRfc1144Entities (curRfc1144)

Description This attribute indicates the current number of V.42bis compression entities in the last collection interval for this

instance of *GprsSubscriberDataPath (Gsd)*. This value reported is the peak
value in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Sndcp snPdusToMs (snPdusTx)

Description This attribute counts the SNDCP-Protocol Data Units (SN-PDUs) sent to the Mobile Station (MS) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Sndcp snPdusFromMs (snPdusRx)

Description This attribute counts the SNDCP-Protocol Data Units (SN-PDUs) received from the Mobile Station (MS), that is, the total number of LL- UNITDATA-PDU and LL-DATA-PDU received from the Logical Link Context (LLC) in the collection interval.

Values Decimal (0..4294967295)

### ATTRIBUTE Gsd Sndcp discardedNpdusFromMs (discNpdusRx)

Description This attribute counts the Network-Protocol Data Units (N-PDUs) that originated from the Mobile Station (MS) which could not be re-assembled. This could result from N-PDUs lost or re-ordered. This counter counts the events in the collection interval.

Values Decimal (0..4294967295)

### COMPONENT Gsd GprsTunnelingProtocol (Gtp)

Groups "GROUP Gsd Gtp Provisioned (Prov)"
"GROUP Gsd Gtp Statistics (Stats)"
"GROUP Gsd Gtp WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS GprsSubscriberDataPath GprsTunnelingProtocol"

Scope Application

Description *Gsd/n GprsTunnelingProtocol*

This component represents the data traffic part of the GPRS Tunneling Protocol (GTP) protocol layer.

## GROUP Gsd Gtp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of a Packet Data Protocol (PDP) context in the Serving GPRS Support Node (SGSN). |

## ATTRIBUTE Gsd Gtp pdusToNetwork (pdusTxNwk)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS Tunneling Protocol (GTP) Protocol Data Units (PDU) transmitted to the Gateway GPRS Support Node (GGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gsd Gtp pdusFromNetwork (pdusRxNwk)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the GPRS Tunneling Protocol (GTP) Protocol Data Units (PDU) received from the Gateway GPRS Support Node (GGSN). This includes PDUs counted in *discPdusFromNetwork*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Gsd Gtp discPdusFromNetwork (discPdus)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the incoming GPRS Tunneling Protocol (GTP) Protocol Data Units (PDUs) discarded because of traffic congestion or because no Packet Data Protocol (PDP) Context |

| | |
|---|---|
| | has been established. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Gtp octetsToNetwork (octToNet)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total octets of the GPRS Tunneling Protocol (GTP) transmitted in Packet Data Unit (PDU) to Gateway GPRS Support Node (GGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Gtp octetsFromNetwork (octFrNet)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total octets of the GPRS Tunneling Protocol (GTP) received in Packet Data Unit (PDU) from the Gateway GPRS Support Node (GGSN). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsd Gtp WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

## COLLECTED STATS GprsSubscriberDataPath GprsTunnelingProtocol

| | |
|---|---|
| Description | The statistics record generated by the GprsSubscriberDataPath GprsTunnelingProtocol component. |

### ATTRIBUTE Gsd Gtp octetsToNetwork (octToNet)

Description: This attribute counts the total octets of the GPRS Tunneling Protocol (GTP) transmitted in Packet Data Unit (PDU) to Gateway GPRS Support Node (GGSN).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsd Gtp octetsFromNetwork (octFrNet)

Description: This attribute counts the total octets of the GPRS Tunneling Protocol (GTP) received in Packet Data Unit (PDU) from the Gateway GPRS Support Node (GGSN).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsd Gtp pdusToNetwork (pduToNet)

Description: This attribute counts the GPRS Tunneling Protocol (GTP) Data Units (PDU) transmitted to the Gateway GPRS Support Node (GGSN).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsd Gtp pdusFromNetwork (pduFrNet)

Description: This attribute counts the GPRS Tunneling Protocol (GTP) Data Units (PDU) received from the Gateway GPRS Support Node (GGSN).

The counter counts the events in the collection interval.

Values: Decimal (0..4294967295)

### ATTRIBUTE Gsd Gtp discPdusFromNetwork (discPdus)

Description: This attribute counts the incoming GPRS Tunneling Protocol (GTP) Protocol Data Units (PDUs) discarded because of traffic congestion or because no Packet Data Protocol (PDP) Context

has been established.

The counter counts the events in the collection interval.

Values Decimal (0..4294967295)

## COMPONENT Gsd MemoryPoolManager (Mpm)

Scope Application

Description *Gsc/n MemoryPoolManager*
*Gsd/n MemoryPoolManager*
*Gtl/n MemoryPoolManager*
*DnsAgent/<vr>,n MemoryPoolManager*

This component represents the memory resources of a given GPRS application that are managed as pools of objects.

Dyn. Subcomp. "COMPONENT Gsd Mpm MemoryPoolClient (Mpc)"

Common Verbs
Help
List
Display

## COMPONENT Gsd Mpm MemoryPoolClient (Mpc)

Instance String (1..30, ASCII)

Scope Application

Description *Gsc/n Mpm MemoryPoolClient/<name>*
*Gsd/n Mpm MemoryPoolClient/<name>*
*SgGtl/n Mpm MemoryPoolClient/<name>*
*DnsAgent/<vr>,n Mpm MemoryPoolClient/<name>*

This component represents a pool of objects of a particular class that a GPRS application currently owns as well as all the objects that could be owned by that application. All the objects in the pool are of the same class. The instance value of this component is a string which is the class name of the objects in the pool.

## GROUP Gsd Tlli Sc V42bisOp (V42bis)

Properties: Operational

Description: This group contains operational attributes that measure the performance of V.42bis.

## ATTRIBUTE Gsd Tlli Sc protocolModeEncoder (modeEncoder)

Access: Read: All
Write: Illegal

Description: This attribute indicates the current mode of the V.42bis encoder. This mode can be either:
***transparent*** - A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences can be inserted into the data stream.
***compressed*** - A mode of operation in which data is transmitted in codewords.
The encoder switches between the two modes depending on whether the data coming from the Mobile Station (MS) is suitable for compression. The data compression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.

Values
transparent
compressed

Default
No default

### ATTRIBUTE Gsd Tlli Sc protocolModeDecoder (modeDecoder)

Access
Read: All
Write: Illegal

Description
This attribute indicates the current mode of the V.42bis decoder. This mode can be either:
***transparent*** - A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences can be inserted into the data stream.
***compressed*** - A mode of operation in which data is transmitted in codewords.
The encoder (at the Mobile Station (MS) or at the Public Switched Telephone Network) switches between the two modes depending on whether the data coming from the SGSN is suitable for compression. The data compression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.

Values
transparent
compressed

Default
No default

### ATTRIBUTE Gsd Tlli Sc v42bisCompressionDirection (p0)

Access
Read: All
Write: Illegal

Description
This attribute indicates the direction in which V.42bis is active, negotiated at link setup by the data link protocol through Exchange Identification (XID) negotiation of parameter P0 (compression direction). The value used for XID negotiations can be provisioned in component *SubNetworkDataConvergenceProtocol* attribute *v42bisCompressionDirection*.
Valid values are:

***none***, No compression is present.
***fromMs***, The data received from the other entity is compressed.
***toMs***, The data sent to the other entity is compressed.
***both***, The data sent and received by the SGSN is compressed.

Values
none
fromMs
toMs
both

Default
No default

### ATTRIBUTE Gsd Tlli Sc v42bisDictionary (p1)

Access
Read: All
Write: Illegal

Description
This attribute indicates the maximum number of V.42bis codewords in the dictionary, as determined by the Exchange Identification (XID) negotiation of parameter P1 (number of codewords). The value used for XID negotiation can be provisioned in component *Sgsn GprsSubscriberDatapath* attribute *v42bisDictionary.*

Values
Decimal (512..4096)

Default
No default

### ATTRIBUTE Gsd Tlli Sc v42bisMaxStringSize (p2)

Access
Read: All
Write: Illegal

Description
This attribute indicates the maximum number of characters allowed in a string represented by a codeword, as determined by the Exchange Identification (XID) negotiation of parameter P2 (maximum string size). The value used for XID negotiation can be provisioned by component Sgsn *GprsSubscriberDatapath* attribute *v42bisMaxStringSize.*

Values
Decimal (6..250)

Default
No default

## ATTRIBUTE Gsd Tlli Sc lastDecodeError (lastDecodeErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates last error found by the decoder. Error values are:<br>***none***, No errors found.<br>***badStepup***, Receipt of STEPUP (step up codeword size) codeword when it can cause C2 (current code word size) to exceed N1 (maximum code word size).<br>***codewordEqC1***, Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry).<br>***emptyCodeword***, Receipt of a codeword representing an empty dictionary entry.<br>***reservedCommand***, Receipt of a reserved command code.<br>***generalError***, Receipt of any other error. |
| Values | none<br>badStepup<br>codewordEqC1<br>emptyCodeword<br>reservedCommand<br>generalError |
| Default | none |

## ATTRIBUTE Gsd Tlli Sc compRatioEncoder (cre)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the compression ratio achieved by the V.42bis encoder running on the Passport. This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes. |
| Values | Decimal (0.00..300.00) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc compRatioDecoder (crd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the compression ratio achieved by the V.42bis encoder at the Mobile Station (MS) or at the Public Switched Telephone Network (PSTN). This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes. |
| Values | Decimal (0.00..300.00) |
| Default | No default |

### GROUP Gsd Tlli Sc SndcpRfc1144Op (SndcpRfc1144)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for the RFC1144 header compression algorithm. |

### ATTRIBUTE Gsd Tlli Sc compPcomp (cPcomp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the negotiated PCOMP value for the COMPRESSED_TCP packets. PCOMP is the identifier of the protocol control information compression algorithm used for the Network Protocol Data Unit (N-PDU). The value is dynamically assigned as part of the XID negotiation with the mobile. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc unCompPcomp (uncPcomp)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the negotiated PCOMP value for the UNCOMPRESSED_TCP packets. PCOMP is the identifier of the protocol control information compression algorithm used for the Network Protocol Data Unit (N-PDU). The value is dynamically assigned as part of the XID negotiation with the mobile. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc slots (s0)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of TCP state slots being used by the RFC1144 compression entity for the Mobile Station (MS). The value is negotiated as part of the XID negotiation with the mobile.<br>The value proposed by the SNDCP in the negotiation is ***16*** and may be reduced during negotiation. |
| Values | Decimal (1..256) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc applicableNsapis (appNsapis)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Network Service Access Point Identifiers (NSAPIs) that use the RFC1144 compression entity. The set of NSAPIs using compression may be determined by XID negotiation with the mobile; if no such negotiation occurs, no NSAPIs use compression.<br><br>If there is no negotiation, the value is empty. If a number is present then the corresponding NSAPI uses the compression entity otherwise it does not. |
| Set of | Decimal (0..15) |
| Default | No default |

### GROUP Gsd Tlli Sc GprsSndcpRfc1144Stats (SndcpRfc1144Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of the RFC1144 header compression algorithm. |

### ATTRIBUTE Gsd Tlli Sc uncompressedTcpSent (uncTcpSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of UNCOMPRESSED_TCP packets sent to the Mobile Station (MS) by the compressor. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc compressedTcpSent (cTcpSent)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of COMPRESSED_TCP packets sent to the Mobile Station (MS) by the compressor. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc outboundSearches (outbSearches)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of outbound searches of a compression state for a Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc outboundMisses (outbMisses)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of misses while searching for a compression state for the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc uncompressedTcpReceived (uncTcpRecd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of UNCOMPRESSED_TCP packets received from the Mobile Station (MS) by the decompressor. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc compressedTcpReceived (cTcpRecd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of COMPRESSED_TCP packets received from the Mobile Station (MS) by the decompressor. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc errorsReceived (errsRecd)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of errored packets received from the Mobile Station (MS) by the decompressor. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc tossedPktsReceived (tossPkts)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of packets discarded by the decompressor because of an error that occurred before this packet. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsd Tlli Sc SndcpStatistics (SndcpStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the per Session Context statistical attributes. |

### ATTRIBUTE Gsd Tlli Sc discardedNpdusFromMs (discNpdusRxMs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Network-Protocol Data Units (N-PDUs) that originated from the Mobile Station (MS) which could not be re-assembled. This could result from N-PDUs lost or re-ordered. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Gsd Tlli Sc snPdusToMs (snPdusTxMs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the SNDCP-Protocol Data Units (SN-PDU) sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Gsd Tlli Sc snPdusFromMs (snPdusRxMs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of SNDCP-Protocol Data Unit (SN-PDU) received from the Mobile Station (MS), that is, the total number of LL-UNITDATA PDU and LL-DATA PDU received from the Logical Link Context (LLC). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Gsd Tlli Sc octetsToMs (octsTxMs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload octets sent to the Mobile Station (after compression is applied). The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc octetsFromMs

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload octets received from the Mobile Station (before decompression is applied). The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc octetsToNetwork (octsTxNwk)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload octets sent to the network. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc octetsFromNetwork (octsRxNwk)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload octets received from the network. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### GROUP Gsd Tlli Sc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsd Tlli Sc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Sc customCounter3 (customCntr3)

### COMPONENT Gsd Tlli LogicalLinkContext (Llc)

| | |
|---|---|
| Groups | "GROUP Gsd Tlli Llc Operational (Oper)"<br>"GROUP Gsd Tlli Llc Statistics (Stats)"<br>"GROUP Gsd Tlli Llc WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Sgsn Tlli/<tlli> LogicalLinkContext*<br>*Gsd/n Tlli/<tlli> LogicalLinkContext*<br><br>This component represents the logical link context information of Logical Link Control (LLC) protocol layer of GPRS. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsd Tlli Llc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the Logical Link Management Entity (LLME). |

### ATTRIBUTE Gsd Tlli Llc tlli

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | When *newTlli* is empty, this attribute indicates the Temporary Logical Link Identity (TLLI) currently in use. When *newTlli* is not empty a new TLLI is being assigned. This attribute indicates the old value of the TLLI. |
| Values | String (4, Hex) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc newTlli (newTlli)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the new value of the Temporary Logical Link Identity (TLLI). The value is empty when no assignment is taking place. |
| Values | String (4, Hex) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc bucketLeakRate (buckLeRate)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute indicates the Flow Control bucket leak rate. This indicates the rate at which data is sent to the Packet Control Unit (PCU) for this mobile. The unit is 100 bits/s. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc bucketSize (buckSz)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the Flow Control bucket size. The value indicates how much data is queued for a mobile to the Packet Control Unit (PCU). The unit is 100 bytes. |
| Values | Decimal (0..65535) |
| Units | octets |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc bucketFullRatio (buckflRt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the percentage of the bucket that is filled with data for a mobile.<br><br>This attribute is used by the bucket flow control algorithm for the mobile, if the Current Bucket Level feature is negotiated between the Packet Control Unit (PCU) and the Serving GPRS Support Node (SGSN). The result of this negotiation is reflected in the *currentBucketLevelFeature* attribute, defined in *SgGtl Nse PtpBvc*.<br><br>A value of ***0*** means that the bucket is empty, while a value of ***100*** means that the bucket is exactly full. A value greater than ***100*** means that the bucket is full and overflowing by that percentage. For example, a value of ***150*** means the bucket is full and overflowing by 50%. A value of ***disabled*** means that this attribute |

| | |
|---|---|
| | is not used by the flow control algorithm because the Current Bucket Level feature is not negotiated. |
| Values | Decimal (0..255)<br>disabled |
| Units | % |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc dataSapsUtilized (dSaps)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates which Service Access Points (SAPs) have been used by this Mobile Station (MS) since being attached. |
| Set of | Decimal (0..15) |
| Default | No default |

### GROUP Gsd Tlli Llc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of the Logical Link Management Entity (LLME). |

### ATTRIBUTE Gsd Tlli Llc uiFramesToMs (uiFrTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Unconfirmed Information (UI) frames sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc uiFramesFromMs (uiFrRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the Unconfirmed Information (UI) frames received from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc iFramesToMs (iFrTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the confirmed Information (I) frames sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc iFramesFromMs (iFrRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the confirmed Information (I) frames received from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc iFramesRetransmittedToMs (iFrRetx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the confirmed Information (I) frames retransmitted to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc framesProtectedToMs (frProtTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the protected frames sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc framesProtectedFromMs (frProtRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the protected frames received from the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |

| Default | No default |

### ATTRIBUTE Gsd Tlli Llc framesCipheredToMs (frCiphTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ciphered frames sent to the Mobile Station (MS). The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc framesCipheredFromMs (frCiphRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the ciphered frames received from the Mobile Station (MS). The counter wraps to zero when it exceeds |

the maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc crcErrorsFromMs (crcErrsRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the frames received from Mobile Station (MS)<br>that contained Cyclic Redundancy Check (CRC) errors. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc congestionDiscardsToMs (congDiscsTxMs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the Protocol Data Units (PDU) that have been discarded at the *GprsSubscriberDatapath* due to Mobile Station (MS) Flow Control, BSS GPRS Virtual Connection (BVC) blockage, or there not being any available room in the sliding window of the Logical Link Entity (LLE) to service the PDU. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Gsd Tlli Llc WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsd Tlli Llc customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Tlli Llc customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |

### ATTRIBUTE Gsd Tlli Llc customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Gsd RemoteApplicationConnection (RaConn)

| | |
|---|---|
| Instance | appType [String (1..8, ASCII)]<br>shelfId [Decimal (0..50)]<br>instance (n) [Decimal (1..15)] |
| Groups | "GROUP Gsd RaConn OsiState (State)"<br>"GROUP Gsd RaConn WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *... RemoteApplicationConnection/<appType, shelfId, n>*<br><br>This component represents the Remote Application Connection information of an application that talks to applications on other shelves. For each application that it can communicate with, one of these connection components is created and is instantiated with the name of the remote application, the Id of the shelf on which the application runs, and the instance number of the application. ShelfId ***0*** represents the Master shelf. |
| Dyn. Subcomp. | "COMPONENT Gsd RaConn AtmConnection (AtmCon)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP Gsd RaConn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Gsd RaConn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component. |

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Gsd RaConn operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Gsd RaConn usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Gsd RaConn WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsd RaConn customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd RaConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd RaConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Gsd RaConn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Gsd RaConn AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Gsd RaConn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |

Description This attribute group contains the operational attributes for the *NapAtmConnection* component.

### ATTRIBUTE Gsd RaConn AtmCon nextHop

Access Read only

Description This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established.

Values The name of the component

Default No default

### COMPONENT Gsd TieredSubscription (Ts)

Groups "GROUP Gsd Ts Statistics (Stats)"
"GROUP Gsd Ts WlcCustomCounters (WlcCustomCntr)"

"COLLECTED STATS GprsSubscriberDataPath TieredSubscription"

Scope Application

Description *Gsd/n TieredSubscription*
*Usd/n TieredSubscription*

This component represents the differentiated tiers of service on the (UMTS) Serving GPRS Support Node (SGSN or USGSN) per Packet Data Protocol (PDP) context basis for downlink traffic. The maximum average bandwidth associated with each tier is not guaranteed at all times but indicates the upper bound on the average data rate for the service.

### GROUP Gsd Ts Statistics (Stats)

Properties Operational

Description This group contains the statistical attributes of this component.

### ATTRIBUTE Gsd Ts activePdpCServiced (actPdpCSer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the active PDP contexts for each tier. The value is incremented on a PDP context activation for a tier and decremented when a PDP context is deactivated for the tier. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |
| Default | No default |

### GROUP Gsd Ts WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Gsd Ts customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Ts customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Gsd Ts customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COLLECTED STATS GprsSubscriberDataPath TieredSubscription

| | |
|---|---|
| Description | The statistics record generated by the GprsSubscriberDataPath TieredSubscription component. |

### ATTRIBUTE Gsd Ts pktsPerTierToMobile (pktsToM)

| | |
|---|---|
| Description | This attribute counts the number of packets successfully sent by the SGSN or USGSN for each tier in the down link direction in the collection interval. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |

### ATTRIBUTE Gsd Ts octetsPerTierToMobile (octToM)

| | |
|---|---|
| Description | This attribute counts the number of octets successfully sent by the SGSN or USGSN for each tier in the down link direction in the collection interval. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |

### ATTRIBUTE Gsd Ts pktsDropped (pktsDr)

| | |
|---|---|
| Description | This attribute counts the packets dropped by the Tiered Subscription of the SGSN or USGSN for each tier in the collection interval.<br><br>For example, if the peak throughput for a context is 56kbit/s and there is a burst of downlink data packets exceeding 56kbit/s, then the excess packets will be dropped, and the *pktsDropped* attribute is incremented every time a packet is dropped. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |

### ATTRIBUTE Gsd Ts activePdpCServiced (actPdpCSer)

| | |
|---|---|
| Description | This attribute indicates the current number of PDP contexts that are active for each tier. The value is incremented on a PDP context activation for a tier and decremented when a PDP context is deactivated for the tier.<br>This value reported is the value at the end of the collection interval. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |

### ATTRIBUTE Gsd Ts peakPdpCServiced (peakPdpCSer)

| | |
|---|---|
| Description | This attribute indicates the maximum number of PDP contexts serviced for the tier during the collection interval. The value is incremented every time *currentPdpCServiced* for that tier exceeds the current value of *peakPdpCServiced* for that tier. It is reset to<br>*currentPdpCServiced* after every data collection. |
| Vector of | Decimal (0..4294967295) |
| Index | Decimal (1..9) |

### COMPONENT Gsd DownlinkBuffer (DBuff)

| | |
|---|---|
| Groups | "GROUP Gsd DBuff Provisioned (Prov)" |

Scope: Application

Description: *Gsd/n DownlinkBuffer*

This component represents the optional Downlink Buffer that can be enabled on the *Gsd*. If the operator desires to enable Downlink Buffering on a given *Gsd* component, the *DBuff* component is added.

Adding or deleting this component will cause a loss of service for the parent *Gsd* component.

Common Verbs:

- DELete

## GROUP Gsd DBuff Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes of the *Gsd/n DownlinkBuffer* component.

## ATTRIBUTE Gsd DBuff maxMsWithBuff (maxBuffMs)

Access: Read: All
Write: All

Description: This attribute specifies the maximum number of mobiles for which a single GPRS Subscriber Data (GSD) application may concurrently buffer downlink data.

The value for this parameter should be carefully considered based on the number of mobiles predicted to be served by a single GSD at any given time, and on the predicted data arrival rate for those mobiles. It is safe to say that not all mobiles will require buffering concurrently, but rather some small percentage.

Depending on the value of *buffCheckInterval*, some capacity degradation may be incurred.

| | |
|---|---|
| Values | Decimal (0..10000) |
| Default | 1000 |

### ATTRIBUTE Gsd DBuff maxPacketsBuffPerMs (maxBuffPkts)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of downlink packets that may be buffered for a single mobile at any given time, regardless of packet size. Packets received beyond this limit are discarded by the Serving GPRS Support Node (SGSN).<br><br>This parameter does not guarantee that each mobile will be able to buffer a particular number of packets; rather, it is intended to serve as a maximum for any one mobile at any given point in time. |
| Values | Decimal (0..100) |
| Default | 12 |

### ATTRIBUTE Gsd DBuff maxBytesBuffPerMs (maxBuffBytes)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of bytes that may be buffered for a single mobile at any given time, regardless of the number of packets buffered. Packets received beyond this limit are discarded by the Serving GPRS Support Node (SGSN).<br><br>This parameter does not guarantee that each mobile will be able to buffer a particular number of bytes; rather, it is intended to serve as a maximum for any one mobile at any given point in time. |
| Values | Decimal (0..102400) |
| Units | bytes |
| Default | 10486 |

### ATTRIBUTE Gsd DBuff pduLifetimeInBuff (pduBuffLife)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum amount of time that a single packet may be buffered. After expiry of this time period, if the buffered packet has not been sent to the mobile, the packet is discarded by the Serving GPRS Support Node (SGSN). |
| Values | Decimal (0..120) |
| Units | seconds |
| Default | 20 |

### ATTRIBUTE Gsd DBuff buffCheckInterval (buffInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the time interval that the Serving GPRS Support Node (SGSN) waits before examining the buffer contents to determine if the reason for buffering still exists.<br><br>The value for this parameter must be selected very carefully. It should be selected based on buffer space provided by the Packet Control Unit (PCU) and the expected data rate for the mobiles attached to the PCU. However, if this value is set too low, depending on the number of mobiles allowed to do buffering concurrently (determined by *maxMsWithBuff*),a non-negligible impact to system capacity may result.<br><br>Changing this value will result in loss of service for this *Gsd* component. |
| Values | Decimal (0.1..120.0) |
| Units | seconds |
| Default | 2.0 |

### ATTRIBUTE Gsd DBuff numSmallBlocks (numSmBlk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the number of small memory blocks that will be allocated for buffering of downlink Packet Data Units (PDUs). A small memory block is approximately 256 octets.<br><br>The maximum amount of memory that may be allocated for buffering in a given GPRS Subscriber Data (GSD) is 10Mb. The total memory computed from values specified for *numSmallBlocks*, *numMediumBlocks*, *numLargeBlocks* and *numXlargeBlocks* must not exceed 10Mb.<br><br>Example: (*numSmallBlocks* * 256) + (*numMediumBlocks* * 512) + (*numLargeBlocks* * 1024) + (*numXLargeBlocks* * 1792) must be less than or equal to 10,485,760.<br><br>Changing this value will result in loss of service for this *Gsd* component. |
| Values | Decimal (0..40000) |
| Default | 5500 |

### ATTRIBUTE Gsd DBuff numMediumBlocks (numMeBlk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the number of medium memory blocks that will be allocated for buffering of downlink Packet Data Units (PDUs). A medium memory block is approximately 512 octets.<br><br>The maximum amount of memory that may be allocated for buffering in a given GPRS Subscriber Data (GSD) is 10Mb. The total memory computed from values specified for *numSmallBlocks*, *numMediumBlocks*, *numLargeBlocks* and *numXlargeBlocks* must not exceed 10Mb. |

Example: (*numSmallBlocks* * 256) + (*numMediumBlocks* * 512) + (*numLargeBlocks* * 1024) + (*numXLargeBlocks* * 1792) must be less than or equal to 10,485,760.

Changing this value will result in loss of service for this *Gsd* component.

Values: Decimal (0..20000)

Default: 1000

### ATTRIBUTE Gsd DBuff numLargeBlocks (numLaBlk)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies the number of large memory blocks that will be allocated for buffering of downlink Packet Data Units (PDUs). A medium memory block is approximately 1024 octets.

The maximum amount of memory that may be allocated for buffering in a given GPRS Subscriber Data (GSD) is 10Mb. The total memory computed from values specified for *numSmallBlocks*, *numMediumBlocks*, *numLargeBlocks* and *numXlargeBlocks* must not exceed 10Mb.

Example: (*numSmallBlocks* * 256) + (*numMediumBlocks* * 512) + (*numLargeBlocks* * 1024) + (*numXLargeBlocks* * 1792) must be less than or equal to 10,485,760.

Changing this value will result in loss of service for this *Gsd* component.

Values: Decimal (0..10000)

Default: 2590

### ATTRIBUTE Gsd DBuff numXlargeBlocks (numXlBlk)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Criticality | Process |
| Description | This attribute specifies the number of extra-large memory blocks that will be allocated for buffering of downlink Packet Data Units (PDUs). An extra-large memory block is approximately 1792 octets.<br><br>The maximum amount of memory that may be allocated for buffering in a given GPRS Subscriber Data (GSD) is 10Mb.The total memory computed from values specified for *numSmallBlocks*, *numMediumBlocks*, *numLargeBlocks* and *numXlargeBlocks* must not exceed 10Mb.<br><br>Example: (*numSmallBlocks* * 256) + (*numMediumBlocks* * 512) + (*numLargeBlocks* * 1024) + (*numXLargeBlocks* * 1792) must be less than or equal to 10,485,760.<br><br>Changing this value will result in loss of service for this *Gsd* component. |
| Values | Decimal (0..5714) |
| Default | 3300 |

### ATTRIBUTE Gsd DBuff buffOnFcBucketFull (buffFcBFull)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether downlink data should be buffered if the downlink flow control bucket is full. Refer to “GSM TS 08.18” for a detailed description of the downlink flow control mechanisms.<br><br>If ***enabled***, downlink data is buffered when the flow control bucket is full. |
| Values | enabled<br>disabled |

| | |
|---|---|
| Default | enabled |

### ATTRIBUTE Gsd DBuff buffOnLlcSuspended (buffLlcSuspd)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether downlink data should be buffered if the Logical Link Control (LLC) layer is suspended. Refer to “GSM TS 04.08” and “GSM TS 04.64” for a description of the LLC layer and its behavior.<br><br>If ***enabled*** downlink data is buffered when the LLC layer is suspended. |
| Values | enabled<br>disabled |
| Default | enabled |

# COMPONENT GsmIwfBearerChannel (GsmBc)

| | |
|---|---|
| Instance | trunkGrp [Decimal (1..8191)]<br>cic [Decimal (1..2047)] |
| Groups | "GROUP GsmBc Operational (Oper)"<br>"GROUP GsmBc CustomerIdentifierData (CidData)"<br>"GROUP GsmBc OsiState (State)" |
| Scope | Application |
| Description | *GsmBc/<trunkGrp>,<cic>*<br>This component represents an individual bearer channel resource for a given *GsmIwfCallServer*. Depending on the call type requested, the *GsmIwfCallServer* links one or more *GsmIwfBearerChannel*s in a single GSM InterWorking Function (IWF) call. Each *GsmIwfBearerChannel* is linked to a channel on a DS1 or E1 port on a logical processor (one *GsmIwfBearerChannel* per channel).<br>The instance value *trunkGrp* is the external identifier for the trunk group configured at the Mobile Services-switching Center (MSC) connected to this node and associated with this *GsmIwfBearerChannel* instance.<br>The instance value *cic* is the external identifier for the trunk group member. It is referred to as the circuit identifier code (cic) and is the same index used when configuring the channel at the Mobile Services-switching Center (MSC).<br><br>This component is specific to the ***gsmIwfBearerChannel*** feature of the ***wirelessIwf*** application. Refer to NTP 411-5221-520 “GPP Interworking Function Data Guide” for details on its usage. |

## GROUP GsmBc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes concerning the operation of this particular *GsmIwfBearerChannel* for the current or most recent call. |

## ATTRIBUTE GsmBc mipState

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current state of the MSC/IWF Interface Protocol (MIP) for an IWF element. Valid values are:<br>***idle***, Startup state of IWF element.<br>***pendingSetup***, Pending initial state of IWF element.<br>***setup***, Initial state of IWF element.<br>***pendingActivation***, Synchronization has been requested, but the IWF element is not yet in the Synchronization state. |

***activated***, Synchronization state.
***holdDisconnect***, Flush buffer state, during call clearing the MSC is responsible for holding the network connection towards the disconnected party while the IWF completes the data transmission (flushing any buffered data towards the disconnected party; any buffered data towards the disconnecting party is discarded.)
***currentlySuspended***, The call is temporarily switched to speech phase during a dual services call.

Values
idle
pendingSetup (pendSet)
setup
pendingActivation (pendAct)
activated (act)
holdDisconnect (holdDisc)
suspended (susp)

Default
idle

## ATTRIBUTE GsmBc maxUserDataRate (maxUserRate)

Access
Read: All
Write: Illegal

Description
This attribute indicates the user rate which is in affect between the IWF and the fixed network. A user rate of ***1200_75*** is 75 bit/s in the receive direction 1200 bit/s in the transmit direction.

Values
300
600
1200
1200_75
2400
4800
7200
9600
12000
14400
16800
19200
21600
24000

| | |
|---|---|
| | 26400<br>28800<br>31200<br>32000<br>33600<br>38400<br>43200<br>48000<br>56000<br>57600<br>64000<br>none |
| Units | bit/s |
| Default | none |

### ATTRIBUTE GsmBc connectionType (connType)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the connection types between the terminal equipment or terminal adaptor and mobile and between the IWF and the network. Valid connection types are:<br>***asynchronous***, Transmission of data which does not require clocking of the data signal.<br>***synchronous***, Transmission of data which requires clocking of the data signal. |
| Values | synchronous (sync)<br>asynchronous (async) |
| Default | No default |

### ATTRIBUTE GsmBc dataBits

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of data bits encoded between start and stop bits in an asynchronous data call connection data stream. This attribute is set to ***notApplicable*** for a synchronous data call. |

| | |
|---|---|
| Values | 7<br>8<br>notApplicable (na) |
| Default | notApplicable |

### ATTRIBUTE GsmBc stopBits

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of stop bits (a mark (binary 1) placed at the end of each data byte) inserted between the data bits in an asynchronous data call connection data stream, this marks the end of the character. This attribute is set to ***notApplicable*** for a synchronous data call. |
| Values | 1<br>2<br>notApplicable (na) |
| Default | notApplicable |

### ATTRIBUTE GsmBc parity

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the type of parity for the data bits in an asynchronous data call connection data stream. Parity is a redundant bit that is added to each data byte to aid in error detection. If odd parity is used, all data bytes have an odd number of 1s, and if even parity is used, all data bytes have an even number of 1s. Also parity may be forced to 0, forced to 1, or may not be used at all (required for sending 8-bit data). This attribute will be set to ***notApplicable*** for a synchronouse data call. Valid values are:<br>***none***, No parity.<br>***odd,*** Odd parity.<br>***even***, Even parity.<br>***forced0***, Parity forced to 0.<br>***forced1***, Parity forced to 1.<br>***notApplicable***, Parity not applicable. |

| | |
|---|---|
| Values | none<br>odd<br>even<br>forced0<br>forced1<br>notApplicable (na) |
| Default | none |

### ATTRIBUTE GsmBc flowControl

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current flow control status of this *GsmIwfBearerChannel* for an asynchronous call. For a synchronous data call this attribute will be set to ***noFlowControlActive***. Valid values are:<br>***noFlowControlActive***, There is no flow control active over the air interface and network interfaces. The applications at the end points handle flow control.<br>***inband***, Embedded characters in the data stream indicate flow control.<br>***v110FlowCtnrl***, Utilization of V.110 flow control.<br>***errorCntrl***, Flow control is handle by datalink protocols. |
| Values | noFlowControlActive (noFlow)<br>inband<br>v110FlowCntrl (v110Flow)<br>errorCntrl (errCntrl) |
| Default | noFlowControlActive |

### ATTRIBUTE GsmBc callType

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current call type. Valid values are:<br>***faxG3***, group 3 fax calls<br>***cda31khz***, asynchronous 3.1kHz modem<br>***cdaUdi***, asynchronous unrestricted digital data call |

***cdsUdi***, synchronous unrestricted digital data call
***cds31khz***, synchronous 3.1kHz modem

Values
faxG3
cda31khz
cdaUdi
cdsUdi
cds31khz

Default
No default

## ATTRIBUTE GsmBc lastResponseCode (respCode)

Access
Read: All
Write: Illegal

Description
This attribute indicates the MSC/IWF Interface Protocol (MIP) response code returned for the last call which was active on this particular *GsmIwfBearerChannel*. Valid values are:
***requestDone***, the call was terminated normally.
***systemError***, the call was terminated due to a base system problem.
***applicationError***, the call was terminated due to an application level problem.
***noResources***, the call was terminated due to a lack of available resources.
***msgSizeMismatch***, Message length does not match length defined by the MSC/IWF Interface Protocol for the particular message type.
***protocolViolation***, Failed to perform the request because the coding of the request message was invalid; message was not understood.
***requestNotSupported***, Message was understood but not supported by the IWF or MSC.
***requestDenied***, Message was understood and supported by the IWF or MSC but the request is denied.
***invalidMessage***, Message received is invalid for the current state of the IWF's state machine or the MSC data call state machine. The message is ignored.
***bufferNotFlushed***, Message from the Iwf to the MSC indicating that the buffers are not flushed as requested by the MSC.

***notApplicable***, this attribute is not applicable for this call. This is the default value for this attribute.

Values
requestDone (reqDone)
systemError (sysErr)
applicationError (applErr)
noResources
msgSizeMismatch (msgSzMismatch)
protocolViolation
requestNotSupported (reqNotSupp)
requestDenied (reqDenied)
invalidMessage (invldMsg)
bufferNotFlushed (bufsUnflushed)
notApplicable (na)

Default
notApplicable

### ATTRIBUTE GsmBc mateBearerChannel (mateBc)

Access
Read: All
Write: Illegal

Description
This attribute contains the name of the mate *GsmIwfBearerChannel* that this *GsmIwfBearerChannel* is involved with in the currently active call.

Values
The name of the component

Default
No default

### GROUP GsmBc CustomerIdentifierData (CidData)

Properties
Provisioned

Description
This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE GsmBc customerIdentifier (cid)

Access
Read and write

Description
This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute,

the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP GsmBc OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE GsmBc adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is

administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE GsmBc operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE GsmBc usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## COMPONENT GsmBc Framer

Groups
"GROUP GsmBc Framer Provisioned (Prov)"
"GROUP GsmBc Framer Statistics (Stats)"
"GROUP GsmBc Framer LinkOptions (Link)"
"GROUP GsmBc Framer OsiState (State)"

Scope
Device

Description
*GsmBc/<trunkGrp>,<cic> Framer*
The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. The *Framer* component also associates an application component with a specific hardware link interface. The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes which are associated with hardware components. The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

Common Verbs
Help
List
Display

## GROUP GsmBc Framer Provisioned (Prov)

Properties
Provisioned

Description
This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific

provisioning data is contained in other provisionable *Framer* groups.

### ATTRIBUTE GsmBc Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP GsmBc Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *Framer* component. |

### ATTRIBUTE GsmBc Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames transmitted to the link interface by *Framer*. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE GsmBc Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames received from the link interface by *Framer*. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE GsmBc Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the link interface by *Framer*. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE GsmBc Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute coutns the the total number of frames with CRC errors, occurring in the receive direction from the link. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE GsmBc Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE GsmBc Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames that were non octet aligned. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE GsmBc Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE GsmBc Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attributecounts the total number of frames transmitted to the link for which underruns occurred. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP GsmBc Framer LinkOptions (Link)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the GsmIwfFramer<br>which controls link layer framing for application components sending and receiving data on a link interface for this particular GsmIwfBearerChannel. |

### ATTRIBUTE GsmBc Framer framingType

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Criticality | Process |
| Description | This attribute indicates the type of framing for the link layer data received and transmitted on this channel. Valid values are:<br>***BtdsFraming***, bit transparent framing required for the |

*GsmIwfBearerChannel* components on MVP cards.
***GsmFraming***, GSM framing for the *GsmIwfBearerChannel* components on DS1C/E1C cards.

Values
btdsFraming
gsmFraming

Default
gsmFraming

## GROUP GsmBc Framer OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE GsmBc Framer adminState (osiAdmin)

Access
Read only

Description
This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE GsmBc Framer operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE GsmBc Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## COMPONENT GsmBc Layer1

| | |
|---|---|
| Groups | "GROUP GsmBc Layer1 Operational (Oper)"<br>"GROUP GsmBc Layer1 Statistics (Stats)" |
| Scope | Application |
| Description | *GsmBc/<trunkGrp>,<cic> Layer1*<br>This component represents the group of measurements for the GSM Layer 1 protocol established for a GSM IWF call (on the mobile station to IWF link) on this particular *GsmIwfBearerChannel.*<br>Note that this component is present only if the current (or most recent call) involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP GsmBc Layer1 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains physical layer operational attributes concerning the operation of this particular *GsmIwfBearerChannel*. |

## ATTRIBUTE GsmBc Layer1 activeMode (mode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the active physical layer protocol between the mobile and the IWF. Valid values are:<br>***v110***, GSM V.110 rate adaptation scheme for interworking V-series connections to an Integrated Services Digital Network (ISDN).<br>***aTrau***, GSM A-Transcoder/Rate Adaptor (A-TRAU). |
| Values | v110<br>aTrau |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 connection (conn)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the connection between the mobile and the IWF. Valid values are:<br>***transparent***, Constant throughput, constant transit delay, and variable error rate (does not use Radio Link Protocol).<br>***nonTransparent***, Improved error rate with variable transit delay and variable throughput (uses Radio Link Protocol). |
| Values | transparent (trans)<br>nonTransparent (nonTrans) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 dataRate

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the layer 1 user data rate for the currently active call for this *GsmIwfBearerChannel*. This is the data rate between the mobile and IWF. |
| Values | Decimal (0..64000) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 intermediateRate (iRate)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the intermediate rate used in the physical layer rate adaptation process. This field is valid between the mobile and the IWF. For user data rates of 300 bit/s - 4800 bit/s the intermediate rate is 8 kbit/s. For user data rates 9600 bit/s and above the intermediate rate is 16 kbit/s. |
| Values | Decimal (8; 16) |
| Units | kbit/s |

| | |
|---|---|
| Default | No default |

### GROUP GsmBc Layer1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains physical layer statistics concerning the operation of this particular *GsmIwfBearerChannel*. |

### ATTRIBUTE GsmBc Layer1 framesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames transmitted on the link. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 framesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames received on the link. Discarded frames are not included in this count. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 bytesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts number of bytes transmitted on the link. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 bytesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of bytes received on the link. Bytes from discarded frames are not included in this count. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 underRunsTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts number of underruns, on a per-call basis, in the transmit direction reported by the hardware on the mobile-side.. These frames are not counted towards the number of frames transmitted (*framesTx*). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 overRunsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts number of overruns, on a per-call basis, in the receive direction reported by the hardware on the mobile-side. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx)*. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 nonOctetErrorsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of non-octet synchronous frame errors, on a per-call basis, received on the link reported by the hardware. This is when a frame whose bit content was not divisible by eight was detected. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 largeFrameErrorsRx (lrgFrmErrRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames, on a per-call basis, received on the link that exceeded internal buffer limits reported by the hardware. A large number of these errors could indicate a bad physical medium. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Layer1 framesDiscarded (frmDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames discarded, on a per-call basis, in the receive direction by software due to frame errors. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE GsmBc Layer1 lrcErrorsTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of corrupted frames, on a per-call basis, due to memory inconsistencies found by Longitude Redundancy Check (LRC) checks at the IWF. These frames are not counted towards the number of frames transmitted (*framesTx*). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT GsmBc Modem

| | |
|---|---|
| Groups | "GROUP GsmBc Modem Operational (Oper)"<br>"GROUP GsmBc Modem Statistics (Stats)" |
| Scope | Application |
| Description | *GsmBc/<trunkGrp>,<cic> Modem*<br>This component represents the group of measurements for the modem protocol established for a GSM IWF call (on the IWF to Public Switched Telephone Network (PSTN) modem link) on this particular *GsmIwfBearerChannel.*<br>Note that this component is present only if the current (or most recent call) involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

### GROUP GsmBc Modem Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure performance of the *modem* component for this particular *GsmIwfBearerChannel*. |

## ATTRIBUTE GsmBc Modem rate

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the transmission rate of the current modem in use. A rate of ***1200_75*** is 75 bit/s in the transmit direction and 1200 bit/s in the receive direction. All other rates are the same in both the transmit and receive directions. |
| Values | 300<br>600<br>1200<br>1200_75<br>2400<br>4800<br>7200<br>9600<br>12000<br>14400<br>16800<br>19200<br>21600<br>24000<br>26400<br>28800<br>31200<br>32000<br>33600<br>38400<br>43200<br>48000<br>56000<br>57600<br>64000 |
| Units | bit/s |
| Default | No default |

## ATTRIBUTE GsmBc Modem algorithmInUse (algorithm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current modem algorithm(s) active for the channel. Valid values are:<br>***v17,*** V.17 is active.V.17 is an ITU-T 14400bit/s modem standard.<br>***v27ter***, V.27ter is active. V.27ter is an ITU-T 7200bit/s modem standard.<br>***v29***, V.29 is active. V.29 an ITU-T 9600bit/s modem standard.<br>***v21***, V.21 active. V.21 is an ITU-4 300bit/s modem standard.<br>***v22bis***, V.22 or V.22bis active. V.22 ia an ITU-T modem standard that operates at 1200bit/s and 600 baud. V.22bis is an ITU-T modem standard that operates at 2400bit/s and 600 baud.<br>***v23***, V.23 active. V.23 is an ITU-T modem standard that operates at a speed of 1200bit/s.<br>***v26ter,*** V.26ter active. V.26ter is an ITU-T modem standard that operates at a speed of 2400bit/s.<br>***v32bis***, V.32 or V.32bis active. V.32 is an ITU-T modem standard that operates at 9600bit/s and 2400 baud. V.32bis is an ITU-T modem standard that operates at a speed of 14.4kbit/s.<br>***v34***, V.34 active. V.34 is an ITU-T modem standard that operates at a speed of up to 28.8kbit/s. |
| Set of | v17<br>v29<br>v27ter<br>v21<br>v22bis<br>v23<br>v26ter<br>v32bis<br>v34 |
| Default | No default |

## ATTRIBUTE GsmBc Modem protocolState (state)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

Description
This attribute indicates the active protocol state of the modem in use.Valid values are:
***idle***, Modem is in an inactive state and has no current connection established.
***training***, Modem is attempting to establish a connection with the far end modem via handshaking.
***connected***, Modem has establish a connection with the far end modem.

Values
idle
training
connected

Default
No default

### ATTRIBUTE GsmBc Modem receiverTransmitter (rxTx)

Access
Read: All
Write: Illegal

Description
This attribute indicates whether the fax data modem is in receive or transmit mode. If this is not a fax data modem call, then the value is set to ***notApplicable***. Valid values are:
***notApplicable***, Not an applicable field.
***rxOnTxOff***, Receiver is on, transmitter is off.
***rxOffTxOn***, Receiver is off, transmitter is on.
***rxTxOn***, Reciever is on, transmitter is on.

Values
notApplicable (na)
rxOnTxOff
rxOffTxOn
rxTxOn

Default
notApplicable

### ATTRIBUTE GsmBc Modem training

Access
Read: All
Write: Illegal

Description
This attribute indicates the training procedure used by the V.17 modems. ITU-T defines two training procedures. A longer training procedure used at call setup, and a short training procedure is used during the fax call when switching from the

V.21 modem to the V.17 modem. A value of ***notApplicable*** indicates that the attribute is not applicable for the modem.

Values
short
long
notApplicable (na)

Default
notApplicable

### ATTRIBUTE GsmBc Modem toUpperFlowControlActive (upperFlow)

Access
Read: All
Write: Illegal

Description
This attribute indicates whether flow control was requested and an indication was sent to an upper layer protocol.

Values
on
off

Default
No default

### ATTRIBUTE GsmBc Modem toDspFlowControlActive (lowerFlow)

Access
Read: All
Write: Illegal

Description
This attribute indicates whether an upper layer protocol requested flow control and an indication was sent to the Digital Signal Processor.

Values
on
off

Default
No default

### ATTRIBUTE GsmBc Modem asyncMode (async)

Access
Read: All
Write: Illegal

Description
This attribute indicates whether conversion between synchronous and asynchronous data format (specifacally, the stripping or insertion of start and stop bits) is being performed. The value will be ***on*** unless the V.42 layer is active or it is a fax call.

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE GsmBc Modem autoHdlcMode (autoHdlc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether High-Level Data Link Control (HDLC) functions are being performed by the modem to support HDLC applications (V.42 for example). |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE GsmBc Modem outbandFlowControl (outbandFlow)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether inband or outband flow control conversions are being performed. The modem performs either inband or outband flow control unless V.42 layer is active, it is a fax call, or no flow control was specified by the MSC. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE GsmBc Modem outbandBreak (outbandBrk)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether inband or outband break control conversions are being performed. This is when the modem detects a break condition as defined by ITU-T X.28 and reports it. When a break condition is discovered all subsequent incoming data is discarded until a start bit is received. |

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE GsmBc Modem autobaud

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether autobaud is active.<br>The modem is instructed at call setup time by the MSC on:<br>What is the initial modem data rate value and<br>Whether a modem is allowed to perform autobauding (***on***) or not (***off***). With Autobauding ***on***, the modem is allowed to connect using a valid modem data rate less than or equal to the initial rate specified to the modem by the MSC. If a modem can not perform autobauding and the carrier can not be established at the initial data rate, the modem is disabled. |
| Values | on<br>off |
| Default | No default |

### GROUP GsmBc Modem Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure performance of the modem component for this particular *GsmIwfBearerChannel*. |

### ATTRIBUTE GsmBc Modem bytesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of payload bytes transmitted. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Modem bytesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of payload bytes received. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Modem framingErrors (frmErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of framing errors detected by the hardware. This is the absence of a stop bit after a start bit and eight bits of data. All incoming data is discarded until the next start bit is received. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT GsmBc V110

| | |
|---|---|
| Groups | "GROUP GsmBc V110 Operational (Oper)"<br>"GROUP GsmBc V110 Statistics (Stats)" |
| Scope | Application |
| Description | *GsmBc/<trunkGrp>,<cic> V110*<br>This component represents the group of measurements for the ITU-T V.110 rate adaptation protocol established for a GSM IWF call (on the IWF to Integrated Services Digital Network (ISDN) terminal adapter link) on this particular *GsmIwfBearerChannel.* Note that this component is present only if the current (or most recent call) involved this protocol. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP GsmBc V110 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of *V110*. |

## ATTRIBUTE GsmBc V110 dataRate

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute contains the layer 1 user data rate for the currently active call for this *GsmIwfBearerChannel*. This is the data rate between the IWF and the fixed network. |
| Values | Decimal (0..65000) |
| Units | bit/s |
| Default | No default |

## ATTRIBUTE GsmBc V110 intermediateRate (iRate)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the intermediate rate used in the physical layer rate adaptation process. This field is valid between the network and the IWF. For user data rates of 300 bit/s to 4800 bit/s the intermediate rate is 8 kbit/s. For a user data rate of 9600 bit/s the intermediate rate is 16 kbit/s. For user data rates of 1200 bit/s to 19200 bit/s the intermediate rate is 32 kbit/s. Data rates above this have no intermediate rate. |
| Values | 8 kbit/s<br>16 kbit/s |

| | |
|---|---|
| | 32 kbit/s<br>notApplicable (na) |
| Default | No default |

### GROUP GsmBc V110 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes which measure the performance of V110. |

### ATTRIBUTE GsmBc V110 framesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames transmitted on the link. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V110 framesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames received on the link. Discarded frames are not included in this count. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V110 bytesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of bytes transmitted on the link. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE GsmBc V110 bytesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of bytes received on the link. Bytes from discarded frames are not included in this count. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V110 underRunsTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of underruns, on a per-call basis, in the transmit direction reported by the hardware on the network side. These frames are not counted towards the number of frames transmitted (*framesTx*). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE GsmBc V110 overRunsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of overruns, on a per-call basis, in the receive direction reported by the hardware on the network side. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V110 nonOctetErrorsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of non-octet synchronous frame errors, on a per-call basis, received on the link reported by the hardware. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V110 largeFrameErrorsRx (lrgFrmErrRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames received on the link that exceeded internal buffer limits reported by the hardware, on a per-call basis. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V110 framesDiscarded (frmDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames discarded, on a per-call basis, in the receive direction by software due to frame errors. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE GsmBc V110 lrcErrorsTx (lrcErrTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of corrupted frames, on a per-call basis, due to memory inconsistencies found by Longitude Redundancy Check (LRC) checks at the IWF. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT GsmBc Fax

| | |
|---|---|
| Groups | "GROUP GsmBc Fax Operational (Oper)"<br>"GROUP GsmBc Fax Statistics (Stats)" |
| Scope | Application |
| Description | *GsmBc/<trunkGrp>,<cic> Fax*<br>This component represents the group of measurements for the fax protocol established for a GSM IWF call (on the mobile station to IWF link or the IWF to Public Switched Telephone Network (PSTN) fax modem/machine link) on this particular *GsmIwfBearerChannel.*<br>Note that this component is present only if the current (or most recent call) involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP GsmBc Fax Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes which measure the performance of the fax protocol. |

## ATTRIBUTE GsmBc Fax activeMode (mode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the mode of the fax T.30 protocol, determined during Exchange Identification (XID) negotiations. The following modes are supported:<br>***normal***, normal T.30 protocol, Error Correction Mode (ECM) not used<br>***ecm***, Error Correction Mode used. Fax error correction is done using a half-duplex page selective repeat technique. |
| Values | normal<br>ecm |
| Default | normal |

## ATTRIBUTE GsmBc Fax protocolState (state)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the protocol state of the fax adaptor. The values are:<br>***setup,*** call setup state<br>***idle,*** idle state only transmitting Synchronize (SYNC) frames<br>***bcsRx,*** receiving Binary Coded Signal (BCS) packet from modem<br>***bcsTx,*** transmitting BCS packet to modem<br>***msgRx,*** receiving fax message from modem<br>***msgTx,*** transmitting fax message to modem |
| Values | setup<br>idle<br>bcsRx<br>bcsTx<br>msgRx<br>msgTx |
| Default | idle |

### ATTRIBUTE GsmBc Fax messageRate (msgRate)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the fax message rate used for sending fax documents. |
| Values | Decimal (0..65000) |
| Units | bit/s |
| Default | No default |

### GROUP GsmBc Fax Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes which measure the performance of the fax protocol. |

### ATTRIBUTE GsmBc Fax messageFramesRx (msgFrmRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of fax message frames received from the mobile. One fax message frame is an eight byte DATA frame defined in GSM 3.45. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Fax messageFramesTx (msgFrmTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of fax message frames transmitted to the mobile. One fax message frame is an eight byte DATA frame defined in GSM 3.45. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE GsmBc Fax bcsFramesRx (bcsFrmRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of fax Binary Coded Signal (BCS) frames received from the mobile. A fax BCS frame is an 8-byte STATUS frame, which carries T.30 BCS data as defined in GSM 3.45. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Fax bcsFramesTx (bcsFrmTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of fax Binary Coded Signal (BCS) frames transmitted to the mobile. A fax BCS frame is an 8-byte STATUS frame, which carries T.30 BCS data as defined in GSM 3.45. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Fax pagesRxFromMobile (pagesRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of fax pages received from the mobile. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Fax pagesTxToMobile (pagesTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | The attribute counts the number of fax pages transmitted to the mobile. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Fax channelModeModify (cmm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of Channel Mode Modify (CMM) requests initiated by the IWF.<br>For transparent fax calls, the transmission speed is determined by the two fax machines at call setup. The speed may change during the transmission to satisfy the T.30 protocol. The CMM request is used by the GSM IWF to request that the T.30 requested speed change can be propagated throughout the network. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Fax bcsFrameErrors (bcsFrmErr)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of fax Binary Coded Signal (BCS) frames in error. This attribute indicates the count of corrupted fax BCS frames over the GSM radio channel. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT GsmBc RadioLinkProtocol (Rlp)

| | |
|---|---|
| Groups | "GROUP GsmBc Rlp Operational (Oper)"<br>"GROUP GsmBc Rlp Statistics (Stats)" |
| Scope | Application |
| Description | *GsmBc<trunkGrp>,<cic> RadioLinkProtocol/<rlp-type>*<br>This component represents the group of measurements for the Radio Link Protocol (RLP) established for a GSM IWF call (on the mobile station to IWF link) on this particular *GsmIwfBearerChannel.*<br>Note that this component is present only if the current (or most recent call) involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP GsmBc Rlp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure performance of the *GsmIwfBearerChannel*. |

## ATTRIBUTE GsmBc Rlp protocolState (state)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the last Radio Link Protocol (RLP) state before call take down. The following are the states:<br>***detached,*** Initial State. The call has not even started.<br>***disconnected***, Asynchronous Disconnected Mode (ADM).<br>***connPending***, In ADM, but sent Set Asynchronous Balanced Mode (SABM) and waiting for a response.<br>***discPending***, Sent Disconnect (DISC), waiting for a response.<br>***connectEstablished***, In Asynchronous Balanced Mode (ABM), Information frames can be exchanged.<br>***synchronized***, Synchronization state entered after a change of channel coding. Handles REMAP procedure. |

| | |
|---|---|
| Values | detached (detach)<br>disconnected (disc)<br>connPending (connPend)<br>discPending (discPend)<br>connectEstablished (connEst)<br>synchronized (sync) |
| Default | detached |

### ATTRIBUTE GsmBc Rlp frameSize

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current Radio Link Protocol (RLP) frame size transmitted. The size of the frame depends on the radio channel type. The frames can be 240 bits long for 12 kbit/s and 6 kbit/s or 576 bits long for 14.5 kbit/s. |
| Values | Decimal (0..65000) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp highestVersion (highVer)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current highest version of the Radio Link Protocol (RLP) protocol negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). Valid values are:<br>***0***, Single-link basic version.<br>***1***, Single-link extended version (for example, extended by data compression).<br>The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *highestVersion*. |
| Values | Decimal (0..1) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp iwfToMsWindowSize (iwfMsWs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current IWF to mobile window size negotiated by the Radio Link Protocol (RLP) during Exchange Information (XID). The window size is the maximum number of sequentially numbered Information (I) frames that may be unacknowledged at any given time. GSM specification 4.22 defines the range as 0 to 61. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *iwftoMsWindowSize*. |
| Values | Decimal (0..61) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp msToIwfWindowSize (msIwfWs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current mobile to IWF window size negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). The window size is the maximum number of sequentially numbered Information (I) frames that may be unacknowledged at any given time. GSM specification 4.22 defines the range as 0 to 61. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *msToIwfWindowSize*. |
| Values | Decimal (0..61) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp t1AckTimer (t1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current T1 timer negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). This is the period in milliseconds within which an acknowledgment of a sent frame must be received. Once this |

| | |
|---|---|
| | timer expires, the transmitting RLP entity shall assume that the frame was lost. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *t1AckTimer.* |
| Values | Decimal (380..1020) |
| Units | msec |
| Default | No default |

### ATTRIBUTE GsmBc Rlp t2AckDelayTimer (t2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current T2 timer negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). This is the maximum period in milliseconds the receiving RLP entity shall wait before sending an acknowledgment for a received in sequenced frame. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *t2AckDelayTimer.* |
| Values | Decimal (10..70) |
| Units | msec |
| Default | No default |

### ATTRIBUTE GsmBc Rlp n2RetransmitCount (n2)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute indicates the current value of N2 negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). This is the maximum number of times a RLP entity shall retransmit an individual frame following the expiry of timer T1. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *n2RetransmitCount*. |
| Values | Decimal (0..255) |

| | |
|---|---|
| Default | No default |

### GROUP GsmBc Rlp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure performance of the *GsmIwfBearerChannel.* |

### ATTRIBUTE GsmBc Rlp iFramesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of valid Information frames transmitted. This count does not include the Information frames discarded. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp iFramesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attributes counts the number of valid Information (I) frames received. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp framesRetransmitted (frmRetrans)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of frames retransmitted. Frames that are not acknowledged within the T1 timer are retransmitted. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE GsmBc Rlp t1AckTimeouts (t1Timeout)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of T1 timer time-outs. Retransmission of all unacknowledged frames is started after T1 timer expiry. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp invalidFrames (invldFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of invalid frames received. These invalid frames are frames received from the mobile which contain errors in the header information. This count does not include the number of frames with Cyclic Redundancy Check (CRC) errors or out-of-sequence Frame Errors. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp crcErrorsRx (crcErrRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames with Cyclic Redundancy Check (CRC) errors received by the IWF Radio Link Protocol (RLP) entity. CRC is a type of block check character that is very effective in detecting communications errors. CRCs are commonly 16 or 32 bits long (though, in GSM non-transparent services, a 24-bit CRC is used). The counter wraps when it exceeds the maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp outOfSequenceFrames (outOfSeqFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of out-of-sequence Information frames received by the IWF Radio Link Protocol (RLP) entity. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp remoteBusyIndications (remoteBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the mobile Radio Link Protocol (RLP) entity is busy (that is, it is in Asynchronous Balanced Mode (ABM) and is not ready to receive Information frames). The RLP entity is considered to be not ready to receive information frames if the mobile sends a flow control indication RNR (Receive Not Ready). A Receive Ready is sent to the RLP entity when the mobile is ready to receive data. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp localBusyIndications (localBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the IWF RLP entity is busy (that is it is in Asynchronous Balanced Mode (ABM) and is not ready to receive Information frames). When the network side introduces flow control towards the mobile and a Receive Not Ready (RNR) is sent to the mobile to stop the mobile from |

| | |
|---|---|
| | sending any more data frames. A Receive Ready (RR) is sent to the mobile when the RLP entity is ready to receive data. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp iFramesTxDiscarded (iFrmTxDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames discarded by the IWF. Untransmitted and unacknowledged frames are discarded when a Set Asynchronous Balanced Mode (SABM) or Disconnect (DISC) is received or sent in Asynchronous Balanced Mode (ABM) mode. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc Rlp resetsRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of resets sent by the mobile. Loss of information may occur when a reset is issued. A reset is issued by the mobile on failure of checkpoint recovery. That is if the mobile does not receive acknowledgment for its information frame, it does checkpoint recovery (it sends a supervisory frame requesting the status of the other entity. If the responding entity fails to respond to N2 of this checkpoint frame a reset is initiated by the originating entity. A reset can also be issued by the mobile during handover where a loss of connection or synchronization occurs. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT GsmBc V42

| | |
|---|---|
| Groups | "GROUP GsmBc V42 Operational (Oper)"<br>"GROUP GsmBc V42 Statistics (Stats)" |
| Scope | Application |
| Description | *GsmBc/<trunkGrp>,<cic> V42*<br>This component represents the group of measurements for the ITU-T V.42 error correcting protocol established for a GSM IWF call (on the IWF to Public Switched Telephone Network (PSTN) modem link) on this particular *GsmIwfBearerChannel*.<br>Note that this component is present only if the current (or most recent call) involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP GsmBc V42 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes which measure V.42 error detection and correction performance. |

## ATTRIBUTE GsmBc V42 protocolState (state)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the state of V.42. Valid states are:<br><br>***notActive***, The V.42 link connection with the Public Switched Telephoned Network) PSTN modem is not established. None of the V.42 functions including the error detection, error correction, and flow control is provided to the data call. This is the initial state of V.42.<br>***disconnected***, This means that the V42 link is disconnected.<br>***linksetup***, The V.42 operation enters this state from the disconnected state after the V.42 sends to the PSTN modem a Set Asynchronous Balanced Mode Extended (SABME) frame in an attempt to establish the error control connection with the PSTN |

modem.
***frameReject***, The V.42 operation enters into this state after it identifies an invalid frame sent by the peer and it sends back a frame reject (FRMR) frame to the peer.
***disconnectRequest***, The V.42 operation enters into this state after it sends to the peer a disconnect (DISC) frame with the attempt to disconnect the V.42 error control link.
***informationTransfer***, The V.42 enters into this state after it receives a UA (unnumbered acknowledgment) frame which the peer sent upon receipt of the SAMBE frame from IWF V.42. Once in this state, the V.42 can exchange data and supervisory information with its peer.
***waitingAck,*** The V.42 enters this state after it sends polling enquiry to its peer. The V.42 sends the polling enquiry when it receives a reject frame (REJ) from its peer or either its acknowledgment timer or inactivity timer timed out on the information frames sent out.

Values
notActive
disconnected (disc)
linksetup
frameReject (frmRej)
disconnectRequest (discReq)
informationTransfer (infoXfer)
waitingAck (waitAck)

Default
notActive

### ATTRIBUTE GsmBc V42 txN401FrameSize (txN401)

Access
Read: All
Write: Illegal

Description
This attribute indicates the current value of parameter N401 for V.42 which is negotiated during Exchange Information (XID). This is the maximum number of octets that can be carried in the information field of an information frame that the IWF V.42 transmits to the Public Switched Telephone Network (PSTN) modem. The IWF V.42 puts this or even smaller size of data into the outgoing information frame. The value used for XID negotiations can be provisioned by component *GsmIwfV42* attribute *txN401FrameSize.*

| | |
|---|---|
| Values | Decimal (0..65355) |
| Default | No default |

### ATTRIBUTE GsmBc V42 rxN401FrameSize (rxN401)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current value of N401, that is negotiated during Exchange Identification (XID). This is the maximum number of octets that can be carried in the information field of an information frame received from the Public Switched Telephone Network (PSTN) modem. An incoming information frame carrying data octets more than this size shall be rejected by the IWF V.42. The value used for XID negotiations can be provisioned by component *GsmIwfV42* attribute *rxN401FrameSize.* |
| Values | Decimal (1..255) |
| Default | No default |

### ATTRIBUTE GsmBc V42 txKwindowSize (txK)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current value of k, that is negotiated during Exchange Identification (XID). This is the size of flow control sliding window used for the information frames that the V.42 transmits to the Public Switched Telephone Network (PSTN) modem. This size governs the maximum number of information frames that the IWF V.42 error-correcting entity can have outstanding (that is, unacknowledged). The value used for XID negotiations can be provisioned by component *GsmIwfV42* attribute *txKwindowSize.* |
| Values | Decimal (0..127) |
| Default | No default |

### ATTRIBUTE GsmBc V42 rxKwindowSize (rxK)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the current value of k that is negotiated during Exchange Identification (XID). This is the size of flow control sliding window used for information frames transmitted from the Public Switched Telephone Network (PSTN) modem. This size governs the maximum number of information frames that the peer of the IWF V.42 error-correcting entity can have outstanding (that is, unacknowledged). The value used for XID negotiations can be provisioned by component *GsmIwfV42* attribute *rxKwindowSize*. |
| Values | Decimal (1..127) |
| Default | No default |

### GROUP GsmBc V42 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes that measure the V.42 error detection and correction performance. |

### ATTRIBUTE GsmBc V42 iBytesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of bytes that the V.42 actually received from the Public Switched Telephone Network (PSTN) modem in a data call. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 iBytesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the total number of bytes that the V.42 transmitted to the Public Switched Telephone Network (PSTN) modem in a data call. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 iFramesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of Information (I) frames that the V.42 received from the Public Switched Telephone Network (PSTN) modem in a data call. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 iFramesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of information frames that the V.42 transmitted to the Public Switched Telephone Network (PSTN) modem in a data call. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 framesRetransmitted (frmRetrans)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of frames retransmitted by the IWF V.42 entity in a data call. The V.42 retransmits the same frame when the associated T401 acknowledgment timer time-outs or when a Reject (REJ) supervisory frame has been received from |

| | |
|---|---|
| | the Public Switched Telephone Network (PSTN) modem. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 t1AckTimeouts (t1Timeout)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times that the T401 timer has timed out within a data call. If this timer times-out frequently, the operator may need to adjust the provisional parameter T401 acknowledgment timer to a larger time amount, since every time that V.42 sends out a frame it sets the T401 timer to wait for the peer's acknowledgment of the frame. When the timer times-out and no acknowledgment has been received, the V.42 sends the same frame to its peer. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 remoteBusyIndications (remoteBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times the Public Switched Telephone Network (PSTN) modem enters a busy state (the IWF has received a Receive Not Ready message) and asks the IWF V.42 not to send Information (I) frames to it until it is ready to receive information frames again (indicated by receipt of a Receive Ready message or a data message). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 localBusyIndications (localBusy)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of times the IWF V.42 enters in a busy condition and asks the peer to stop sending information frames until it has cleared up from the busy condition. The V.42 enters busy condition when its data buffer is about to be overflowed by the incoming Information (I) frames. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 badFramesRx (badFrmRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of bad frames the IWF V.42 has received from the Public Switched Telephone Network (PSTN) remote modem within the data call. In this instance, “bad frames” refer to the V.42 protocol error frames other than the check sequence error frames. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42 crcErrorsRx (crcErrRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the total number of frames received from the remote Public Switched Telephone Network (PSTN) modem that contain incorrect frame check sequence. A high value signifies the condition of the physical medium is poor. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

Default No default

## COMPONENT GsmBc V42bis

Groups "GROUP GsmBc V42bis Operational (Oper)"
"GROUP GsmBc V42bis Statistics (Stats)"

Scope Application

Description *GsmBc<trunkGrp>,<cic> V42bis*
This component represents the group of measurements for the ITU-T V.42bis data compression protocol established for a GSM IWF call (on the mobile station to the IWF link or the IWF to Public Switched Telephone Network (PSTN) fax modem link) on this particular *GsmIwfBearerChannel.*
Note that this component is present only if the current (or most recent call) involved this protocol.

## GROUP GsmBc V42bis Operational (Oper)

Properties Operational

Description This group contains operational attributes that measure the performance of *V.42bis*.

## ATTRIBUTE GsmBc V42bis protocolModeEncoder (modeEncoder)

Access Read: All
Write: Illegal

Description This attribute indicates the current mode of the V.42bis encoder. This mode can be either:
***transparent*** - A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences may be inserted into the data stream.
***compressed*** - A mode of operation in which data is transmitted in codewords.
The encoder switches between the two modes depending on

whether the data coming from the Date Terminal Equipment (DTE) is suitable for compression. The data comression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.

Values
transparent
compressed

Default
No default

### ATTRIBUTE GsmBc V42bis protocolModeDecoder (modeDecoder)

Access
Read: All
Write: Illegal

Description
This attribute indicates the current mode of the V.42bis decoder. This mode can be either:
***transparent*** - A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences may be inserted into the data stream.
***compressed*** - A mode of operation in which data is transmitted in codewords.
The encoder (at the mobile or Public Switched Telephone Network) switches between the two modes depending on whether the data coming from the Date Terminal Equipment (DTE) is suitable for compression. The data comression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.

Values
transparent
compressed

Default
No default

### ATTRIBUTE GsmBc V42bis compressionDirection (p0)

Access
Read: All
Write: Illegal

Description
This attribute indicates the direction in which V.42bis is active, negotiated at link setup by the data link protocol through

Exchange Identification (XID) negotiation of parameter P0 (compression direction). The value used for XID negotiations can be provisioned by component *GsmIwfV42bisProv* attribute *compressionDirection*. Valid values are:
***none***, No compression is present.
***encode***, The data sent by the IWF to the other entity is compressed.
***decode***, The data received by the IWF from the other entity is compressed.
***both***, The data sent and received by the IWF is compressed.

Values
none
encode
decode
both

Default
No default

### ATTRIBUTE GsmBc V42bis maximumCodewords (p1)

Access
Read: All
Write: Illegal

Description
This attribute indicates the maximum number of codewords in the dictionary negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P1 (number of codewords). The value used for XID negotiations can be provisioned by component *GsmIwfV42bisProv* attribute *maximumCodewords*.

Values
Decimal (0..4096)

Default
No default

### ATTRIBUTE GsmBc V42bis maximumStringSize (p2)

Access
Read: All
Write: Illegal

Description
This attribute indicates the maximum number of characters allowed in a string represented by a codeword negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P2 (maximum string size). The value used for XID negotiations can be

provisioned by component *GsmIwfV42bisProv* attribute *maximumStringSize*.

Values: Decimal (6..250)

Default: No default

### ATTRIBUTE GsmBc V42bis lastDecodeError (lastDecodeErr)

Access: Read: All
Write: Illegal

Description: This attribute indicates last error found by the decoder. Error values are:
***none***, No errors found.
***badStepup***, Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size).
***codewordEqC1***, Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry).
***emptyCodeword***, Receipt of a codeword representing an empty dictionary entry.
***reservedCommand***, Receipt of a reserved command code.
***generalError***, Receipt of any other error.
The action taken by V.42bis on detecting an error is provisioned by component *GsmIwfV42bis* attribute *actionOnError*.

Values:
none
badStepup
codewordEqC1
emptyCodeword
reservedCommand
generalError

Default: none

### ATTRIBUTE GsmBc V42bis compRatioEncoder

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the

compression ratio achieved by the V.42bis encoder running on the Passport. This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes.

Values: Decimal (0.00..300.00)

Default: No default

### ATTRIBUTE GsmBc V42bis compRatioDecoder

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the compression ratio achieved by the V.42bis encoder at the mobile or Public Switched Telephone Network (PSTN). This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes.

Values: Decimal (0.00..300.00)

Default: No default

### GROUP GsmBc V42bis Statistics (Stats)

Properties: Operational

Description: This group contains operational attributes that measure the performance of *V.42bis*.

### ATTRIBUTE GsmBc V42bis modeChangesEncode (modeChgEncode)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of mode changes (from transparent to compressed or from compressed to transparent) by the encoder. The counter wraps when it exceeds the maximum value.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE GsmBc V42bis modeChangesDecode (modeChgDecode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of mode changes (from transparent to compressed or from compressed to transparent) by the decoder. The mode changes are determined by the encoder at the mobile or the Public Switched Telephone Network (PSTN). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42bis resetsEncode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of resets sent by the encoder. A reset is a command code sent by the encoder to force dictionary reinitialization. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42bis resetsDecode

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of resets received by the decoder. A reset is a command code sent by the encoder to force dictionary reinitialization. The resets of the decoder are determined by the encoder at the mobile or Public Switched Telephone Network (PSTN). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42bis reInitializations (reInit)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times V.42bis is reinitialized because of a destructive break (a destructive break is a break that causes data to be discarded) occurring on the error-corrected connection initiatated by either the mobile or Public Switched Telephone Network (PSTN). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc V42bis errorsInDecode (errDecode)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of errors found by the decoder. The errors could be any of the following:<br>1.Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size).<br>2. Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry).<br>3. Receipt of a codeword representing an empty dictionary entry.<br>4. Receipt of a reserved command code.<br>5. Receipt of any other error.<br>The counter wraps when it exceeds the maximum value.<br>The action taken by V.42bis on detecting any of these errors is provisioned by component *GsmIwfV42bis* attribute *actionOnError*. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT GsmBc Layer2RelayCop (L2RCop)

| | |
|---|---|
| Groups | "GROUP GsmBc L2RCop Operational (Oper)"<br>"GROUP GsmBc L2RCop Statistics (Stats)" |

| | |
|---|---|
| Scope | Application |
| Description | *GsmBc/<trunkGrp>,<cic> Layer2RelayCop*<br>This component represents the group of measurements for the GSM Layer 2 Relay Character Oriented Protocol (L2RCOP) established for a GSM IWF call (on the mobile station to the IWF link) on this particular *GsmIwfBearerChannel*.<br>Note that this component is present only if the current (or most recent call) involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

## GROUP GsmBc L2RCop Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of *L2RCop*. |

## ATTRIBUTE GsmBc L2RCop flowControlStateTx (flowControlTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether flow control is active in the transmit direction (towards the network side) for Layer2 Relay. |
| Values | active<br>inactive |
| Default | inactive |

## ATTRIBUTE GsmBc L2RCop flowControlStateRx (flowControlRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether flow control is active in the receive direction (towards the mobile) for Layer2 Relay. |
| Values | active<br>inactive |

| | |
|---|---|
| Default | inactive |

### GROUP GsmBc L2RCop Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of *L2RCop*. |

### ATTRIBUTE GsmBc L2RCop bytesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of data bytes relayed by Layer2 Relay in the transmit direction (towards the network). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc L2RCop bytesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of data bytes relayed by Layer2 Relay in the receive direction (towards the mobile). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc L2RCop breakCountRx (breakRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of breaks received from the mobile. A break received from the mobile results in the V.42bis function being reset and the break condition forwarded to the network. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE GsmBc L2RCop breakCountTx (breakTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of breaks transmitted to the mobile (a break was received from the network). A break received from the network results in the V.42bis function being reset and the break condition forwarded to the mobile. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT GsmBc UpperRelay

| | |
|---|---|
| Groups | "GROUP GsmBc UpperRelay Operational (Oper)"<br>"GROUP GsmBc UpperRelay Statistics (Stats)" |
| Scope | Application |
| Description | *GsmBc/<trunkGrp>,<cic> UpperRelay*<br>This component represents the group of measurements for the Upper Relay function established for a GSM IWF call (internally between the two *GsmIwfBearerChannel*s involved in a call) from this particular *GsmIwfBearerChannel* perspective.<br>Note that this component is present only if the current (or most recent call) involved this protocol. |
| Common Verbs | Help<br>List<br>Display |

### GROUP GsmBc UpperRelay Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of the *UpperRelay.* |

### ATTRIBUTE GsmBc UpperRelay bufferSize

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the size of the transmit and receive flow control buffers. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE GsmBc UpperRelay flowControlStateTx (flowControlTx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the transmit flow control is active or not. |
| Values | active<br>inactive |
| Default | inactive |

### ATTRIBUTE GsmBc UpperRelay flowControlStateRx (flowControlRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates whether the receive flow control is active or not. |
| Values | active<br>inactive |
| Default | inactive |

### GROUP GsmBc UpperRelay Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of the *UpperRelay*. |

### ATTRIBUTE GsmBc UpperRelay framesTx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames that are sent in the transmit direction. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc UpperRelay framesRx

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of frames that are sent in the receive direction. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmBc UpperRelay unacknowledgedFrames (unackFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of current frames sent that have not been acknowledged. |
| Values | Decimal (0..4294967295) |
| Default | No default |

# COMPONENT GsmIwfCallServer (GsmCs)

| | |
|---|---|
| Instance | Decimal (1..8191) |
| Groups | "GROUP GsmCs Provisioned (Prov)"<br>"GROUP GsmCs CustomerIdentifierData (CidData)"<br>"GROUP GsmCs OsiState (State)"<br>"GROUP GsmCs Statistics (Stats)" |
| Scope | Application |
| Description | *GsmCs/<trunkGrp>*<br>The *GsmIwfCallServer* component represents an instance of a call manager for Global System for Mobile communications (GSM) InterWorking Function (IWF) calls on this node. The *GsmIwfCallServer* provides a mechanism to segregate call resources (*GsmIwfBearerChannels)* and maintenance activities for the *GsmIwfBearerChannels* associated with that *GsmIwfCallServer.* The instance value *trunkGrp* is an external identifier for the trunk group configured at the Mobile Services-switching Center (MSC) connected to this node and associated with this *GsmIwfCallServer* instance.<br><br>This component is specific to the ***gsmIwfCallServer*** feature of the ***wirelessIwf*** application. Refer to NTP 411-5221-520 “GPP Interworking Function Data Guide” for details on its usage. |

| Opt. Subcomp. | "COMPONENT GsmCs LogicalProcessor (Lp)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP GsmCs Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains general provisioning data for the *GsmIwfCallServer* that does not fit within other provisioning groups. |

## ATTRIBUTE GsmCs commentText

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | Use of this attribute is at the discretion of the system administrator. Typically, this attribute specifies the name of the trunk group at the Mobile Services-switching Center (MSC) configured for this *GsmIwfCallServer* plus any other commentary information. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE GsmCs mscIpAddress (ipAddr)

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This attribute specifies the Internetwork Protocol (IP) Address of the Mobile Services-switching Center (MSC) Control Module (CM) that is permitted to set up GSM InterWorking Function (IWF) calls using this *GsmIwfCallServer*. This address must be specified in order for this *GsmIwfCallServer* to provide service. If call setups are attempted from an MSC which does not have this address, those calls are rejected.<br>The *callsRequested* statistic of this *GsmIwfCallServer* is incremented, but the *callsSetup* statistic of this *GsmIwfCallServer* is not, when call setup attempts are rejected. Also, at the MSC, appropriate call failure logs are generated. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE GsmCs virtualRouterName (vr)

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Criticality | Component |
| Description | This attribute specifies the *VirtualRouter* that this *GsmIwfCallServer* uses to transmit signaling messages to and receive signaling messages from the Mobile Services-switching Center (MSC) that utilizes this *GsmIwfCallServer*. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE GsmCs voiceLaw (encoding)

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This attribute specifies the voice law to be established for the IWF to Public Switched Telephone Network (PSTN) modem link for calls established by this *GsmIwfCallServer*. Valid values are: |

***aLaw***, a protocol for encoding voice-band audio, Pulse Code Modulation (PCM).
***muLaw***, a protocol for encoding voice-band audio, PCM.

Note that this value must match the voice law used at the Mobile Services-switching Center (MSC) connected to this *GsmIwfCallServer.*

Values: aLaw, muLaw

Default: aLaw

## GROUP GsmCs CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

## ATTRIBUTE GsmCs customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default 0

### GROUP GsmCs OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE GsmCs adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

### ATTRIBUTE GsmCs operationalState (osiOper)

Access Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE GsmCs usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP GsmCs Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes that measure the performance of this particular *GsmIwfCallServer.* |

### ATTRIBUTE GsmCs currentCalls (currCall)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of active calls currently serviced by this particular *GsmIwfCallServer.* |
| Values | Decimal (0..2047) |
| Default | 0 |

### ATTRIBUTE GsmCs callsRequested (callsReq)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IWF call setup requests received at this particular *GsmIwfCallServer* from the Mobile Services-switching Center (MSC). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmCs callsSetup (callsSet)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IWF calls successfully setup by this particular *GsmIwfCallServer.* A call is considered setup when the IWF-Setup-Request message is received, indicating a request for a data communications service, and the IWF has successfully allocated the necessary resources to fulfill the request. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmCs callsActivated (callsAct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the number of IWF calls successfully activated by this particular *GsmIwfCallServer.* A call is considered activated when the IWF receives an IWF-Activate-Request, indicating that the call parties are connected and that data communications must begin. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmCs callsReleasedNormal (callsRlsdNor)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IWF calls that have completed successfully on this particular *GsmIwfCallServer.* The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmCs callsReleasedAbnormal (callsRlsdAbnor)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of IWF calls that have been released due to error conditions at this particular *GsmIwfCallServer* or one if its *GsmIwfBearerChannel*s. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmCs channelConfigChanges (chanConfig)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of channel configuration requests from the Mobile-services Switching Center (MSC) that have been received at this *GsmIwfCallServer* and have resulted in |

| | |
|---|---|
| | successful responses. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmCs channelModeModifyRequests (cmm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of channel mode modify requests that have been generated by fax calls serviced by this particular *GsmIwfCallServer*. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmCs statusMessagesRx (statusMsgRx)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of status messages received from the Mobile Services-switching Center (MSC). The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE GsmCs erroredMipFrames (errMipFrm)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of MSC/IWF Interface Protocol (MIP) messages received from the Mobile Services-switching Center (MSC) that were in error. The counter wraps when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

## COMPONENT GsmCs RadioLinkProtocol (Rlp)

| | |
|---|---|
| Instance | half6kRate (half6k)<br>full6kRate (full6k)<br>full12kRate (full12k)<br>full14k5Rate (full14k5) |
| Groups | "GROUP GsmCs Rlp Provisioned (Prov)" |
| Scope | Application |
| Description | *GsmCs/<trunkGrp> RadioLinkProtocol/<radio-channel-type>*<br>This component represents a group of Radio Link Protocol (RLP) instances, indexed by radio channel type. Valid radio channel types are:<br><br>***half6kRate***, Half rate channel at 6 kbit/s.<br>***full6kRate***, Full rate channel at 6 kbit/s.<br>***full12kRate***, Full rate channel at 12 kbit/s.<br>***full14k5Rate***, Full rate channel at 14.5 kbit/s.<br><br>Many RLP attributes are dependent on the frame rate and frame size, that is dictated by the radio channel type. When a *GsmIwfCallServer* is added, a *RadioLinkProtocol* instance is added automatically for each possible instance value. The attributes are set to default values, dependent on the radio channel type of the component instance. |
| Common Verbs | Help<br>List<br>Display |

## GROUP GsmCs Rlp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the Radio Link Protocol (RLP) parameters used for the call set up by this particular *GsmIwfCallServer*. Changes to these attributes do not effect existing calls. |

### ATTRIBUTE GsmCs Rlp highestVersion (highVer)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the highest version of the Radio Link Protocol (RLP) protocol supported on this *GsmIwfCallServer.*<br>Valid values are:<br>***0***, Single-link basic version.<br>***1***, Single-link extended version (for example, extended by data compression).<br>During the Exchange Information (XID) negotiation at the start of the call, both RLP entities (mobile station and IWF) can agree to use a particular RLP version. The IWF attempts to negotiate the value specified by this attribute.<br>Note that if V.42bis data compression is be established between the mobile station and IWF, both entities must agree to use version 1 (or higher).<br>The default value for *highestVersion* is 1 to enable support for V.42bis data compression. The negotiated value can be viewed in the component *GsmIwfRlpOp* attribute *highestVersion*.<br>Changes to this attribute do not effect existing calls. |
| Values | Decimal (0..1) |
| Default | 1 |

### ATTRIBUTE GsmCs Rlp iwfToMsWindowSize (iwfMsWs)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum number of sequentially numbered Information (I) frames that may be outstanding (that is, unacknowledged) at any given time from the IWF to the mobile station. GSM specification 4.22 defines the range as 0 to 61.<br>During the Exchange Information (XID) negotiation, both Radio Link Protocol (RLP) entities (mobile station and IWF) can agree to use a specific window size. The IWF attempts to negotiate to the value specified by this attribute.<br>The negotiated value can be viewed in the component *GsmIwfRlpOp* attribute *iwfToMsWindowSize.*<br>Changes to this attribute do not effect existing calls. |

| | |
|---|---|
| Values | Decimal (0..61) |
| Default | 61 |

### ATTRIBUTE GsmCs Rlp msToIwfWindowSize (msIwfWs)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum number of sequentially numbered Information (I) frames that may be outstanding (that is, unacknowledged) at any given time from the mobile station to IWF.<br>GSM specification 4.22 defines the range as 0-61.<br>During the Exchange Information (XID) negotiation, both Radio Link Protocol (RLP) entities (mobile station and IWF) can agree to use a specific window size. The IWF attempts to negotiate to the value specified by this attribute.<br>The negotiated value can be viewed in the component GsmIwf*RlpOp* attribute *msToIwfWindowSize*. Changes to this attribute do not effect existing calls. |
| Values | Decimal (0..61) |
| Default | 61 |

### ATTRIBUTE GsmCs Rlp t1AckTimer (t1)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the time in milliseconds within which an acknowledgment of a sent frame must be received. Once this timer expires, the transmitting Radio Link Protocol (RLP) entity shall assume that the frame was lost.<br>During the Exchange Information (XID) negotiation, both RLP entities (mobile station and IWF) can agree to use specific value for this timer (T1). The IWF attempts to negotiate to the value specified by this attribute.<br>The default value for *t1AckTimer* is 520 msec for the ***full14k5Rate*** instance of this component, 480 msec for ***full12kRate,*** 540 msec for ***full6kRate***, and 780 msec for ***half6kRate***. The negotiated value can be viewed in the |

component *GsmIwfRlpOp* attribute *t1AckTimer*.
Changes to this attribute do not effect existing calls.

Values: Decimal (380..1020)

Units: msec

Default: No default

### ATTRIBUTE GsmCs Rlp t2AckDelayTimer (t2)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum time in milliseconds the receiving Radio Link Protocol (RLP) entity shall wait before sending an acknowledgment for a received information frame. During the Exchange Information (XID) negotiation, both RLP entities (mobile station and IWF) can agree to use specific value for this timer (T2). The IWF attempts to negotiate to the value specified by this attribute.
The negotiated value can be viewed in the component *GsmIwfRlpOp* attribute *t2AckDelayTimer.*
Changes to this attribute do not effect existing calls.

Values: Decimal (10..79)

Units: msec

Default: 50

### ATTRIBUTE GsmCs Rlp n2RetransmitCount (n2)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum number of times a Radio Link Protocol (RLP) entity shall retransmit an individual frame following the expiry of timer T1.

During the Exchange Information (XID) negotiation, both RLP entities (mobile station and InterWorking Function (IWF)) can agree to use specific value for N2 (Retransmit Count). The IWF attempts to negotiate to the value specified by this attribute.
The negotiated value can be viewed in the component

| | |
|---|---|
| | *GsmIwfRlpOp* attribute *n2RetransmitCount*.<br>Changes to this attribute do not effect existing calls. |
| Values | Decimal (1..255) |
| Default | 6 |

### COMPONENT GsmCs Fax

| | |
|---|---|
| Groups | "GROUP GsmCs Fax Provisioned (Prov)" |
| Scope | Application |
| Description | *GsmCs/<trunkGrp> Fax*<br>This component represents a group of fax provisioning attributes. These attributes specify various default settings for aspects of the fax protocol, which may be used for a GSM IWF call. |
| Common Verbs | Help<br>List<br>Display |

### GROUP GsmCs Fax Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the fascimile protocol (T.30 and GSM 03.45) for this particular *GsmIwfCallServer*. Changes to these attributes do not effect existing calls. |

### ATTRIBUTE GsmCs Fax t1CalledToneTimer (t1)

| | |
|---|---|
| Access | Read: All<br>Write: Configuration |
| Description | This attribute specifies the delay to generate a Called (CED) tone at the IWF after the called station is connected to the line for mobile terminated calls. Changes to this attribute do not effect existing calls. |
| Values | Decimal (1.50..3.00) |
| Units | seconds |

| | |
|---|---|
| Default | 1.80 |

## COMPONENT GsmCs V42

| | |
|---|---|
| Groups | "GROUP GsmCs V42 Provisioned (Prov)" |
| Scope | Application |
| Description | *GsmCs/<trunkGrp> V42*<br>This component represents a group of ITU-T V.42 error correcting data link protocol provisioning attributes. These attributes specify various default settings for aspects of the V.42 protocol, that may be used for a GSM IWF call for the IWF to Public Switched Telephone Network (PSTN) modem link. |
| Common Verbs | Help<br>List<br>Display |

## GROUP GsmCs V42 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the V.42 protocol for this particular *GsmIwfCallServer*. Changes to these attributes do not effect existing calls. |

## ATTRIBUTE GsmCs V42 t400DetectTimer (t400)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum amount of time that the IWF waits for an Originator Detection Pattern (ODP) or Answerer Detection Pattern (ADP). ODP/ADP is a series of special bit patterns used during the call setup procedures.<br>If the IWF is the Originator of the call, it starts sending ODP patterns and waits for an ADP for the duration of T400 milliseconds from the answerer at call setup time.<br>If the IWF is the Answerer of the call, it waits for an ODP for T400 seconds from the originator and if it receives during that time it sends an ADP pattern to the originator at the call setup time. Since both sides operate with different values of T400 |

timer, a higher value increases the chance of a successful call setup.
Changes to this attribute do not effect existing calls.

Values: Decimal (0.75..2.54)

Units: seconds

Default: 2.00

### ATTRIBUTE GsmCs V42 t401AckTimer (t401)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum amount of time that the IWF waits for an acknowledgment before retransmitting a frame. Since information about the T401 timer is not carried in the Exchange Identification (XID) negotiations at call setup time, both sides operate with different timer values. The value for T401 depends on many factors, such as propagation delay or frame processing time. A frame is retransmitted up to N400 times if the timer T401 expires before an acknowledgment for a frame is actually received. The performance of the data link layer can be impacted by the value of this timer as retransmissions of frames occur on expiry of timer T401.
Changes to this attribute do not effect existing calls.

Values: Decimal (0.50..9.00)

Units: seconds

Default: 4.00

### ATTRIBUTE GsmCs V42 t402AckDelayTimer (t402)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum amount of time that the IWF may wait following the receipt of any frame requiring a reply before it initiates transmission of an appropriate reply in order to ensure that the reply frame is received by the remote error-correcting entity prior to expiration of the T401 timer of the remote error-correcting entity. Since information about the T402

timer is not carried in the Exchange Identification (XID) negotiations at call setup, both sides operate with different timer values. If this timer expires, then the reply that would have been returned prior to its expiration is not sent. The performance of the data link layer can be impacted by the value of this timer as retransmissions of frames occur on expiry of timer T401. For better performance, a value of *t402AckDelayTimer* (T402) equal to half the value of *t401AckTimer* (T401) is recommended. Changes to this attribute do not effect existing calls.

Values: Decimal (0.25..4.50)

Units: seconds

Default: 2.00

### ATTRIBUTE GsmCs V42 t403IdleProbeTimer (t403)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum amount of time that the IWF allows to elapse without frames being exchanged. The link is permitted to remain idle with no frames being exchanged on the data link. Upon expiry of this timer, the IWF polls its peer for status. Since information about the T403 timer is not carried in the Exchange Identification (XID) negotiations at call setup time, both sides operate with different timer values.
Changes to this attribute do not effect existing calls.

Values: Decimal (30..90)

Units: seconds

Default: 60

### ATTRIBUTE GsmCs V42 txN401FrameSize (txN401)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum number of octets that can be carried in the information field of an Information (I) frame, Exchange Identification (XID) frame, and a Unnumbered Information (UI) frame from the IWF to the remote entity. The

default value is 128 octets, and no XID negotiations required for *txN401FrameSize*. If the value for *txN401FrameSize* value is set to other than 128 octets, then XID frames are exchanged to negotiate a value. The value provided for *txN401FrameSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 128 is specified, then the IWF negotiates or attempts to negotiate a value between the 128 (as a minimum) and the given value (as a maximum). If a value less than 128 is specified, then the IWF attempts to negotiate a value between the given value (as a minimum) and 128 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to 128 is recommended. The negotiated value can be viewed in the component *GsmIwfV42Op* attribute *txN401FrameSize*. Changes to this attribute do not effect existing calls.

Values: Decimal (1..255)

Units: octets

Default: 128

### ATTRIBUTE GsmCs V42 rxN401FrameSize (rxN401)

Access: Read: All
Write: Service

Description: This attribute specifies the maximum number of octets that can be carried in the information field of an Information (I) frame, Exchange Identification (XID) frame, and a Unnumbered Information (UI) frame from the remote entity to the IWF. The default value is 128 octets, and no XID negotiations are required for *rxN401FrameSize*. If the value set for *rxN401FrameSize* is other than 128, XID frames are exchanged to negotiate a value. The value provided for *rxN401FrameSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 128 is specified, then the IWF attempts to negotiate for a value between 128 (as a minimum) and the given value (as a maximum). If a value less than 128 value is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 128 (as a maximum). Any value can be specified

| | |
|---|---|
| | as long as it is within the provisionable limits. However, a value equal to or close to the default is recommended.<br>The negotiated value can be viewed in the component *GsmIwfV42Op* attribute *rxN401FrameSize*. Changes to this attribute do not effect existing calls. |
| Values | Decimal (1..255) |
| Units | octets |
| Default | 128 |

### ATTRIBUTE GsmCs V42 txKwindowSize (txK)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the IWF to the remote entity. The default value is 15 frames, and if this value is used then no Exchange Identification (XID) negotiations are required for *txKwindowSize*. If the value set for *txKwindowSize* is other than 15, then XID frames are exchanged to negotiate a value. The value provided for *txKwindowSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 15 is specified, then the IWF attempts to negotiate a value between 15 (as a minimum) and the given value (as a maximum). If a value less than 15 is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 15 (as a maximum). Any value can be specified as long at it is within the provisionable limits. However, a value equal to or close to the default is recommended.<br>The negotiated value can be viewed in the component *GsmIwfV42Op* attribute *txKwindowSize*. Changes to this attribute do not effect existing calls. |
| Values | Decimal (1..255) |
| Default | 15 |

### ATTRIBUTE GsmCs V42 rxKwindowSize (rxK)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the remote entity to the IWF. The default value is 15 frames, and if this value is used then no Exchange Identification (XID) negotiations are required for *rxKwindowSize*. If the value set for rxKwindowSize is other than 15, then XID frames are exchanged to negotiate a value. The value provided for *rxKwindowSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 15 is specified, then the IWF attempts to negotiate a value between 15 (as a minimum) and the given value (as a maximum). If a value less than 15 is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 15 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to the default is recommended.<br>The negotiated value can be viewed in the component *GsmIwfV42Op* attribute *rxKwindowSize*. Changes to this attribute do not effect existing calls. |
| Values | Decimal (1..255) |
| Default | 15 |

### ATTRIBUTE GsmCs V42 n400RetransLimit (n400)

| | |
|---|---|
| Access | Read: All<br>Write: Service |
| Description | This attribute specifies the maximum number of times the IWF retransmits a frame upon expiry of *t401AckTimer* before appropriate recovery action is taken. Information about N400 (Retransmission Limit) is not carried in the Exchange Identification (XID) negotiation at call setup time so both sides operate with different N400 values.<br>Changes to this attribute do not effect existing calls. |
| Values | Decimal (0..255) |

Default 10

## COMPONENT GsmCs V42bis

Groups "GROUP GsmCs V42bis Provisioned (Prov)"

Scope Application

Description *GsmCs/<trunkGrp> V42bis*
This component represents a group of ITU-T V.42bis data compression protocol provisioning attributes. These attributes specify various default settings for aspects of the V.42bis protocol, which may be used in a GSM IWF call on the mobile station to IWF link and/or the IWF to Public Switched Telephone Network (PSTN) modem link.

Common Verbs
Help
List
Display

## GROUP GsmCs V42bis Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes for the V.42bis data compression protocol parameters used for the calls set up by this particular *GsmIwfCallServer*. Changes to these attributes do not effect existing calls.

## ATTRIBUTE GsmCs V42bis compressionDirection (p0)

Access Read: All
Write: Service

Description This attribute specifies the V.42bis data compression direction to be supported. The value for compression direction is negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P0 (compression direction).
During XID negotiation of parameter P0, both sides (IWF and mobile or IWF and Public Switched Telephone Network (PSTN)) agree on the compression direction.
Valid values are:

***none***, No compression is present.
***encode***, The data sent by the IWF to the other entity is compressed.
***decode***, The data received by the IWF from the other entity is compressed.
***both***, The data sent and received by the IWF is compressed.
The negotiated value can be viewed in the component GsmIwf*V42bisOp* attribute *compressionDirection*. Changes to this attribute do not effect existing calls.

Values
none
encode
decode
both

Default
both

### ATTRIBUTE GsmCs V42bis maximumCodewords (p1)

Access
Read: All
Write: Service

Description
This attribute specifies the maximum number of V.42bis codewords the IWF supports. A codeword is a binary number that represents a string of characters in compressed form. V.42bis keeps a dictionary of codewords for each compression direction. During Exchange Identification (XID) negotiation of parameter P1 (number of codewords), both sides (IWF and mobile or IWF and Public Switched Telephone Network (PSTN)) agree on the total number of codewords in the dictionaries. Changes to this attribute impact the compression ratio for the encoder (component *GsmV42BisOp* attribute *compRatioEncoder*). Changes also impact the amount of memory used (more memory is used when increasing the attribute). The gain in performance obtained from the selection of a larger dictionary may be offset by the larger codeword size needed, and for certain types of data, better performance may be obtained by using a smaller dictionary.
The negotiated value can be viewed in the component GsmIwf*V42bisOp* attribute *maximumCodewords* . Changes to this attribute do not effect existing calls.

Values
Decimal (512; 1024; 2048; 4096)

Default 2048

### ATTRIBUTE GsmCs V42bis maximumStringSize (p2)

Access
Read: All
Write: Service

Description
This attribute specifies the maximum number of characters allowed in a string represented by a codeword that the IWF supports. Each codeword in a V.42bis dictionary represents a string of characters. During Exchange Identification (XID) negotiation of parameter P2 (maximum string size), both sides (IWF and mobile or IWF and Public Switched Telephone Network (PSTN)) agree on the maximum string length to be used in the dictionaries. Changes to this attribute impact the compression ratio for the encoder (component *GsmIwfV42bisOp* attribute *compRatioEncoder*).
The negotiated value can be viewed in the component GsmIwf*V42bisOp* attribute *maximumStringSize*. Changes to this attribute do not effect existing calls.

Values Decimal (6..250)

Default 20

### ATTRIBUTE GsmCs V42bis actionOnError (actOnErr)

Access
Read: All
Write: Service

Description
This attribute specifies whether or not V.42bis takes down the call or resets the link when any of the following errors occur:
1.Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size).
2. Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry).
3. Receipt of a codeword representing an empty dictionary entry.
4. Receipt of a reserved command code.
5. Receipt of any other error.
If the value is ***resetLink***, the error corrected connection and V.42bis dictionaries are reset. Some data is lost but the call

continues. If the value is ***takeDownCall***, the call is taken down. Changes to this attribute do not effect existing calls.

Values
resetLink
takeDownCall

Default
resetLink

## COMPONENT GsmCs LogicalProcessor (Lp)

Instance
Decimal (0..15)

Groups
"GROUP GsmCs Lp Operational (Oper)"

Scope
Application

Description
*GsmCs/<trunkGrp> LogicalProcessor/n*
The *LogicalProcessor* component represents a logical processor that may be linked to this *GsmIwfCallServer.* A *GsmIwfBearerChannel* is indirectly linked to this *LogicalProcessor* by way of the *Framer component.* This component must be added to the *GsmIwfCallServer* (and the change activated) prior to adding the *GsmIwfBearerChannel*s.

Common Verbs
Help
List
Display
Add
DELete

## GROUP GsmCs Lp Operational (Oper)

Properties
Operational

Description
This group contains operational attributes pertaining to information about *GsmIwfBearerChannels* and logical processors associated with a *GsmIwfCallServer* from a high-level view.

## ATTRIBUTE GsmCs Lp configuredBearerChannels (configBc)

Access
Read: All
Write: Illegal

| | |
|---|---|
| Description | This attribute indicates the number of *GsmIwfBearerChannel* components provisioned for the Logical Processor represented by this component. |
| Values | Decimal (0..124) |
| Default | No default |

### ATTRIBUTE GsmCs Lp activeCalls (actCalls)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the number of *GsmIwfBearerChannel* components currently active on this *LogicalProcessor*. |
| Values | Decimal (0..124) |
| Default | No default |

### ATTRIBUTE GsmCs Lp assignedCapacity (assgnCap)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates what percentage (0 to 100%) of a given *LogicalProcessor* has been reserved for the data calls which are currently active. When the *assignedCapacity* reaches 100%, no new calls are established on the given *LogicalProcessor*. During the life of a call, the compute requirements will vary. The compute capacity required for a given call type depends on the type of call established including such factors as connection type, data compression, user rate, error correction, flow control; therefore, at call establishment the compute capacity is added to the *assignedCapacity* for a *LogicalProcessor*. When the call is released, it's compute capacity is subtracted from the assigned capacity for the Lp.The *GsmIwfCallServer* uses this information to balance the distribution of data calls across the logical processors. |
| Values | Decimal (0..100) |
| Default | No default |

## ATTRIBUTE GsmCs Lp modemsSupported (modemSup)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates if modems are supported with this *LogicalProcessor.* |
| Values | yes<br>no |
| Default | No default |

# COMPONENT HuntGroup (Hg)

| | |
|---|---|
| Instance | Decimal (1..65535) |
| Groups | "GROUP Hg CustomerIdentifierData (CidData)"<br>"GROUP Hg NsapAddress"<br>"GROUP Hg Provisioned (Prov)"<br>"GROUP Hg OsiState (State)"<br>"GROUP Hg Operational" |
| Scope | Application |
| Description | *HuntGroup/n*<br>The *HuntGroup* component provides a hunt group capability for switched calls (SVCs).<br>A hunt group is a single DNA used to represent a group of service DNAs. A customer calling the DNA of the hunt group receives the benefits of higher capacity and availability as calls are spread across several lines. |
| Subcomponents | "COMPONENT Hg HuntGroupMember (HgM)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Hg CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Hg customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Hg NsapAddress

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes common to all NSAP format addresses. |

### ATTRIBUTE Hg address

| | |
|---|---|
| Access | Read and write |
| Description | The *address* attribute specifies the numbering plan and digits which form a unique DNA identifier of the hunt group. The format of the *address* attribute is <numberingPlan>.<digits> |

| | |
|---|---|
| | where numbering plan is x for X.121 and e for E.164. An example X.121 address is x.12345678. |
| Values | String (1..17, NativeAddressWith15DigitX121) |
| Default | No default |

### GROUP Hg Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | The *Provisioned* group contains the provisioned attributes of the hunt group. |

### ATTRIBUTE Hg logicalProcessor (lp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the logical processor on which the hunt group process will execute. The *Lp/n Eng Hgs* component contains statistics for all hunt groups on the LP. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Hg selectionPolicy

| | |
|---|---|
| Access | Read and write |
| Description | The *selectionPolicy* attribute specifies the algorithm used to select a hunt group member.<br><br>A value of ***startFromZero*** means that on a new call, the first available member starting from the member with the lowest instance value is selected. Subsequent hunts for the same call select the first available member starting from the previously chosen member. This algorithm is used when it is desirable to have the first member receive the majority of the calls and subsequent members only receive calls in overflow situations.<br><br>A value of ***rotary*** means that on a new call, the first available member is selected starting from the member which received the |

last new call. Subsequent hunts for the same call select the first available member starting from the previously chosen member. This algorithm is used when it is desirable to loadspread the calls equally across the members.

A value of ***mostAvailable*** means that on a new call, the most available member is selected based on the availability information received from the member. Subsequent hunts for the same call select the most available member starting from the previously chosen member. This algorithm is used when it is desirable to send each call to the member which has the highest probability of connecting it.

Values: startFromZero
rotary
mostAvailable

Default: mostAvailable

### ATTRIBUTE Hg maxHuntAttempts

Access: Read and write

Description: The *maxHuntAttempts* attribute specifies the maximum attempts allowed to hunt the call. Hunting ceases if either this maximum is exceeded or the member list is exhausted.

Values: Decimal (1..63)

Default: 63

### ATTRIBUTE Hg appendSuffixDigits

Access: Read and write

Description: The *appendSuffixDigits* attribute specifies how suffix called address digits are handled. Suffix called address digits are any trailing digits, signalled in a call, beyond the provisioned hunt group *address*. If this attribute is set to ***yes***, suffix digits are appended to the member *address* before the call is forwarded to the member. If it is set to ***no***, suffix digits are not appended to the member *address*.

| | |
|---|---|
| Values | no<br>yes |
| Default | yes |

### GROUP Hg OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Hg adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Hg operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Hg usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Hg Operational

| | |
|---|---|
| Properties | Operational |
| Description | The *Operational* group contains the operational attributes of the hunt group. |

## ATTRIBUTE Hg huntAttempts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of hunt attempts made by the hunt group. The count includes both initial and subsequent hunt attempts. This count is contained within the *huntAttempts* attribute of the *Lp/n Eng Hgs* component. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Hg failedCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of calls which could not be connected by any of the hunt group members. This could occur if the hunt group is locked or has exhausted its member list. If a call cannot be connected by the hunt group it is sent to call redirection. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Hg initialHuntAttempts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of new (non-hunted) calls received by the hunt group which are forwarded to a member. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Hg availabilityUpdates

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of availability update packets received by the hunt group from its members. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Hg maxAddrLenExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times a member could not be selected to receive a call with suffix address digits because its DNA length would exceed the maximum of 14 digits with the suffix digits appended. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Hg badPackets

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of unrecognizable packets received by the hunt group and discarded. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Hg HuntGroupMember (HgM)

| | |
|---|---|
| Instance | Decimal (1..63) |
| Groups | "GROUP Hg HgM Provisioned (Prov)"<br>"GROUP Hg HgM OsiState (State)"<br>"GROUP Hg HgM Operational" |

| | |
|---|---|
| Scope | Application |
| Description | *Hg/n HuntGroupMember/n*<br>The *HuntGroupMember* component defines an instance of a hunt group member. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Hg HgM Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | The *Provisioned* group contains the provisioned attributes of the hunt group member. |

### ATTRIBUTE Hg HgM address

| | |
|---|---|
| Access | Read and write |
| Description | The *address* attribute specifies the numbering plan and digits which form a unique DNA identifier of the hunt group member. The format of the *address* attribute is <numberingPlan>.<digits> where numbering plan is x for X.121 and e for E.164. An example X.121 address is x.12345678. |
| Values | String (1..17, NativeAddressWith15DigitX121) |
| Default | No default |

### GROUP Hg HgM OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component |

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Hg HgM adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Hg HgM operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Hg HgM usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Hg HgM Operational

Properties
Operational

Description
The *Operational* group defines operational attributes associated with the *HuntGroupMember* component.

### ATTRIBUTE Hg HgM availability

Access
Read and write

Description
This attribute indicates the current availability of the member. The higher the value, the more available the member is perceived to be. A value of ***0*** indicates the member is unavailable.

A member must be considered ‘available’ by the hunt group in

order to receive a call, regardless of the selection policy in use. The hunt group members report whether or not they are available to receive calls to the hunt group. Some services base their availability on unused logical channels, others on bandwidth or memory capacity.

During initialization, the hunt group assumes all of its members are equally available and sets their *availability* value to the maximum of ***4095***. Similarly, a new hunt group member added to an existing hunt group has its *availability* value initialized to ***4095***. This ensures that members which have not reported their availability to the hunt group are tried in order to trigger the member to report its true availability.

The *availability* of a member can change in the following ways:
- Hunt group members can report their availability to the hunt group using a DPRS availability packet.
- A network operator can temporarily change the value by the *Set* command. This change remains in effect until changed again by any of these ways.
- The hunt group resets a member's *availability* to the maximum of ***4095*** if it has been ***0*** for at least 2.5 hours. This ensures that 'lost' availability information does not prevent a member from returning to service.

Values: Decimal (0..4095)

Default: 4095

### ATTRIBUTE Hg HgM availabilityUpdates

Access: Read only

Description: This attribute counts the number of availability update packets received by the hunt group member. This counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Hg HgM callsRefused

Access: Read only

| | |
|---|---|
| Description | This attribute counts the number of call packets which were returned to the hunt group by the member because it could not connect the call. If this counter increments frequently, it could indicate a problem with the member's reporting of its availability to the hunt group or an incompatibility in the call options. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

# COMPONENT HlrSimulator (HlrSim)

| | |
|---|---|
| Groups | "GROUP HlrSim Operational (Oper)" |
| Scope | Application |
| Description | *HlrSimulator*<br><br>This component represents a sub-set of the Home Location Register (HLR) functionality. *HlrSim* is used to simulate the HLR to communicate the provisioned subscriber data to the *MapClient* processes (defined in *GprsSubscriberControl*). The *HlrSim* and all its subcomponents are to be used by Nortel Networks personnel. This is not a supported customer HLR tool. |
| Opt. Subcomp. | "COMPONENT HlrSim Subscriber (Subs)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP HlrSim Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes of the *HlrSim* component. |

## ATTRIBUTE HlrSim currentActiveSubscribers (curActSubs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the active subscribers that are currently supported by the HlrSim. |
| Values | Decimal (0..1000) |
| Default | No default |

## ATTRIBUTE HlrSim totalSubscribers (totSubs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the total subscribers that are currently supported by the HlrSim. |
| Values | Decimal (0..1000) |
| Default | No default |

## COMPONENT HlrSim Subscriber (Subs)

| | |
|---|---|
| Instance | BCD (5..15) |
| Scope | Application |
| Description | *HlrSim Subscriber/<imsi>*<br><br>This component represents the GPRS subscription and authentication information of a single subscriber. The instance value is the International Mobile Subscriber Identity (IMSI) for a Mobile Station (MS). |

| | |

## COMPONENT HlrSim Subs AuthenticationQuintet (AuthQuint)

| | |
|---|---|
| Instance | Decimal (1..3) |
| Scope | Application |
| Description | *HlrSim Subs/<imsi> AuthenticationQuintet/n*<br>This component represents the authentication quintets to be used by the UMTS Serving GPRS Support Node (USGSN) for subscriber authentication.<br><br>The *mobileStationType* attribute in the *HlrSim Subscriber* component must be set to ***r99*** when this component is provisioned. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## COMPONENT HlrSim Subs CamelSubscriberInformation (Csi)

| | |
|---|---|
| Scope | Application |

Description *HlrSim Subs/<imsi> CamelSubscriberInformation*

This component represents the CAMEL (Customized Application for Mobile network Enhanced Logic) Subscriber Information (CSI) used by the SGSN or USGSN for a subscriber requiring CAMEL support.

When the SGSN receives Subscriber Information from the HLR, the CSI is included.

Subcomponents "COMPONENT HlrSim Subs Csi TriggerDetectionPoint (Tdp)"

## COMPONENT HlrSim Subs Csi TriggerDetectionPoint (Tdp)

Instance Decimal (1..5)

Scope Application

Description *HlrSim Subs/<imsi> Csi TriggerDetectionPoint/n*

This component represents a CAMEL Trigger Detection Point (TDP). A TDP represents an SGSN event that is detected and acted upon. If a given TDP is set for a subscriber, the occurrence of that event causes a change in state of the CAMEL dialogues being maintained by the SGSN for that subscriber.

### GROUP Htds CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Htds customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Htds IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Htds ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Htds ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Htds OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Htds snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

### GROUP Htds OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Htds adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Htds operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Htds usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Htds availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)

migrating

Default

No default

### ATTRIBUTE Htds proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

| | |
|---|---|
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

### ATTRIBUTE Htds controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Htds alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Htds standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Htds unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

## COMPONENT Htds Framer (Framer)

Groups
"GROUP Htds Framer Provisioned (Prov)"
"GROUP Htds Framer LinkOptions (Link)"
"GROUP Htds Framer OsiState (State)"
"GROUP Htds Framer Statistics (Stats)"
"GROUP Htds Framer LinkUtilization (Util)"

"COLLECTED STATS HdlcTransparentDataService Framer"

Scope
Application

Description
*Htds/n Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Common Verbs
Help
List
Display

## GROUP Htds Framer Provisioned (Prov)

Properties
Provisioned

Description
This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific

provisioning data is contained in other provisionable *Framer* groups.

### ATTRIBUTE Htds Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a hardware component name.<br><br>The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP Htds Framer LinkOptions (Link)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains attributes defining the framing of data on the link interface. |

### ATTRIBUTE Htds Framer dataInversion

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed.<br><br>This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density.<br><br>Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted. |

| | |
|---|---|
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Htds Framer nonOctetData

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute determines whether the data being received has the potential to be non-octet aligned. If it is set to yes, then neither crc checking and generation or abort detection will be functional. |
| Values | no<br>yes |
| Default | no |

### ATTRIBUTE Htds Framer frameCrcType

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute defines the type of CRC used.<br><br>The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used. |
| Values | crc16<br>crc32<br>noCrc |
| Default | crc16 |

### ATTRIBUTE Htds Framer flagsBetweenFrames

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute defines the number of flags that are inserted between frames sent to the link interface. |
| Values | Decimal (1..16) |
| Default | 1 |

### ATTRIBUTE Htds Framer lineSignalTransport (lst)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute determines how modem status lead information on a V35 or V11 port is handled. When the value of the attribute is set to ***on***, line signal changes are passed transparently through the network to the remote end of the connection, where they are passed out on that end's outgoing leads. When the value of the attribute is set to ***off***, line signal changes are not transparently passed through the network. Both ends must be provisioned to support this function for line signal transport to work. It is highly recommended that line signal interpretation is set to "don't care" on the associated vport component (ie. vport attributes *readyLineState* and *dataTransferLineState)*. |
| Values | off<br>on |
| Default | off |

### GROUP Htds Framer OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Htds Framer adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Htds Framer operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Htds Framer usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Htds Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a Framer component. |

### ATTRIBUTE Htds Framer aborts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of aborts received.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Htds Framer crcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with CRC errors.<br>This count wraps to zero after reaching its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Htds Framer lrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames with LRC errors.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Htds Framer nonOctetErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames that were non octet aligned.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Htds Framer overruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received from the link for which overruns occurred.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Htds Framer underruns

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames transmitted to the link for which underruns occurred.<br>This count wraps to zero after reaching its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Htds Framer largeFrmErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames received which were too large. The frame was longer than 8 kbytes or it contained more than the 255 block hardware limit.<br>This count wraps to zero after reaching its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Htds Framer frmToIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames transmitted to the link interface by Framer.<br><br>Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Htds Framer frmFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of frames received from the link interface by Framer. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Htds Framer octetFromIf

| | |
|---|---|
| Access | Read only |
| Description | The number of bytes received from the link interface by Framer. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### GROUP Htds Framer LinkUtilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the link utilization operational data for a Framer component. |

### ATTRIBUTE Htds Framer normPrioLinkUtilToIf

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the utilization of the normal priority data sent to the link as a percentage of the available bandwidth allocated for the service on the link. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Htds Framer normPrioLinkUtilFromIf

| | |
|---|---|
| Access | Read only |
| Description | aThis attribute is the utilization of the normal priority data received from the link as a percentage of the available bandwidth allocated for the service on the link. The utilization is the average for the last minute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

## COLLECTED STATS HdlcTransparentDataService Framer

| | |
|---|---|
| Description | The statistics record generated by the HdlcTransparentDataService Framer component. |

### ATTRIBUTE Htds Framer rxBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes received on the link by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Htds Framer rxFrames

| | |
|---|---|
| Description | This attribute provides the number of frames received on the link interface by the Framer in the last collection interval. |
| Values | Long Integer |

### ATTRIBUTE Htds Framer txBytes

| | |
|---|---|
| Description | This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE Htds Framer txFrames

| | |
|---|---|
| Description | This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link. |
| Values | Long Integer |

### ATTRIBUTE Htds Framer rxTotalLinkUtil

| | |
|---|---|
| Description | This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval. |
| Values | Decimal (0..100) |

## COMPONENT Htds PermanentLogicalConnection (Plc)

| | |
|---|---|
| Groups | "GROUP Htds Plc Provisioning (Prov)" |
| Scope | Application |

| | |
|---|---|
| Description | *Htds/n PLC*<br>This is the description of the PLC Component for the Htds service. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Htds Plc Provisioning (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all provisionable attributes for a permanent logical connection. Note that all of the attributes are valid and provisionable on both ends of a connection. However with the exception of *remoteName*, all operational attributes are derived from the originating end provisioning, which may be either end unless *remoteName* is not provisioned on one end. |

## ATTRIBUTE Htds Plc remoteName (rName)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s remote end point's address in the format of a Passport component name. The syntax of a component is:<br>"em/node type/instance". For an alternative representation of end point's addresses, see *addressToCall* and l*ocalAddress PLC* attributes. When using Passport component name representation, end points are identified using a node name and a service name. As an example, the end point component for a third Htds service on node MoonBase is: "*EM/MoonBase HTDS/3*". If the *remoteName* is provisioned, it must match the name of the remote end or the connection will not be established even if the remote end is provisioned correctly. If no *remoteName* is provisioned, then this *LC* will accept connections from any other remote *LC* and it will not originate calls. Connections establish faster and are unique if both ends are provisioned with *remoteName*. *RemoteName* should be used when the remote end of the connection resides within the same topology region. If it resides |

in a different topology region, then *addressToCall* and *localAddress PLC* attributes should be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*.
These strings are case insensitive, but the complete component name must be input.

Values: String (0..40, ASCII)

Default: ""

### ATTRIBUTE Htds Plc setupPriority (spri)

Access: Read and write

Criticality: Process

Description: This attribute gives the priority at which a path is established. Zero(0) is the highest priority and four(4) is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.*

Values: Decimal (0..4)

Default: 2

### ATTRIBUTE Htds Plc holdingPriority (hpri)

Access: Read and write

Criticality: Process

Description: This attribute gives the priority that a path holds once it is established. Zero(0) is the highest priority and four(4) is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing

| | |
|---|---|
| | path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority.* |
| Values | Decimal (0..4) |
| Default | 2 |

### ATTRIBUTE Htds Plc requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the bandwidth (in bits per second) reserved by a path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that Transmit at this end represents Receive at the remote end. Note that when the values do not correspond the originating end of the connection determines the value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE Htds Plc requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute gives the bandwidth (in bits per second) reserved by a path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that |

| | |
|---|---|
| | Transmit at this end represents Receive at the remote end. Note that when the values do not correspond the originating end of the connection determines the value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE Htds Plc requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the type of traffic transmitted over the path. There are eight(8) possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five(5) other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType***,** will be candidates for this connection. |
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | data |

## ATTRIBUTE Htds Plc permittedTrunkTypes (pttyp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute lists up to eight(8) types of trunk that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six(6) remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | (terrestrial, satellite, trunkType1, trunkType2, trunkType3) |

## ATTRIBUTE Htds Plc requiredSecurity (rsec)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the required minimum level of security of the trunks on the route. Zero(0) represents the most secure and seven(7) represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.* |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Htds Plc requiredCustomerParm (rcparm)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the allowed customer defined parameter of the trunks on the route. Its value, a number from zero(0) to seven(7), is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero(0) to seven(7). The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path. |
| Values | Decimal (0..7) |
| Default | 4 |

### ATTRIBUTE Htds Plc pathAttributeToMinimize (pamin)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost or delay of a route is the sum of the cost or delay metrics of all the trunks on the route. The route selection algorithm uses this attribute as the minimization criteria. If more than one route is found while using this attribute as the minimization criteria, then the route with the smallest non-minimization metric is chosen amongst the equivalent routes. |
| Values | cost<br>delay |
| Default | cost |

### ATTRIBUTE Htds Plc maximumAcceptableCost (maxCost)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. This attribute is used to accept or reject a path after the route selection algorithm has been applied, regardless of the minimization criteria. It is possible that there may not be a route with an acceptable cost. |
| Values | Decimal (0..65535) |
| Default | 1280 |

### ATTRIBUTE Htds Plc maximumAcceptableDelay (maxDelay)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates an upper bound on the delay of a route, which is the sum of the delay of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512 byte packet.<br>Note that the delay for a trunk can be a provisioned (with override) or measured value on the trunk. PORs does not recommend using override for the delay on a trunk since this has little added value for PORs traffic.<br>Remember, that the trunk *measuredRoundTripDelay* (ms) discovered through the Trunk staging protocols, divided by two and truncated, to provide the one way delay, is used to populate the topological database. The value includes emission, propagation, and queuing delays. A 512 byte data packet is used to perform the measurement. This value is updated periodically by Trunks and reflects the operating delay of the trunk. PORs uses this attribute to accept or reject a path after the route selection algorithm has been applied, regardless of the minimization criteria. |
| Values | Decimal (0..100000) |

| | |
|---|---|
| Units | msec |
| Default | 100000 |

### ATTRIBUTE Htds Plc emissionPriority (epri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. *EmissionPriority* of Zero(0) indicates the highest emission priority, while two (2) indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher). |
| Values | Decimal (1..2) |
| Default | 1 |

### ATTRIBUTE Htds Plc discardPriority (dpri)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the importance of the packets on the path. One(1) is used for paths carrying the most important traffic, and three(3) is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically). |
| Values | Decimal (1..3) |
| Default | 2 |

### ATTRIBUTE Htds Plc pathType (pType)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies if the path for this PLC is determined automatically or by static provisioning. The default (***normal***) is to |

automatically choose a route with Route Selection. ***Normal*** *pathTypes* require less provisioning and can dynamically handle path failures. The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).
The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.

Values
normal
manual
forced

Default
normal

## ATTRIBUTE Htds Plc pathFailureAction (pfa)

Access
Read and write

Criticality
Process

Description
This attribute is used to specify whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

| | |
|---|---|
| | All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends. |
| Values | reRoutePath<br>disconnectConnection |
| Default | reRoutePath |

### ATTRIBUTE Htds Plc bumpPreference (bpref)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute controls when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *holdingPriority* in order to acquire its bandwidth and be established. By default, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. A connection may be set to always bump in order to find the best route it may have. |
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | bumpWhenNecessary |

### ATTRIBUTE Htds Plc optimization (opt)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval. |

| | |
|---|---|
| Values | disabled<br>enabled |
| Default | enabled |

### ATTRIBUTE Htds Plc addressToCall (addrToCall)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s remote end point's address in the format of a NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. For an alternative representation of end point's addresses, see *remoteName* attribute. If the *addressToCall* is provisioned, it must match *localAddress* provisioned on the remote end or the connection will not be established. Connections establish faster and are unique if both ends are provisioned with *addressToCall*. *AddressToCall* must be used when the remote end of the connection resides in different topology region. If it resides in the same topology region, then *remoteName* may be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Htds Plc localAddress (localAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is the *PLC*'s end point address in the format of an NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. *LocalAddress* must share a prefix with MOD nodePrefix or one of MOD alternatePorsPrefixes for this node, otherwise PORS will not be able to route calls to this service. *LocalAddress* is used in conjunction with *addressToCall*. That is, the end responsible for originating calls must have *addressToCall* provisioned, while the |

| | |
|---|---|
| | end responsible for terminating calls must have *localAddress* provisioned. In such a case, *addressToCall* on the originating end must match exactly the *localAddress* of the terminating end. Note that both ends may be originating and terminating at the same time. That is, both ends may have *addressToCall* and *localAddress* provisioned as long as *addressToCall* and *localAddress* on different ends are identical. |
| Values | String (0..40, ASCII) |
| Default | "" |

### ATTRIBUTE Htds Plc maximumAcceptableGatewayCost (maxGateCost)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates an upper bound on the gateway cost metric of a route, which is the sum of the gateway cost metrics of all gateway links on the route. It has the same semantics as the *maximumAcceptableCost* except that gateway cost metrics are used instead of trunk cost metrics. Gateway cost metrics are provisioned under *Trunk Address* component of a gateway link specifying a gateway costs of reaching an address through the link. |
| Values | Decimal (0..65535) |
| Default | 2048 |

### ATTRIBUTE Htds Plc manualPath (mpath)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is optional and specifies the sequence of trunks to be used as the route for the path, thus bypassing PORS' automatic route selection. If the path fails the validation, no other path can be selected[1]. This attribute should only be used in special cases since the route selection algorithm is able to find and maintain the best routes. A related path attribute, the *pathType*, determines if this route will be used as a manual or forced path type. |

As an example, the trunk component name for the third trunk on node MoonBase is "*EM/MoonBase Trk/3*". Note that only the first end of the trunk that the packet would encounter is provisioned. These strings are case insensitive but the complete component name must be input.

Note 1: the trunk designation must be a 3-letter form, e.g., 'trk'. Note 2: only the outbound trunks component names are used to provision the ***manualPath***.

Note 3: It is recommended to have two independent routes specified for a manual path by specifying a different ***manualPath*** (non-symmetric) for each end. In this case, there is no way to select which route will be used (first up wins) but if one path is torn down due to a failure then the other ***manualPath*** may be used to reroute the path.

| | |
|---|---|
| Vector of | String (0..40, ASCII) |
| Index | Decimal (0..9) |
| Default | ([10] "") |

## COMPONENT Htds LogicalConnection (LCo)

| | |
|---|---|
| Groups | "GROUP Htds LCo PathData"<br>"GROUP Htds LCo Statisitics (Stats)" |
| Scope | Application |
| Description | ...*Lc*<br>This component contains all of the operation attributes for a Path Oriented Logical Connection. |
| Common Verbs | Help<br>List<br>Display |

### VERB RERoute Htds LCo

| | |
|---|---|
| Impact | Service |
| Description | RERoute ..Lc<br>This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified.<br>This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively.<br><br>When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path.<br><br>If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent. |

### GROUP Htds LCo PathData

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all operational attributes for the path oriented LCo. |

### ATTRIBUTE Htds LCo state

| | |
|---|---|
| Access | Read only |
| Description | This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal |

operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.

Values
pathDown
selectingRoute
connecting
pathUp
pathDownRetrying

Default
No default

### ATTRIBUTE Htds LCo overrideRemoteName (orn)

Access
Read: All
Write: All

Description
If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.

Values
String (0..40, ASCII)

Default
""

### ATTRIBUTE Htds LCo end

Access
Read only

Description
This attribute identifies whether this is the calling or called end of the path.

Values
calling
called

Default
No default

### ATTRIBUTE Htds LCo costMetric (cost)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Htds LCo delayMetric (delay)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Htds LCo roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond.<br>For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic.<br>For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip |

| | |
|---|---|
| | delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC.<br>When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond. |
| Values | Decimal (0..200000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Htds LCo setupPriority (spri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Htds LCo holdingPriority (hpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE Htds LCo requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Htds LCo requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Htds LCo requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType***,** will be candidates for this connection. |

| | |
|---|---|
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2)<br>trafficType3 (tt3)<br>trafficType4 (tt4)<br>trafficType5 (tt5) |
| Default | No default |

### ATTRIBUTE Htds LCo permittedTrunkTypes (pttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path. |
| Set of | terrestrial<br>satellite<br>trunkType1 (tt1)<br>trunkType2 (tt2)<br>trunkType3 (tt3)<br>trunkType4 (tt4)<br>trunkType5 (tt5)<br>trunkType6 (tt6) |
| Default | No default |

### ATTRIBUTE Htds LCo requiredSecurity (rsec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* |

attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.*

Values — Decimal (0..7)

Default — No default

### ATTRIBUTE Htds LCo requiredCustomerParameter (rcparm)

Access — Read only

Description — This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.

Values — Decimal (0..7)

Default — No default

### ATTRIBUTE Htds LCo emissionPriority (epri)

Access — Read only

Description — This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).

Values — Decimal (0..2)

Default — No default

### ATTRIBUTE Htds LCo discardPriority (dpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically). |
| Values | Decimal (1..3) |
| Default | No default |

### ATTRIBUTE Htds LCo pathType (pType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).<br><br>The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself. |
| Values | normal<br>manual<br>forced |
| Default | No default |

### ATTRIBUTE Htds LCo retryCount (rcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology.<br>This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Htds LCo pathFailureCount (pfcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE Htds LCo reasonForNoRoute (rnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason |

***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

Values

attributeProfileProblem
manualPathIndexProblem

Default

none

### ATTRIBUTE Htds LCo lastTearDownReason

Access

Read only

Description

This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:
***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up.
***normalShutDown*** - This path has gone down due to normal call termination.
***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.

***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
***trunkCardFailure***- A trunk FP card has failed along the path.
***accessCardFailure***- The FP on which the peer access service was running has failed.
***operatorForced***- The path has terminated due to the operator locking a trunk along the path.
***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
***networkCongestion*** - The path has failed due to control information being lost and not recoverable.
***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name.
***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid.
***unknownReason*** - The failure was not resolved.
***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled.
***remoteNameMismatch*** - The remote end has alarmed and rejected this setup due to remoteName provisioning.
***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.
***reconnectFromFarEnd*** - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.

***bumped*** - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
***optimized*** - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
***trunkOrFarEndDidNotSupportMode*** - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

| Default | none |

### ATTRIBUTE Htds LCo pathFailureAction

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.<br>With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.<br><br>All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends |
| Values | reRoutePath<br>disconnectConnection |
| Default | No default |

### ATTRIBUTE Htds LCo bumpPreference (bpref)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority*. A connection may also always bump in order to obtain the best route. |

| | |
|---|---|
| Values | bumpWhenNecessary<br>bumpToObtainBestRoute |
| Default | No default |

### ATTRIBUTE Htds LCo optimization (opt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval. |
| Values | disabled<br>enabled |
| Default | No default |

### ATTRIBUTE Htds LCo pathUpDateTime

| | |
|---|---|
| Access | Read: Service<br>Write: Illegal |
| Description | This is the time stamp when the current path was established or reestablished. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Htds LCo path

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the trunk component names over which the path has been instantiated and the remote end point name terminating the path. |
| List of | String (0..40, ASCII) |
| List Size | 21 |

| | |
|---|---|
| Default | No default |

### GROUP Htds LCo Statisitics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics attributes for the path oriented LCo. |

### ATTRIBUTE Htds LCo pktsToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets transmitted to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Htds LCo bytesToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Htds LCo pktsFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote LCo via the network. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Htds LCo bytesFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes received from the remote LCo via the network. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

# COMPONENT IpDlciGroup (IpDlciGrp)

| | |
|---|---|
| Instance | Decimal (1..4294967295) |
| Groups | "GROUP IpDlciGrp CustomerIdentifierData (CidData)"<br>"GROUP IpDlciGrp IfEntryProv (IfEntry)"<br>"GROUP IpDlciGrp Provisioned (Prov)"<br>"GROUP IpDlciGrp MediaProv (Mp)"<br>"GROUP IpDlciGrp OsiState (State)"<br>"GROUP IpDlciGrp OperationalStatus (OperStatus)" |
| Scope | Application |
| Description | *IpDlciGroup/n*<br>This component represents a logical interface between a Virtual Router and a FrameRelay Interface (*FrUni*).<br><br>An *IpDlciGroup* associates multiple frame relay *DataLinkConnectionIdentifer*s (*Dlci*) with a single *VirtualRouter ProtocolPort*. The *IpDlciGroup* component is associated with a *ProtocolPort* using the *linkToProtcolPort* attribute and to frame relay *Dlci*s using the *linkToFrDlci* attribute in each *FrConnection* subcomponent. |
| Subcomponents | "COMPONENT IpDlciGrp FrConnection (Frc)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP IpDlciGrp CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE IpDlciGrp customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP IpDlciGrp IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE IpDlciGrp ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE IpDlciGrp ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP IpDlciGrp Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *IpDlciGroup* component. |

### ATTRIBUTE IpDlciGrp maxTransmissionUnit (mtuSize)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the size of the largest datagram (including the frame relay header) which can be sent on the interface. |
| Values | Decimal (262..9190) |
| Units | octets |
| Default | 1604 |

### GROUP IpDlciGrp MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the Media Application component. |

### ATTRIBUTE IpDlciGrp linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains a protocol port component name. The attribute associates the application with a protocol port. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP IpDlciGrp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE IpDlciGrp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users |

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE IpDlciGrp operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE IpDlciGrp usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has

spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP IpDlciGrp OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE IpDlciGrp snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### COMPONENT IpDlciGrp FrConnection (Frc)

Instance
Decimal (1..255)

Groups
"GROUP IpDlciGrp Frc Provisioned (Prov)"
"GROUP IpDlciGrp Frc OsiState (State)"
"GROUP IpDlciGrp Frc Statistics (Stats)"

Scope
Application

| | |
|---|---|
| Description | *IpDlciGrp/n FrConnection/n*<br>This component represents a virtual connection over which internetworking frames are relayed between IP and frame relay. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP IpDlciGrp Frc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *FrConnection* component. |

## ATTRIBUTE IpDlciGrp Frc linkToFrDlci (frDlci)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the frame relay *Dlci IpConn* component that this connection is associated with. |
| Values | Link (Hardware, linkToIpDlciGrp) |
| Default | No default |

## ATTRIBUTE IpDlciGrp Frc ipCos

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP connection class of the Frame Relay connection. This value is used to distinguish the connection from others for the purpose of IP forwarding and IP accounting. IP connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between IP routers.<br><br>If an IP packet is forwarded to a *ProtocolPort* or *Interface* |

configured to use more than one Frame Relay connection, then one of the connections is selected for transmitting the packet. The selection is made according to the connection class assigned to the packet.

An explanation of how an IP packet is assigned a connection class is found in the description of the *connectionClass* operational attribute of the *DifferentiatedServicesDomain PerHopBehavior* component, and in the description of *Vr Ip CosPolicyGroup* component.

Modifying this attribute will reset the *FrConnection*.

The remainder of this description applies only to an *FrConnection* used by a *VirtualRouter ProtocolPort* and not to an *FrConnection* used by a *Router Interface* or *VpnRouteForwarder Interface* component.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial CoS value assigned to an IP packet received on the Frame Relay connection. See the description of *Vr Ip CosPolicyGroup* for more information.

Values: Decimal (0..3)

Default: 0

### ATTRIBUTE IpDlciGrp Frc ipDscp

Access: Read and write

Criticality: Component

Description: This attribute specifies the value marked into the Differentiated Services Code Point (DSCP) field of an IP packet received at an *IpPort* over the Frame Relay connection. This DSCP marking is applied only if one of the following conditions is true:

1) the *IpPort* is linked by its *diffServAssignment* attribute to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, or

2) the *Ip* is linked by its *diffServAssignment* attribute to a *Vr Ip DifferentiatedServices* interface configuration where the *baMode* attribute of the *IngressServices* subcomponent is set to ***link***, and the *IpPort* does not have the *diffServAssignment* attribute set.

If one of these conditions is true, then the *ipDscp* value must match a *Virtual Router DifferentiatedServicesDomain PerHopBehavior* subcomponent instance value. See the description of *Vr Ip DifferentiatedServices* interface configuration for more information.

If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipDscp* must be set to ***na***.

This attribute is not applicable to a Frame Relay connection associated with a *Router Interface* or *VpnRouteForwarder Interface* component.

Modifying this attribute will reset the *FrConnection*.

### ATTRIBUTE IpDlciGrp Frc linkToIpLogicalInterface (ipIf)

Access Read and write

Description This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ipAddress*, that this connection is associated with.

When set, the value of this attribute must be consistent with the *linkToProtocolPort* attribute value of the parent *IpDlciGroup* component. That is, they must both point to the same *ProtocolPort* component.

Values Link (Service, linkToMediaConnection)

Default No default

### GROUP IpDlciGrp Frc OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE IpDlciGrp Frc adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or

*Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

## ATTRIBUTE IpDlciGrp Frc operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

## ATTRIBUTE IpDlciGrp Frc usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP IpDlciGrp Frc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the packet based statistics maintained for the *FrConnection* component. |

### ATTRIBUTE IpDlciGrp Frc inUnknownProtocol

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets received on this connection which are discarded because they contain an unknown protocol. This counter wraps around to ***0*** when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE IpDlciGrp Frc inUnsupportedProtocol

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets received on this connection which are discarded because they contain an unsupported protocol. This includes packets received for protocols not |

| | |
|---|---|
| | currently bound to the associated *ProtocolPort* component. This counter wraps around to ***0*** when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE IpDlciGrp Frc inLastDiscardedProtocolHeader

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the first eight octets of the most recent packet that was received from the interface with an unknown or unsupported protocol. |
| Values | String (1..8, Hex) |
| Default | No default |

# COMPONENT IpInterfaceOverFrameRelay (IpiFr)

| | |
|---|---|
| Groups | "GROUP IpiFr Provisioned (Prov)" |
| Scope | Application |
| Description | *IP Interface over Frame Relay*<br><br>The *IP interface over Frame Relay* component allows external Network Management Stations using Frame Relay PVC connections to perform the network management functions on the Passport module.<br><br>Network Management Stations can be directly connected to a Passport module with a FrameRelay PVC connection, or indirectly connected via an IP routing capable device which has a FrameRelay PVC connection to the Passport module. |
| Subcomponents | "COMPONENT IpiFr DataNetworkAddress (Dna)" |
| Opt. Subcomp. | "COMPONENT IpiFr LogicalChannelNumber (Lcn)"<br>"COMPONENT IpiFr StaticRoute (Sr)" |
| Dyn. Subcomp. | "COMPONENT IpiFr Route (R)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP IpiFr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group provides the provisionable attributes for the IpiFr component. |

## ATTRIBUTE IpiFr ipAddress (ipa)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the unique Internet Protocol (IP) Address that represents the IP address of the IPI service. |
| Values | IP address |
| Default | 0.0.0.0 |

## ATTRIBUTE IpiFr maximumNumberOfLcn (maxLcn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the maximum number of LCNs that are supported on this service. It specifies the maximum number of connections from external network management sites to this IpiFr service. |
| Values | Decimal (24) |
| Default | 24 |

## ATTRIBUTE IpiFr subnetMask (sm)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the subnetwork mask for the IPI service. |
| Values | IP address |
| Default | 255.0.0.0 |

## COMPONENT IpiFr DataNetworkAddress (Dna)

| | |
|---|---|
| Groups | "GROUP IpiFr Dna Address"<br>"GROUP IpiFr Dna OutgoingOptions"<br>"GROUP IpiFr Dna IncomingOptions"<br>"GROUP IpiFr Dna CallOptions" |

| | |
|---|---|
| Scope | Application |
| Description | *IpiFr Dna*<br>This is the description of the Ipi Frame Relay *Dna* component. It is offers a subset of the generic *Dna* component attributes |
| Opt. Subcomp. | "COMPONENT IpiFr Dna ClosedUserGroup (Cug)" |
| Common Verbs | Help<br>List<br>Display |

## GROUP IpiFr Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | *Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 attributes. String of address digits is complemented by type of address and Npi. These attributes are used to interpret format of the address digits. |

## ATTRIBUTE IpiFr Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE IpiFr Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | *Dna* attribute contains digits which form unique identifier of the customer interface. It can be compared (approximation only) to |

telephone number where phone number identifies unique telephone set. *Dna* digits are selected and assigned by network operators. *MaximumLenOfDna* is 15digits.

Values BCD (1..15)

Default No default

### GROUP IpiFr Dna OutgoingOptions

Properties Provisioned

Description *OutgoingOptions* group defines call options of a *Dna* for calls which are made out of the interface represented by *Dna*. All these options are not used for calls arriving to the interface represented by *Dna*.

### ATTRIBUTE IpiFr Dna outCalls (ouc)

Access Read only

Description This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) can be made using this particular *D*na. If set to a value of ***disallowed*** , then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Outgoing Calls Barred' feature for *Dnas* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.

Values disallowed
allowed

Default disallowed

### ATTRIBUTE IpiFr Dna outDefaultPriority (odf)

Access Read only

Criticality Component

Description This attribute, if set to ***normal*** indicates that the default priority for outgoing calls (from the DTE to the network) using this particular *Dna* is normal priority - if the priority is not specified

by the DTE. If this attribute is set to ***high*** then the default priority for outgoing calls using this particular *Dna* is high priority.

It can be overridden by the *discardPriority* under *DLCI Direct Call* subcomponent.

Values
normal
high

Default
high

### ATTRIBUTE IpiFr Dna defaultTransferPriority (dtp)

Access
Read and write

Criticality
Component

Description
This attribute specifies the default transfer priority to network for all outgoing calls using this particular *Dna*. It is overRidden by the transferPriority provisioned in the *DLCI* Direct Call sub-component.

The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.

Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), routing metric (delay or throughput).

When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay.

When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput.

The default of *defaultTransferPriority* is ***high.***

Values
normal
high

| | |
|---|---|
| Default | high |

### ATTRIBUTE IpiFr Dna transferPriorityOverRide (tpor)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | When this attribute is set to ***yes***, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority.<br><br>For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority.*<br><br>The default of *transferPriorityOverRide* is ***yes***. |
| Values | yes<br>no |
| Default | yes |

### GROUP IpiFr Dna IncomingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | *IncomingOptions* defines set of options for incoming calls. These options are used for calls arriving to the interface represented by *Dna*. For calls originated from the interface, *IncomingOptions* attributes are not used. |

### ATTRIBUTE IpiFr Dna incCalls (inc)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for *Dna's* in that incoming calls are barred if this attribute is set to a value of ***disallowed***. |

| | |
|---|---|
| | Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable. |
| Values | disallowed<br>allowed |
| Default | allowed |

### ATTRIBUTE IpiFr Dna incAccess (ina)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute is an extension of the Closed User Group (CUG) facility, as follows:<br>This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTEs that have Outgoing Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE.<br>This attribute corresponds to the CCITT 'Closed User Group with Incoming Access' feature for *Dnas* in that incoming access is granted if this attribute is set to a value of ***allowed***. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### GROUP IpiFr Dna CallOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | *CallOptions* group defines additional options for calls not related directly to direction of a call. |

### ATTRIBUTE IpiFr Dna serviceCategory (cat)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute is assigned for each different type of service within which this *Dna* is configured. It is placed into the Service Category attribute in the accounting record by both ends of the *Vc*. |
| Values | gsp<br>x25<br>enhancedIti<br>ncs<br>mlti<br>sm<br>ici<br>dsp3270<br>iam<br>mlhi<br>term3270<br>iti<br>bsi<br>hostIti<br>x75<br>hdsp3270<br>api3201<br>sdlc<br>snaMultiHost<br>redirectionServ<br>trSnaTpad<br>offnetNui<br>gasServer<br>vapServer<br>vapAgent<br>frameRelay<br>ipiVc<br>ipiFr |
| Default | ipiFr |

### ATTRIBUTE IpiFr Dna accountClass (acl)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator and it is an arbitrary number. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE IpiFr Dna serviceExchange (sre)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute is an arbitrary number, entered by the network operator. It is included in the accounting record created by *Vc*. |
| Values | Decimal (0..255) |
| Default | 0 |

### COMPONENT IpiFr Dna ClosedUserGroup (Cug)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP IpiFr Dna Cug CugOptions" |
| Scope | Application |
| Description | *IpiFr Dna ClosedUserGroup*<br>This group defines options associated with national or international *CUG* Identifier. Other *DNAs* in the network can have *CUGs* defined which groups these *DNAs* by *CUG interlockCode*. If *DNAs* are defined with *CUGs*, calls from *DNAs* which do not have the same *interlockCode* defined are refused. Attributes *incAccess* and *outAccess* can override this rule. *IpiFr* handles only incoming calls. Therefore, Closed User Group for |

this interface is defined for validation of incoming PVC calls only.

Common Verbs

DELete

## GROUP IpiFr Dna Cug CugOptions

Properties: Provisioned

Description: This group defines options for a CUG. Attributes in this group define *ClosedUserGroup* options associated with *interlockCode*. *DNA's* with the same *CUG* (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same *CUG* group are defined here.

## ATTRIBUTE IpiFr Dna Cug type

Access: Read and write

Description: This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTEs for which there is no X.75 Gateway between. (National CUGs cannot normally traverse an X.75 Gateway).
If this attribute is set to ***national***, then the *CUG* is a national *CUG*, in which case, the *dnic* should be left at its default value since it is not part of a national *CUG*. If this attribute is set to ***international***, then the *CUG* is an international *CUG*, in which case, the *dnic* should be set appropriately as part of the *CUG interlockCode*.

Values: national
international

Default: national

### ATTRIBUTE IpiFr Dna Cug dnic

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *dnic* (Data Network ID Code) of the *CUG* by which packet networks are identified. This attribute is not applicable if the *CUG* is a ***national*** *CUG*, as specified by the CUG *type* attribute. There are usually 1 or 2 *dnics* assigned per country, for public networks. The U.S. is an exception where each BOC has a *dnic*. Also, a group of private networks can have its own *dnic*.<br><br>*dnic* value is not an arbitrary number. It is assigned by international agreement and controlled by CCITT. |
| Values | BCD (4) |
| Default | 0000 |

### ATTRIBUTE IpiFr Dna Cug interlockCode (ilc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the *CUG* identifier of a national or international *CUG* call. It is an arbitrary number and it also can be called CUG in some descriptions. Interfaces (*DNA's*) defined with this number can make calls to *DNA's* with the same *interlockCode*. |
| Values | Decimal (0..65535) |
| Default | 65535 |

### ATTRIBUTE IpiFr Dna Cug incCalls (inc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular CUG. If set to ***disallowed***, then incoming calls cannot be made using this CUG - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for CUGs in that incoming calls are barred if this attribute is set to a value of ***disallowed***. |

| | |
|---|---|
| Values | disallowed<br>allowed |
| Default | allowed |

## COMPONENT IpiFr LogicalChannelNumber (Lcn)

| | |
|---|---|
| Instance | Decimal (16..39) |
| Groups | "GROUP IpiFr Lcn OsiState (State)"<br>"GROUP IpiFr Lcn Operational (Oper)"<br>"GROUP IpiFr Lcn Provisioned (Prov)" |
| Scope | Application |
| Description | *IpiFr Lcn/n*<br><br>This component represents one *Logical Channel Number* responsible for logical connection with the PVC. There can be up to 24 instances of *Lcn* on the *IpiFr* component. |
| Subcomponents | "COMPONENT IpiFr Lcn DirectCall (Dc)" |
| Dyn. Subcomp. | "COMPONENT IpiFr Lcn Vc" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP IpiFr Lcn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE IpiFr Lcn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE IpiFr Lcn operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE IpiFr Lcn usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values: idle
active (activ)
busy

Default: idle

### ATTRIBUTE IpiFr Lcn availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The

*operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE IpiFr Lcn proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been

initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE IpiFr Lcn controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is

***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE IpiFr Lcn alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE IpiFr Lcn standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

| | |
|---|---|
| Values | hotStandby (hot)<br>coldStandby (cold)<br>providingService (serv)<br>notSet (nSet) |
| Default | notSet |

### ATTRIBUTE IpiFr Lcn unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP IpiFr Lcn Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains status of the internal IP network interface. |

### ATTRIBUTE IpiFr Lcn ipInterfaceDevice (ipIfD)

| | |
|---|---|
| Access | Read only |
| Description | The status of the internal IP network interface is *inactive* until either the remoteIpAddress attribute is provisioned, or an IP packet is exchanged between a Network Management Station and the internal IP network interface (via the LCN). At this point, the status changes to *active*. |
| Values | inactive<br>active |
| Default | inactive |

### ATTRIBUTE IpiFr Lcn opRemoteIpAddress (opRmtIpa)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the remote network device connected to this interface. The value is either 0.0.0.0 until the first data packet is received from the remote end, or is the value provisioned in *remoteIpAddress*. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE IpiFr Lcn packetsSent (pktS)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of IP packets sent from this interface. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn packetsReceived (pktRx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of IP packets received from the remote network device. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn discardTxPackets (discTxPkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of IP packets destined to the remote end which were discarded by this interface. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn discardRcvPackets (discRxPkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of IP packets received from the remote end which were discarded by this interface. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP IpiFr Lcn Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group provides the provisionable attributes for the *IpiFR Lcn* component. |

### ATTRIBUTE IpiFr Lcn remoteIpAddress (rmtIpa)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the IP address of the remote device connected to this *Lcn* interface. This device can be a host, and / or a gateway. If the device is a gateway, and *StaticRoute*s are defined using this gateway, it is recommended that this attribute be set. It is also recommended to set this attribute, if management applications such as Software Download and SNMP, which can initiate IP traffic with Network Management Stations, are potentially using this *Lcn* interface. IP routing information within IpiFr is not known or activated for this *Lcn* interface until the remoteIpAddress is known.<br><br>When the destination IpAddress is left at its default value of 0.0.0.0, the calling IP address is learnt from the first data packet received. |
| Values | IP address |
| Default | 0.0.0.0 |

### COMPONENT IpiFr Lcn DirectCall (Dc)

| | |
|---|---|
| Groups | "GROUP IpiFr Lcn Dc Options" |

| | |
|---|---|
| Scope | Application |
| Description | *IPIFR Lcn/x DC*<br>This component defines direct call options for calls issued without operator intervention. Connection is complete and can be initiated automatically. |
| Common Verbs | Help<br>List<br>Display |

## GROUP IpiFr Lcn Dc Options

| | |
|---|---|
| Properties | Provisioned |
| Description | Options group defines attributes associated with direct call. It defines complete connection in terms of path and call options. This connection can be permanent (pvc) or, in future release, switched (svc). It can have facilities. The total number of bytes of facilities including the facility codes, and all of the facility data from all of the four classes of facilities:<br>CCITT_Facilities<br>DTE_Facilities<br>National_Facilities<br>International_Facilities<br>must not exceed 512 bytes. |

## ATTRIBUTE IpiFr Lcn Dc remoteNpi (rnpi)

| | |
|---|---|
| Access | Read and write |
| Description | RemoteNumbering Plan Indicator (Npi) indicates the numbering plan used in the *remoteDna*. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE IpiFr Lcn Dc remoteDna (rdna)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the Data Network Address (*Dna*) of the remote. This is the called (destination) DTE address (*Dna*) to which this direct call will be sent. Initially, the called DTE address attribute must be present, that is, there must be a valid destination address. However, it may be possible in the future to configure the direct call with a mnemonic address, in which case, this attribute will contain a zero-length *Dna*, and the mnemonic address will be carried as one of the facilities. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Dc remoteDlci (rdlci)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute provides the value of the remote DLCI (Data Link Connection Identifier) |
| Values | Decimal (16..1007) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Dc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the type of *Vc* call:<br>***permanentMaster***,<br>***permanentSlave***,<br><br>If the value is set to ***permanentMaster,*** then a permanent connection will be established between 2 ends. The remote end must be defined as a ***permanentSlave, permanentBackupSlave*** or ***permanentSlaveWithBackup***. The connection cannot be established if the remote end is defined as anything else. The end defined as ***permanentMaster*** always initiates the calls. It will attempt to call once per minute.<br><br>If the value is set to ***permanentSlave*** then a permanent connection will be established between 2 ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot |

be established if the remote end is defined as anything else. The ***permanentSlave*** *end* will attempt to call once per minute.

Values
permanentMaster (master)
permanentSlave (slave)

Default
permanentSlave

### ATTRIBUTE IpiFr Lcn Dc transferPriority (tp)

Access
Read and write

Description
This attribute specifies the transfer priority to network for the outgoing calls using this particular *DLCI*. It overRides the *defaultTransferPriority* provisioned in its associated *Dna* component.

The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.

Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), routing metric (delay or throughput).

When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay.

When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput.

The default of *transferPriority* is ***useDnaDefTP***. It means using the provisioning value under *defaultTransferPriority* of its associated *Dna* for this *DLCI*.

Values
normal
high
useDnaDefTP

Default
useDnaDefTP

## ATTRIBUTE IpiFr Lcn Dc discardPriority (dp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the discard priority for outgoing call using this *DLCI*.<br><br>The discard priority has three provisioning values: ***normal***, ***high***, and ***useDnaDefPriority***. Traffic with normal priority are discarded<br>first than the traffic with high priority. The *Dna* default value (provisioned by *outDefaultPriority*) is taken if this attribute is set to the value ***useDnaDefPriority***.<br><br>The default of *discardPriority* is ***useDnaDefPriority***. |
| Values | normal<br>high<br>useDnaDefPriority |
| Default | useDnaDefPriority |

## COMPONENT IpiFr Lcn Vc

| | |
|---|---|
| Groups | "GROUP IpiFr Lcn Vc CallData (Cad)"<br>"GROUP IpiFr Lcn Vc IntervalData (Intd)"<br>"GROUP IpiFr Lcn Vc FrameRelayData (Frd)" |
| Scope | Application |
| Description | This component defines attributes collected by Frame Relay *Vc*. |
| Common Verbs | Help<br>List<br>Display |

## VERB Ping IpiFr Lcn Vc

Impact: Passive

Description: *Ping [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] FrUni/<n> Dlci/<n> Vc*

*Ping* causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the *ping* query packet will be the same as that of the Frame Relay data except at the source and destination module. The *ping* packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the *roundTripDelay* option is specified, the command reports the time taken to reach the destination and back. For the *roundTripDelay* option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the *ping* packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The *ping* command supports the following options:

*-roundTripDelay (-rtd):* If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

*-sendPktDataSize:* This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

*-returnPktDataSize:* This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is

less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

### GROUP IpiFr Lcn Vc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application. |

### ATTRIBUTE IpiFr Lcn Vc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***. |
| Values | pvc<br>svc<br>spvc<br>frf10spvc |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***. |

| | |
|---|---|
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc callingNpi

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc fastSelectCall

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc accountingEnd

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc segmentSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum packet size allowed on the *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc rcosToNetwork (rcosto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the routing metric routing class of service to<br>the network. |
| Values | throughput<br>delay<br>multimedia |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc rcosFromNetwork (rcosfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the routing metric Routing Class of Service from the Network. |
| Values | throughput<br>delay<br>multimedia |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc emissionPriorityToNetwork (epto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority to the network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc emissionPriorityFromNetwork (epfrom)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the network internal emission priority from the network. |
| Values | normal<br>high<br>interrupting |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc dataPath (dapa)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value.<br><br>If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system)<br><br>If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed. |

| | |
|---|---|
| | If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc dprsMcsEndPoint (dmep)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components.<br><br>If the connection is using ***dprsOnly*** data path, this attribute is empty.<br><br>If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint. |
| List of | The name of the component |
| Default | No default |

### GROUP IpiFr Lcn Vc IntervalData (Intd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued. |

### ATTRIBUTE IpiFr Lcn Vc elapsedTimeTillNow

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc segmentsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc segmentsSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. |

| | |
|---|---|
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc callReferenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP IpiFr Lcn Vc FrameRelayData (Frd)

| | |
|---|---|
| Properties | Operational |
| Description | This group defines Frame Relay attributes collected by Frame Relay *Vc*.<br>The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.<br>Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.<br>Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers |

### ATTRIBUTE IpiFr Lcn Vc frmCongestedToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc cannotForwardToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc notDataXferToSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc outOfRangeFrmFromSubnet

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc combErrorsFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc* |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc duplicatesFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc notDataXferFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery. |

| | |
|---|---|
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc frmLossTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc ooSeqByteCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc peakOoSeqPktCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc sendSequenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame. |
| Values | Decimal (0..1048575) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc pktRetryTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc subnetRecoveries

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of successful *Vc* recovery attempts. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc ooSeqPktCntExceeded

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE IpiFr Lcn Vc peakOoSeqByteCount

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays the frame relay peak byte count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*. |
| Values | Decimal (0..50000) |
| Default | No default |

## COMPONENT IpiFr StaticRoute (Sr)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP IpiFr Sr Provisioned (Prov)" |
| Scope | Application |
| Description | *IpiFr StaticRoute/destIpAddress*<br><br>This component contains information for setting up a static routes on the IpiFr service. These provisioned static IP routes allow the ability to specify IP routes to Network Management Stations which are not directly connected to the Passport module. The component is indexed by a destination IP Address. It represents the static IP route to a particular IP host, subnetwork, or network. The default route IP address is indexed by 0.0.0.0 .<br><br>Note that subnetwork routes are identified using IpiFr's provisioned subnetMask. This subnetMask only applies to the IP network for which IpiFr's IP Address belongs. Therefore, subnetwork routes are only supported for this local IP network. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP IpiFr Sr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group provides the provisionable parameters for setting up a static route. |

### ATTRIBUTE IpiFr Sr gatewayIpAddress (gtyIpa)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | The attribute specifies the IP Address of the next hop in this route to the destination IP Address. For this static route to be active, the value of this attribute must match the *opRemoteIpAddress* attribute of one of the *Lcn* components. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE IpiFr Sr backupGatewayIpAddress (bGtyIpa)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | The attribute specifies an ordered list of alternative gateways to use for the route to the destination IP Address. This attribute is only supported for the default route.<br><br>If the *Lcn* interface of the current gateway IP Address fails, then the *backupGatewayIpAddress*es, listed in this attribute, are searched, in order, for a gatewayIpAddress with an enabled *Lcn*. If found, the static route to this destination IP Address is updated to use the found gateway IP Address.<br><br>Note that an *Lcn* interface can fail due to either the *Vc* through the Passport Network failing, or an *Lmi* indication that the far-end link is failed. |
| Values | IP address |
| Replication | Decimal (1..23) |
| Default | No default |

## COMPONENT IpiFr Route (R)

| | |
|---|---|
| Instance | IP address |
| Groups | "GROUP IpiFr R Operational (Oper)" |
| Scope | Application |
| Description | *IpiFr Route/destIpAddress*<br><br>This dynamic component represents an active IP route within the IpiFr service. The component is indexed by the destination IP Address of the IP route. It represents the IP route to a particular IP host, subnetwork, or network. The default route IP address is indexed by 0.0.0.0 .<br><br>Note that only an active route is shown as an *IpiFr Route/ <IP_Address>* . A provisioned static route (i.e. *IpiFr StaticRoute/ <IP_Address>*) will be listed as an active route only if it's Lcn interface is enabled (i.e. the associated *Vc* through the Passport network is up, and the FrameRelay *Lmi* is reporting the far-end link is up ) . |
| Common Verbs | Help<br>List<br>Display |

## GROUP IpiFr R Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational status of the static route |

## ATTRIBUTE IpiFr R gtyIpAddr (gtyIpa)

| | |
|---|---|
| Access | Read only |
| Description | The attribute specifies the IP Address of the next hop in this route to the destination IP Address. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE IpiFr R lcnIf (lcnIf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the *Lcn* interface used by this IP route. |
| Values | Decimal (16..39) |
| Default | No default |

### ATTRIBUTE IpiFr R type

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a route is going to a host or a subnet or a network. |
| Values | host<br>subnet<br>network |
| Default | No default |

# COMPONENT IpInterfaceOverVc (Ipivc)

| | |
|---|---|
| Groups | "GROUP Ipivc Provisioned (Prov)" |
| Scope | Application |
| Description | IpiVc<br><br>The IP interface over VC allows access to the module for external network management. |
| Subcomponents | "COMPONENT Ipivc DataNetworkAddress (Dna)" |
| Opt. Subcomp. | "COMPONENT Ipivc DefaultRoute (Dr)" |
| Dyn. Subcomp. | "COMPONENT Ipivc LogicalChannelNumber (Lcn)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Ipivc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the IpiVc component. |

## ATTRIBUTE Ipivc ipAddress (ipa)

| | |
|---|---|
| Access | Read and write |
| Description | This IP Address represents the IP address of the IP interface. |

| | |
|---|---|
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Ipivc maximumNumberOfLcn (maxLcn)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the maximum number of LCNs that can be setup to the IP Interface over Vc. It defines the maximum number of calls that the external network management systems can setup to IpiVc simultaneously. |
| Values | Decimal (24) |
| Default | 24 |

### COMPONENT Ipivc DataNetworkAddress (Dna)

| | |
|---|---|
| Groups | "GROUP Ipivc Dna Address"<br>"GROUP Ipivc Dna OutgoingOptions"<br>"GROUP Ipivc Dna IncomingOptions"<br>"GROUP Ipivc Dna CallOptions" |
| Scope | Application |
| Description | *IpiVc Dna*<br>This is the description of the generic Vc Dna Component. It includes the superset of all attributes which may apply to a VC. Particular applications will typically offer only a subset of these attributes by providing a definition of their own Dna subcomponent. |
| Subcomponents | "COMPONENT Ipivc Dna ClosedUserGroup (Cug)" |
| Common Verbs | Help<br>List<br>Display |

### GROUP Ipivc Dna Address

| | |
|---|---|
| Properties | Provisioned |
| Description | DnaAddress group contains attributes common to all Dna’s. Every Dna used in the network is defined with this group 0f 2 |

attributes. String of address digits is complemented by type of address and Npi. These attributes are used to interpret format of the address digits.

### ATTRIBUTE Ipivc Dna numberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute indicates the Numbering Plan Indicator (NPI) of the Dna that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks. |
| Values | x121<br>e164 |
| Default | x121 |

### ATTRIBUTE Ipivc Dna dataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | *Dna* attribute contains digits which form unique identifier of the customer. It is the equivalent of the telephone number in the telephone network. MaximumLenOfDna is 15digits. |
| Values | BCD (1..15) |
| Default | No default |

### GROUP Ipivc Dna OutgoingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | DnaOutOptionsProv group defines call options of a Dna for calls which are made out of the interface represented by Dna. All these options are not used for calls arriving to the interface represented by Dna. |

### ATTRIBUTE Ipivc Dna outCalls (ouc)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) can be made using this particular DNA. If set to a value of ***disallowed***, then outgoing calls cannot be made using this DNA - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Outgoing Calls Barred' feature for DNAs in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this DNA to be usable. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### ATTRIBUTE Ipivc Dna defaultTransferPriority (dtp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the default transfer priority to network for all outgoing calls using this particular *Dna*. It is overRidden by the transferPriority provisioned in the *DLCI* Direct Call sub-component.<br><br>The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.<br><br>Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), routing metric (delay or throughput).<br><br>When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay.<br><br>When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput.<br><br>The default of *defaultTransferPriority* is ***normal***. |

| | |
|---|---|
| Values | normal<br>high |
| Default | normal |

### ATTRIBUTE Ipivc Dna transferPriorityOverRide (tpor)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | When this attribute is set to ***yes***, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority.<br><br>For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority.*<br><br>The default of *transferPriorityOverRide* is ***no***. |
| Values | yes<br>no |
| Default | no |

### GROUP Ipivc Dna IncomingOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | DnaIncOptions defines a set of options for incoming calls. These options are used for calls arriving to the interface represented by Dna. For calls originated from the interface, IncomingOptions attributes are not used. |

### ATTRIBUTE Ipivc Dna incCalls (inc)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then incoming calls cannot be made to this DNA - such calls will be cleared by the local DCE. This |

attribute corresponds to the CCITT 'Incoming Calls Barred' feature for DNAs in that incoming calls are barred if this attribute is set to a value of ***disallowed***.

Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this DNA to be usable.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Ipivc Dna incHighPriorityReverseCharge (ihp)

Access: Read only

Criticality: Component

Description: This attribute, if set to a value of ***allowed*** indicates that incoming high priority, reverse charged calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE.
This attribute, together with the *incNormalPriorityReverseChargeCalls* attribute corresponds to the CCITT 'Reverse Charging Acceptance' feature for DNAs in that reverse charged calls are accepted if both attributes are set to a value of ***allowed***.
This attribute is ignored if the corresponding attribute, incCalls is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Ipivc Dna incNormalPriorityReverseCharge (inp)

Access: Read only

Criticality: Component

Description: This attribute, if set to a value of ***allowed*** indicates that incoming normal priority, reverse charged calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***,

then such calls cannot be made to this DNA - such calls will be cleared by the local DCE.
This attribute, together with the *incHighPriorityReverseChargeCalls* attribute corresponds to the CCITT 'Reverse Charging Acceptance' feature for DNAs in that reverse charged calls are accepted if both attributes are set to a value of ***allowed***.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Ipivc Dna incIntlNormalCharge (iin)

Access: Read only

Criticality: Component

Description: This attribute, if set to a value of ***allowed*** indicates that incoming international normal charged calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE.
This attribute also currently controls access to/from the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls (also normal charged) are allowed.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Ipivc Dna incIntlReverseCharge (iir)

Access: Read only

Criticality: Component

Description: This attribute, if set to a value of ***allowed*** indicates that incoming international reverse charged calls (from the network to the DTE)

can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE.
This attribute also currently controls access to/from the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls (also normal charged) are ***allowed***.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Ipivc Dna incFastSelect (ifs)

Access: Read only

Criticality: Component

Description: This attribute specifies whether fast select calls may be received. This attribute, if set to a value of ***allowed*** indicates that incoming fast select calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE.
This attribute corresponds to the CCITT 'Fast Select Acceptance' feature for DNAs in that incoming fast select calls are accepted if this attribute is set to a value of ***allowed***.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: disallowed

### ATTRIBUTE Ipivc Dna incSameService (iss)

Access: Read only

Criticality: Component

Description: This attribute, if set to a value of ***allowed*** indicates that incoming calls from the same service type (eg: X.25, ITI, SNA) (from the

network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: disallowed
allowed

Default: allowed

### ATTRIBUTE Ipivc Dna incChargeTransfer (ict)

Access: Read only

Criticality: Component

Description: This attribute, if set to a value of ***yes*** indicates that the charges for incoming normal charged calls from a DTE with the same NIC (calls from the network to the DTE) will be transferred to the called DTE. If set to a value of ***no***, then charges will not be transferred.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Values: no
yes

Default: no

### ATTRIBUTE Ipivc Dna incAccess (ina)

Access: Read only

Criticality: Component

Description: This attribute is an extension of the Closed User Group (CUG) facility, as follows:
This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTEs that have Outgoing Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE.
This attribute corresponds to the CCITT 'Closed User Group with

| | |
|---|---|
| | Incoming Access' feature for DNAs in that incoming access is granted if this attribute is set to a value of ***allowed***. |
| Values | disallowed<br>allowed |
| Default | disallowed |

## GROUP Ipivc Dna CallOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | DnaCallOptions group defines additional options for calls not related directly to direction of a call. |

## ATTRIBUTE Ipivc Dna serviceCategory (cat)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute is computed based on the type of service within which this DNA is configured. It is placed into the Service Category attributes in the accounting record by both ends of the VC. |
| Values | gsp<br>x25<br>enhancedIti<br>ncs<br>mlti<br>sm<br>ici<br>dsp3270<br>iam<br>mlhi<br>term3270<br>iti<br>bsi<br>hostIti<br>x75<br>hdsp3270<br>api3201<br>sdlc |

snaMultiHost

Default: ipiVc

### ATTRIBUTE Ipivc Dna packetSizes (pks)

Access: Read only

Criticality: Component

Description: This attribute indicates the allowable packet sizes supported for calls setup using this DNA. To set a given packet size to be allowed on the DNA, the packet size is entered, and the corresponding bit in the structure is set to a value of 1. To set a given packet size to be disallowed on the DNA, the packet size is entered preceded with the '~' character, and the corresponding bit in the structure is set to a value of 0. CCITT recommends that packet size 128 always be supported.

Set of:
16
32
64
128
256
512
1024
2048
4096

Default: (2048)

### ATTRIBUTE Ipivc Dna defaultRecvFrmNetworkPacketSize (rps)

Access: Read only

Criticality: Component

| | |
|---|---|
| Description | This attribute indicates the default local receive packet size from network to DTE for all calls using this particular DNA. |
| Values | 16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | 2048 |

### ATTRIBUTE Ipivc Dna defaultSendToNetworkPacketSize (sps)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the default local send packet size from DTE to network for all calls using this particular DNA. |
| Values | 16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | 2048 |

### ATTRIBUTE Ipivc Dna defaultRecvFrmNetworkThruputClass (drt)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the default receive throughput class for all calls using this particular DNA. |

| | |
|---|---|
| Values | Decimal (0..15) |
| Default | 10 |

### ATTRIBUTE Ipivc Dna defaultSendToNetworkThruputClass (dst)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the default send throughput class for all calls using this particular DNA. |
| Values | Decimal (0..15) |
| Default | 10 |

### ATTRIBUTE Ipivc Dna defaultRecvFrmNetworkWindowSize (rws)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the default number of data packets that can be received by the DTE from the DCE before more packets can be received. This view is oriented with respect to the DTE. |
| Values | Decimal (1..7) |
| Default | 2 |

### ATTRIBUTE Ipivc Dna defaultSendToNetworkWindowSize (sws)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute indicates the number of data packets that can be transmitted from the DTE to the DCE and must be acknowledged before more packets can be transmitted. |
| Values | Decimal (1..7) |
| Default | 2 |

### ATTRIBUTE Ipivc Dna packetSizeNegotiation (psn)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute, if set to a value of ***local*** indicates that packet sizes can be negotiated locally at the interface irrespective of the remote interface. If set to a value of ***endtoEnd***, then local negotiation is not permitted and packet sizes are negotiated between 2 ends of Vc. |
| Values | endToEnd<br>local |
| Default | local |

### ATTRIBUTE Ipivc Dna accountClass (acl)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator.<br>This attribute is returned by the local VC in the accounting record for all calls setup using this particular DNA. |
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE Ipivc Dna serviceExchange (sre)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute is an arbitrary number, Data Service Exchange, as entered by the network operator and reported in accounting record. It is converted into an internal 8-bit integer value for use in the accounting record as well as in various X.25 and X.75 Tariff utilities. |

| | |
|---|---|
| Values | Decimal (0..255) |
| Default | 0 |

### ATTRIBUTE Ipivc Dna cugFormat (cft)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute specifies which cug format is used when DTE signals CUG indices, basic or extended.<br>This attribute, if set to a value of ***extended*** indicates that the DTE signals and receives CUG indices in extended CUG format. If set to a value of ***basic***, then the DTE signals and receives CUG indices in the basic CUG format. |
| Values | basic<br>extended |
| Default | basic |

### ATTRIBUTE Ipivc Dna cug0AsNonCugCall (cnc)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |
| Description | This attribute, if set to a value of ***allowed*** indicates that when a CUG index of 0 is signaled in a call request packet, the call is treated as a non-CUG call. If this attribute is set to a value of ***disallowed***, then a CUG index of 0 is treated as an index, and an attempt is made to find the particular CUG corresponding with the DNA. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### ATTRIBUTE Ipivc Dna fastSelectCallsOnly (fso)

| | |
|---|---|
| Access | Read only |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute, if set to a value of ***yes***, indicates that the service is permitted restricted fast select calls only in both the incoming and the outgoing directions using this DNA. If set to a value of ***no***, then non fast select calls are permitted as well. |
| Values | no<br>yes |
| Default | no |

## COMPONENT Ipivc Dna ClosedUserGroup (Cug)

| | |
|---|---|
| Groups | "GROUP Ipivc Dna Cug CugOptions" |
| Scope | Application |
| Description | *IpiVc Dna Cug*<br>ClosedUserGroup options defines options associated with national or international Cug Identifier. Other Dna's in the network can have Cug's defined which groups these Dna's by Cug InterlockCode. If Dna's are defined with Cugs, calls from Dna's which do not have the same interlockCode defined are refused. Attributes *incAccess* and *outAccess* can override this rule. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Ipivc Dna Cug CugOptions

| | |
|---|---|
| Properties | Provisioned |
| Description | This group defines options for Dna closed user group. Attributes in this group define options associated with interlockCode. Dna's with the same Cug (interlockCode) can make calls within this group. Various combinations which permit or prevent calls in the same Cug group are defined here. |

## ATTRIBUTE Ipivc Dna Cug type

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTEs for which there is no X.75 Gateway between. (National CUGs cannot normally traverse an X.75 Gateway).<br>If this attribute is set to ***national***, then the CUG is a national CUG, in which case, the DNIC should be left at its default value of BCD.0000 since it is not part of a national CUG. If this attribute is set to ***international***, then the CUG is an international CUG, in which case, the DNIC should be set appropriately as part of the CUG interlock code. |
| Values | national<br>international |
| Default | national |

### ATTRIBUTE Ipivc Dna Cug dnic

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the DNIC (Data Network ID Code) of the Cug by which packet networks are identified if the Cug is an International Cug - it is specified as 4 BCD digits. This attribute is not applicable if the Cug is a National Cug, as specified by the Cug TYPE attribute. There are usually 1 or 2 DNICs assigned per country, for public networks. The U.S. is an exception where each BOC has a DNIC. Also, a group of private networks can have its own DNIC.<br><br>DNIC value is not an arbitrary number. It is assigned by international agreement and controlled by CCITT. |
| Values | BCD (4) |
| Default | 0000 |

### ATTRIBUTE Ipivc Dna Cug interlockCode (ilc)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the Cug Identifier of a national or international Cug call. It is an arbitrary number and it also can be called Cug in some descriptions. Interfaces (Dna's) defined with this number can make calls to Dna's with the same interlockCode. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Ipivc Dna Cug outCalls (ouc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE into the network) can be made using this particular CUG. If set to a value of ***disallowed***, then outgoing calls cannot be made using this CUG - such calls will be cleared by the local DCE.<br>This attribute corresponds to the CCITT 'Outgoing Calls Barred' feature for CUGs in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | disallowed |

### ATTRIBUTE Ipivc Dna Cug incCalls (inc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular CUG. If set to a value of ***disallowed***, then incoming calls cannot be made using this CUG - such calls will be cleared by the local DCE.<br>This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for CUGs in that incoming calls are barred if this attribute is set to a value of ***disallowed***. |
| Values | disallowed<br>allowed |
| Default | allowed |

## ATTRIBUTE Ipivc Dna Cug privileged (pri)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute, if set to a value of ***yes*** indicates that this CUG is a privileged CUG. In DPN, at least one side of a call setup within a CUG must have the CUG as a privileged CUG. If set to a value of ***no***, then the CUG is not privileged.<br>If both the local DTE and the remote DTE subscribe to the CUG, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTEs in which case the other DTEs cannot call one another, but can call the host. In this example, the host would have the privileged CUG, and the other DTEs would belong to the same CUG, but it would not be privileged. |
| Values | no<br>yes |
| Default | yes |

## COMPONENT Ipivc DefaultRoute (Dr)

| | |
|---|---|
| Groups | "GROUP Ipivc Dr Provisioned (Prov)" |
| Scope | Application |
| Description | IpiVc DefaultRoute<br><br>This component contains information for setting up a default route on the IpiVc service.The default route feature permits establishment of a TCP/IP connection to the Software Distribution (SDS). |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Ipivc Dr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for setting up a default route on the IpiVc service. |

## ATTRIBUTE Ipivc Dr callingIpAddress (ipa)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | The field specifies the IP Address of the remote end, which issues the X.25 call. |
| Values | IP address |
| Default | 0.0.0.0 |

## ATTRIBUTE Ipivc Dr callingNumberingPlanIndicator (npi)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This field specifies the numbering plan of the address. |
| Values | x121<br>e164 |
| Default | x121 |

## ATTRIBUTE Ipivc Dr callingDataNetworkAddress (dna)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This field specifies the address (in Binary Coded Decimal BCD format) assigned to the remote end. |
| Values | BCD (1..15) |
| Default | No default |

## COMPONENT Ipivc LogicalChannelNumber (Lcn)

| | |
|---|---|
| Instance | Decimal (16..39) |
| Groups | "GROUP Ipivc Lcn OsiState (State)"<br>"GROUP Ipivc Lcn Operational (Oper)" |
| Scope | Application |
| Description | IpiVc Lcn/<n><br><br>The Logical Channel Number responsible for the logical connection with the VC. There can be up to 24 instances of Lcn on the IpiVc component. |
| Dyn. Subcomp. | "COMPONENT Ipivc Lcn Vc" |
| Common Verbs | Help<br>List<br>Display<br>LOCK<br>Unlock |

## GROUP Ipivc Lcn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Ipivc Lcn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or |

*Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Ipivc Lcn operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

| | |
|---|---|
| Default | disabled |

### ATTRIBUTE Ipivc Lcn usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Ipivc Lcn availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can |

be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Ipivc Lcn proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Ipivc Lcn controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Ipivc Lcn alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Ipivc Lcn standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Ipivc Lcn unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Ipivc Lcn Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains status of the internal IP network interface. |

### ATTRIBUTE Ipivc Lcn ipInterfaceDevice (ioIfD)

| | |
|---|---|
| Access | Read only |
| Description | The status of the internal IP network interface is *inactive* until an IP packet is exchanged between a Network Management Station and the internal IP network interface (via the LCN). At this point, the status changes to *active*. |
| Values | inactive<br>active |
| Default | inactive |

### ATTRIBUTE Ipivc Lcn remoteIpAddress (rmtIpa)

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the IP address of the remote network device connected to this interface. The destinationIpAddress |

| | |
|---|---|
| | default is 0.0.0.0, until the first data packet is received from the remote end. |
| Values | IP address |
| Default | 0.0.0.0 |

### ATTRIBUTE Ipivc Lcn packetsSent (pktS)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of IP packets sent from this interface. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn packetsReceived (pktRx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of IP packets received from the remote network device. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn discardTxPackets (discTxPkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of IP packets destined to the remote end which were discarded by the interface. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn discardRcvPackets (discRxPkt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts number of IP packets received from the remote end which were discarded by this interface. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### COMPONENT Ipivc Lcn Vc

| | |
|---|---|
| Groups | "GROUP Ipivc Lcn Vc CallData (Cad)"<br>"GROUP Ipivc Lcn Vc IntervalData (Intd)"<br>"GROUP Ipivc Lcn Vc Statistics (Stats)" |
| Scope | Application |
| Description | ... *Vc()*<br>This component defines display of general Vc dynamic attributes |
| Common Verbs | Help<br>List<br>Display |

### GROUP Ipivc Lcn Vc CallData (Cad)

| | |
|---|---|
| Properties | Operational |
| Description | This group represents operational call data related to General *Vc*. It can be displayed only for General *Vc* which is created by application. |

### ATTRIBUTE Ipivc Lcn Vc type

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the type of call, ***pvc*** or ***svc***. *type* is provided at provisioning time. |
| Values | pvc<br>svc |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc state

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is |

***dataTransferP4***.

| | |
|---|---|
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc previousState

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing. |
| Values | creating<br>readyP1<br>dteWaitingP2<br>dceWaitingP3<br>dataTransferP4<br>unsupportedP5<br>dteClearRequestP6<br>dceClearIndicationP7<br>termination |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc diagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc previousDiagnosticCode

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the internal substate of call control. It is used to further refine *state* of call processing. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc calledNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the called end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc calledDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc calledLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc callingNpi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Numbering Plan Indicator (NPI) of the calling end. |
| Values | x121<br>e164 |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc callingDna

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Data Network Address (*Dna*) of the calling end. |
| Values | BCD (1..15) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc callingLcn

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Logical Channel Number of the calling end. |
| Values | Decimal (1..65535) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc accountingEnabled

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options. |
| Values | yes<br>no |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc fastSelectCall

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays that this is a fast select call. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc localRxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of send packets. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc localTxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of send packets. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512 |

| | |
|---|---|
| | 1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc localTxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the send window size provided on incoming call packets or the default when a call request packet does not explicitly provide the window size. |
| Values | Decimal (0..127) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc localRxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the receive window size provided on incoming call packets or the default when a call request does not explicitly provide the window sizes. |
| Values | Decimal (0..127) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc pathReliability

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the path reliability. |
| Values | high<br>normal |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc accountingEnd

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record. |
| Values | callingEnd<br>calledEnd |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc priority

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the call is a ***normal*** or a ***high*** priority call. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc segmentSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc subnetTxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of the data packets on this *Vc*. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256 |

| | |
|---|---|
| | 512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc subnetTxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the current send window size of *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc subnetRxPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the locally negotiated size of receive packets. |
| Values | unknown<br>16<br>32<br>64<br>128<br>256<br>512<br>1024<br>2048<br>4096 |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc subnetRxWindowSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the receive window size provided on incoming call packets and to the default when a call request does not explicitly provide the window sizes. |
| Values | Decimal (0..4096) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc maxSubnetPktSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the maximum packet size allowed on *Vc*. |
| Values | Decimal (0..4096) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc transferPriorityToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the priority in which data is transferred to the network.<br><br>The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.<br><br>Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput).<br><br>When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay.<br><br>When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput. |
| Values | normal<br>high |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc transferPriorityFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the priority in which data is transferred from the network. |

The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.

Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput).

When the transfer priority is set at ***high***, and the trunk queue is set to high, the routing metric is set to delay.

When the transfer priority is set at ***normal***, the trunk queue is set to normal, and the routing metric is set to throughput.

Values: normal
high

Default: No default

### GROUP Ipivc Lcn Vc IntervalData (Intd)

Properties: Operational

Description: This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.

### ATTRIBUTE Ipivc Lcn Vc elapsedTimeTillNow

Access: Read only

Description: This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.

Values: Decimal (0..16777215)

Default: No default

### ATTRIBUTE Ipivc Lcn Vc segmentsRx

Access: Read only

| | |
|---|---|
| Description | This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc segmentsSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet. |
| Values | Decimal (0..16777215) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc startTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc callReferenceNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Ipivc Lcn Vc Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | ... *Statistics(Stats)*<br>This group defines general attributes collected by general *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots.<br>Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. |

### ATTRIBUTE Ipivc Lcn Vc ackStackingTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of ack stacking timer expiries. It is used as an indicator of the acknowledgment behavior across the subnet when ack stacking is in effect. If it expires often, usually this means end users will experience longer delay.<br>The ack stacking timer specifies how long the *Vc* will wait before finally sending the subnet acknowledgment. if this attribute is set to a value of 0, then the *Vc* will automatically return acknowledgment packets without delay. If this attribute is set to a value other than zero, then the *Vc* will wait for this amount of |

time in an attempt to piggyback the acknowledgment packet on another credit or data packet. If the *Vc* cannot piggyback the acknowledgment packet within this time, then the packet is returned without piggybacking.

Values: Decimal (0..5000)

Default: No default

### ATTRIBUTE Ipivc Lcn Vc outOfRangeFrmFromSubnet

Access: Read only

Description: This attribute counts the number of subnet frames discarded due to the sequence number being out of range.
Two Categories apply for the General *Vc*
1) lost Acks (previous Range)
2) unexpected Packets (next Range)
*Vc* internally maintains its own sequence number of packet order and sequencing. Due to packet retransmission, *Vc* may receive duplicate packets that have the same *Vc* internal sequence number. Only 1 copy is accepted by the *Vc* and other copies of the same packets are detected through this count. This attribute can be used to record the frequency of packet retransmission due to *Vc* and other part of the subnet.

Values: Decimal (0..5000)

Default: No default

### ATTRIBUTE Ipivc Lcn Vc duplicatesFromSubnet

Access: Read only

Description: This attribute counts the number of subnet packets discarded due to duplication. It is used to detect software error fault or duplication caused by retransmitting.

Values: Decimal (0..5000)

Default: No default

### ATTRIBUTE Ipivc Lcn Vc frmRetryTimeouts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which have retransmission time-out.<br>If packets from *Vc* into the subnet are discarded by the subnet, the source *Vc* will not receive any acknowledgment. The retransmission timer then expires and packets will be retransmitted again. Note that the *Vc* idle probe may be retransmitted and is included in this count. This statistics does not show the distribution of how many times packets are retransmitted (e.g. first retransmission results in successful packet forwarding). |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc peakRetryQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of the retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest body of unacknowledged packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc peakOoSeqQueueSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of the out of sequence queue.<br>This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc peakOoSeqFrmForwarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of the sequence packet queue.<br>This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets, which by the receipt of an expected packet have been transformed to expected packets. The number of times this peak is reached is not recorded as it is traffic dependent. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc peakStackedAcksRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak size of wait acks.<br>This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest collective acknowledgment. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc subnetRecoveries

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of successful *Vc* recovery attempts.<br>This attribute is used as an indicator of how many times the *Vc* path is broken but can be recovered. This attribute is useful to record the number of network path failures. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc windowClosuresToSubnet

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of window closures to subnet. A packet may have been sent into the subnet but its acknowledgment from the remote *Vc* has not yet been received. This is a 8 bit sequence number.This number is useful in detecting whether the *Vc* is sending any packet into the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc windowClosuresFromSubnet

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of window closures from subnet. This attribute is useful in detecting whether the *Vc* is receiving any packet from the subnet. |
| Values | Decimal (0..5000) |
| Default | No default |

### ATTRIBUTE Ipivc Lcn Vc wrTriggers

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the number of times the *Vc* stays within the W-R region. The W-R region is a value used to determined the timing of credit transmission. Should the current window size be beneath this value, the credits will be transmitted immediately. Otherwise, they will be transmitted later with actual data. The wrTriggers statistic is therefore used to analyze the flow control and credit mechanism. |
| Values | Decimal (0..5000) |
| Default | No default |

# COMPONENT IuxInterface (IuxIf)

| | |
|---|---|
| Instance | Decimal (1..16383) |
| Groups | "GROUP IuxIf CustomerIdentifierData (CidData)"<br>"GROUP IuxIf Provisioned (Prov)"<br>"GROUP IuxIf OsiState (State)" |
| Scope | Application |
| Description | *IuxInterface/n*<br>This component represents the UTRAN Interface. A particular instance represents either an Iub interface, an Iur Interface, or an Iucs interface.<br>On U-Plane, the *Path* subcomponents represent the individual AAL2 paths within this UTRAN interface.<br>On C-Plane, the *SignallingBearer* components represent the bearers for AAL5 terminated traffic. |
| Opt. Subcomp. | "COMPONENT IuxIf Path"<br>"COMPONENT IuxIf SignallingBearer (Sig)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP IuxIf CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE IuxIf customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP IuxIf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *IuxIf* component. |

### ATTRIBUTE IuxIf commentText

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies an arbitrary string whose use is left to the discretion of the system administrator. It is not used by the system. For example, this attribute could be used to specify the |

| | |
|---|---|
| | type of interface (for example, Iub, Iur, or Iucs) or the name of the Node B, remote RNC, or SGSN endpoint which is logically connected to this Iu interface. |
| Values | String (0..60, ASCII) |
| Default | "" |

### ATTRIBUTE IuxIf loadBalancingMethod (lb)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the load balancing scheme to be used by the system when distributing the paths of this *IuxIf* component across the protocol converter type '*Lp Ap Rnc*' device. The value ***spread*** means the paths of this *IuxIf* component are assigned to the protocol converter in a round-robin fashion. The value ***weighted*** means the paths of this *IuxIf* component are assigned to the protocol converter based on the expected traffic load of this *IuxIf*. The suggested value for SGSN and remote RNC is ***spread***. The suggested value for Node B is ***weighted***. |
| Values | spread<br>weighted |
| Default | weighted |

### ATTRIBUTE IuxIf weight

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the expected traffic load from the far-end equipment attached to this UTRAN interface relative to other interfaces. It is used by the system for load balancing when using the ***weighted*** method. A larger value represents a larger traffic load. |
| Values | Decimal (0..1000) |
| Default | 500 |

## GROUP IuxIf OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE IuxIf adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE IuxIf operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE IuxIf usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### COMPONENT IuxIf Path

Instance
Decimal (1..65535)

Groups
"GROUP IuxIf Path Provisioned (Prov)"
"GROUP IuxIf Path OsiState (State)"
"GROUP IuxIf Path Operational (Oper)"

| | |
|---|---|
| Scope | Application |
| Description | *IuxIf/n Path/n*<br>This component represents an ATM AAL2 path within this UTRAN interface. Each path is associated with an ATM PVC endpoint. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP IuxIf Path Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *Path* component. |

## ATTRIBUTE IuxIf Path atmConnection

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ATM nailed up endpoint that this path will use. For example, *AtmIf/n Vcc/vpi.vci Nep*. |
| Values | Link (Hardware, applicationName) |
| Default | No default |

## ATTRIBUTE IuxIf Path qos

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the QoS (Quality of Service) for this path. |
| Values | Decimal (0..3) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE IuxIf Path pathOwner

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute is used to select the owner of the path according to Q.2630.1. On a path between two RNC nodes, this attribute is used to select the order of CID allocation to reduce the probability of collisions. The RNC node which is configured as the owner of this path allocates CIDs from 8 upwards. The RNC node which is not configured as the owner of this path allocates CIDs from 255 downwards.<br>To reduce the probability of CID collision, the RNCs at each end of an Iur interface should have this attribute set to different values. This attribute is only meaningful to the Iur interface. It is not used by other Iu interfaces. |
| Values | yes<br>no |
| Default | yes |

### GROUP IuxIf Path OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE IuxIf Path adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or |

*Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE IuxIf Path operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE IuxIf Path usageState (osiUsage)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP IuxIf Path Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Path* component. |

### ATTRIBUTE IuxIf Path remoteBlockingStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates if this path is remotely blocked or not within this UTRAN interface. The path is remotely blocked if it is locked by the remote node. |
| Values | blocked<br>unblocked |
| Default | No default |

### ATTRIBUTE IuxIf Path localBlockingStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether this path is locally blocked or not within this UTRAN interface. The path is locally blocked if it is locked by the local node. |

| | |
|---|---|
| Values | blocked<br>unblocked |
| Default | No default |

## COMPONENT IuxIf SignallingBearer (Sig)

| | |
|---|---|
| Instance | Decimal (0..6) |
| Scope | Application |
| Description | *IuxIf/n Sig/n*<br>This component represents the C-Plane part of the UTRAN interface. An instance of it can be the SAAL-UNI connection used for the Iub. |
| Opt. Subcomp. | "COMPONENT IuxIf Sig SaalUni" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## COMPONENT IuxIf Sig SaalUni

| | |
|---|---|
| Groups | "GROUP IuxIf Sig SaalUni OsiState (State)" |
| Scope | Application |
| Description | *IuxIf/n Sig/m SaalUni*<br>This component represents an Signalling ATM Adaptation Layer User-Netowrk Interface for a particular Signalling Bearer within this UTRAN interface. |
| Opt. Subcomp. | "COMPONENT IuxIf Sig SaalUni NailedupAccessPoint (Nap)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP IuxIf Sig SaalUni OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE IuxIf Sig SaalUni adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE IuxIf Sig SaalUni operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE IuxIf Sig SaalUni usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### COMPONENT IuxIf Sig SaalUni NailedupAccessPoint (Nap)

Groups
"GROUP IuxIf Sig SaalUni Nap Provisioned (Prov)"

Scope
Application

Description
*IuxIf/n Sig/m SaalUni Nap*
This component is used to link AAL5 represents an Signalling

| | |
|---|---|
| | ATM Adaptation Layer User-Netowrk Interface for a particular Signalling Bearer within this UTRAN interface. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP IuxIf Sig SaalUni Nap Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *NailedupAccessPoint* component. |

## ATTRIBUTE IuxIf Sig SaalUni Nap atmConnection

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ATM nailed up endpoint that this path will use. For example, *AtmIf/n Vcc/vpi.vci Nep.* |
| Values | Link (Hardware, applicationName) |
| Default | No default |

# COMPONENT Layer2TunnelingProtocolAccessConcentrator (Lac)

| | |
|---|---|
| Instance | Decimal (1..15) |
| Groups | "GROUP Lac Provisioned (Prov)"<br>"GROUP Lac Operational (Oper)"<br>"GROUP Lac CustomerIdentifierData (CidData)" |
| Scope | Application |
| Description | *Layer2TunnelingProtocolAccessConcentrator/n*<br><br>This component represents the Layer 2 Tunneling Protocol (L2TP) functionality on a Logical Processor. This component behaves as an L2TP Access Concentrator (LAC). An instance of this component is provisioned for each Logical Processor that is to have L2TP functionality. |
| Subcomponents | "COMPONENT Lac L2tpNetworkServer (Lns)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lac Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Lac* component. |

### ATTRIBUTE Lac linkToUdpPort (lToPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a link to the *GprsIpServer IpAddress Udp Port* component. The IP address specified becomes the source IP address and the UDP port specified becomes the source port for communication with the external LNS. Changing this value causes the *Lac* to reset its communication links with the *GprsIpServer*. Transactions being processed may be affected. |
| Values | Link (Service, linkToApplication) |
| Default | No default |

### ATTRIBUTE Lac linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the link to a Logical Processor that this *Lac* is to use. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Lac hostName (host)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the host name the *Lac* component uses in communication with the external LNS. The host name will be sent in the Host Name Attribute Value Pair (AVP) and may be used by the external LNS for tunnel authentication. It is recommended that all host names be distinct. |
| Values | String (0..80, ASCII) |
| Default | "" |

### GROUP Lac Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains operational attributes of the LAC. |

### ATTRIBUTE Lac vendorName (vName)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute identifies the vendor name of the L2TP protocol stack. This information is communicated to the external LNS in the Vendor Name Attribute Value Pair (AVP). |
| Values | String (0..255, ASCII) |
| Default | No default |

### ATTRIBUTE Lac firmwareRev (firmRev)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute identifies defines the firmware or software revision for the L2TP protocol stack. This information is communicated to the external LNS in the Firmware Revision Attribute Value Pair (AVP). |
| Values | Decimal (0..2147483646) |
| Default | No default |

### ATTRIBUTE Lac protocolVersion (protoVers)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the supported L2TP protocol version and revision numbers. Supported versions are identified in the form of version.revision. |
| List of | String (3..7, ASCII) |
| List Size | 10 |
| Default | No default |

### GROUP Lac CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lac customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### COMPONENT Lac L2tpNetworkServer (Lns)

| | |
|---|---|
| Groups | "GROUP Lac Lns Provisioned (Prov)"<br>"GROUP Lac Lns TunnelProv (Tunnel)"<br>"GROUP Lac Lns Operational (Oper)"<br>"GROUP Lac Lns TunnelStatistics (TunStats)" |
| Scope | Application |
| Description | *Lac/n L2tpNetworkServer/n*<br><br>This component represents the external L2TP Network Server (LNS) that communicates with the *Lac* component. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP Lac Lns Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains miscellaneous provisionable attributes of the *Lac Lns* component. |

## ATTRIBUTE Lac Lns ipAddress (ipAddr)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP address of the external LNS. The value must not be set to 0.0.0.0. |
| Values | IP address |
| Default | No default |

## ATTRIBUTE Lac Lns udpPort (udpPort)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the UDP port on the external LNS used by this *Lac*. This must match the UDP port provisioned on that LNS. |
| Values | Decimal (0..65535) |
| Default | 1701 |

## ATTRIBUTE Lac Lns useLengthField (useLen)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies if the *Lac* should use a length field in L2TP data messages. The value of ***yes*** should be used when |

compatibility is needed with LNSs that may require the length field to be utilized. Proper operation of L2TP over UDP/IP does not require the length field to be used in data messages.

Values
yes
no

Default
no

### ATTRIBUTE Lac Lns useHiddenAvps (hidAvps)

Access
Read: All
Write: All

Description
This attribute specifies if the *Lac* should use hidden Attribute Value Pairs (AVPs) in the control messages sent to the LNS. The value of ***no*** is used if the LNS does not support hidden AVPs for all control messages. The value of ***yes*** is permitted if *secret* is not empty.

Values
yes
no

Default
no

### ATTRIBUTE Lac Lns snoopAccm (snoop)

Access
Read: All
Write: All

Description
This attribute specifies if the *Lac* should snoop for Asynchronous Control Character Map (ACCM) Link Control Protocol (LCP) packets in the Point-to-Point Protocol (PPP) data stream. Setting this to ***yes*** will allow the L2TP stack to immediately detect any negotiated ACCM changes. This will prevent needlessly dropped PPP packets in the event the LNS's Set Link Info (SLI) message is delayed in transit relative to the time the ACCM negotiation takes effect. Additionally, this option allows operability with LNSs that do not support the L2TP SLI message.

Values
yes
no

Default
yes

### GROUP Lac Lns TunnelProv (Tunnel)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes describing the configuration requirements for both incoming and outgoing tunnel connection attempts. |

### ATTRIBUTE Lac Lns hostName (host)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the host name of the external LNS. This is the host name expected to be sent by the external LNS in the Host Name Attribute Value Pair (AVP) and may be used to authenticate the LNS. |
| Values | String (0..80, ASCII) |
| Default | "" |

### ATTRIBUTE Lac Lns authentication (auth)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies how the *Lac* authenticates the LNS. The value ***none*** indicates that no authentication is performed. The value ***simple*** indicates that peers are authenticated simply by their host name as described in the Host Name AVP. The value ***challenge*** indicates that all peers are challenged to prove their identification. This mechanism is described in the L2TP protocol specification. |
| Values | none<br>simple<br>challenge |
| Default | none |

### ATTRIBUTE Lac Lns secret

| | |
|---|---|
| Access | Read: Illegal<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the shared secret used during the tunnel authentication phase of tunnel establishment. This must match the shared secret provisioned on the LNS. |
| Values | String (0..255, ASCII) |
| Default | "" |

### ATTRIBUTE Lac Lns helloInterval (hello)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the interval in which Hello (or keep-alive) packets are sent by the *Lac* to the external LNS. |
| Values | Decimal (0..3600) |
| Units | seconds |
| Default | 60 |

### ATTRIBUTE Lac Lns idleTimeout (idleTo)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the period of time that an established tunnel between the *Lac* and the external LNS with no active sessions waits before disconnecting the tunnel. A value of zero indicates that the tunnel disconnects immediately after the last session disconnects. A value of -1 leaves the tunnel up indefinitely. |
| Values | Signed (-1..86400) |
| Units | seconds |
| Default | -1 |

### ATTRIBUTE Lac Lns controlRWS (ctlRWS)

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the control channel receive window size for tunnels between the *Lac* and the external LNS. It specifies the maximum number of packets the external LNS can send without waiting for an acknowledgement from the *Lac*. |
| Values | Decimal (1..24) |
| Default | 4 |

### ATTRIBUTE Lac Lns maxRetrans (maxReTx)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of retransmissions which the *Lac* attempts for tunnels to the external LNS before assuming that the LNS is no longer responding. |
| Values | Decimal (4..32) |
| Default | 5 |

### ATTRIBUTE Lac Lns maxRetransTimeout (maxReTxTo)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum retransmission timeout interval which the *Lac* waits before retransmitting a control packet that has not been acknowledged by the external LNS. |
| Values | Decimal (1..32) |
| Units | seconds |
| Default | 16 |

### ATTRIBUTE Lac Lns payloadSequencing (payldSeq)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies whether session payload packets are requested to be sent with sequence numbers from the external LNS. The value ***never*** indicates that the *Lac* never initiates sequencing but does sequencing if asked by the external LNS. |

| | |
|---|---|
| | The value ***always*** indicates that the *Lac* sends the Sequencing Required Attribute Value Pair (AVP) during session establishment. |
| Values | never<br>always |
| Default | always |

### ATTRIBUTE Lac Lns reassemblyTimeout (reasTo)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the time the *Lac* waits before processing payload packets that were received out of sequence. A low value increases the chance of delayed packets to be discarded (which may cause the PPP decompression engine to reset) while a high value may cause more queueing and possibly degrade throughput if packets are truly lost. The default value is zero which will result in all delayed packets being lost. |
| Values | Decimal (0..2147483646) |
| Units | msec |
| Default | 0 |

### GROUP Lac Lns Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Lac Lns* component. |

### ATTRIBUTE Lac Lns lastErrors (lastErrs)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute gives textual descriptions of the last five tunnel errors. Each description is displayed with a result code, an error code, and and may include a message describing the reason or error. |

| | |
|---|---|
| Vector of | String (0..255, ASCII) |
| Index | Decimal (1..5) |
| Default | No default |

### GROUP Lac Lns TunnelStatistics (TunStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains attributes that are used to describe the current status and statistics of tunnels. |

### ATTRIBUTE Lac Lns totalTunnels (totTun)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the tunnels between the *Lac* and the external LNS that have successfully reached the established state. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns failedTunnels (failTun)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the tunnels between the *Lac* and the external LNS that failed to reach the established state. This count includes the failed tunnel authentication attempts as counted by *failedAuthentication.* The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns failedAuthentication (failAuth)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the failed tunnel connection attempts detected locally by the *Lac* and those reported as failed by the external Lns. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns activeTunnels (actTun)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the tunnels that are currently active between the *Lac* and the external LNS. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns totalSessions (totSes)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the sessions that have successfully reached the established state on the tunnels between the *Lac* and the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns failedSessions (failSes)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the sessions that failed to reach the established state on the tunnels between the *Lac* and the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns activeSessions (actSes)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute indicates the sessions that are currently active on the tunnels between the *Lac* and the external LNS. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns controlRecvOctets (ctlRecvOct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the control channel octets received by the *Lac* from the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns controlRecvPackets (ctlRecvPkt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the control channel packets received by the *Lac* from the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns controlSendOctets (ctlSndOct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the contol channel octets that were transmitted by the *Lac* to the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns controlSendPackets (ctlSndPkt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the control packets that were transmitted by the *Lac* to the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns payloadRecvOctets (payRecvOct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload channel octets that were received by the *Lac* from the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns payloadRecvPackets (payRecvPkt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the payload channel packets that were received by the *Lac* from the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns payloadRecvDiscards (payRecvDisc)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the received payload packets that were discarded by the *Lac*. The primary reason for payload packet discards is flow control ocurring due to the difference in the data rates between the slower mobile connection and the faster network connection. Other possible reasons for discards are that payload packets are too big, are badly formed, or are out of sequence. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns payloadSendOctets (paySndOct)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the payload channel octets that were transmitted by the *Lac* to the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lac Lns payloadSendPackets (paySndPkt)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute counts the payload packets that were transmitted by the *Lac* to the external LNS. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

# COMPONENT LineAutomaticProtectionSwitching (Laps)

| | |
|---|---|
| Instance | Decimal (0..15999) |
| Groups | "GROUP Laps CustomerIdentifierData (CidData)"<br>"GROUP Laps Provisioned (Prov)"<br>"GROUP Laps OsiState (State)"<br>"GROUP Laps Operational (Oper)" |
| Scope | Device |
| Description | *AutomaticProtectionSwitching/n*<br>This component manages the line protection of a SONET or SDH interface. Line Automatic Protection Switching (LAPS) can switch traffic from an active line onto a standby line when a failure or degradation occurs on the active line.<br><br>**Note**: The *Lp/n Sonet/m Test* component *or Lp/n Sdh/m Test* component functionality is not supported when that line is provisioned as either working or protection line of the *Laps* component. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Laps Sts"<br>"COMPONENT Laps Vc4" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## VERB PROTECTIONLOCKOUT (PROTLOCK) Laps

| | |
|---|---|
| Impact | Service |
| Description | *ProtectionLockout Laps/n*<br>This command has different behaviors based on the protocol type which is provisioned.<br><br>A) The *protocol* attribute is set to ***standard***:<br><br>This command instructs the *Laps* component to lock out the protection line from being used as the receive active line. If the protection line is active when the *ProtectionLockout* command is entered, the working line is made active even if there is a failure or degradation present on the working line.<br><br>This command is ignored when the following conditions exist:<br><br>1) The *mode* attribute value is set to ***unidirectional*** and a *nearEndRequest* attribute already has a value of ***lockoutOfProtection***.<br>2) The *mode* attribute value is set to ***bidirectional*** and a *nearEndRequest* attribute or *farEndRequest* attribute already has a value of ***lockoutOfProtection***. |

B) The *protocol* attribute is set to ***g841AnnexB***:

This command instructs the *Laps* component to freeze the selector in its current position such that the receive active line cannot be changed. All requests are ignored while this command is in effect. This command is treated as a local request and is not signaled to the far end.

For all protocol types, the command remains in effect until it is cancelled with the *Clear* command. This command can only be issued when the *Laps* component is unlocked.

## VERB SWITCH Laps

| | |
|---|---|
| Impact | Service |
| Description | *Switch [-force] [-workingToProtection] [-protectionToWorking] Laps/n*<br>This command instructs the *Laps* component to switch the *nearEndRxActiveLine* attribute from the working line to the protection line (or vice versa). While this occurring the *nearEndRequest* attribute value is ***manualSwitch***.<br><br>If the *-force* option is specified, the *Laps* component is instructed to switch. The *nearEndRequest* attribute value is ***forcedSwitch.*** The *-force* option must always be used when the *Laps protocol* attribute is set to ***g841AnnexB***.<br><br>The *switch* command, with various options described above, can only be issued if the *Laps* component is unlocked. It remains in effect until it is cancelled either with the *'clear laps/n"* command, or until a higher value for the *nearEndRequest* attribute (or *farEndRequest* attribute if the provisioned *mode* attribute value is set to ***bidirectional***) goes into effect.<br><br>If the *-workingToProtection* option is specified, the *Laps* component switches the *nearEndRxActiveLine* attribute from the working line to the protection line.<br><br>If the *-protectionToWorking* option is specified, the *Laps* component switches the *nearEndRxActiveLine* attribute from the |

protection line to the working line.

This command is ignored when the following conditions exist:

1) An equal or higher priority value for the *nearEndRequest* attribute is already in effect
2) An equal or higher priority value for the *farEndRequest* attribute is already in effect if the provisioned *mode* attribute value is set to ***bidirectional***.
For the list of request priorities refer to the description for the *Laps nearEndRequest* attribute.

This command can only be issued when the *Laps* component is unlocked.

### VERB CLEAR Laps

| | |
|---|---|
| Impact | Service |
| Description | *Clear Laps/n*<br>This command clears the *nearEndRequest* attribute if the value is ***lockoutOfProtection***, ***forcedSwitch***, or ***manualSwitch***.<br><br>This command can only be issued when the *Laps* component is unlocked. |

### GROUP Laps CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Laps customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. |

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Laps Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioned attributes for the *Laps* component. |

### ATTRIBUTE Laps workingLine (working)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is a link to the *Sonet* or *Sdh* component that provides the *Laps* component's working line (working line one in ITU-T G.841 Annex B terms). This attribute must be set.<br><br>The *workingLine* attribute and *protectionLine* attribute pairs must be valid. LAPS (Line Automatic Protection Switching) protection can be configured between paired ports on the card or between corresponding ports on adjacent cards.<br><br>The following semantic checks exist for the *workingLine* and *protectionLine* attributes:<br><br>The *workingLine* and *protectionLine* attributes can link ports on two different LPs (Logical Processor):<br>- the port number must match (that is, port zero on *Lp*/m must |

link to port 0 on *Lp*/n, and so forth).
- the *Sonet* or *Sdh* components specified by the link must not have a *Sts* or *Vc4* component.
- each *Lp* must link to exactly one card (that is, the *spareCard* attribute is not allowed to be set on either *Lp).*
- each *Lp* must link to the same type of card (that is, the *shelf card/n cardType* attribute must be identical for both cards).
- the two cards must be in adjacent slots in the shelf, with the lower-numbered slot being an even number.
- each *Lp* must link to the same *LogicalProcessorType* component.
- if the two lines of the protection pair are on different *Lps*, then the *connectionPoolCapacity* attribute value of the *Lp Eng Arc Ov* components for the two adjacent *Lps* must be the same.

The *workingLine* and *protectionLine* attributes can link to a pair of ports under the same LP (Logical Processor) for the following cards:
- for ***4pOC3SmIrAtm*** and ***4pOC3MmAtm*** cards, the port number pair must be 0-1 or 2-3.
- for the ***1pOC12SmLrAtm*** card, the port number pair must be between the two ports 0-1.

| | |
|---|---|
| Values | Link (Hardware, lineAutomaticProtectionSwitch) |
| Default | No default |

### ATTRIBUTE Laps protectionLine (protection)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is a link to the *Sonet* or *Sdh* component that provides the *Laps*' component protection line (working line two in ITU-T G.841 Annex B terms). This attribute must be set.<br><br>The same rules apply as described in the *workingLine* attribute. |
| Values | Link (Hardware, lineAutomaticProtectionSwitch) |
| Default | No default |

## ATTRIBUTE Laps mode

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the protection mode to use.<br><br>If set to value of ***unidirectional***, the *Laps* component of the near end (NE) can decide independently of the far end (FE) which channel, either working or protection, is active for receive. For this value, the transmit and receive may be on different channels. Therefore, one end may receive from the protection line while the other end receives from the active line.<br><br>If set to ***bidirectional*** value, it instructs the *Laps* component of the NE to decide jointly with the FE which channel, either working or protection, is to be active for receiving. For this value, the transmit and receive are on the same channel. Therefore both ends receive from the same line.<br><br>Note that if either end of the *Laps* component is set to ***unidirectional***, the *Laps* component operates in ***unidirectional*** mode. In other words, ***bidirectional*** mode takes effect if and only if both ends of the *Laps* components are in ***bidirectional*** mode. |
| Values | unidirectional<br>bidirectional |
| Default | unidirectional |

## ATTRIBUTE Laps revertive

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether revertive switching is to be used.<br><br>When this attribute value is set to ***no***, the *Laps* component will not revert the receive active line from protection back to working when a working line request is cleared.<br><br>When this attribute value is set to ***yes***, the *Laps* component will revert the receive active line from protection back to working when a working line request is cleared and after the provisioned |

value of *waitToRestorePeriod* attribute has expired.

Note that it is acceptable for the near end and far end to be provisioned with a mix of revertive and nonrevertive switching; one end can be revertive and the other nonrevertive.

Values
no
yes

Default
no

### ATTRIBUTE Laps holdOffTime (hoTime)

Access
Read and write

Description
This attribute specifies the delay between the detection of a signal failure or signal degradation on the active line and the initiation of a line switchover.

Values
Decimal (0.0..10.0)

Units
seconds

Default
0.0

### ATTRIBUTE Laps waitToRestorePeriod (wtrPeriod)

Access
Read and write

Description
This attribute has a different meaning based on the protocol type provisioned.

A) The *protocol* attribute is set to ***standard***:

This attribute specifies the time (in minutes) during which the protection line remains the receive active line after the working line recovers from the fault that caused the switch. This attribute is only applicable when the *revertive* attribute value is set to ***yes***.

B) The *protocol* attribute is set to ***g841AnnexB***:

This attribute specifies the time (in minutes) after which a Signal Fail or Signal Degrade condition has cleared, but before which the line with the condition is considered in service. Once this

time reaches zero, traffic continues to be received from the current receive active line by swapping the primary and secondary section labels. No line switch takes place.

Values: Decimal (5..12)

Units: minutes

Default: 5

### ATTRIBUTE Laps signalDegradeRatio (sdRatio)

Access: Read and write

Description: This attribute specifies the minimum bit error ratio (BER) for which a signal degradation failure is declared. Its value is the exponent of the BER, which corresponds to a BER range of 10e-5 through 10e-9.

The switch initiation time for a signal degradation varies depending on the observed BER (***not*** the provisioned *signalDegradeRatio*), as described in the following table.

**BER - Switch Initiation Time (OC-3)**
10e-5 - 1 second
10e-6 - 10 seconds
10e-7 - 100 seconds
10e-8 - 16 minutes 40 seconds
10e-9 - 2 hours 46 minutes 40 seconds

The clearing threshold for a signal degradation is one-tenth the value of the *signalDegradeRatio* attribute. For example, if the provisioned *signalDegradeRatio* attribute is ***-5***, the corresponding clearing threshold is 10e-6. The clearing time varies depending on the clearing threshold (***not*** the observed BER), and can be determined from the above table.

Values: Signed (-9..-5)

Default: -5

## ATTRIBUTE Laps mimicAps

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies whether the Mimic APS protocol should be enabled.<br><br>Mimic APS is a Nortel Networks proprietary protocol to allow for an Automatic Protection Switching variant to be used between Passport 15000 FPs and other non-Passport hardware which supports the Mimic APS protocol.<br><br>It currently only supports the following four-port OC3 multi-mode and single-mode FPs: ***4pOC3SmIrAtm*** and ***4pOC3MmAtm***.<br><br>When the *mimicAps* attribute is set to ***enabled***, the Mimic APS protocol is used. The Mimic APS protocol supports only unidirectional non-revertive modes of APS and as such the *mode* and *revertive* attributes must be set to ***unidirectional*** and ***no*** respectively. |
| Values | disabled<br>enabled |
| Default | disabled |

## ATTRIBUTE Laps protocol

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the protocol used to protect the physical interfaces.<br><br>The value ***standard*** indicates that 1+1 linear APS is used, as described in the standards document GR-253 published by Telcordia and G.841 published by the ITU-T.<br><br>The value ***g841AnnexB*** indicates that optimized 1+1 bidirectional switching is used, as described in the standard |

G.841 Annex B published by the ITU-T. This value is only supported on the ***16pOC3SmIrAtm*** card type.

The *mode* attribute must be set to ***bidirectional***, the *revertive* attribute set to ***no***, and the *holdOffTime* attribute set to ***0*** when the *protocol* attribute is set to ***g841AnnexB***.

Values: standard
g841AnnexB

Default: standard

### ATTRIBUTE Laps primarySectionMismatchTime

Access: Read and write

Description: This attribute specifies the time to wait after a primary section mismatch defect is detected/cleared, before raising/clearing an alarm.

A primary section mismatch occurs when the received and transmitted channels in the K2 byte do not match.

This attribute only applies when the *protocol* attribute is set to ***g841AnnexB***.

Values: Decimal (50..1000)

Units: msec

Default: 50

### GROUP Laps OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Laps adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Laps operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the |

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Laps usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Laps availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The

*operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Laps proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been

initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Laps controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is

***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Laps alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Laps standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

| | |
|---|---|
| Values | hotStandby (hot)<br>coldStandby (cold)<br>providingService (serv)<br>notSet (nSet) |
| Default | notSet |

### ATTRIBUTE Laps unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Laps Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Laps* component. |

### ATTRIBUTE Laps nearEndRxActiveLine (neRxLine)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates which near end line is active for receiving data from the far end. |
| Values | protection<br>working |
| Default | No default |

## ATTRIBUTE Laps nearEndRequest (neReq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the request currently being ***transmitted*** to the far end in the SONET/SDH line overhead K1 byte of the protection line. Requests are prioritized so that high priority requests preempt or block those with a lower priority. The possible requests, in order of priority from highest to lowest, are as follows.<br><br>***lockoutOfProtection*** — the working line is prevented from switching to the protection line under any circumstance due to a '*ProtectionLockout Laps/n*' command being in effect.<br><br>***forcedSwitch*** — the line indicated by the attribute *nearEndRequestChannel* has a '*Switch -force laps/n*' command in effect against it. Note that a ***signalFail*** value on the protection line has higher priority than a ***forcedSwitch*** value.<br><br>***signalFail*** — the line indicated by the attribute *nearEndRequestChannel* is experiencing a signal failure (SF). Failures include LOS, LOF, received AIS-L, a signal BER exceeding 10e-3, or a locked *Sonet/Sdh* component. Note that a ***signalFail*** value on the protection line has higher priority than a ***forceSwitch*** value.<br><br>***signalDegrade*** — the line indicated by the attribute *nearEndRequestChannel* is experiencing a signal degradation (SD).<br><br>***manualSwitch*** — the line indicated by the attribute *nearEndRequestChannel* has a *Switch* command in effect against it.<br><br>***waitToRestore*** — the protection line is active, the *revertive* attribute value is ***yes***, and the working line has recovered from a signal failure (SF) or signal degradation (SD). After the period defined by the attribute *waitToRestorePeriod*, the working line automatically reverts to being the receive active line and the *nearEndRequest* attribute value changes to ***noRequest***. |

***reverseRequest*** — the line indicated by the attribute *nearEndRequestChannel* is active due to a request from the far end. This request is only applicable when the provisioned *mode* attribute value is ***bidirectional***.

***doNotRevert*** — the protection line is active, provisioned attribute *revertive* is set to ***no***, and either: (1) the working line has recovered from a *signalFail* or ***signalDegrade***; or (2) a ***forcedSwitch*** or ***manualSwitch*** request has been cleared. The receive active line does not automatically revert to the working line.

***noRequest*** — the working line is active and no other requests are in effect.

Values

lockoutOfProtection
forcedSwitch
signalFail
signalDegrade
manualSwitch
waitToRestore
reverseRequest
doNotRevert
noRequest

Default

No default

### ATTRIBUTE Laps nearEndRequestChannel (neReqChan)

Access

Read only

Description

This attribute indicates to which channel the *nearEndRequest* applies. The protection channel refers to working channel two in ITU-T G.841 Annex B terms.

Values

protection
working

Default

No default

### ATTRIBUTE Laps farEndRequest (feReq)

Access

Read only

Description

This attribute indicates the request currently being ***received*** from the far end in the SONET/SDH line overhead K1 byte of the protection line. Requests are prioritized so that high priority requests preempt or block those with a lower priority. The possible requests, in order of priority from highest to lowest, are as follows.

***lockoutOfProtection*** — indicates the working line is prevented from switching to the protection line under any circumstances due to a *ProtectionLockout* command being in effect in the far end.

***forcedSwitch*** — the line indicated by the attribute *farEndRequestChannel* has a "*Switch -force*" command in effect against it. Note that a ***signalFail*** value on the protection line has higher priority than a ***forcedSwitch*** value.

***signalFail*** — the line indicated by the attribute *farEndRequestChannel* is experiencing a signal failure (SF). Failures include LOS, LOF, received AIS-L, a signal BER exceeding 10e-3, or a locked *Sonet* component. Note that a ***signalFail*** value on the protection line has higher priority than a ***forceSwitch*** value.

***signalDegrade*** — the line indicated by the attribute *farEndRequestChannel* is experiencing a signal degradation (SD).

***manualSwitch*** — the line indicated by the attribute *farEndRequestChannel* has a *Switch* command in effect against it.

***waitToRestore*** — the FE protection line is active, the FE *revertive* attribute value is ***yes***, and the FE working line has recovered from a signal failure (SF) or signal degradation (SD). After the period defined by the attribute *waitToRestorePeriod,* the FE working line automatically reverts to being the receive active line and the *farEndRequest* attribute value changes to ***noRequest***.

***reverseRequest*** — the line indicated by the attribute *farEndRequestChannel* is active due to a request from the far end. This request is only applicable when the provisioned *mode* attribute is set to ***bidirectional***.

***doNotRevert*** — the FE protection line is active, the FE provisioned attribute *revertive* is ***no***, and either: (1) the FE working line has recovered from a *signalFail* or *signalDegrade*; or (2) a *forcedSwitch* or *manualSwitch* request has been cleared in the FE. The receive active line in the will not automatically revert to the working line in the far end.

***noRequest*** — the FE working line is active and no other requests are in effect.

Values
lockoutOfProtection
forcedSwitch
signalFail
signalDegrade
manualSwitch
waitToRestore
reverseRequest
doNotRevert
noRequest

Default
No default

### ATTRIBUTE Laps farEndRequestChannel (feReqChan)

Access
Read only

Description
This attribute indicates to which channel the *farEndRequest* applies. The protection channel refers to working channel two in ITU-T G.841 Annex B terms.

Values
protection
working

Default
No default

### ATTRIBUTE Laps sdOnLines

Access
Read only

Description
This attribute indicates which lines, if any, are currently experiencing a signal degradation (SD).

| | |
|---|---|
| Set of | protection<br>working |
| Default | No default |

### ATTRIBUTE Laps switchovers

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times that a switchover of the active line has occurred since the *Laps* component became active. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Laps timeUntilRestore

| | |
|---|---|
| Access | Read only |
| Description | This attribute has a different meaning based on the protocol type provisioned:<br><br>A) The *protocol* attribute is set to ***standard***:<br><br>This attribute indicates the amount of time until the receive active line is automatically switched back from the protection line to the working line. It is only applicable for a *Laps* component that is provisioned to be revertive, currently has the protection line as the receive active line, and has a *nearEndRequest* attribute value of ***waitToRestore***.<br><br>B) The *protocol* attribute is set to ***g841AnnexB***:<br><br>This attribute indicates the amount of time until the line which previously had a Signal Fail or Signal Degrade condition is considered back in service. Once this time reaches zero, traffic continues to be received from the current receive active line by swapping the primary and secondary section labels. No line switch takes place. |

| | |
|---|---|
| Values | Decimal (0..12) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Laps protocolFailureAlarm (pfAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the *Laps* component is experiencing an APS protocol failure alarm. Protocol failure alarms include the protection switching byte mismatch alarm (code 7011 5270) and the channel mismatch failure alarm (code 7011 5271).<br><br>This attribute does not apply to G.841 Annex B APS. It is filtered out when the *protocol* attribute is set to ***g841AnnexB***. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps modeMismatchAlarm (mmAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the *Laps* component is experiencing a LAPS mode mismatch alarm (code 7011 5272). This alarm indicates either:<br><br>(1) that the far end is operating with a 1:n switching architecture (not supported by Passport), as opposed to 1+1; or<br><br>(2) that the value of the *mode* attribute on the far end is different from the value of the mode attribute on the near end.<br><br>When a mode mismatch occurs: (1) if the far end is operating with a 1:n switching architecture it will operate as 1+1; and (2) if either end has a provisioned *mode* attribute value of ***unidirectional*** then both ends will operate unidirectionally. |

This attribute does not apply to G.841 Annex B APS. It is filtered out when the *protocol* attribute is set to ***g841AnnexB***.

Values
on
off

Default
No default

### ATTRIBUTE Laps primarySectionMismatchAlarm (psmAlarm)

Access
Read only

Description
This attribute indicates whether the *Laps* component is experiencing a primary section mismatch alarm (code 7011 5276). This alarm indicates the primary section indicated in the received K2 byte of the SDH line overhead has not matched the primary section transmitted in the K2 byte for 50 milliseconds.

This attribute does not apply, and will be filtered out, when the *protocol* attribute is set to ***standard***.

Values
on
off

Default
No default

### ATTRIBUTE Laps primarySection (ps)

Access
Read only

Description
This attribute indicates which line is currently labelled as the primary section.

This attribute does not apply, and will be filtered out, when the *protocol* attribute is set to ***standard***.

Values
protection
working

Default
No default

### GROUP Laps Sts Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for the component. |

### ATTRIBUTE Laps Sts applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines which application is running on the path. |
| Values | Link |
| Default | No default |

### GROUP Laps Sts CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Laps Sts customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager |

(referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Values — Decimal (0; 1..8191)

Default — 0

### GROUP Laps Sts OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Laps Sts adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Laps Sts operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Laps Sts usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Laps Sts availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

### ATTRIBUTE Laps Sts proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

### ATTRIBUTE Laps Sts controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Laps Sts alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. |

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Laps Sts standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not

supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Laps Sts unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Laps Sts IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Laps Sts ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Laps Sts ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Laps Sts OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Laps Sts snmpOperStatus

| | |
|---|---|
| Access | Read only |

Description

The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values

up
down
testing

Default

up

## GROUP Laps Sts Operational (Oper)

Properties

Operational

Description

This group contains the common operational data for the component.

## ATTRIBUTE Laps Sts lopAlarm (lop)

Access

Read only

Description

This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the

component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Laps Sts rxAisAlarm (ais)

Access
Read only

Description

This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Laps Sts rxRfiAlarm (rfi)

Access
Read only

Description

This attribute displays whether the Path Remote Failure

Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values

on
off

Default

No default

### ATTRIBUTE Laps Sts signalLabelMismatch (slm)

Access

Read only

Description

This attribute displays whether the Path Signal Label Mismatch (P-SLM) failure condition has been entered. A P-SLM failure condition is entered when P-SLM defects have been observed and accumulated for period of 2.5 seconds +/- 0.5 seconds. A P-SLM defect occurs when detecting an unexpected path signal label. The expected Path signal labels are “Mapping for ATM” or “Equipped - Non Specific Payload”. If the P-SLM defects are intermittently occurring, the P-SLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Signal Label Mismatch failure condition is cleared. The

condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Laps Sts txAis

Access
Read only

Description
This attribute displays whether the Path Alarm Indication Signal (P-AIS) signal is being transmitted on the path. The P-AIS signal is transmitted when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Laps Sts txRdi

Access
Read only

Description
This attribute displays whether the Path Remote Defect Indicator (P-RDI) signal is being transmitted over the path signal. The P-RDI signal is transmitted over the outgoing line upon detection of LOP, P-AIS or the occurrence of the LCD state. This attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default No default

### GROUP Laps Sts Statistics (Stats)

Properties Operational

Description

This group contains the statistics data for the component.

### ATTRIBUTE Laps Sts pathErrorFreeSec (pefs)

Access Read only

Description

This attribute counts the one second intervals that the component has been in a near-end error free state.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Sts pathCodeViolations (pcv)

Access Read only

Description

This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Sts pathErroredSec (pes)

Access Read only

Description

This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Sts pathSevErroredSec (pses)

Access Read only

Description

This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Sts pathAisLopSec (pals)

Access Read only

Description

This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Sts pathUnavailSec (puas)

Access: Read only

Description:

This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Laps Sts pathFailures (pf)

Access: Read only

Description:

This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Laps Sts farEndPathErrorFreeSec (fepefs)

Access: Read only

Description:

This attribute counts the one second intervals that the component has been in a far-end error free state.

The counter wraps to 0 when it exceeds its maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts farEndPathSevErroredSec (fepses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Severely Errored Seconds |

(FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Laps Sts farEndPathAisLopSec (fepals)

Access: Read only

Description:

This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Laps Sts farEndPathUnavailSec (fepuas)

Access: Read only

Description:

This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts farEndPathFailures (fepf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Laps Sts Provisioned (ChProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data for *Sts* components provisioned under *Sonet* components that support channelization.. |

### ATTRIBUTE Laps Sts txPathTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. The path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SONET frames. At the remote end, the path trace is reassembled, and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..64, ASCII) |
| Default | "" |

### ATTRIBUTE Laps Sts expectedRxPathTrace

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..64, ASCII) |
| Default | "" |

### ATTRIBUTE Laps Sts concatNumber

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the STS concatenation level for the *Sts* component on channelized cards. It must be set to a concatenation level supported by the FP upon which the *Sts* is defined, except for non-channelized cards, in which case it must be set to 0. For example, a value of 1 in this attribute would represent STS-1 concatenation, while a value of 3 would represent STS-3c, a value of 12 would represent STS-12c, and so forth. *Sts* channelization to the tributary level is supported only if this attribute is set to 1. |
| Values | Decimal (0; 1; 3; 12; 48) |
| Default | No default |

### COMPONENT Laps Sts AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Laps Sts Cell Provisioned (Prov)"<br>"GROUP Laps Sts Cell Operational (Oper)"<br>"GROUP Laps Sts Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the |

interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

DELete

## GROUP Laps Sts Cell Provisioned (Prov)

Properties: Provisioned

Description

This group contains the provisioning attributes for the *AtmCell* component.

## ATTRIBUTE Laps Sts Cell alarmActDelay (act)

Access: Read and write

Description

This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Values: Decimal (0..2000)

Units: msec

Default: No default

## ATTRIBUTE Laps Sts Cell scrambleCellPayload (scramble)

Access: Read and write

Description

Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Values

off
on

Default

No default

### ATTRIBUTE Laps Sts Cell correctSingleBitHeaderErrors

Access

Read and write

Description

This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values

off
on

Default

off

### ATTRIBUTE Laps Sts Cell clearDelay (clear)

Access

Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the

port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Laps Sts Cell hecSampleInterval (hSample)

Access: Read and write

Description:

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Laps Sts Cell hecErrorLimit (hLimit)

Access: Read and write

Description:

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When

the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Laps Sts Cell lcdStateDelay (delay)

Access: Read and write

Description:

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..50)

Units: msec

Default: No default

### ATTRIBUTE Laps Sts Cell hecErrorIntervalLimit (hIntLimit)

Access: Read and write

Description:

This attribute counts the instances of the *hecSamplingInterval*

attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..25)

Default: 1

## GROUP Laps Sts Cell Operational (Oper)

Properties: Operational

Description:

This group contains the common operational attributes for the *AtmCell* component.

## ATTRIBUTE Laps Sts Cell lcdAlarm (lcd)

Access: Read only

Description:

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component

with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values
on
off

Default
off

## GROUP Laps Sts Cell Statistics (Stats)

Properties
Operational

Description
This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE Laps Sts Cell uncorrectableHeaderErrors (ucErr)

Access
Read only

Description
This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An

OCD defect terminates when six consecutive correct HECs have been detected.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Sts Cell sevErroredSec (ses)

Access Read only

Description

This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Sts Cell receiveCellUtilization (rxutil)

Access Read only

Description

This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen

when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values Decimal (0..100)

Units %

Default 0

### ATTRIBUTE Laps Sts Cell transmitCellUtilization (txutil)

Access Read only

Description

This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values Decimal (0..100)

Units %

Default 0

### ATTRIBUTE Laps Sts Cell correctableHeaderErrors (cErr)

Access Read only

Description

This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected

Values Decimal (0..4294967295)

Default 0

## GROUP Laps Sts Vt1dot5 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE Laps Sts Vt1dot5 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; |

otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP Laps Sts Vt1dot5 OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Laps Sts Vt1dot5 adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is

administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Laps Sts Vt1dot5 operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Laps Sts Vt1dot5 usageState (osiUsage)

Access: Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

### ATTRIBUTE Laps Sts Vt1dot5 availabilityStatus (osiAvail)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is

***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration

activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Laps Sts Vt1dot5 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Laps Sts Vt1dot5 unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Laps Sts Vt1dot5 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Laps Sts Vt1dot5 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Laps Sts Vt1dot5 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |

| | |
|---|---|
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Laps Sts Vt1dot5 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Laps Sts Vt1dot5 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Laps Sts Vt1dot5 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for the component. |

### ATTRIBUTE Laps Sts Vt1dot5 rxAisAlarm

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates whether a Tributary Unit Alarm Indication Signal (TU-AIS) alarm state has been entered. A TU-AIS alarm state is entered when TU-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-AIS defect occurs when three consecutive TU pointers are in the all 1's state. This alarm is cleared after no TU-AIS defect has been detected for 10 seconds +/- 0.5 seconds.

Values

on
off

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 rxRdiAlarm

Access

Read only

Description

This attribute indicates whether a Low Order Path Remote Defect Indicator (LP-RDI) alarm state has been entered. An LP-RDI alarm state is entered when LP-RDI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RDI defect occurs when RDI conditions are detected in five consecutive frames. This alarm is cleared after no LP-RDI defect has been detected for 10 seconds +/- 0.5 seconds.

Values

on
off

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 rxRfiAlarm

Access

Read only

Description

This attribute indicates whether a Low Order Path Remote Failure Indicator (LP-RFI) alarm state has been entered. An LP-RFI alarm state is entered when LP-RFI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RFI defect occurs when a RFI condition is detected. This alarm is cleared after no LP-RFI defect has been detected for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
No default

### ATTRIBUTE Laps Sts Vt1dot5 unequippedAlarm

Access
Read only

Description
This attribute indicates whether a Low Order Path Unequipped (LP-UNEQ) alarm state has been entered. An LP-UNEQ alarm state is entered when LP-UNEQ defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-UNEQ defect occurs when an unequipped condition is detected for five consecutive multi frames. This alarm is cleared after no LP-UNEQ defect has been detected for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
No default

### ATTRIBUTE Laps Sts Vt1dot5 traceIdMismatchAlarm

Access
Read only

Description
This attribute indicates whether a Low Order Path Trace Identification Mismatch (LP-TIM) alarm state has been entered. An LP-TIM alarm state is entered when LP-TIM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-TIM defect occurs when a TIM condition is detected. This alarm is cleared after no LP-TIM defect has been detected for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
No default

### ATTRIBUTE Laps Sts Vt1dot5 lopAlarm

Access
Read only

Description

This attribute indicates whether a Tributary Unit Loss of Pointer (TU-LOP) alarm state has been entered. An TU-LOP alarm state is entered when TU-LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-LOP defect occurs when eight consecutive invalid pointer values or eight consecutive New Data Flag (NDF) pointers are detected. This alarm is cleared after no TU-LOP defect has been detected for 10 seconds +/- 0.5 seconds.

Values

on
off

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 txAis

Access

Read only

Description

This attribute indicates whether the Low order Path Alarm Indication Signal (LP-AIS) is being transmitted on the low order path. The LP-AIS signal is transmitted when the component *adminState* is *locked* or *operationalState* is *disabled* and *availabilityStatus* is *dependency.*

Values

on
off

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 txRdi

Access

Read only

Description

This attribute indicates whether the Low Order Path Remote Defect Indication (LP-RDI) is being transmitted on the low order path. The LP-RDI signal is transmitted upon detection of TU-LOP, TU-AIS, LP-TIM or LP-UNEQ. The value is *off* when the component *adminState* is *locked* or *operationalState* is *disabled* and *availabilityStatus* is *dependency.*

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### GROUP Laps Sts Vt1dot5 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the component. |

### ATTRIBUTE Laps Sts Vt1dot5 pathErrorFreeSec (pefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a near-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 pathAisLopSec (pals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 pathUnavailSec (puas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 farEndPathSevErroredSec (fepses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than $x$ FEPCVs or one or more P-RDI defects. The value of $x$ is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 farEndPathAisLopSec (fepals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 farEndPathUnavailSec (fepuas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 farEndPathFailures (fepf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure). |

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

## COMPONENT Laps Sts Vt1dot5 DS1

Groups:
"GROUP Laps Sts Vt1dot5 DS1 Provisioned (Prov)"
"GROUP Laps Sts Vt1dot5 DS1 CustomerIdentifierData (CidData)"
"GROUP Laps Sts Vt1dot5 DS1 AdminInfo (AdminInfo)"
"GROUP Laps Sts Vt1dot5 DS1 IfEntryProv (IfEntry)"
"GROUP Laps Sts Vt1dot5 DS1 OperationalStatus (OperStatus)"
"GROUP Laps Sts Vt1dot5 DS1 OsiState (State)"
"GROUP Laps Sts Vt1dot5 DS1 Operational (Oper)"
"GROUP Laps Sts Vt1dot5 DS1 Statistics (Stats)"

Scope: Application

Description:
*Lp/n DS3/n DS1/n*
The *DS1* component controls and monitors a DS1 tributary of a channelized DS3 port on a Function Processor that supports channelization of a DS3.

Subcomponents: "COMPONENT Laps Sts Vt1dot5 DS1 Channel (Chan)"

Dyn. Subcomp.: "COMPONENT Laps Sts Vt1dot5 DS1 Test (Test)"

## GROUP Laps Sts Vt1dot5 DS1 Provisioned (Prov)

Properties: Provisioned

Description: This group contains all of the provisioning data for a *DS1* component.

### ATTRIBUTE Laps Sts Vt1dot5 DS1 lineType (lineType)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the framing of the DS1 tributary.<br>***d4*** defines a framing pattern of 12 frames per multiframe.<br>***esf*** defines a framing pattern of 24 frames per multiframe.<br>***d4Cas*** defines a framing pattern of 12 frames per multiframe with channel associated signalling.<br>***esfCas*** defines a framing pattern of 24 frames per multiframe with channel associated signalling.<br>***unframed*** defines an unknown framing pattern for clear channels.<br><br>For the ***4pDS3ChAtm*** card, only ***d4*** and ***esf*** framing patterns are permitted.<br><br>The ***4pDS3ChAal1*** card supports the ***d4*** and ***esf*** framing patterns, as well as ***unframed***. |
| Values | d4<br>esf<br>d4Cas<br>esfCas<br>unframed |
| Default | esf |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 zeroCoding (zeroCoding)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute defines the zero encoding on the DS1 tributary.<br>***bit7Stuffing*** sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8.<br>***none*** does no zero encoding, it does not change any value of the bits in the timeslot. The value ***none*** is compatible with any zero coding scheme which transports all 8 data bits in a timeslot (this would include both ***ami*** and ***b8zs*** values of the *DS1 zeroCoding* attribute). |

| | |
|---|---|
| Values | bit7Stuffing<br>none |
| Default | none |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 clockingSource (clockingSource)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the source of the transmit clock for the DS1 tributary.<br>When the clocking source is ***local***, the crystal on the port generates the clocking for the DS1 tributary.<br>When the clocking source is ***line***, the port synchronizes to the clock from the DS1 tributary.<br>When the clocking source is ***module***, the port's clock synchronizes to the clock provided by the oscillator on the active CP.<br>When the clocking source is ***sameAsDs3***, the Ds1 port's clock synchronizes to the same clock source as that of its parent Ds3 port.<br><br>On a ***1pDS3C*** card, if the *NetworkSynchronization (NS)* component is present, the default value of this attribute will be ***module***; otherwise it will be ***line***.<br><br>On a ***2pDS3cAal*** card, the only valid values are ***local*** and ***module***. If the *NS* component is present, the default value of this attribute will be ***module***; otherwise it will be ***local***.<br><br>On the ***4pDS3Ch***, ***4pDS3ChAtm***, and ***4pDS3ChAal1*** cards, the only valid value is ***sameAsDs3***. This is because a DS1 must have the same clocking source as its parent DS3. |
| Values | local<br>line<br>module<br>sameAsDs3 |
| Default | No default |

### GROUP Laps Sts Vt1dot5 DS1 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Laps Sts Vt1dot5 DS1 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Laps Sts Vt1dot5 DS1 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Laps Sts Vt1dot5 DS1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Laps Sts Vt1dot5 DS1 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Laps Sts Vt1dot5 DS1 operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Laps Sts Vt1dot5 DS1 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 DS1 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 DS1 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 DS1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Laps Sts Vt1dot5 DS1 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for a component in a digital hierarchy interface. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 rxAisAlarm (rxAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds<br>+/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** for the duration of an AIS alarm state.<br>The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds. |

| | |
|---|---|
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 lofAlarm (lofAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (2 out of 5 framing bits in error) have been detected for 3 seconds +/- 0.5 seconds. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state<br>The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 rxRaiAlarm (rxRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds. The RAI alarm is usually an indication that the far end facility is unable to gain synchronization. |

| | |
|---|---|
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 txAisAlarm (txAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the tributary is in a locked state. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 txRaiAlarm (txRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the tributary detects a LOF alarm condition. |
| Values | on<br>off |
| Default | off |

### GROUP Laps Sts Vt1dot5 DS1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common statistical data for a component in a digital hierarchy interface. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of seconds since the tributary was activated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of seconds that the tributary has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of errored seconds the tributary has counted since it was activated. An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of severely errored seconds the tributary has counted since it was activated. A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of severely errored framing seconds the tributary has counted since it was activated A severely errored framing second occurs when a second with one or more Out Of Frame events occurs. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of seconds that the tributary has been in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of CRC-6 errors. These will only be counted when the *lineType* is ***esf***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frame errors. A frame error is an error in the framing bits. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

## COMPONENT Laps Sts Vt1dot5 DS1 Channel (Chan)

| | |
|---|---|
| Instance | Decimal (0..23) |
| Groups | "GROUP Laps Sts Vt1dot5 DS1 Chan Provisioned (Prov)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan CustomerIdentifierData (CidData)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan IfEntryProv (IfEntry)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan OperationalStatus (OperStatus)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan OsiState (State)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan Operational (Oper)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan AdminInfo (AdminInfo)" |
| Scope | Application |
| Description | *Channel*<br>The *Channel* component is configured to control a group of timeslots that form a fractional group on a DS1 or E1 port. Cell-based cards allow only one channel per port, and this is automatically provisioned with all available timeslots. Similarly, the ***1pDS3C*** card type only allows one channel per port, and this is automatically provisioned with all available timeslots. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan timeslotDataRate (dataRate)

Access Read and write

Criticality Component

Description This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.

When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this

attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

| | |
|---|---|
| Values | 56k<br>doNotOverride |
| Default | doNotOverride |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan applicationFramerName

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the link to the software stack. It defines which application is running on top of this hardware component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Laps Sts Vt1dot5 DS1 Chan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID). |

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

| | |
|---|---|
| | An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Laps Sts Vt1dot5 DS1 Chan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Laps Sts Vt1dot5 DS1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |

Description — This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan snmpOperStatus

Access — Read only

Description — The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values — up
down
testing

Default — up

### GROUP Laps Sts Vt1dot5 DS1 Chan OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan usageState (osiUsage)

Access
Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan availabilityStatus (osiAvail)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Laps Sts Vt1dot5 DS1 Chan Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Channel* component. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan actualChannelSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the measured link speed of the *Channel* component. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### GROUP Laps Sts Vt1dot5 DS1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### COMPONENT Laps Sts Vt1dot5 DS1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Laps Sts Vt1dot5 DS1 Chan Test OsiState (State)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan Test Setup (Setup)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V*35, *X21, DS1, E1, DS3, E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Laps Sts Vt1dot5 DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Laps Sts Vt1dot5 DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Laps Sts Vt1dot5 DS1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Laps Sts Vt1dot5 DS1 Chan Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).<br>***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). |

Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test frmPatternType (fpt)

Access
Read and write

Description
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.
***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.
***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.

| | |
|---|---|
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be |

| | |
|---|---|
| | no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Laps Sts Vt1dot5 DS1 Chan Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. |

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values

testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

| | |
|---|---|
| Default | neverStarted |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test bitErrorRate

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |

| | |
|---|---|
| Units | minutes |
| Default | 0.00 |

### COMPONENT Laps Sts Vt1dot5 DS1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Laps Sts Vt1dot5 DS1 Chan Cell Provisioned (Prov)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan Cell Operational (Oper)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Laps Sts Vt1dot5 DS1 Chan Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is |

| | |
|---|---|
| | necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.<br><br>Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm. |

| | |
|---|---|
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell clearDelay (clear)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..60) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell hecSampleInterval (hSample)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |

Default 0

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell hecErrorLimit (hLimit)

Access Read and write

Description This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values Decimal (1..250000)

Default No default

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell lcdStateDelay (delay)

Access Read and write

Description This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values Decimal (1..50)

Units msec

Default No default

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

### GROUP Laps Sts Vt1dot5 DS1 Chan Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.<br>In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected. |

For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values: on
off

Default: off

## GROUP Laps Sts Vt1dot5 DS1 Chan Cell Statistics (Stats)

Properties: Operational

Description: This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell uncorrectableHeaderErrors (ucErr)

Access: Read only

Description: This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.<br><br>Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Laps Sts Vt1dot5 DS1 Chan TrunkConditioning (Tc)

| | |
|---|---|
| Groups | "GROUP Laps Sts Vt1dot5 DS1 Chan Tc Provisioned (Prov)"<br>"GROUP Laps Sts Vt1dot5 DS1 Chan Tc Operational (Op)" |
| Scope | Device |
| Description | *Lp/n Ds1/n Chan/n Tc*<br>*Lp/n E1/n Chan/n Tc*<br>*Lp/n Ds3/n Ds1/n Chan/n Tc* |

*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*
*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*
*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*
*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

## GROUP Laps Sts Vt1dot5 DS1 Chan Tc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all specific provisioning data for a *Tc* component. |

## ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Tc replacementData (data)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.<br><br>The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:<br>DS1 MUX Out Of Service Code = 0x1A<br>E1 MUX Out Of Service Code = 0xFF<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.<br><br>On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***. |
| Values | Hex (H.0..H.ff) |
| Units | Hex |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Tc signalOneDuration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.<br><br>If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.<br><br>The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Tc noServiceResponse (resp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:<br><br>***autoConfigure*** - automatically configure the channels response.<br>***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.<br>***ais*** - transmit AIS in the egress direction.<br>***noResponse*** - no response is sent in the egress direction.<br><br>A value of ***autoConfigure*** will result in TC being transmitted for all card types. |
| Values | autoConfigure<br>tc<br>ais<br>noResponse |

| | |
|---|---|
| Default | autoConfigure |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Tc signalOne (sigOne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Tc signalTwo (sigTwo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### GROUP Laps Sts Vt1dot5 DS1 Chan Tc Operational (Op)

| | |

## VERB START Laps Sts Vt1dot5 DS1 Test

Impact
Service

Description
This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

### VERB STOP Laps Sts Vt1dot5 DS1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Laps Sts Vt1dot5 DS1 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Laps Sts Vt1dot5 DS1 Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).<br>***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).<br>Note that not all test types are not supported by all function |

processors.

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test frmPatternType (fpt)

Access
Read and write

Description
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.
***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.
***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.

| | |
|---|---|
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be |

| | |
|---|---|
| | no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Laps Sts Vt1dot5 DS1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time |

specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values

testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

| | |
|---|---|
| Default | neverStarted |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. |

For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

| | |
|---|---|
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Laps Sts Vt1dot5 DS1 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

## COMPONENT Laps Vc4

| | |
|---|---|
| Instance | Decimal (0..3) |
| Groups | "GROUP Laps Vc4 Provisioned (Prov)"<br>"GROUP Laps Vc4 CustomerIdentifierData (CidData)"<br>"GROUP Laps Vc4 OsiState (State)"<br>"GROUP Laps Vc4 IfEntryProv (IfEntry)"<br>"GROUP Laps Vc4 OperationalStatus (OperStatus)"<br>"GROUP Laps Vc4 Operational (Oper)"<br>"GROUP Laps Vc4 Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n Sdh/n Vc4/n*<br>*Laps/n Vc4/n*<br>This component controls a *Vc4* path signal that is carried within an SDH signal. The *Vc4* component may only be defined on Passport 15000 cards that support STM and the 2pSTM1eCh card on the Passport 7000. |
| Opt. Subcomp. | "COMPONENT Laps Vc4 AtmCell (Cell)"<br>"COMPONENT Laps Vc4 Vc12" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Laps Vc4 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for the component. |

## ATTRIBUTE Laps Vc4 applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines which application is running on the path. |

| | |
|---|---|
| Values | Link |
| Default | No default |

### ATTRIBUTE Laps Vc4 pathTraceLength

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transmitted path trace message length. The *pathTraceLength* attribute at transmitting and receiving end must match. |
| Values | 16<br>64 |
| Default | 16 |

### ATTRIBUTE Laps Vc4 txPathTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. If *pathTraceLength* is 16, the path identifier is prefixed with a CRC byte and padded by null characters if necessary to form a 16-octet path trace message transmitted in byte J1 of 16 outgoing SDH frames. If *pathTraceLength* is 64, the path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SDH frames. At the remote end, the path trace is reassembled, the CRC is checked if necessary and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued.<br><br>Usage guidelines for path trace message are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..64, Extended ASCII) |
| Default | "" |

### ATTRIBUTE Laps Vc4 expectedRxPathTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..64, Extended ASCII) |
| Default | "" |

### ATTRIBUTE Laps Vc4 concatNumber

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of contiguous Administration Unit 4 (AU-4) concatenated together. AU-4s can be concatenated together to form an AU-4-4c or AU-4-16c (4 or 16 concatenated AU-4s) which can transport payloads requiring greater capacity than one Container-4 capacity.<br><br>Only *Vc4/0* can have *concatNumber* set to 16 and only *Vc4/0*, *Vc4/4*, *Vc4/8* or *Vc4/12* can have *concatNumber* set to 4.<br><br>When a *Vc4* uses concatenation, the other concatenated *Vc4* instance number cannot be used. For example, if *Vc4/0 concatNumber* is 4, the next provisionable *Vc4* is *Vc4/4*.<br><br>*Vc4* channelization, indicated by provisioning subcomponents such as *Vc12*, is allowed only if this attribute is set to 1. This value must be set to 0 for card types which do not support the use of this attribute. |
| Values | 0<br>1<br>4<br>16 |

| | |
|---|---|
| Default | No default |

### GROUP Laps Vc4 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Laps Vc4 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Laps Vc4 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every |

component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Laps Vc4 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Laps Vc4 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be |

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Laps Vc4 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Laps Vc4 availabilityStatus (osiAvail)

Access
Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is

one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Laps Vc4 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has

not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Laps Vc4 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but

tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Laps Vc4 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Laps Vc4 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the

role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Laps Vc4 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Laps Vc4 IfEntryProv (IfEntry)

Properties
Provisioned

Description
This group contains the provisionable attributes for the ifEntry.

### ATTRIBUTE Laps Vc4 ifAdminStatus (ifState)

Access
Read and write

Description
The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Laps Vc4 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Laps Vc4 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Laps Vc4 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Laps Vc4 Operational (Oper)

| | |
|---|---|
| Properties | Operational |

Description This group contains the common operational data for the component.

### ATTRIBUTE Laps Vc4 lopAlarm (lop)

Access Read only

Description This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values on
off

Default No default

### ATTRIBUTE Laps Vc4 rxAisAlarm (ais)

Access Read only

Description This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one’s in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect

accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Laps Vc4 rxRfiAlarm (rfi)

Access
Read only

Description
This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 signalLabelMismatch (slm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Path Signal Label Mismatch (P-SLM) failure condition has been entered. A P-SLM failure condition is entered when P-SLM defects have been observed and accumulated for period of 2.5 seconds +/- 0.5 seconds. A P-SLM defect occurs when detecting an unexpected path signal label. The expected Path signal labels are “Mapping for ATM” or “Equipped - Non Specific Payload”. If the P-SLM defects are intermittently occurring, the P-SLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The component goes into an operational state of *disabled* until the Path Signal Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.<br><br>The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 txAis

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Path Alarm Indication Signal (P-AIS) signal is being transmitted on the path. The P-AIS signal is transmitted when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 txRdi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Path Remote Defect Indicator (P-RDI) signal is being transmitted over the path signal. The P-RDI signal is transmitted over the outgoing line upon detection of LOP, P-AIS or the occurrence of the LCD state. This attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |
| Values | on<br>off |
| Default | No default |

### GROUP Laps Vc4 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the component. |

### ATTRIBUTE Laps Vc4 pathErrorFreeSec (pefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a near-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 pathAisLopSec (pals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 pathUnavailSec (puas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Laps Vc4 farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Laps Vc4 farEndPathSevErroredSec (fepses)

Access Read only

Description This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Vc4 farEndPathAisLopSec (fepals)

Access Read only

Description This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Laps Vc4 farEndPathUnavailSec (fepuas)

Access Read only

Description This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals

where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Laps Vc4 farEndPathFailures (fepf)

Access: Read only

Description: This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### COMPONENT Laps Vc4 AtmCell (Cell)

Groups:
"GROUP Laps Vc4 Cell Provisioned (Prov)"
"GROUP Laps Vc4 Cell Operational (Oper)"
"GROUP Laps Vc4 Cell Statistics (Stats)"

Scope: Device

Description: The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

Common Verbs:

DELete

## GROUP Laps Vc4 Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

## ATTRIBUTE Laps Vc4 Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

## ATTRIBUTE Laps Vc4 Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Laps Vc4 Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.<br><br>Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Laps Vc4 Cell clearDelay (clear)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..60) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Cell hecSampleInterval (hSample)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Cell hecErrorLimit (hLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..250000) |
| Default | No default |

### ATTRIBUTE Laps Vc4 Cell lcdStateDelay (delay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..50) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Laps Vc4 Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

## GROUP Laps Vc4 Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

## ATTRIBUTE Laps Vc4 Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.<br>In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.<br>For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.<br>If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle<br>The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.<br>The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked. |
| Values | on<br>off |
| Default | off |

## GROUP Laps Vc4 Cell Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

## ATTRIBUTE Laps Vc4 Cell uncorrectableHeaderErrors (ucErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Laps Vc4 Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects. |

| | |
|---|---|
| | Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Cell transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

## ATTRIBUTE Laps Vc4 Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT Laps Vc4 Vc12

| | |
|---|---|
| Instance | k [Decimal (1..3)]<br>l [Decimal (1..7)]<br>m [Decimal (1..3)] |
| Groups | "GROUP Laps Vc4 Vc12 Provisioned (Prov)"<br>"GROUP Laps Vc4 Vc12 CustomerIdentifierData (CidData)"<br>"GROUP Laps Vc4 Vc12 OsiState (State)"<br>"GROUP Laps Vc4 Vc12 IfEntryProv (IfEntry)"<br>"GROUP Laps Vc4 Vc12 OperationalStatus (OperStatus)"<br>"GROUP Laps Vc4 Vc12 Operational (Oper)"<br>"GROUP Laps Vc4 Vc12 Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n Sdh/n Vc4/n Vc12/k,l,m*<br>This component controls the *Vc12* low order path signal that is carried within an SDH signal. The *Vc12* component may only be defined on Passport 15000 cards that support STM and the 2pSTM1eCh card on the Passport 7000. |

## GROUP Laps Vc4 Vc12 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for the component. |

## ATTRIBUTE Laps Vc4 Vc12 txPathTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the low order path identifier. The string must be constructed with 7-bit characters only. The path identifier is prefixed with a CRC byte and padded by null characters if necessary to form a 16-octet path trace message transmitted in byte J2 of 16 outgoing SDH frames. At the remote end, the path trace is reassembled, the CRC is checked and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected and the *expectedRxPathTrace* attribute is not an empty string (default value), an alarm is issued.<br><br>Usage guidelines for path trace message are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.<br><br>The functionality supported by this attribute is available on the *4pOC3Ch* functional processor. |
| Values | String (0..15, Extended ASCII) |

Default ""

### ATTRIBUTE Laps Vc4 Vc12 expectedRxPathTrace

Access Read and write

Description This attribute specifies the expected path trace identifier which is used to identify the low order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. If an empty string (default value) is provisioned, the Low Order Path Trace Identification Mismatch (LP-TIM) defect is ignored.

The functionality supported by this attribute is available on the *4pOC3Ch* functional processor.

Values String (0..15, Extended ASCII)

Default ""

### GROUP Laps Vc4 Vc12 CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE Laps Vc4 Vc12 customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Values — Decimal (0; 1..8191)

Default — 0

### GROUP Laps Vc4 Vc12 OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Laps Vc4 Vc12 adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Laps Vc4 Vc12 operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Laps Vc4 Vc12 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Laps Vc4 Vc12 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be

applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest

## ATTRIBUTE Laps Vc4 Vc12 proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |

### ATTRIBUTE Laps Vc4 Vc12 controlStatus (osiCntrl)

Access Read only

Description If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default No default

### ATTRIBUTE Laps Vc4 Vc12 alarmStatus (osiAlarm)

Access Read only

Description If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Laps Vc4 Vc12 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Laps Vc4 Vc12 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

| | |
|---|---|
| Default | false |

### GROUP Laps Vc4 Vc12 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Laps Vc4 Vc12 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Laps Vc4 Vc12 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Laps Vc4 Vc12 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Laps Vc4 Vc12 snmpOperStatus

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Laps Vc4 Vc12 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for the component. |

### ATTRIBUTE Laps Vc4 Vc12 rxAisAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Tributary Unit Alarm Indication Signal (TU-AIS) alarm state has been entered. A TU-AIS alarm state is entered when TU-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-AIS defect occurs when three consecutive TU pointers are in the all 1's state. This alarm is cleared after no TU-AIS defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 rxRdiAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Remote Defect Indicator (LP-RDI) alarm state has been entered. An LP-RDI alarm state is entered when LP-RDI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RDI defect occurs when RDI conditions are detected in five |

consecutive frames. This alarm is cleared after no LP-RDI defect has been detected for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
No default

### ATTRIBUTE Laps Vc4 Vc12 rxRfiAlarm

Access
Read only

Description
This attribute indicates whether a Low Order Path Remote Failure Indicator (LP-RFI) alarm state has been entered. An LP-RFI alarm state is entered when LP-RFI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RFI defect occurs when a RFI condition is detected. This alarm is cleared after no LP-RFI defect has been detected for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
No default

### ATTRIBUTE Laps Vc4 Vc12 rxReiAlarm

Access
Read only

Description
This attribute indicates whether a Low Order Path Remote Error Indicator (LP-REI) alarm state has been entered. An LP-REI alarm state is entered when LP-REI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-REI defect occurs when a REI condition is detected. This alarm is cleared after no LP-REI defect has been detected for 10 seconds +/- 0.5 seconds.

Values

### ATTRIBUTE Laps Vc4 Vc12 bip2Alarm

Access
Read only

| | |
|---|---|
| Description | This attribute indicates whether a Low Order Path Error Monitoring (BIP-2) alarm state has been entered. An BIP-2 alarm state is entered when BIP-2 defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The BIP-2 defect occurs when a mismatch between the calculated and received BIP-2 is detected. This alarm is cleared after no BIP-2 defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 unequippedAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Unequipped (LP-UNEQ) alarm state has been entered. An LP-UNEQ alarm state is entered when LP-UNEQ defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-UNEQ defect occurs when an unequipped condition is detected for five consecutive multi frames. This alarm is cleared after no LP-UNEQ defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 traceIdMismatchAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Trace Identification Mismatch (LP-TIM) alarm state has been entered. An LP-TIM alarm state is entered when LP-TIM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-TIM defect occurs when a TIM condition is detected. This alarm is cleared after no LP-TIM defect has been detected for 10 seconds +/- 0.5 seconds. |

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 lopAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Tributary Unit Loss of Pointer (TU-LOP) alarm state has been entered. An TU-LOP alarm state is entered when TU-LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-LOP defect occurs when eight consecutive invalid pointer values or eight consecutive New Data Flag (NDF) pointers are detected. This alarm is cleared after no TU-LOP defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 txAis

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the Low order Path Alarm Indication Signal (LP-AIS) is being transmitted on the low order path. The LP-AIS signal is transmitted when the component *adminState* is ***locked*** or *operationalState* is ***disabled*** and *availabilityStatus* is *dependency.* |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 txRdi

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the Low Order Path Remote Defect Indication (LP-RDI) is being transmitted on the low order path. The LP-RDI signal is transmitted upon detection of TU- |

LOP, TU-AIS, LP-TIM or LP-UNEQ. The value is ***off*** when the component *adminState* is ***locked*** or *operationalState* is ***disabled*** and *availabilityStatus* is ***dependency***.

Values
on
off

Default
No default

## GROUP Laps Vc4 Vc12 Statistics (Stats)

Properties
Operational

Description
This group contains the statistics data for the component.

## ATTRIBUTE Laps Vc4 Vc12 pathErrorFreeSec (pefs)

Access
Read only

Description
This attribute counts the one second intervals that the component has been in a near-end error free state.

The counter wraps to 0 when it exceeds its maximum value.

Values
Decimal (0..4294967295)

Default
0

## ATTRIBUTE Laps Vc4 Vc12 pathCodeViolations (pcv)

Access
Read only

Description
This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.

The counter wraps to 0 when it exceeds its maximum value.

Values
Decimal (0..4294967295)

Default
0

### ATTRIBUTE Laps Vc4 Vc12 pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 pathAisLopSec (pals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 pathUnavailSec (puas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 farEndPathSevErroredSec (fepses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 farEndPathAisLopSec (fepals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 farEndPathUnavailSec (fepuas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 farEndPathFailures (fepf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure). |

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

## COMPONENT Laps Vc4 Vc12 E1

Groups:
"GROUP Laps Vc4 Vc12 E1 Provisioned (Prov)"

"GROUP Laps Vc4 Vc12 E1 Operational (Oper)"
"GROUP Laps Vc4 Vc12 E1 E1Operational (E1Oper)"
"GROUP Laps Vc4 Vc12 E1 Statistics (Stats)"

Scope: Device

Description:
*Lp/n E1/n*
*Lp/n Sdh/i Vc4/j Vc12/k,l,m E1*
The *E1* component controls and monitors an E1 port or tributary on a Function Processor. The number of ports supported depends on the type of card, and is usually encoded in the *Shelf Card/n cardType*, for example 4pE1Aal1: 4 port. The lowest instance value is usually ***0***, except for the ***32pE1Aal*** card when it is ***1***. No instance value is used when the E1 is a STM tributary. Multi-Service cards have an instance range 0..31, except that instance values 30 and 31 are not available for an “ATM UNI port”. (An E1 “ATM UNI port” is an *E1* component with a single *Chan* whose *applicationFramerName* attribute is linked to an *AtmIf* component.)

The instance number of an *E1* “ATM UNI port” must not be the same as the instance number of an *IMA* group under the same *Lp*.

## GROUP Laps Vc4 Vc12 E1 Provisioned (Prov)

Properties Provisioned

Description This group contains all of the provisioning data for an E1 component.

## ATTRIBUTE Laps Vc4 Vc12 E1 lineType (lineType)

Access Read and write

Description This attribute specifies the framing of the E1 line.
When ***cas*** (channel associated signalling) is selected, timeslot 16 is reserved for multiframe signalling and only 30 timeslots are available for data. The signalling bits are not interpreted.
When ***ccs*** (common channel signalling) is selected, timeslot 16 is not reserved for multiframe signalling and 31 timeslots are available for data. The signalling bits are not interpreted.
When ***unframed*** is selected, a clear channel is defined whereby data from all timeslots including the framing data (in timeslot 0) and timeslot 16 are passed transparently. This value is valid only for AAL1 cards.

For cell-based cards the ATM Forum specifies that timeslot 16 be reserved, leaving 30 timeslots available for data.
The ***8pE1Atm*** and ***1pStm1ChSmIr*** cards support the ***ccs*** value

only. The ***4pOC3ChSmIr*** card only supports the ***ccs*** and ***unframed*** values. For both these cards, the default value is ***ccs***. For all other cards, the default value is ***cas***.

Values
ccs
cas
unframed

Default
No default

### ATTRIBUTE Laps Vc4 Vc12 E1 clockingSource (clockingSource)

Access
Read and write

Description
This attribute defines the source of the transmit clock for the E1 line.

When ***local*** is selected, the crystal on the port generates the clocking for the line.

When ***line*** is selected, the port synchronizes to the clock from the facility.

When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP.

When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***.

When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network.

When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network.

A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured***

If the *NetworkSynchronization* component is present, the default

value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pE1Atm*** card, which it defaults to ***local***.
On a ***3pE1Atm*** card all ports must have the same value, and be either ***local*** or ***module***.

***otherPort*** is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards.

On ***4E1Aal1*** cards either:

all four ports' *clockingSource* values must be ***local*** OR
all four ports' *clockingSource* values must be ***module*** OR
one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. A port can only have ***srtsMode*** selected if the other ports are ***module*** or ***srtsMode***.

Values
local
line
module
otherPort
srtsMode
adaptiveMode

Default
No default

## ATTRIBUTE Laps Vc4 Vc12 E1 crc4Mode

Access
Read and write

Description
This attribute defines whether the CRC-4 checking and generation on the E1 line is enabled or disabled.

The default CRC-4 mode is ***off*** except for the cell-based cards which default to ***on*** as per the ATM Forum.

Values
on
off

Default
No default

## ATTRIBUTE Laps Vc4 Vc12 E1 sendRaiOnAis

Access
Read and write

| | |
|---|---|
| Description | This attribute defines whether the Remote Alarm Indicator (RAI) will be sent when receiving an AIS alarm. The value is ***yes*** by default; it can be changed to ***no*** only for ports on J2MV cards. |
| Values | no<br>yes |
| Default | yes |

### ATTRIBUTE Laps Vc4 Vc12 E1 raiDeclareAlarmTime

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the period of time that a Remote Alarm Indicator (RAI) must be present before declaring an RAI alarm. The value of ***auto*** sets the RAI declare time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiClearAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used. |
| Values | Decimal (1..20000)<br>auto |
| Units | msec |
| Default | 100 |

### ATTRIBUTE Laps Vc4 Vc12 E1 raiClearAlarmTime

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the period of time that a Remote Alarm Indicator (RAI) has been absent before clearing an RAI alarm. The value of ***auto*** sets the RAI clear time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiDeclareAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used. |

| | |
|---|---|
| Values | Decimal (1..20000)<br>auto |
| Units | msec |
| Default | 100 |

### ATTRIBUTE Laps Vc4 Vc12 E1 ssmE1SaNumber

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which of the five available Sa bits (Sa4 to Sa8) recommended in ITU G.704 is to be used for Synchronization Status Messages (SSM). If set to ***none***, the transmission of SSM is disabled on this port. |
| Values | Decimal (4..8)<br>none |
| Default | none |

### GROUP Laps Vc4 Vc12 E1 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Laps Vc4 Vc12 E1 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. |

| | |
|---|---|
| | An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Laps Vc4 Vc12 E1 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Laps Vc4 Vc12 E1 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Laps Vc4 Vc12 E1 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Laps Vc4 Vc12 E1 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Laps Vc4 Vc12 E1 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Laps Vc4 Vc12 E1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Laps Vc4 Vc12 E1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

Default up

## GROUP Laps Vc4 Vc12 E1 OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Laps Vc4 Vc12 E1 adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

## ATTRIBUTE Laps Vc4 Vc12 E1 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Laps Vc4 Vc12 E1 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Laps Vc4 Vc12 E1 availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Laps Vc4 Vc12 E1 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Laps Vc4 Vc12 E1 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE Laps Vc4 Vc12 E1 alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Laps Vc4 Vc12 E1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the

resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Laps Vc4 Vc12 E1 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Laps Vc4 Vc12 E1 Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for a component in a digital hierarchy interface.

### ATTRIBUTE Laps Vc4 Vc12 E1 losAlarm (losAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOS alarm state.<br>The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Laps Vc4 Vc12 E1 rxAisAlarm (rxAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's density of at least 99.9% is present for a time T, where 3 ms ≤ T ≤ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all |

measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Laps Vc4 Vc12 E1 lofAlarm (lofAlarm)

Access
Read only

Description
This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds).
If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Laps Vc4 Vc12 E1 rxRaiAlarm (rxRaiAlarm)

Access
Read only

Description
This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**,

and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time).
The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

Values: on
off

Default: off

### ATTRIBUTE Laps Vc4 Vc12 E1 txAisAlarm (txAisAlarm)

Access: Read only

Description: This attribute displays whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the port is in a locked state.

Values: on
off

Default: off

### ATTRIBUTE Laps Vc4 Vc12 E1 txRaiAlarm (txRaiAlarm)

Access: Read only

Description: This attribute displays whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the port detects a LOF alarm condition (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: RAI is transmitted when the port detects a LOS, LOF, or AIS condition).

Values: on
off

Default off

### GROUP Laps Vc4 Vc12 E1 E1Operational (E1Oper)

Properties Operational

Description This group contains all of the operational data for a E1 component that are not defined in the DSCommonOp group.

### ATTRIBUTE Laps Vc4 Vc12 E1 multifrmLofAlarm (multiLofAlarm)

Access Read only

Description This attribute indicates whether a multiframe LOF (loss of frame) alarm state is entered. A multiframe LOF alarm state is entered when a multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe LOF defects are intermittently occurring, the multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds. When the multiframe LOF alarm is on, a multiframe RAI alarm indicator is transmitted on the line.

The ***8pE1Atm*** card does not support the multiframe LOF alarm.

Values on
off

Default off

### ATTRIBUTE Laps Vc4 Vc12 E1 rxMultifrmRaiAlarm (rxMultiRaiAlarm)

Access Read only

Description This attribute displays whether a multiframe RAI (remote alarm indicator) alarm state has been entered. A multiframe RAI alarm state is entered when a multiframe RAI alarm indicator (bit 6 of timeslot 16 in frame 0 is set to a one) is observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe RAI indicator is intermittently received, the multiframe RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all

measurements based on a 200 ms polling cycle.
The multiframe RAI alarm condition is cleared when the multiframe RAI alarm indication is not received for 10 seconds +/- 0.5 seconds. The multiframe RAI alarm is usually an indication that the far end facility is unable to gain multiframe synchronization.

The ***8pE1Atm*** card does not support the multiframe RAI alarm.

Values: on
off

Default: off

### ATTRIBUTE Laps Vc4 Vc12 E1 txMultifrmRaiAlarm (txMultiRaiAlarm)

Access: Read only

Description: This attribute displays whether a multiframe RAI (remote alarm indicator) alarm is being sent on the E1 line. This is transmitted when the E1 port detects a multiframe LOF condition.

The ***8pE1Atm*** card does not generate the multiframe RAI alarm.

Values: on
off

Default: off

### ATTRIBUTE Laps Vc4 Vc12 E1 ssmE1Tx

Access: Read only

Description: This attribute indicates the current Synchronization Status Message (SSM) transmitted on the E1 port within the Sa byte defined in ITU G.704.
This attribute is filtered when *ssmE1SaNumber* is set to ***none***.

Values: Decimal (0..15)

Default: No default

### ATTRIBUTE Laps Vc4 Vc12 E1 multifrmCRC4LofAlarm (multiCRC4LofAlarm)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates whether E1 CRC-4 multiframe LOF (loss of frame) alarm state is entered. A CRC-4 multiframe LOF alarm state is entered when a CRC-4 multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the CRC-4 multiframe LOF defects are intermittently occurring, the CRC-4 multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds.<br>The *multifrmCRC4LofAlarm* is not implemented for the ***E1***, ***1pE1V***, ***1pE1Mvp***, ***1pE1Mvpe***, ***4pE1Mvpe***, ***8pE1Atm***, ***E1C*** and ***4pE1Aal1*** cards. |
| Values | on<br>off |
| Default | off |

### GROUP Laps Vc4 Vc12 E1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common statistical data for a component in a digital hierarchy interface. |

### ATTRIBUTE Laps Vc4 Vc12 E1 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds since the port component was activated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds that the port has been in an error free state. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored framing second occurs when a second with one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | The total number of seconds that the interface is in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 bpvErrors (bpvErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of Bipolar Violations. A bipolar violation is an error in the alternate mark inversion pattern (AMI) on the line. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |
| Description | If the interface is a DS1 line, it is the current count of CRC-6 errors. These will only be counted when the lineType is ESF. If the interface is an E1 line, it is the total number of CRC-4 errors. These will only be counted when crc4Mode is on. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of frame errors. A frame error is an error in the framing bits |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 losStateChanges (losChanges)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line lost signal. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. This attribute is incremented for ports on the voice cards (for example the 1pDS1V and the 1pE1V function processors) only. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Laps Vc4 Vc12 E1 Channel (Chan)

| | |
|---|---|
| Instance | Decimal (0..31) |
| Groups | "GROUP Laps Vc4 Vc12 E1 Chan Provisioned (Prov)"<br>"GROUP Laps Vc4 Vc12 E1 Chan CustomerIdentifierData (CidData)"<br>"GROUP Laps Vc4 Vc12 E1 Chan IfEntryProv (IfEntry)"<br>"GROUP Laps Vc4 Vc12 E1 Chan OperationalStatus (OperStatus)"<br>"GROUP Laps Vc4 Vc12 E1 Chan OsiState (State)"<br>"GROUP Laps Vc4 Vc12 E1 Chan Operational (Oper)"<br>"GROUP Laps Vc4 Vc12 E1 Chan AdminInfo (AdminInfo)" |
| Scope | Application |
| Description | *Channel*<br>The *Channel* component is configured to control a group of timeslots that form a fractional group on a DS1 or E1 port. Cell-based cards allow only one channel per port, and this is automatically provisioned with all available timeslots. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan timeslotDataRate (dataRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.<br><br>When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.<br><br>When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.<br><br>On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.<br><br>One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes. |
| Values | 56k<br>doNotOverride |
| Default | doNotOverride |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan applicationFramerName

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the link to the software stack. It defines which application is running on top of this hardware component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Laps Vc4 Vc12 E1 Chan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Laps Vc4 Vc12 E1 Chan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is |

| | |
|---|---|
| | not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Laps Vc4 Vc12 E1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## GROUP Laps Vc4 Vc12 E1 Chan OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Laps Vc4 Vc12 E1 Chan adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Laps Vc4 Vc12 E1 Chan operationalState (osiOper)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Laps Vc4 Vc12 E1 Chan availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***degraded*** indicates the service provided by the |

component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which

doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Laps Vc4 Vc12 E1 Chan controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Laps Vc4 Vc12 E1 Chan alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization

activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Laps Vc4 Vc12 E1 Chan Operational (Oper)

Properties
Operational

Description
This group contains all of the operational data for a *Channel* component.

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan actualChannelSpeed

Access
Read only

Description
This attribute displays the measured link speed of the *Channel* component.

Values
Decimal (0..4294967295)

Units
bit/s

| | |
|---|---|
| Default | 0 |

### GROUP Laps Vc4 Vc12 E1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### COMPONENT Laps Vc4 Vc12 E1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Laps Vc4 Vc12 E1 Chan Test OsiState (State)"<br>"GROUP Laps Vc4 Vc12 E1 Chan Test Setup (Setup)"<br>"GROUP Laps Vc4 Vc12 E1 Chan Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Laps Vc4 Vc12 E1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Laps Vc4 Vc12 E1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Laps Vc4 Vc12 E1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Laps Vc4 Vc12 E1 Chan Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. |

***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

## ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Laps Vc4 Vc12 E1 Chan Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination: |

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

| | |
|---|---|
| Default | 0.00 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Laps Vc4 Vc12 E1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Laps Vc4 Vc12 E1 Chan Cell Provisioned (Prov)"<br>"GROUP Laps Vc4 Vc12 E1 Chan Cell Operational (Oper)"<br>"GROUP Laps Vc4 Vc12 E1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Laps Vc4 Vc12 E1 Chan Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are |

corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values: off
on

Default: off

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell clearDelay (clear)

Access: Read and write

Description: This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell hecSampleInterval (hSample)

Access: Read and write

Description: This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the

*hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell hecErrorLimit (hLimit)

Access: Read and write

Description: This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1*

| | |
|---|---|
| | or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..50) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

### GROUP Laps Vc4 Vc12 E1 Chan Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.<br>In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.<br>For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.<br>If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle<br>The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.<br>The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked. |
| Values | on<br>off |
| Default | off |

## GROUP Laps Vc4 Vc12 E1 Chan Cell Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell uncorrectableHeaderErrors (ucErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.<br><br>Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |

Default 0

## COMPONENT Laps Vc4 Vc12 E1 Chan TrunkConditioning (Tc)

Groups "GROUP Laps Vc4 Vc12 E1 Chan Tc Provisioned (Prov)"
"GROUP Laps Vc4 Vc12 E1 Chan Tc Operational (Op)"

Scope Device

Description *Lp/n Ds1/n Chan/n Tc*
*Lp/n E1/n Chan/n Tc*
*Lp/n Ds3/n Ds1/n Chan/n Tc*
*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*
*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*
*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*
*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the

following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

## GROUP Laps Vc4 Vc12 E1 Chan Tc Provisioned (Prov)

Properties: Provisioned

Description: This group contains all specific provisioning data for a *Tc* component.

## ATTRIBUTE Laps Vc4 Vc12 E1 Chan Tc replacementData (data)

Access: Read and write

Description: This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.

The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:
DS1 MUX Out Of Service Code = 0x1A
E1 MUX Out Of Service Code = 0xFF

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.

On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***.

Values: Hex (H.0..H.ff)

| | |
|---|---|
| Units | Hex |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Tc signalOneDuration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.<br><br>If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.<br><br>The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Tc noServiceResponse (resp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:<br><br>***autoConfigure*** - automatically configure the channels response.<br>***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.<br>***ais*** - transmit AIS in the egress direction.<br>***noResponse*** - no response is sent in the egress direction.<br><br>A value of ***autoConfigure*** will result in TC being transmitted for all card types. |

| | |
|---|---|
| Values | autoConfigure<br>tc<br>ais<br>noResponse |
| Default | autoConfigure |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Tc signalOne (sigOne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### ATTRIBUTE Laps Vc4 Vc12 E1 Chan Tc signalTwo (sigTwo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |

| | |
|---|---|
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### GROUP Laps Vc4 Vc12 E1 Chan Tc Operational (Op)

| | |

### GROUP Laps Vc4 Vc12 E1 Chan Flm Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all specific operational data for an *Flm* component. |

## ATTRIBUTE Laps Vc4 Vc12 E1 Chan Flm flmStatus (status)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of a Frame Relay channel on an E1 line. By combining the E1 channel-associated-signalling (CAS) A-bits status, and HDLC defect, a single value indicates the likely cause of the failure. This mechanism assumes that the far end equipment loops back signaling A-bits for some or all of the timeslots in a channel. The A-bits in channel are transmitted as ‘0’. If they are all received as ‘0’, it is assumed that the E1 link is up in both directions. The presence of HDLC frames indicates that the service is connected.<br><br>When A-bits and HDLC frames are correctly received, ***frameLinkUp*** is indicated.<br><br>When neither are received, ***frameLinkDown*** is indicated.<br><br>When HDLC frames are not receive but A-bits are not at fault, ***lossOfHdlc*** is indicated.<br><br>When HDLC frames are received, but there is a fault in any of timeslot’s A-bits on a channel ***lossOfAbit*** is indicated. |
| Values | notMonitoring<br>frameLinkUp<br>frameLinkDown<br>lossOfHdlc<br>lossOfAbit |
| Default | No default |

## COMPONENT Laps Vc4 Vc12 E1 Test (Test)

| | |
|---|---|

- Display

### VERB START Laps Vc4 Vc12 E1 Test

Impact — Service

Description — This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

### VERB STOP Laps Vc4 Vc12 E1 Test

Impact — Service

Description — This command stops a test running on the hardware component.

### GROUP Laps Vc4 Vc12 E1 Test OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Laps Vc4 Vc12 E1 Test adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Laps Vc4 Vc12 E1 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Laps Vc4 Vc12 E1 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Laps Vc4 Vc12 E1 Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Laps Vc4 Vc12 E1 Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

### ATTRIBUTE Laps Vc4 Vc12 E1 Test type (type)

Access
Read and write

Description
This attribute is the type of test to be run. The available test types include the following:
***card*** test sets up an internal loop on the board and runs a bit error rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.

***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

## ATTRIBUTE Laps Vc4 Vc12 E1 Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values

Decimal (4..4096)

| | |
|---|---|
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |

| | |
|---|---|
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Laps Vc4 Vc12 E1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates either the status of the test or the cause of the test's termination:

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these

values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Laps Vc4 Vc12 E1 Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Laps Vc4 Vc12 E1 Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

| | |
|---|---|
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Laps Vc4 Vc12 E1 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Laps Vc4 Vc12 E1 Dsp

| | |
|---|---|
| Scope | Device |
| Description | *LogicalProcessor/n E1/0 Dsp*<br>The *Dsp* component presents the status of the Digital Signal Processors (DSPs) present on a voice card.<br>A voice card's *Dsp* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Dsp* components cannot be added or deleted. |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Laps Vc4 Vc12 E1 Audio

| | |
|---|---|
| Scope | Device |
| Description | *LogicalProcessor/n E1/0 Audio*<br>The *Audio* component presents the audio status of the channels on a voice card.<br>A voice card's *Audio* component is created automatically whenever the parent E1 component becomes active, and remains |

in existence as long as the E1 component exists. *Audio* components cannot be added or deleted.

# COMPONENT LanApplication (La)

| | |
|---|---|
| Instance | Decimal (0..255) |
| Groups | "GROUP La CustomerIdentifierData (CidData)"<br>"GROUP La MediaProvisioned (MediaProv)"<br>"GROUP La IfEntryProv (IfEntry)"<br>"GROUP La OsiState (State)"<br>"GROUP La OperationalStatus (OperStatus)"<br>"GROUP La Operational (Oper)" |
| Scope | Application |
| Description | *LanApplication/n*<br>The *LanApplication* component, using the *Framer* subcomponent, is used to provide the interface either between the *VirtualRouter ProtocolPort* and a LAN component such as *Ethernet*, or to an ATM transport. |
| Subcomponents | "COMPONENT La Framer" |
| Opt. Subcomp. | "COMPONENT La Transport (Trsp)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP La CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE La customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP La MediaProvisioned (MediaProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the *LanApplication/n* component. |

### ATTRIBUTE La linkToProtocolPort

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *ProtocolPort* component to which the application is associated. This attribute must not be set if there is |

| | |
|---|---|
| | a *Transport* subcomponent under this *LanApplication* component. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### ATTRIBUTE La enetConnection

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the Enet component to which the application is associated. This attribute must not be set if there is a Transport subcomponent under this LanApplication component or the linkToProtocolPort is set. |
| Values | Link (Service, linkToEnetIf) |
| Default | No default |

### GROUP La IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE La ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE La ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP La OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE La adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE La operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE La usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP La OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE La snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP La Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes specific to the *LanApplication* component. |

### ATTRIBUTE La macAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the media access controller (MAC) address which was assigned to this component by the system. The value is displayed in canonical format.<br><br>No two stations in a network may have the same MAC address. |

| | |
|---|---|
| Values | String (6, Dashed Hex) |
| Default | No default |

## COMPONENT La Framer

| | |
|---|---|
| Groups | "GROUP La Framer Provisioned (Prov)"<br>"GROUP La Framer Statistics (Stats)" |
| Scope | Application |
| Description | *LanApplication/n Framer*<br>The *Framer* component is used to link a *LanApplication* to a Lan interface such as *Ethernet*, *Fddi*, *TokenRing* or *Ethernet100BaseT*. |
| Common Verbs | Help<br>List<br>Display |

## GROUP La Framer Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the link to the Lan interface such as *Ethernet*, *Fddi*, or *TokenRing*. |

## ATTRIBUTE La Framer interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute associates the *LanApplication* with a specific Lan interface such as *Ethernet*, *Fddi*, or *TokenRing*. This also defines the *LogicalProcessor* on which *Framer*'s parent component (as well as *Framer* itself) will run. Only one (1) LAN interface can be linked to a *Framer* except for *Ethernet100BaseT* LAN interface, for which up to two (2) interfaces residing on the same *LogicalProcessor* can be linked. |
| List of | Link (Hardware, applicationFramerName) |
| List Size | 2 |

| | |
|---|---|
| Default | No default |

### GROUP La Framer Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics data for a *Framer* Component. |

### ATTRIBUTE La Framer IrcErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the count of the number of frames or cells that have failed the Longintudinal Redundancy Check (LRC) as they were being sent to the link. This check is used to verify the integrity of the data prior to transmission. Usually the problem is on the originating card, with the destination card the only one reporting the error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT La Transport (Trsp)

| | |
|---|---|
| Scope | Application |
| Description | *La/n Transport*<br>The *Transport* component represents a transport connection using the network protocol specified by the provisioned subcomponent. |
| Subcomponents | "COMPONENT La Trsp AtmTransport (Atmtr)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### COMPONENT La Trsp AtmTransport (Atmtr)

| | |
|---|---|
| Groups | "GROUP La Trsp Atmtr OsiState (State)"<br>"GROUP La Trsp Atmtr OperationalStatus (OperStatus)" |

"GROUP La Trsp Atmtr AtmTransportCon (TrspCon)"
"GROUP La Trsp Atmtr Statistics (Stats)"

Scope: Application

Description: *La/n Trsp AtmTransport*
The *AtmTransport* component represents one endpoint of an ATM transport connection which uses RFC 1483 VC encapsulation.

Subcomponents: "COMPONENT La Trsp Atmtr AtmAddress (Addr)"
"COMPONENT La Trsp Atmtr Spvc (Spvc)"

Common Verbs:

## GROUP La Trsp Atmtr OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE La Trsp Atmtr adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it

is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE La Trsp Atmtr operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE La Trsp Atmtr usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP La Trsp Atmtr OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE La Trsp Atmtr snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP La Trsp Atmtr AtmTransportCon (TrspCon)

Properties
Operational

Description
This group contains operational data associated with ATM SPVC for the *AtmTransport* component.

### ATTRIBUTE La Trsp Atmtr remoteAddress (raddr)

Access
Read only

Criticality
Component

| | |
|---|---|
| Description | This attribute indicates the 40-digit remote NSAP address of the remote *LanApplication* at the far end of this transport connection. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE La Trsp Atmtr serviceCategory (sc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM service category of the transport connection.<br><br>If the value of the *endpoint* attribute is ***called***, and the value of the *spvcStatus* is not ***connected***, this attribute has a value of ***notAvailable***.<br><br>If the value of the *endpoint* attribute is ***called***, and the value of the *spvcStatus* is ***connected***, this attribute can have a value of either ***ubr*** or ***nrtvbr***.<br><br>If the value of the *endpoint* attribute is ***calling***, this attribute reflects the value of the configured *endpoint* attribute. |
| Values | notAvailable (notAvail)<br>unspecifiedBitRate (ubr)<br>nrtVariableBitRate (nrtvbr) |
| Default | No default |

### ATTRIBUTE La Trsp Atmtr peakCellRate01 (pcr01)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Peak Cell Rate (PCR) of the ATM VCC to which this interworking function is linked for all cells (with CLP=0 and CLP=1).<br><br>The *pcr01* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE La Trsp Atmtr sustainedCellRate0 (scr0)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Sustained Cell Rate (SCR) of the ATM VCC to which this interworking function is linked for high priority cells (with CLP=0).<br><br>The *scr0* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |
| Default | No default |

### ATTRIBUTE La Trsp Atmtr maximumBurstSize0 (mbs0)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Maximum Burst Size (MBS) of the ATM VCC to which this interworking function is linked for high priority cells (with CLP=0).<br><br>The *mbs0* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |
| Default | No default |

### GROUP La Trsp Atmtr Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics attributes for the *AtmTransport* connection. |

### ATTRIBUTE La Trsp Atmtr congDiscFromIf (cdfi)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the frames received from the ethernet interface to the network, that have been discarded due to congestion on the egress ATM trunk card. The value wraps to ***0*** when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE La Trsp Atmtr ethernetNetworkDownDiscards (ethNetDownDisc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received from the ethernet interface that have been discarded because the ATM transport connection was inactive. The value wraps to ***0*** when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT La Trsp Atmtr AtmAddress (Addr)

| | |
|---|---|
| Groups | "GROUP La Trsp Atmtr Addr Provisioned (Prov)"<br>"GROUP La Trsp Atmtr Addr AtmAddressOper (Aaddr)" |
| Scope | Application |
| Description | *La/n Trsp AtmTr Address*<br>The *Address* component contains the local *lanApplication* address in the ATM network. |
| Common Verbs | Help<br>List<br>Display |

### GROUP La Trsp Atmtr Addr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *AtmTransport Address* component. |

### ATTRIBUTE La Trsp Atmtr Addr localAddress (lAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies a 40-digit ATM address in standard ISO NSAP format. This is the ATM address of the local *LanApplication* component within the ATM routing database.<br><br>If no NSAP address is provisioned, a default NSAP address is generated using the value of the *nodePrefix* attribute of the *ModuleData* component and the value of the *macAddress* attribute of the *LanApplication* component. |
| Values | String (40, AESANsapAddress) |
| Default | 4700000000000000000000000000000000000000 |

### GROUP La Trsp Atmtr Addr AtmAddressOper (Aaddr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational data associated with *Address* componet |

### ATTRIBUTE La Trsp Atmtr Addr activeLocalAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the operational local Nsap address associated with the *atmTransport* component |
| Values | String (0..40, ASCII) |
| Default | No default |

### COMPONENT La Trsp Atmtr Spvc (Spvc)

| | |
|---|---|
| Instance | Decimal (0..0) |
| Groups | "GROUP La Trsp Atmtr Spvc Provisioned (Prov)"<br>"GROUP La Trsp Atmtr Spvc Operational (Oper)" |
| Scope | Network |

| | |
|---|---|
| Description | *La/n Trsp AtmTr Spvc/m*<br>The *Spvc* component represents one of the SPVC endpoints of the ATM transport connection. |
| Subcomponents | "COMPONENT La Trsp Atmtr Spvc TrafficManagement (Tm)" |
| Dyn. Subcomp. | "COMPONENT La Trsp Atmtr Spvc AtmConnection (AtmCon)" |
| Common Verbs | Help<br>List<br>Display |

### VERB Clear (Clr) La Trsp Atmtr Spvc

| | |
|---|---|
| Impact | Service |
| Description | *Clear La/n Trsp AtmTr Spvc/m*<br>This command tears down the active SPVC connection.<br>If there is no active SPVC, the clear command has no effect. |

### GROUP La Trsp Atmtr Spvc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *AtmTransport Spvc/m* component. |

### ATTRIBUTE La Trsp Atmtr Spvc remoteAddress (raddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the NSAP address of the remote end of the ATM transport connection.<br><br>This attribute is ignored if the value of the *endPoint* attribute is ***called***. |
| Values | String (40, AESANsapAddress) |
| Default | 470000000000000000000000000000000000000 |

### ATTRIBUTE La Trsp Atmtr Spvc remoteConnectionIdentifier (rci)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the remote connection identifier. The identifier is a remote *Atm Vpi.Vci* logical channel number assignment The remote *Atm Vpi.Vci* logical channel number is input as "***Vpi.Vci***". If not provisioned or a called end it will show "***0. 65535***" |
| Values | Integer Sequence (0..255; 0..65536) |
| Default | No default |

### ATTRIBUTE La Trsp Atmtr Spvc endPoint (endpt)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies whether this *LanApplication* is the ***called*** or ***calling*** endpoint of the VCC. The ***called*** endpoint receives the setup request from the remote end of the ATM transport connection. The ***calling*** endpoint initiates the setup request to the remote end of the ATM transport connection.<br><br>When this attribute is set to a value of ***called***, the *remoteAddress* attribute is not used. When this attribute is set to a value of ***calling***, the *remoteAddress* attribute must have a value. |
| Values | called<br>calling |
| Default | called |

### ATTRIBUTE La Trsp Atmtr Spvc retryPeriod (retry)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval after which an SPVC connection attempts re-establishment after a setup or teardown of the ATM transport connection. |
| Values | Decimal (10..3600) |

| | |
|---|---|
| Units | seconds |
| Default | 20 |

## GROUP La Trsp Atmtr Spvc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *AtmTransport Spvc* component. |

## ATTRIBUTE La Trsp Atmtr Spvc spvcStatus (status)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the incoming and outgoing connection.<br><br>***serviceNotReady*** indicates that the component is initialising when first created; a connection has not been established, and no incoming setup requests are processed.<br><br>***serviceReady*** indicates that a connection has not yet been established, and that setup requests are sent if the *endpoint* attribute is ***calling*** and that the setup request is expected if the *endpoint* attribute is ***called***.<br><br>***waitingForConnect*** indicates that a connection has not been established, and the component is waiting to restart.<br><br>***connected*** indicates that a connection has been established.<br><br>***setupFailed*** indicates that the ATM Networking resources are not available to setup the connection at the calling endpoint.<br><br>***connectFailed*** indicates that the ATM Networking resources are not avaialble to setup the connection at the called endpoint.<br><br>***releaseFailed*** indicates that *retryLimit* consecutive connection setup attempts have failed, and the connection procedure has been aborted. |
| Values | serviceNotReady<br>serviceReady |

waitingForConnect
connected
setupFailed
connectFailed
releaseFailed

Default — No default

### ATTRIBUTE La Trsp Atmtr Spvc retryFailures (failures)

Access — Read only

Description — *retryFailures* counts the number of consecutive failed connection attempts prior to the current attempt.

*retryFailures* is reset to ***0*** whenever a connection is successfully established. The value wraps to ***0*** when it exceeds the maximum value.

Values — Decimal (0..4294967295)

Default — No default

### ATTRIBUTE La Trsp Atmtr Spvc lastSetupFailureCause (failCause)

Access — Read only

Description — *lastSetupFailureCause* indicates the cause of the last ATM transport connection setup failure.

The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.

Values — Decimal (0..255)

Default — No default

### ATTRIBUTE La Trsp Atmtr Spvc lastSetupFailureDiagnostic (failDiag)

Access — Read only

Description — *lastSetupFailureDiagnostic* provides a diagnostic to supplement the *lastSetupFailureCause* attribute.

The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.

| | |
|---|---|
| Values | String (0..8, ASCII) |
| Default | No default |

### ATTRIBUTE La Trsp Atmtr Spvc lastTearDownCause (cause)

| | |
|---|---|
| Access | Read only |
| Description | *lastTearDownCause* indicates the cause of the last ATM transport connection tear down.<br><br>The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE La Trsp Atmtr Spvc lastTearDownDiagnostic (diag)

| | |
|---|---|
| Access | Read only |
| Description | *lastTearDownDiagnostic* provides a diagnostic to supplement the *lastTearDownCause* attribute.<br><br>The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. |
| Values | String (0..8, ASCII) |
| Default | No default |

### COMPONENT La Trsp Atmtr Spvc TrafficManagement (Tm)

| | |
|---|---|
| Groups | "GROUP La Trsp Atmtr Spvc Tm Provisioned (Prov)" |
| Scope | Network |
| Description | *La/n Trsp AtmTr Spvc/m TrafficManagement*<br>The *TrafficManagement* component represents the traffic management parameters for the ATM SPVC transport connection. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP La Trsp Atmtr Spvc Tm Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *AtmTransport TrafficManagement* component. |

## ATTRIBUTE La Trsp Atmtr Spvc Tm serviceCategory (sc)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the desired ATM service category for this transport connection.<br><br>Refer to NTP 241-5701-705 for more information on ATM Traffic Management. |
| Values | unspecifiedBitRate (ubr)<br>nrtVariableBitRate (nrtvbr) |
| Default | nrtVariableBitRate |

## ATTRIBUTE La Trsp Atmtr Spvc Tm bandwidth (bw)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the desired bandwidth, in bits per second, for this connection. This bandwidth value is used to convert it to a sustained cell rate (SCR) for ATM traffic management.<br><br>Refer to NTP 241-5701-705 for more information on ATM Traffic Management. |
| Values | Decimal (320..4294967295) |

| | |
|---|---|
| Units | bit/s |
| Default | 100000000 |

### ATTRIBUTE La Trsp Atmtr Spvc Tm averageFrameSize (afs)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the expected average frame size, in bytes, for this connection. This average frame size is used to derive the sustained cell rate (SCR) for ATM traffic management.<br><br>Refer to NTP 241-5701-705 for more information on ATM Traffic Management. |
| Values | Decimal (64..1500) |
| Units | bytes |
| Default | 1500 |

### COMPONENT La Trsp Atmtr Spvc AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP La Trsp Atmtr Spvc AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP La Trsp Atmtr Spvc AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE La Trsp Atmtr Spvc AtmCon nextHop

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

# COMPONENT LanEmulationClient (Lec)

| | |
|---|---|
| Instance | Decimal (0..31) |
| Groups | "GROUP Lec CustomerIdentifierData (CidData)"<br>"GROUP Lec IfEntryProv (IfEntry)"<br>"GROUP Lec MediaProv (Mp)"<br>"GROUP Lec Provisioned (Prov)"<br>"GROUP Lec OsiState (State)"<br>"GROUP Lec OperationalStatus (OperStatus)"<br>"GROUP Lec Operational (Oper)"<br>"GROUP Lec Statistics (Stats)" |
| Scope | Application |
| Description | *LanEmulationClient/n*<br>This component represents a LAN Emulation Client (LEC) as specified in the ATM Forum LAN Emulation over ATM Specification (LANE). The LEC provides a MAC level emulated Ethernet service to higher layer protocols using ATM VCCs.<br><br>The ‘laneClient’ feature must be provisioned on all ILS and ATM cards. |

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Lec LeArpEntry (LeArp)"<br>"COMPONENT Lec Connection (Conn)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Lec CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lec customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of |

| | |
|---|---|
| | any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lec IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lec ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lec ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lec MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the base provisioning data for the Media Application component. |

### ATTRIBUTE Lec linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains a protocol port component name. The attribute associates the application with a protocol port. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP Lec Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *LanEmulationClient* component. |

### ATTRIBUTE Lec lanType

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the data frame format for this LEC. Auto-configuring LECs use this attribute in their Configure requests. Manually-configured LECs use it in their Join requests. A value of ***unspecified*** implies that the data frame format is obtained from the LECS or LES.<br>The value of this attribute may be overridden by the LECS or LES; *actualLanType* contains the actual value. |
| Values | unspecified<br>ethernet |
| Default | unspecified |

### ATTRIBUTE Lec maxFrameSize

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies the maximum data frame size for this LEC. Auto-configuring LECs use this attribute in their Configure requests. Manually-configured LECs use it in their Join requests. A value of ***unspecified*** may only be used for auto-configuring LECs. |
| Values | unspecified<br>1516<br>1580<br>4544<br>9234<br>18190 |
| Units | octets |
| Default | unspecified |

### ATTRIBUTE Lec lanName

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ELAN name for this LEC. Auto-configuring LECs use this attribute in their Configure requests. Manually-configured LECs use it in their Join requests. An empty string means unspecified.<br>The value of this attribute may be overridden by the LECS or LES; *actualLanName* contains the actual value. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Lec v2Capable (v2c)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies whether this LEC exhibits LANE v2 behavior where it differs in its requirements from LANE v1 behavior. |

| | |
|---|---|
| Values | yes<br>no |
| Default | yes |

### ATTRIBUTE Lec lecsAddress (lecsAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ATM address of the LECS. If this attribute is non-null, the LEC attempts to set up a Configuration Direct SVC to this address as the first step in the LECS Connect phase. Otherwise, the well known LECS ATM address is used.<br>Only one of the attributes *lecsAddress* and *lesAddress* can be specified at one time. |
| Values | String (0..20, Hex) |
| Default | No default |

### ATTRIBUTE Lec lesAddress (lesAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the ATM address of the LES. The LEC uses this address to connect directly to the LES, thus bypassing the LECS. A LEC which did not use the LECS is deemed to be manually-configured.<br>Only one of the attributes *lecsAddress* and *lesAddress* can be specified at one time. |
| Values | String (0..20, Hex) |
| Default | No default |

### ATTRIBUTE Lec maxDataSvcs

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute specifies the maximum number of Data Direct SVCs which this LEC can have active at any one time. When operating at the maximum, an SVC setup request releases the oldest 10% of the Data Direct SVCs of this LEC.<br>A SET alarm is issued when *currDataSvcs* rises above 95% of this value and is CLEAR-ed when it falls below 85%.<br>Set *maxDataSvcs* as low as acceptable since a fixed amount of memory is consumed proportional to this value on every LP with this feature present. |
| Values | Decimal (16..1018) |
| Default | 16 |

### ATTRIBUTE Lec maxArpEntries

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the maximum number of entries which this LEC can have in its LE_ARP table at any one time. When operating at the maximum, if an additional entry must be installed, up to 10% of the oldest entries are removed.<br>A SET alarm is issued when *currArpEntries* rises above 95% of this value and is CLEAR-ed when it falls below 85%. |
| Values | Decimal (32..10240) |
| Default | 5120 |

### ATTRIBUTE Lec ilsForwarder (ilsFwdr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *IlsForwarder* that this LEC is using. |
| Values | Link (Service, linkToTrafficSource) |
| Default | No default |

### GROUP Lec OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lec adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Lec operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Lec usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values: idle
active (activ)
busy

Default: idle

### GROUP Lec OperationalStatus (OperStatus)

Properties: Operational

Description: This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Lec snmpOperStatus

Access: Read only

| | |
|---|---|
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lec Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status attributes of the *LanEmulationClient* component. |

### ATTRIBUTE Lec actualLanType (actLanType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the data frame format of this LEC. This may come from the *lanType* attribute, LECS or LES. The data frame format is not ***unspecified*** for an operational LEC.<br>This attribute represents the ‘C2’ LEC state parameter in the ATM Forum LANE specification.<br><br>Token Ring data frame format is not supported. The LEC does not become operational if the LECS or LES specify a LAN type of Token Ring. |
| Values | unspecified<br>ethernet |
| Default | No default |

### ATTRIBUTE Lec actualMaxFrameSize (actMaxFrameSize)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum data frame size of this LEC. This may come from the *maxFrameSize* attribute, LECS or LES. The value is not ***unspecified*** for an operational LEC. |

| | |
|---|---|
| Values | unspecified<br>1516<br>1580<br>4544<br>9234<br>18190 |
| Units | octets |
| Default | No default |

### ATTRIBUTE Lec actualLanName (actLanName)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the name of the ELAN to which this LEC is connected. This may come from the *lanName* attribute, LECS or LES. It may be null for an operational LEC.<br>This attribute represents the 'C5' LEC state parameter in the ATM Forum LANE specification. |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Lec elanId

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the ELAN to which this LEC is connected. For v2, the value will be set in the configuration phase, |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lec actualV2Capable (v2)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether this LEC exhibits LANE v2 behavior. The value is set in the Join phase. |
| Values | yes<br>no |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lec configurationSource (configSource)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether this LEC used the LECS, and if so, the method used to establish the Configuration Direct VCC. |
| Values | usedProvisionedLecsAddress<br>gotLecsAddressViaIlmi<br>usedWellKnownLecsAddress<br>usedLecsPvc<br>didNotUseLecs |
| Default | No default |

### ATTRIBUTE Lec actualLecsAddress (actLecsAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM address of the LECS used to configure this LEC. The address is null if the LECS was not used. |
| Values | String (0..20, Hex) |
| Default | No default |

### ATTRIBUTE Lec actualLesAddress (actLesAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM address of the LES which is currently serving this LEC. The address is not null for an operational LEC.<br>This attribute represents the ‘C9’ LEC state parameter in the ATM Forum LANE specification. |
| Values | String (0..20, Hex) |
| Default | No default |

### ATTRIBUTE Lec atmAddress (atmAddr)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the ATM address of this LEC.<br>This attribute represents the ‘C1’ LEC state parameter in the ATM Forum LANE specification. |
| Values | String (0..20, Hex) |
| Default | No default |

### ATTRIBUTE Lec macAddress (macAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the MAC address of this LEC.<br>This attribute represents the ‘C6’ LEC state parameter in the ATM Forum LANE specification. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lec lecId

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the LANE Client Identifier (LECID) assigned to this LEC by the LES during the Join phase. The LECID uniquely identifies a LEC on a particular ELAN.<br>This attribute represents the ‘C14’ LEC state parameter in the ATM Forum LANE specification. |
| Values | Decimal (0..65279) |
| Default | No default |

### ATTRIBUTE Lec interfaceState

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current state of the LEC. Note that *ifOperStatus* is ***up*** only when *interfaceState* is ***operational***.<br>- ***initialState***: Some parameters (such as addresses and ELAN name) are known to the LEC.<br>- ***lecsConnect***: LEC establishes Configuration Direct VCC to LECS. Manually-configured LECs skip this state.<br>- ***configure***: LEC discovers LES.<br>- ***join***: LEC establishes control connections to LES. LEC is |

assigned unique LECID and knows all ELAN parameters.
- ***initialRegistration***: LEC may register additional MAC addresses with LES. This is in addition to the single MAC address registered during Join phase.
- ***busConnect***: LEC issues LE_ARP to locate the BUS and sets up the connection. The BUS then establishes the Multicast Forward VCC to the LEC.
- ***operational***: LEC is operational and can forward data traffic.

Values

initialState
lecsConnect
configure
join
initialRegistration
busConnect
operational

Default

No default

## ATTRIBUTE Lec lastFailureResponseCode

Access

Read only

Description

The attribute indicates the status code from the last failed Configure or Join response. Failed responses are those for which the LE_CONFIGURE_RESPONSE / LE_JOIN_RESPONSE frame contains a non-zero code, or fails to arrive within a time-out period. If none of the LEC's requests have failed, this attribute has the value ***none***.

Values

none
timeout
undefinedError
versionNotSupported
invalidRequestParameters
duplicateLanDestination
duplicateAtmAddress
insufficientResources
accessDenied
invalidRequesterId
invalidLanDestination
invalidAtmAddress
noConfiguration

| | |
|---|---|
| | leConfigureError<br>insufficientInformation |
| Default | No default |

### ATTRIBUTE Lec lastFailureState

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the state that the LEC was in when it updated the *lastFailureResponseCode*. If *lastFailureResponseCode* is ***none***, this attribute has the value ***initialState***.<br>See the *interfaceState* attribute for a description of each state. |
| Values | initialState<br>lecsConnect<br>configure<br>join<br>initialRegistration<br>busConnect<br>operational |
| Default | No default |

### GROUP Lec Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of the *LanEmulationClient* component. |

### ATTRIBUTE Lec arpRequestsOut

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the LE_ARP_REQUESTS sent by this LEC. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec arpRepliesIn

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the LE_ARP_RESPONSES received by this LEC. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec arpRequestsIn

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the LE_ARP_REQUESTS received by this LEC. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec arpRepliesOut

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the LE_ARP_RESPONSES sent by this LEC. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec controlFramesOut

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the control packets sent by this LEC. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec controlFramesIn

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the control packets received by this LEC. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec svcFailures

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of SVCs that could not be set up. The reasons for failure are:<br>- outgoing SVCs that this LEC failed to establish;<br>- incoming SVCs that this LEC failed to establish; and<br>- incoming SVCs that this LEC rejected for protocol or security reasons.<br>This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec currDataSvcs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Data Direct SVCs that this LEC has in service. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec peakDataSvcs

| | |
|---|---|
| Access | Read only |
| Description | The attribute is the peak value of *currDataSvcs*. In other words, this value is the maximum number of Data Direct SVCs that this LEC had in service at any one time. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec currArpEntries

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the current number of entries that this LEC has in its LE ARP table. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec peakArpEntries

| | |
|---|---|
| Access | Read only |
| Description | The attribute is the peak value *currArpEntries*. In other words, this value is the maximum number of entries that this LEC had in its LE ARP table at any one time. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec badControlFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the control frames discarded by the LEC due to invalid or illegal frame format, and those frames with a STATUS code other than “Success”. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec protocolViolations

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of responses received by |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec unsupportedTlvs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times an unsupported TLV was |
| Values | Decimal (0..4292967295) |
| Default | No default |

### COMPONENT Lec LeArpEntry (LeArp)

| | |
|---|---|
| Instance | String (6, Dashed Hex) |
| Groups | "GROUP Lec LeArp Operational (Oper)" |
| Scope | Application |
| Description | *Lec/n LeArpEntry/<Mac Address>*<br>This component defines an entry in the LE_ARP table. Each entry contains information about the binding of one MAC address to one ATM address. |
| Common Verbs | Help<br>List<br>Display |

### VERB Clear Lec LeArp

| | |
|---|---|
| Impact | Passive |
| Description | *Clear Lec/n LeArp/<Mac Address>*<br>This verb removes the specified entry from the LE_ARP table. |

### GROUP Lec LeArp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *LeArpEntry* component. |

### ATTRIBUTE Lec LeArp atmAddress (atmAddr)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the ATM address of the BUS or LEC associated with the MAC address of this entry. If the MAC address is the all-ones broadcast address, the entry is for the BUS. |
| Values | String (20, Hex) |
| Default | No default |

### ATTRIBUTE Lec LeArp isRemoteAddress (remote)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether this entry is for a local or remote MAC address. In this context, ‘local’ means a MAC address that is local to a LEC, and ‘remote’ means a MAC address for which the LEC is proxy.<br>If ***yes***, the address is believed to be remote, or its local/remote status is unknown.<br>If ***no***, the address is believed to be local; that is, registered with the LES by the LEC whose ATM address is *atmAddress*. |
| Values | yes<br>no |
| Default | No default |

### ATTRIBUTE Lec LeArp connectionId (connId)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the connection identifier associated with this entry. The connection identifier is the instance of the *Connection* component. |
| Values | Decimal (0..1022) |
| Default | No default |

### COMPONENT Lec Connection (Conn)

| | |
|---|---|
| Instance | Decimal (0..1022) |
| Groups | "GROUP Lec Conn Operational (Oper)"<br>"GROUP Lec Conn Statistics (Stats)" |

| | |
|---|---|
| Scope | Application |
| Description | *Lec/n Connection/n*<br>This component defines an ATM connection (SVC) that is used by the LEC. |
| Dyn. Subcomp. | "COMPONENT Lec Conn AtmConnection (AtmCon)" |
| Common Verbs | Help<br>List<br>Display |

### VERB Clear Lec Conn

| | |
|---|---|
| Impact | Passive |
| Description | *Clear Lec/n Conn/n*<br>This verb clears the specified *Connection*. Clearing the BUS connection results in temporary loss of the ability to send/receive broadcast and unknown data traffic. Clearing a connection to the LES reinitializes the LEC. |

### GROUP Lec Conn Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational status attributes of the *Connection* component. |

### ATTRIBUTE Lec Conn remoteAtmAddress (remoteAtmAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM address of the far end. |
| Values | String (20, Hex) |
| Default | No default |

### ATTRIBUTE Lec Conn age

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the age of this connection. |
| Values | Decimal (0..4292967295) |

| | |
|---|---|
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lec Conn type

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of this connection. |
| Values | configurationDirectVcc (configDirect)<br>controlDirectVcc (controlDirect)<br>controlDistributeVcc (controlDistrib)<br>dataDirectVcc (data)<br>defaultMulticastSendVcc (dfltMcastSend)<br>multicastForward (mcastFwd) |
| Default | No default |

### GROUP Lec Conn Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes of the *Connection* component. |

### ATTRIBUTE Lec Conn outFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent over this connection. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

### ATTRIBUTE Lec Conn inFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received over this connection. This counter wraps to zero when the maximum value is reached. |
| Values | Decimal (0..4292967295) |
| Default | No default |

## COMPONENT Lec Conn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Lec Conn AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Lec Conn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

## ATTRIBUTE Lec Conn AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

# COMPONENT LawfulInterceptAccessFunction (Liaf)

| | |
|---|---|
| Instance | Decimal (1..15) |
| Groups | "GROUP Liaf Provisioned (Prov)"<br>"GROUP Liaf Statistics (Stats)"<br>"GROUP Liaf OsiState (State)"<br>"GROUP Liaf WlcCustomCounters (WlcCustomCntr)" |
| Scope | Application |
| Description | *Liaf/n*<br><br>This component represents the Lawful Intercept Access Function (Liaf). Lawful Intercept is used by law enforcement agencies to monitor the activities of a subscriber on the network based on the IMSI or the MSISDN. |
| Subcomponents | "COMPONENT Liaf MemoryPoolManager (Mpm)" |
| Dyn. Subcomp. | "COMPONENT Liaf RemoteApplicationConnection (RaConn)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Liaf Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains provisionable attributes of the *LawfulInterceptAccessFunction (Liaf)* component. |

### ATTRIBUTE Liaf linkToLogicalProcessor (lp)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the Logical Processor (LP) that the *LawfulInterceptAccessFunction (Liaf)* component is provisioned on. No more than one *LawfulInterceptAccessFunction (Liaf)* component can be linked to the same *LogicalProcessor* instance. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE Liaf admfAddr

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP address of the Lawful Intercept Gateway (LIG) Administrative Function (ADMF).<br><br>The ADMF provides a list of target subscribers to be monitored by the *LawfulInterceptAccessFunction (Liaf)* component.<br><br>Changing this value causes the outstanding transactions to be affected. |
| Values | IP address |
| Default | No default |

### ATTRIBUTE Liaf admfPort

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the IP port number of the Lawful Intercept Gateway (LIG) Administrative Function (ADMF).<br><br>The ADMF provides a list of target subscribers to be monitored by the *LawfulInterceptAccessFunction (Liaf)* component. |

| | |
|---|---|
| | Changing this value causes the outstanding transactions to be affected. |
| Values | Decimal (1024..65535) |
| Default | 2000 |

### ATTRIBUTE Liaf nsInterceptions (nsInt)

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies a capacity service level that represents a maximum number of monitored targets. When this number of monitored targets is reached, the OSI usage state transitions to busy and an alarm is generated. |
| Values | Decimal (256..3000) |
| Default | 256 |

### ATTRIBUTE Liaf linkToLiClient

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies links to the UMTS/GPRS subscriber control entities that are handled by this *LawfulInterceptAccessFunction (Liaf)* component.<br><br>This attribute must be set to *Usc* or *Gsc* instance, based on whether it is used in UMTS or GPRS.<br><br>Changing this value causes the outstanding transactions to be affected. |
| List of | Link (Service, linkToLisp) |
| Default | No default |

### ATTRIBUTE Liaf linkToPort

| | |
|---|---|
| Access | Read: All<br>Write: All |

| | |
|---|---|
| Description | This attribute specifies the IP address and TCP port numbers of the *LawfulInterceptAccessFunction (Liaf)* component.<br><br>The IP Address and TCP Port numbers are specified by setting this attribute to link to the correct *Gips IpAddress Tcp Port* components on the same card.<br><br>Two *Gips IpAddress Tcp Port* components must be assigned: one for the Lawful Intercept Gateway (LIG) Administration Function (ADMF) connectivity, and the second for LIG Delivery Function (DF) connectivity.<br><br>Changing this value causes the outstanding transactions to be lost. |
| List of | Link (Service, linkToApplication) |
| Default | No default |

## GROUP Liaf Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes of the *LawfulInterceptAccessFunction (Liaf)* component. |

## ATTRIBUTE Liaf admfErrors (admf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts errors encountered by the *LawfulInterceptAccessFunction (Liaf)* component when decoding a message from the Lawful Intercept Gateway (LIG) Administrative Function (ADMF). It allows the user to determine if there is a problem (for example, formatting or corrupt data) with the messages received from the ADMF. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Liaf nsInterceptionsExceed (nsiExceed)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of times the number of monitored targets exceeds *nsInterceptions*. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Liaf bufferOverFlows (buffOf)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute counts the number of TCP buffer overflows. The counter wraps to zero when it exceeds the maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Liaf OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Liaf adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or |

*Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Liaf operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

| | |
|---|---|
| Default | disabled |

### ATTRIBUTE Liaf usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Liaf availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can |

be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Liaf proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Liaf controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Liaf alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of
underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default
No default

### ATTRIBUTE Liaf standbyStatus (osiStby)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Liaf unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Liaf WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Liaf customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Liaf customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Liaf customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Liaf MemoryPoolManager (Mpm)

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n MemoryPoolManager*<br>*Gsd/n MemoryPoolManager*<br>*Gtl/n MemoryPoolManager*<br>*DnsAgent/<vr>,n MemoryPoolManager*<br><br>This component represents the memory resources of a given GPRS application that are managed as pools of objects. |
| Dyn. Subcomp. | "COMPONENT Liaf Mpm MemoryPoolClient (Mpc)" |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Liaf Mpm MemoryPoolClient (Mpc)

| | |
|---|---|
| Instance | String (1..30, ASCII) |

| | |
|---|---|
| Scope | Application |
| Description | *Gsc/n Mpm MemoryPoolClient/<name>*<br>*Gsd/n Mpm MemoryPoolClient/<name>*<br>*SgGtl/n Mpm MemoryPoolClient/<name>*<br>*DnsAgent/<vr>,n Mpm MemoryPoolClient/<name>*<br><br>This component represents a pool of objects of a particular class that a GPRS application currently owns as well as all the objects that could be owned by that application. All the objects in the pool are of the same class. The instance value of this component is a string which is the class name of the objects in the pool. |

## GROUP Liaf RaConn OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Liaf RaConn adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Liaf RaConn operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Liaf RaConn usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Liaf RaConn WlcCustomCounters (WlcCustomCntr)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the spare counters that can be dynamically patched. |

### ATTRIBUTE Liaf RaConn customCounter1 (customCntr1)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Liaf RaConn customCounter2 (customCntr2)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Liaf RaConn customCounter3 (customCntr3)

| | |
|---|---|
| Access | Read: All<br>Write: Illegal |

| | |
|---|---|
| Description | This attribute does not count anything and is not displayed under normal operating circumstances. It is included here to provide a mechanism by which custom counters can be set up at runtime through a patch. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Liaf RaConn AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP Liaf RaConn AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Liaf RaConn AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

## ATTRIBUTE Liaf RaConn AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

## GROUP LocalMedia If CustomerIdentifierData (CidData)

Properties

Provisioned

Description

This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

## ATTRIBUTE LocalMedia If customerIdentifier (cid)

Access

Read and write

Description

This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP LocalMedia If IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE LocalMedia If ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE LocalMedia If ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP LocalMedia If MediaProv (Mp)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the base provisioning data for the media base component. |

### ATTRIBUTE LocalMedia If linkToProtocolPort (pp)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface. |
| Values | Link (Service, linkToMedia) |
| Default | No default |

### GROUP LocalMedia If Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *If* component. |

### ATTRIBUTE LocalMedia If maxTransmissionUnit (mtu)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the size of the largest datagram which can be sent on the interface. This includes the size of the header (if applicable) as well as the protocol data unit. |
| Values | Decimal (256..9180) |
| Units | octets |
| Default | 9180 |

### ATTRIBUTE LocalMedia If trafficType (tt)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the supported traffic types of the *LocalMedia If* component. It contains one or more of the values.***Rnc***, ***Cpds***, ***CpdsCoreNetwork, type3, type4***.<br><br>***Rnc***: This traffic type supports all types of traffic in RNC-IN. |

***Cpds***: This traffic type supports all types of traffic in CPDS, except the traffic between PCU and PDSN.

***CpdsCoreNetwork***: This traffic type supports traffic between PCU and PDSN.

***type3***: .Reserved for future use.

***type4***: Reserved for future use.

Set of
rnc
cpds
cpdsCoreNetwork
type3
type4

Default
No default

### GROUP LocalMedia If OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE LocalMedia If snmpOperStatus

Access
Read only

Description
The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP LocalMedia If OsiState (State)

Properties
Operational

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE LocalMedia If adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE LocalMedia If operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE LocalMedia If usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

# COMPONENT LpPair (LpP)

| | |
|---|---|
| Instance | Integer Sequence (0..15; 0..15) |
| Scope | Application |
| Description | *LpPair/m.n*<br>This component represents a pair of LPs, *LP/m* and *LP/n*. There are no real instances of this component which you can issue commands against. It is solely for the purpose of alarm handling for other components which can link to two LPs (for example, via a *LineAutomaticProtectionSwitching*, or *Laps*, component). These other components are typically spared across the two LPs, which means that the LP hierarchical clear alarms alone are not sufficient to properly clear certain alarms; use of the *LpPair* component does provide this.<br><br>Thus, the name of an *LpPair* can appear in the related component name field of an alarm so that subsequent alarm clearing can be handled appropriately. It can also appear in the component name field of an alarm, for a hierarchical clear against the pair of LPs and for components which are spared across the two LPs. The LP alarms and their fields remain unchanged. |

## VERB RESET Lp

Impact: Service

Description:

*Reset Lp/n*
*Reset -force Lp/0*

This command is used to reset the processor card on which this *LP* is currently running. Resetting a processor card implies: (1) resetting the hardware (as if the card had just been powered on), (2) performing the card's self-tests, and (3) reloading the software.

A *Reset* command issued against the CP (*Lp/0*) causes it to reload from the committed provisioning data file.

A *Reset* command issued against an FP causes it to reload the same software it was already running. This is the software load that is derived from the provisioning data in the CP's current view (this may or may not be the committed view).

**Options:**
*-force*
This option causes the reset to occur against lp/0 even if the current or edit view differs from the committed view, or if the standby OAM Ethernet port is not available, or if the standby CP is currently loading the committed provisioning data file. Use of this option would cause the loss of data in any unsaved view, and any FPs running uncommitted data would restart. On any lp other than lp/0, -force has no meaning.

## VERB RESTART Lp

Impact: Service

Description: *Restart Lp/n*
*Restart -force Lp/0*

This command is used to restart the processor card on which this *LP* is currently running. Restarting a processor card causes the software to reinitialize itself and behave as if it had just been reloaded. A *Restart* command issued against the CP (*Lp/0*) causes it to restart using the committed provisioning data.

**Options:**
*-force*
This option causes the restart to occur against lp/0 even if the current or edit view differs from the committed view, or if the standby OAM Ethernet port is not available, or if the standby CP is currently loading the committed provisioning data file. Use of this option would cause the loss of data in any unsaved view, and any FPs running uncommitted data would restart. On any lp other than lp/0, -force has no meaning.

## VERB RELOADcp (Reload) Lp

Impact: Service

Description: *ReloadCp -force -filename(<name>) Lp/0*

This command is used to force the CP to reload using a specified provisioning file instead of using the committed provisioning file. The command has a parameter that specifies the name of the file to use.

## VERB SWITCHover Lp

Impact: Service

Description:

*Switchover Lp/n*
*Switchover -time(yyyy-mm-dd hh:mm) Lp/n*
*Switchover -cancel Lp/n*
*Switchover -force Lp/0*

This command forces a sparing operation to occur. The *spareCard* becomes active if the *mainCard* is currently active or, alternatively, the *mainCard* becomes active if the *spareCard* is currently active.

**Options:**
*-time*
This option is used to specify the time when a scheduled switchover is to take effect.

*-cancel*
*This option is used to cancel a scheduled switchover.*

*-force*
This option causes the switchover to occur even if the current or edit view differs from the committed view. Use of this option would cause the loss of data in any unsaved view. In addition, any FPs running uncommitted data would restart.

## GROUP Lp Provisioned (Prov)

Properties: Provisioned

Description:

This Group contains the provisionable attributes for the *LP* component.

## ATTRIBUTE Lp mainCard (main)

Access: Read and write

Description:

This is the preferred processor card on which this *LP* should be assigned.

| | |
|---|---|
| Values | Link (Service, configuredLPs) |
| Default | No default |

### ATTRIBUTE Lp spareCard (spare)

| | |
|---|---|
| Access | Read and write |
| Description | This is the spare processor card on which this *LP* should be assigned. |
| Values | Link (Service, configuredLPs) |
| Default | No default |

### ATTRIBUTE Lp logicalProcessorType (lpt)

| | |
|---|---|
| Access | Read and write |
| Description | This is the Logical Processor Type (LPT) that determines which software this *LP* will run. |
| Values | Link (Service, logicalProcessors) |
| Default | No default |

### ATTRIBUTE Lp oneForNSparingBehavior

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sparing behavior in a 1 for N sparing configuration when a main card fails.<br>If the attribute value is ***delayedSwitchOver***, the failure of a main card to recover as the active card will initiate a switchover to the spare card. This sparing behavior gives the failed main card a chance to recover and hence allows the main cards to remain protected by the spare card.<br>If the attribute value is ***immediateSwitchOver***, the failure of a main card initiates an immediate switchover to the spare card. This sparing behavior provides greater emphasis on reducing outage time for a failed main card at the expense of leaving the other main cards unprotected. |
| Values | delayedSwitchOver (delayedSO)<br>immediateSwitchOver (immediateSO) |

| | |
|---|---|
| Default | delayedSwitchOver |

### ATTRIBUTE Lp linkToApplications

| | |
|---|---|
| Access | Read only |
| Description | This attribute allows applications to link themselves directly to the *LP* component. |
| List of | Link |
| List Size | 256 |
| Default | No default |

### GROUP Lp CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE Lp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default
No default

### ATTRIBUTE Lp controlStatus (osiCntrl)

Access
Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Operational (Oper)

Properties
Operational

| | |
|---|---|
| Description | This Group contains the operational attributes for the LP component. |

### ATTRIBUTE Lp activeCard

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates on which card this LP is currently running (if any). |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE Lp mainCardStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the status of this LP's main card. The following values have been defined:<br>***notProvisioned***— No main card has been provisioned.<br>***notAvailable***— The main card is not available.<br>***available***— The main card is available (running as standby).<br>***active***— The main card is running as active. |
| Values | notProvisioned<br>notAvailable<br>available<br>active |
| Default | No default |

### ATTRIBUTE Lp spareCardStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute specifies the status of this LP's spare card. The following values have been defined:<br>***notProvisioned***— No spare card has been provisioned.<br>***notAvailable***— The spare card is not available.<br>***alreadyInUse***— The spare card is already in use by another LP.<br>***available***— The spare card is available (running as standby).<br>***active***— The spare card is running as active. |

| | |
|---|---|
| Values | notProvisioned<br>notAvailable<br>alreadyInUse<br>available<br>active |
| Default | No default |

### ATTRIBUTE Lp restartOnCpSwitch

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the *Lp* always restarts upon a CP switchover. The value is ***true*** if the *featureList* of the associated *Sw Lpt* component contains a feature that does not support hitless CP switchover. The value is also ***true*** when the feature ***noHitlessCpSwitch*** is provisioned on the CP. A value of ***false*** does not guarantee “no restart”; dynamic conditions may still result in an FP restart when a CP switchover occurs. |
| Values | false<br>true |
| Default | No default |

### ATTRIBUTE Lp scheduledSwitchover

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the execution time of the scheduled switchover. When there is no switchover scheduled the time is equals to 0 (0000-00-00 00:00). |
| Values | Time (DHM) |
| Default | No default |

### GROUP Lp Utilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that specify the processor’s utilization levels. When this group exists for an LP component, the attributes are representative of the active card. |

### ATTRIBUTE Lp timeInterval

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time period (in minutes) for which the average, minimum and maximum utilization values are calculated. This attribute is reset to 0 every 15 minutes. |
| Values | Decimal (0..15) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Lp cpuUtil

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates an approximation of the current processor utilization level (expressed as a percentage). |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp cpuUtilAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates an average processor utilization level over the specified time period, *timeInterval*. This average is calculated based on one minute CPU utilization averages. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp cpuUtilAvgMin

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the minimum processor utilization level over a specified time period, *timeInterval*. This is based on one minute CPU utilization averages. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp cpuUtilAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum processor utilization level over a specified time period, *timeInterval*. This is based on one minute CPU utilization averages. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp sharedMsgBlockUsage

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's current shared message block memory utilization. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp sharedMsgBlockUsageAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's average memory utilization of shared message blocks, calculated over a specified time period, *timeInterval*. This utilization value is calculated using 15 second samples. At the start of each *timeInterval*, this average memory utilization is reset to the current usage, *sharedMsgBlockUsage*. |

| | |
|---|---|
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp sharedMsgBlockUsageAvgMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's minimum memory utilization of shared message blocks, calculated over a specified time period, *timeInterval*. This utilization value is calculated using 15 second samples. At the start of each *timeInterval*, this minimum memory utilization is reset to the current usage, *sharedMsgBlockUsage*. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp sharedMsgBlockUsageAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's maximum memory utilization of shared message blocks, calculated over a specified time period, *timeInterval*. This utilization value is calculated using 15 second samples. At the start of each *timeInterval*, this maximum memory utilization is reset to the current usage, *sharedMsgBlockUsage*. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp localMsgBlockUsage

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the processor's current memory utilization of message blocks which are used for local messaging on the card. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp localMsgBlockUsageAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's average memory utilization of message blocks used for local messaging on the card, calculated over a specified time period, *timeInterval*. This utilization value is calculated using 15 second samples. At the start of each *timeInterval*, this average memory utilization is reset to the current usage, *localMsgBlockUsage.* |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp localMsgBlockUsageMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's minimum memory utilization of message blocks used for local messaging on the card, calculated over a specified time period, *timeInterval*. This utilization value is updated at 15 second intervals. At the start of each *timeInterval*, this minimum memory utilization is reset to the current usage, *localMsgBlockUsage*. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp localMsgBlockUsageMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's maximum memory utilization of message blocks used for local messaging on the card, calculated over a specified time period, *timeInterval*. This utilization value is updated at 15 second intervals. At the start of each *timeInterval*, this maximum memory utilization is reset to the current usage, *localMsgBlockUsage*. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp memoryUsage

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's current memory utilization for each type of memory. |
| Vector of | Decimal (0..2147483647) |
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |
| Default | No default |

### ATTRIBUTE Lp memoryUsageAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's average memory utilization for each type of memory in the specified time period, *timeInterval*. This value is calculated using 15 second samples. |
| Vector of | Decimal (0..2147483647) |

| | |
|---|---|
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |
| Default | No default |

### ATTRIBUTE Lp memoryUsageAvgMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's minimum memory utilization for each type of memory in the specified time period, *timeInterval*. This value is calculated using 15 second samples. |
| Vector of | Decimal (0..2147483647) |
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |
| Default | No default |

### ATTRIBUTE Lp memoryUsageAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor's maximum memory utilization for each type of memory in the specified time period, *timeInterval*. This value is calculated using 15 second samples. |
| Vector of | Decimal (0..2147483647) |
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |
| Default | No default |

### GROUP Lp Capacity (Cap)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational attributes that specify the processor's capacity levels. When this group exists for an *LP* component, the attributes are representative of the active *Card*. |

### ATTRIBUTE Lp sharedMsgBlockCapacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor card's shared message block memory capacity. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp localMsgBlockCapacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor card's local message block memory capacity. These message blocks are used for local messaging on the card. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp memoryCapacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the processor card's memory capacity for each type of memory. |
| Vector of | Decimal (0..2147483647) |
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |
| Default | No default |

# COLLECTED STATS LogicalProcessor

| | |
|---|---|
| Description | The statistics record generated by the LogicalProcessor component. |

### ATTRIBUTE Lp cardNumber (ca)

| | |
|---|---|
| Description | This attribute is the card number associated to this statistical information. |
| Values | Decimal (0..15) |

### ATTRIBUTE Lp cardStatus

| | |
|---|---|
| Description | This attribute indicates whether the card is running as ***active*** or ***standby***. |
| Values | standby<br>active |

### ATTRIBUTE Lp cpuUtilAvg

| | |
|---|---|
| Description | This attribute indicates an average processor utilization level over a the specified collection interval. This average is calculated based on one minute CPU utilization averages. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Lp cpuUtilAvgMin

| | |
|---|---|
| Description | This attribute indicates the minimum processor utilization level over a specified collection interval. This is calculated based on one minute CPU utilization averages. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Lp cpuUtilAvgMax

| | |
|---|---|
| Description | This attribute indicates the maximum processor utilization level over a specified collection interval. This is based on one minute CPU utilization averages. |

| | |
|---|---|
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Lp memoryCapacity

| | |
|---|---|
| Description | This attribute indicates the processor's memory capacity for each type of memory. |
| Vector of | Decimal (0..2147483647) |
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |

### ATTRIBUTE Lp memoryUsageAvg

| | |
|---|---|
| Description | This attribute indicates the processor's average memory utilization for each type of memory in the specified collection interval. This is calculated using 15 second samples. |
| Vector of | Decimal (0..2147483647) |
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |

### ATTRIBUTE Lp memoryUsageAvgMin

| | |
|---|---|
| Description | This attribute indicates the processor's minimum memory utilization for each type of memory in the specified collection interval. This is calculated using 15 second samples. |
| Vector of | Decimal (0..2147483647) |
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |

### ATTRIBUTE Lp memoryUsageAvgMax

| | |
|---|---|
| Description | This attribute indicates the processor's maximum memory utilization for each type of memory in the specified collection interval. This is calculated using 15 second samples. |
| Vector of | Decimal (0..2147483647) |
| Units | kbyte |
| Index | fastRam<br>normalRam<br>sharedRam |

### ATTRIBUTE Lp sharedMsgBlockCapacity

| | |
|---|---|
| Description | This attribute indicates the processor's shared message block memory capacity. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |

### ATTRIBUTE Lp sharedMsgBlockUsageAvg

| | |
|---|---|
| Description | This attribute indicates the processor's average shared message block memory utilization over a specified collection interval. This is calculated using 15 second samples. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |

### ATTRIBUTE Lp sharedMsgBlockUsageAvgMin

| | |
|---|---|
| Description | This attribute indicates the processor's minimum shared message block memory utilization over a specified collection interval. This is calculated using 15 second samples. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |

### ATTRIBUTE Lp sharedMsgBlockUsageAvgMax

| | |
|---|---|
| Description | This attribute indicates the processor's maximum shared message block memory utilization over a specified collection interval. This is calculated using 15 second samples. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |

### ATTRIBUTE Lp localMsgBlockCapacity

| | |
|---|---|
| Description | This attribute indicates the processor's local message block memory capacity. These message blocks are used for local messaging on the card. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |

### ATTRIBUTE Lp localMsgBlockUsageAvg

| | |
|---|---|
| Description | This attribute indicates the processor's average memory utilization of message blocks used for local messaging on the card, calculated over a specified collection interval. This is calculated using 15 second samples. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |

### ATTRIBUTE Lp localMsgBlockUsageMin

| | |
|---|---|
| Description | This attribute indicates the processor's minimum memory utilization of message blocks used for local messaging on the card, calculated over a specified collection interval. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |

### ATTRIBUTE Lp localMsgBlockUsageMax

| | |
|---|---|
| Description | This attribute indicates the processor's maximum memory utilization of message blocks used for local messaging on the card, calculated over a specified collection interval. |

| | |
|---|---|
| Values | Decimal (0..2147483647) |
| Units | kbyte |

### COMPONENT Lp BridgedSonet (Bso)

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Lp Bso CustomerIdentifierData (CidData)"<br>"GROUP Lp Bso Provisioned (Prov)"<br>"GROUP Lp Bso OsiState (State)" |
| Scope | Device |
| Description | *Lp/n BridgedSonet/n*<br>This component controls a bridge on a SONET card that is connected to the line hardware of the mate SONET card. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Lp Bso CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Bso customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. |

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP Lp Bso Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioning data for a *BridgedSonet* component.

### ATTRIBUTE Lp Bso portBridgeGroupLink (pbgl)

Access: Read and write

Description: This attribute specifies the name of the *Pbg* component. The specified *Pbg* component provides port bridging for a SONET line specified by *Pbg/n workingLine* and this *BridgedSonet* component.

Values: Link

Default: No default

### GROUP Lp Bso OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific

information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Bso adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Bso operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Bso usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp Bso availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp Bso proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp Bso controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp Bso alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms

may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Bso standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Bso unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### COMPONENT Lp Ethernet (Enet)

Instance
Decimal (0..5)

Groups
"GROUP Lp Enet CustomerIdentifierData (CidData)"
"GROUP Lp Enet IfEntryProv (IfEntry)"
"GROUP Lp Enet Provisioned (Prov)"
"GROUP Lp Enet AdminInfo (AdminInfo)"
"GROUP Lp Enet OsiState (State)"
"GROUP Lp Enet OperationalStatus (OperStatus)"
"GROUP Lp Enet Operational (Oper)"
"GROUP Lp Enet Statistics (Stats)"

Scope
Device

| | |
|---|---|
| Description | *Lp/n Ethernet/n*<br>This component defines an instance of an *Ethernet* station attached to a bus. One instance of this component will be created for each hardware port. Each station will be provisioned prior to operating on the bus. |
| Subcomponents | "COMPONENT Lp Enet LanTest (Lt)"<br>"COMPONENT Lp Enet Test" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Enet CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE Lp Enet customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. |

| | |
|---|---|
| | An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Enet IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Enet ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Enet ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Enet Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains provisioned attributes for the *Ethernet* component. |

### ATTRIBUTE Lp Enet heartbeatPacket

| | |
|---|---|
| Access | Read and write |
| Description | The *heartbeat* packet feature is used to select whether or not the station will generate a *heartbeat* packet. If enabled, the station will generate one *heartbeat* packet every second. If disabled, the station will not generate any *heartbeat* packets. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Lp Enet applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains the component name of a *Framer* which is associated with the *Ethernet* component. This link is used by the component administration system (CAS) to identify which card the application component (associated with the *Framer* component) is to be created. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Lp Enet AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Enet vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Enet commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Enet OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Enet adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Enet operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Enet usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Enet OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Enet snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Enet Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Ethernet* component. |

### ATTRIBUTE Lp Enet macAddress

| | |
|---|---|
| Access | Read only |
| Description | The medium access controller (MAC) address is an address that is only recognized by one station on the network The value of this attribute will be assigned by the system. MAC address is displayed in canonical format. |
| Values | String (6, Dashed Hex) |

| | |
|---|---|
| Default | No default |

### GROUP Lp Enet Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes for the *Ethernet* component. |

### ATTRIBUTE Lp Enet alignmentErrors

| | |
|---|---|
| Access | Read only |
| Description | The *alignmentErrors* counter indicates the number of frames received which were not an integral number of octets in length. Frames will be checked for *alignmentErrors* before they are checked for Frame Check Sequence (FCS) errors. If there is an alignment error, the error will only be counted here and not in *fcsErrors*. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet fcsErrors

| | |
|---|---|
| Access | Read only |
| Description | The *fcsErrors*, Frame Check Sequence (FCS) error, counter indicates the number of frames received which were an integral number of octets in length and did not pass the FCS check. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet singleCollisionFrames

| | |
|---|---|
| Access | Read only |
| Description | The *singleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced exactly one collision. This counter wraps around after it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet multipleCollisionFrames

| | |
|---|---|
| Access | Read only |
| Description | The *multipleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced more than one collision. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet sqeTestErrors

| | |
|---|---|
| Access | Read only |
| Description | The *sqeTestErrors*, Signal Quality Error (SQE) Test errors, counter indicates the number of times the “SQE Test Error” message has been generated for the station. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet deferredTransmissions

| | |
|---|---|
| Access | Read only |
| Description | The *deferredTransmissions* counter indicates the number of frames which experienced a transmission delay because the medium was busy. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet lateCollisions

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The *lateCollisions* counter indicates the number of times a collision was detected later than 512 bit-times into the transmission of a packet. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet excessiveCollisions

| | |
|---|---|
| Access | Read only |
| Description | The *excessiveCollisions* counter indicates the number of frames which failed to get transmitted due to excessive collisions. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet macTransmitErrors

| | |
|---|---|
| Access | Read only |
| Description | The Medium Access Controller (MAC) transmit error counter indicates the number of times that a transmission failed due to internal MAC transmit errors. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet carrierSenseErrors

| | |
|---|---|
| Access | Read only |
| Description | The carrier sense error counter indicates the number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet frameTooLongs

| | |
|---|---|
| Access | Read only |
| Description | The frame too long counter indicates the number of frames received which exceeded the maximum frame size. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Enet macReceiveErrors

| | |
|---|---|
| Access | Read only |
| Description | The Medium Access Controller (MAC) receive error counter indicates the number of times a receive failed due to internal MAC receive errors. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Lp Enet LanTest (Lt)

| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Enet Lt Fb AppleHeader (AppleH)

| | |
|---|---|
| Groups | "GROUP Lp Enet Lt Fb AppleH TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component adds an AppleTalk header to a frame or packet. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Enet Lt Fb AppleH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest AppleHeader component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Enet Lt Fb AppleH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Enet Lt Fb AppleH TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Enet Lt Fb AppleH tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Enet Lt Fb IpxHeader (IpxH)

| | |
|---|---|
| Groups | "GROUP Lp Enet Lt Fb IpxH TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component adds an IPX header to a frame or packet. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Enet Lt Fb IpxH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters forLanTest IpxHeader component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Enet Lt Fb IpxH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Enet Lt Fb IpxH TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Enet Lt Fb IpxH tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Enet Lt Control (Cntl)

| | |
|---|---|
| Groups | "GROUP Lp Enet Lt Cntl TestOp (Top)" |
| Scope | Device |
| Description | LanTest Control<br>This component controls the overall testing by telling the |

FrameBuild component to start and check the FrameCompare component to see if the test is complete.

### VERB Get Lp Enet Lt Cntl

Impact: Passive

Description: This verb is used to get and display operational parameters for the LanTest Control component. This includes attributes set using the Set verb.

### VERB Tlist Lp Enet Lt Cntl

Impact: Passive

Description: This verb is used to display the list of arguments to a component.

### GROUP Lp Enet Lt Cntl TestOp (Top)

Properties: Operational

Description: This group contains the operational data for the LanTest component and its subcomponents.

### ATTRIBUTE Lp Enet Lt Cntl tData (td)

Access: Read and write

Description: This attribute is used to display and set attributes.

Values: String (0..255, ASCII)

Default: No default

### COMPONENT Lp Enet Test

Groups: "GROUP Lp Enet Test PortTestOp (PTO)"
"GROUP Lp Enet Test Results (Results)"

Scope: Device

| | |
|---|---|
| Description | *Lp/n Fddi/n Test*, or<br>*Lp/n Ethernet/n Test*, or<br>*Lp/n TokenRing/n Test, or*<br>*Lp/n IlsForwarder/n Test*<br>The Test component is used to do StartUp port test for LAN cards. |
| Common Verbs | Help<br>List<br>Display |

### VERB Start Lp Enet Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to start a test as per the attributes set within each subcomponent of Test. |

### VERB Stop Lp Enet Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to stop a test. |

### VERB Reset Lp Enet Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to reset the Test component. |

### GROUP Lp Enet Test PortTestOp (PTO)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanPortTest component. |

### ATTRIBUTE Lp Enet Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following: card test sets up an internal loop on the board and runs a bit error rate test; manual test assumes the line is looped back externally and a bit error rate test is performed; |

| | |
|---|---|
| | localLoop test loops back the local modem and performs a bit error rate test; remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test; externalLoop test loops back the line to the far end; payloadLoop test only loops back the payload data received from the incoming line; Note that localLoop, remoteLoop and payloadLoop are not supported by all function processors. |
| Values | onCard<br>normal<br>wrapA<br>wrapB<br>thruA<br>thruB<br>extWrapA<br>extWrapB<br>extThruA<br>extThruB<br>extWrapAB<br>extWrapBA |
| Default | No default |

### ATTRIBUTE Lp Enet Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Enet Test duration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration (in minutes) that test data will be transmitted. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop. |

| | |
|---|---|
| Values | Decimal (1..30240) |
| Units | minutes |
| Default | 1 |

### GROUP Lp Enet Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the Test component. |

### ATTRIBUTE Lp Enet Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Enet Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Enet Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the reason the test is terminated. |
| Values | testTimeExpired<br>stoppedByOperator |

| | |
|---|---|
| | unknown<br>neverStarted<br>testRunning |
| Default | neverStarted |

### ATTRIBUTE Lp Enet Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Enet Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Enet Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Enet Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits received during the test period. This counter is not expected to reach its maximum value. |

| | |
|---|---|
| | The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Enet Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of errored frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Lp Fddi (Fi)

| | |
|---|---|
| Instance | Decimal (0) |
| Groups | "GROUP Lp Fi CustomerIdentifierData (CidData)"<br>"GROUP Lp Fi IfEntryProv (IfEntry)"<br>"GROUP Lp Fi SmtProvisioned (SmtProv)"<br>"GROUP Lp Fi MacProvisioned (MacProv)"<br>"GROUP Lp Fi AdminInfo (AdminInfo)"<br>"GROUP Lp Fi OsiState (State)"<br>"GROUP Lp Fi OperationalStatus (OperStatus)"<br>"GROUP Lp Fi SmtOperational (SmtOper)"<br>"GROUP Lp Fi MacOperational (MacOper)"<br>"GROUP Lp Fi MacCOperational (MacCOper)"<br>"GROUP Lp Fi NcMacOperational (NcMacOper)" |
| Scope | Device |
| Description | *Lp/n Fddi/n*<br>This component defines an instance of a FDDI station attached to a ring. One instance of this component must be created for each hardware interface. Each station must be provisioned prior to inserting into the ring. |

| | |
|---|---|
| Subcomponents | "COMPONENT Lp Fi LanTest (Lt)"<br>"COMPONENT Lp Fi PhysicalLayer (Phy)"<br>"COMPONENT Lp Fi Test" |

### GROUP Lp Fi CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Fi customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of |

| | |
|---|---|
| | any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Fi IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Fi ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Fi ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Fi SmtProvisioned (SmtProv)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable Station Management (SMT) attributes of the *Fddi* component. |

### ATTRIBUTE Lp Fi userData

| | |
|---|---|
| Access | Read and write |
| Description | The user data field is used to identify the FDDI interface on the ring. The user data contains a message with a maximum of 32 characters. |
| Values | String (0..32, ASCII) |
| Default | FDDI |

### ATTRIBUTE Lp Fi acceptAa

| | |
|---|---|
| Access | Read and write |
| Description | The *acceptAa* attribute defines the station type A to station type A connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Lp Fi acceptBb

| | |
|---|---|
| Access | Read and write |
| Description | The *acceptBb* attribute defines the station type B to station type B connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Lp Fi acceptAs

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The *acceptAs* attribute defines the station type A to station type S connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Lp Fi acceptBs

| | |
|---|---|
| Access | Read and write |
| Description | The *acceptBs* attribute defines the station type B to station type S connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Lp Fi acceptAm

| | |
|---|---|
| Access | Read and write |
| Description | The *acceptAm* attribute defines the station type A to station type M connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected. |
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Lp Fi acceptBm

| | |
|---|---|
| Access | Read and write |
| Description | The *acceptBm* attribute defines the station type B to station type M connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected. |
| Values | enabled<br>disabled |

| | |
|---|---|
| Default | enabled |

### ATTRIBUTE Lp Fi useThruBa

| | |
|---|---|
| Access | Read and write |
| Description | The *useThruBa* attribute is used to configure the requested path of the associated station. If ***enabled***, only the secondary preferred path is permitted. If ***disabled***, only the primary preferred path is permitted. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Lp Fi neighborNotifyInterval

| | |
|---|---|
| Access | Read and write |
| Description | The *neighborNotifyInterval* attribute contains the amount of time, expressed in seconds, between neighbor notification frames. |
| Values | Decimal (2..30) |
| Units | seconds |
| Default | 30 |

### ATTRIBUTE Lp Fi statusReportPolicy

| | |
|---|---|
| Access | Read and write |
| Description | The *statusReportPolicy* attribute indicates whether or not the station will generate status reporting frames for its implemented events and conditions. If ***true***, the station will generate the status frames. If ***false***, the station will not generate the status frames. |
| Values | true<br>false |
| Default | true |

### ATTRIBUTE Lp Fi traceMaxExpirationTimer (traceExp)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The *traceMaxExpirationTimer* attribute is used to configure the maximum propagation time, expressed in milliseconds, for a trace on a FDDI topology. This value places a lower bound on the detection time for an unrecovered ring. |
| Values | Decimal (0..1000000) |
| Units | msec |
| Default | 7000 |

### ATTRIBUTE Lp Fi applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains the component name of a *Framer* which is associated with the *Fddi* component. This defines which *LanApplication/n Framer* will be using this *Fddi* interface. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Lp Fi MacProvisioned (MacProv)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable MAC attributes of the *Fddi* component. |

### ATTRIBUTE Lp Fi tokenRequestTimer (tReq)

| | |
|---|---|
| Access | Read and write |
| Description | The *tokenRequestTimer* value contains the token request value assigned to the associated medium access controller (MAC).<br><br>Warning:<br>Changes to this attribute can have adverse effects on the performance of the FDDI ring. Therefore it is recommended that this parameter only be modified by personnel with a thorough understanding of the consequences that may result from changes to this attribute. |

| | |
|---|---|
| Values | Decimal (20480..1340000000) |
| Units | nsec |
| Default | 165290000 |

### ATTRIBUTE Lp Fi tokenMaxTimer (tMax)

| | |
|---|---|
| Access | Read and write |
| Description | The *tokenMaxTimer* value is the maximum timer value the negotiated token rotation time may assume.<br><br>Warning:<br>Changes to this attribute can have adverse effects on the performance of the FDDI ring. Therefore it is recommended that this parameter only be modified by personnel with a thorough understanding of the consequences that may result from changes to this attribute. |
| Values | Decimal (40960..1342200000) |
| Units | nsec |
| Default | 167770000 |

### ATTRIBUTE Lp Fi validTransmissionTimer (tvx)

| | |
|---|---|
| Access | Read and write |
| Description | The *validTransmissionTimer* (Tvx) value specifies the amount of time required for a valid transmission. The station must receive a valid transmission once every Tvx.<br><br>Warning:<br>Changes to this attribute can have adverse effects on the performance of the FDDI ring. Therefore it is recommended that this parameter only be modified by personnel with a thorough understanding of the consequences that may result from changes to this attribute. |
| Values | Decimal (40960..1342200000) |
| Units | nsec |

| | |
|---|---|
| Default | 2621400 |

### GROUP Lp Fi AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Fi vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Fi commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Fi OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Fi adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component. |

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Lp Fi operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Lp Fi usageState (osiUsage)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Fi OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Fi snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Fi SmtOperational (SmtOper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational station management (SMT) attributes of the *Fddi* component. |

### ATTRIBUTE Lp Fi version

| | |
|---|---|
| Access | Read only |
| Description | The *version* attribute contains a copy of the currently supported version numbers of the management information base (MIB) and the station management (SMT). |
| Values | String (0..32, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Fi bypassPresent

| | |
|---|---|
| Access | Read only |
| Description | The *bypassPresent* attribute indicates whether the optical bypass switch is present on its AB port pair. If ***true***, the optical bypass switch is present. If ***false***, it is not present. |
| Values | true<br>false |
| Default | No default |

### ATTRIBUTE Lp Fi ecmState

| | |
|---|---|
| Access | Read only |
| Description | The *ecmState*, Entity Coordination Manager (ECM), state indicates the current state of the ECM state machine. |
| Values | out<br>in<br>trace<br>leave<br>pathTest<br>insert<br>check<br>deinsert |
| Default | No default |

### ATTRIBUTE Lp Fi cfState

| | |
|---|---|
| Access | Read only |
| Description | The *cfState* attribute indicates the current state of the configuration management (CFM) state machine. |
| Values | isolated<br>localA<br>localB<br>localAB<br>localS<br>wrapA<br>wrapB<br>wrapAB<br>wrapS<br>cWrapA<br>cWrapB<br>cWrapS<br>thru |
| Default | No default |

### GROUP Lp Fi MacOperational (MacOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational Medium Access Controller (MAC) attributes of the of the *Fddi* component. |

### ATTRIBUTE Lp Fi ringLatency

| | |
|---|---|
| Access | Read only |
| Description | The *ringLatency* attribute contains the measured ring latency of the ring the station is attached to. |
| Values | Decimal (1280..1342000000) |
| Units | nsec |
| Default | No default |

### ATTRIBUTE Lp Fi macAddress

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The medium access controller (MAC) address is an address that is recognized by only one station on the attached ring. The value of this attribute is assigned by the system. This attribute is displayed in canonical format. The non-canonical version of this address is indicated in *ncMacAddress*. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi upstreamNeighbor

| | |
|---|---|
| Access | Read only |
| Description | The *upstreamNeighbor* attribute contains the MAC address associated with the upstream neighbor station on the ring. This attribute is displayed in canonical format. The non-canonical version of this address is indicated in *ncUpstreamNeighbor.* |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi downstreamNeighbor

| | |
|---|---|
| Access | Read only |
| Description | The *downstreamNeighbor* attribute contains the MAC address associated with the downstream station on the ring. This attribute is displayed in canonical format. The non-canonical version of this address is indicated in *ncDownstreamNeighbor.* |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi oldUpstreamNeighbor

| | |
|---|---|
| Access | Read only |
| Description | *The oldUpstreamNeighbor* attribute contains the previous value of the MAC address associated with the upstream station on the ring. This attribute is displayed in canonical format. The non-canonical version of this address is indicated in *ncOldUpstreamNeighbor.* |

| | |
|---|---|
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi oldDownstreamNeighbor

| | |
|---|---|
| Access | Read only |
| Description | The *oldDownstreamNeighbor* attribute contains the previous value of the MAC address associated with the downstream station on the ring. This attribute is displayed in canonical format. The non-canonical version of this address is indicated in *ncOldDownstreamNeighbor.* |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi dupAddressTest

| | |
|---|---|
| Access | Read only |
| Description | The *dupAddressTest* attribute indicates the condition results of the duplicate address test. If ***notDone***, the test has not been executed. If ***pass***, the test has successfully executed. If ***fail***, the test has failed. |
| Values | notDone<br>pass<br>fail |
| Default | No default |

### ATTRIBUTE Lp Fi tokenNegotiatedTimer (tNeg)

| | |
|---|---|
| Access | Read only |
| Description | The *tokenNegotiatedTimer* specifies the negotiated token rotation time. |
| Values | Decimal (80..1340000000) |
| Units | nsec |
| Default | 167772000 |

### ATTRIBUTE Lp Fi frameCounts

| | |
|---|---|
| Access | Read only |
| Description | The *frameCounts* attribute contains the number of frames that have been received by the station. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Fi copiedCounts

| | |
|---|---|
| Access | Read only |
| Description | The *copiedCounts* attribute contains the number of frames successfully copied into this station's receive buffers, not including MAC control frames. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Fi transmitCounts

| | |
|---|---|
| Access | Read only |
| Description | The *transmitCounts* attribute contains the number of frames transmitted by this station, not including MAC control frames. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Fi errorCounts

| | |
|---|---|
| Access | Read only |
| Description | The *errorCounts* attribute contains the number of error frames first detected by this station. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Fi lostCounts

| | |
|---|---|
| Access | Read only |
