| Description | The *lostCounts* attribute contains the number of instances that the station has detected a format error during frame reception such that the frame was stripped. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Fi rmtState

| | |
|---|---|
| Access | Read only |
| Description | The *rmtState*, ring management (RMT), state indicates the current state of the RMT state machine. |
| Values | isolated<br>nonOp<br>ringOp<br>detect<br>nonOpDup<br>ringOpDup<br>directed<br>trace |
| Default | No default |

### ATTRIBUTE Lp Fi frameErrorFlag

| | |
|---|---|
| Access | Read only |
| Description | The *frameErrorFlag* attribute indicates the MAC frame error condition status. If ***true***, a MAC frame error is present. If ***false***, a MAC frame error condition is not present. |
| Values | true<br>false |
| Default | No default |

### GROUP Lp Fi MacCOperational (MacCOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the Medium Access Controller (MAC) Counters Table of the *Fddi* component. |

### ATTRIBUTE Lp Fi tokenCounts

| | |
|---|---|
| Access | Read only |
| Description | The *tokenCounts* attribute contains the number of times the station has received a token. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Fi tvxExpiredCounts

| | |
|---|---|
| Access | Read only |
| Description | The *tvxExpiredCounts*, Transmission Valid eXpired (TVX), attribute contains the number of times that TVX timer has expired. This counter may increment as stations go on and off the ring. A rapidly increasing value may indicate a problem. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Fi notCopiedCounts

| | |
|---|---|
| Access | Read only |
| Description | The *notCopiedCounts* attribute contains the number of times that the station has detected a frame addressed to itself but did not copy it due to local buffer congestion. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Fi lateCounts

| | |
|---|---|
| Access | Read only |
| Description | The *lateCounts* attribute contains the number of token rotation time (TRT) expirations since the station was reset or a token was received. This counter may increment as stations go on and off the ring. A rapidly increasing value may indicate a problem. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Fi ringOpCounts

| | |
|---|---|
| Access | Read only |
| Description | The *ringOpCounts* attribute contains the number of times the station has made the transition from the ring not operational state to the ring operational state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Lp Fi NcMacOperational (NcMacOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Fddi* component related to non-canonical MAC addresses. |

### ATTRIBUTE Lp Fi ncMacAddress

| | |
|---|---|
| Access | Read only |
| Description | The medium access controller (MAC) address is an address that is recognized by only one station on the attached ring. The value of this attribute is assigned by the system. This attribute is displayed in non-canonical format. The canonical version of this address is indicated in *macAddress*. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi ncUpstreamNeighbor

| | |
|---|---|
| Access | Read only |
| Description | The *ncUpstreamNeighbor* attribute contains the MAC address associated with the upstream neighbor station on the ring. This attribute is displayed in non-canonical format. The canonical version of this address is indicated in *upstreamNeighbor*. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi ncDownstreamNeighbor

| | |
|---|---|
| Access | Read only |
| Description | The *ncDownstreamNeighbor* attribute contains the MAC address associated with the downstream station on the ring. This attribute is displayed in non-canonical format. The canonical version of this address is indicated in *downstreamNeighbor* |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi ncOldUpstreamNeighbor

| | |
|---|---|
| Access | Read only |
| Description | *The ncOldUpstreamNeighbor* attribute contains the previous value of the MAC address associated with the upstream station on the ring. This attribute is displayed in non-canonical format. The canonical version of this address is indicated in *oldUpstreamNeighbor.* |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Fi ncOldDownstreamNeighbor

| | |
|---|---|
| Access | Read only |
| Description | The *ncOldDownstreamNeighbor* attribute contains the previous value of the MAC address associated with the downstream station |

on the ring. This attribute is displayed in non-canonical format. The canonical version of this address is indicated in *oldDownstreamNeighbor*.

Values: String (6, Dashed Hex)

Default: No default

## COMPONENT Lp Fi LanTest (Lt)

Groups: "GROUP Lp Fi Lt TestOp (Top)"

Scope: Device

Description: *Lp/n Fddi/n LanTest*, or
*Lp/n Ethernet/n LanTest*, or
*Lp/n TokenRing/n LanTest, or*
*Lp/n IlsForwarder/n LanTest*
The LanTest component is used to control testing on LAN interfaces. This includes LLC layer loopback, on-card loopback, SNMP required tests, and any testing to be done in the lab or manufacturing.

Dyn. Subcomp.:
"COMPONENT Lp Fi Lt FrameCompare (FrmCmp)"
"COMPONENT Lp Fi Lt FrameCopy (FrmCpy)"
"COMPONENT Lp Fi Lt PortConfig (PrtCfg)"
"COMPONENT Lp Fi Lt FrameBuild (Fb)"
"COMPONENT Lp Fi Lt Control (Cntl)"

## VERB Start Lp Fi Lt

Impact: Service

Description: This verb is used to start a test as per the attributes set within each subcomponent of LanTest.

### VERB Stop Lp Fi Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to stop a test. |

### VERB Reset Lp Fi Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to reset the LanTest component. |

### VERB Get Lp Fi Lt

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Fi Lt

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to an attribute. |

### GROUP Lp Fi Lt TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Fi Lt tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Fi Lt FrameCompare (FrmCmp)

| | |
|---|---|
| Groups | "GROUP Lp Fi Lt FrmCmp TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component compares frames received from the hardware and emulator during testing. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Fi Lt FrmCmp

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FrameCompare component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Fi Lt FrmCmp

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Fi Lt FrmCmp TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Fi Lt FrmCmp tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Fi Lt FrameCopy (FrmCpy)

| | |
|---|---|
| Groups | "GROUP Lp Fi Lt FrmCpy TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component receives its input from FrameBuild and places it upon the hardware which sends it to the appropriate emulator. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Fi Lt FrmCpy

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FrameCopy component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Fi Lt FrmCpy

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Fi Lt FrmCpy TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Fi Lt FrmCpy tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Fi Lt PortConfig (PrtCfg)

| | |
|---|---|
| Groups | "GROUP Lp Fi Lt PrtCfg TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component controls the emulator and hardware to ensure frames output from each will match in FrameCompare. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Fi Lt PrtCfg

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest PortConfig component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Fi Lt PrtCfg

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Fi Lt PrtCfg TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Fi Lt PrtCfg tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Fi Lt FrameBuild (Fb)

| | |
|---|---|
| Groups | "GROUP Lp Fi Lt Fb TestOp (Top)" |
| Scope | Device |
| Description | LanTest Framebuild<br>This component controls the building of all frames built and sent |

by the LanTest component. Each component under FrameBuild builds a portion of a packet or frame.

Dyn. Subcomp.

"COMPONENT Lp Fi Lt Fb TransmitInfo (TxInfo)"
"COMPONENT Lp Fi Lt Fb FddiMac (MacFddi)"
"COMPONENT Lp Fi Lt Fb EthernetMac (MacEnet)"
"COMPONENT Lp Fi Lt Fb TokenRingMac (MacTr)"
"COMPONENT Lp Fi Lt Fb DataField (Data)"
"COMPONENT Lp Fi Lt Fb IpHeader (IpH)"
"COMPONENT Lp Fi Lt Fb LlcHeader (Llch)"
"COMPONENT Lp Fi Lt Fb AppleHeader (AppleH)"

### VERB Get Lp Fi Lt Cntl

Impact: Passive

Description: This verb is used to get and display operational parameters for the LanTest Control component. This includes attributes set using the Set verb.

### VERB Tlist Lp Fi Lt Cntl

Impact: Passive

Description: This verb is used to display the list of arguments to a component.

### GROUP Lp Fi Lt Cntl TestOp (Top)

Properties: Operational

Description: This group contains the operational data for the LanTest component and its subcomponents.

### ATTRIBUTE Lp Fi Lt Cntl tData (td)

Access: Read and write

Description: This attribute is used to display and set attributes.

Values: String (0..255, ASCII)

Default: No default

### COMPONENT Lp Fi PhysicalLayer (Phy)

Instance: a
b

Groups: "GROUP Lp Fi Phy Provisionable (Prov)"
"GROUP Lp Fi Phy Operational (Oper)"

| | |
|---|---|
| Scope | Device |
| Description | *Lp/n Fddi/n Phy/x*<br>This component defines an instance of a FDDI port attached to a ring. Two instances of this component must be provisioned for each hardware port. Each port must be provisioned prior to inserting into the ring. |
| Common Verbs | Help<br>List<br>Display<br>Add |

### GROUP Lp Fi Phy Provisionable (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the Fddi *Phy* component. |

### ATTRIBUTE Lp Fi Phy lerCutoff

| | |
|---|---|
| Access | Read and write |
| Description | The *lerCutoff* attribute contains the link error rate estimate at which a link connection will be broken. The values will range from 10**-4 to 10**-15. Only the absolute value of the base 10 log is reported. |
| Values | Decimal (4..15) |
| Default | 7 |

### ATTRIBUTE Lp Fi Phy lerAlarm

| | |
|---|---|
| Access | Read and write |
| Description | The *lerAlarm* attribute contains the link error rate estimate at which a link connection will generate an alarm. The values will range from 10**-4 to 10**-15. Only the absolute value of the base 10 log is reported |
| Values | Decimal (4..15) |
| Default | 8 |

### ATTRIBUTE Lp Fi Phy linkErrorMonitor

| | |
|---|---|
| Access | Read and write |
| Description | The *linkErrorMonitor* attribute is used to select the state of the link error monitor for the associated *Phy* component. If ***enabled***, the link error monitor will send the correct test status to the neighboring station. If ***disabled***, the link error monitor will always send a test passed status to the neighboring station. |
| Values | enabled<br>disabled |
| Default | enabled |

### GROUP Lp Fi Phy Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the Fddi *Phy* component. |

### ATTRIBUTE Lp Fi Phy neighborType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the neighbor type of the neighbor physical layer. |
| Values | a<br>b<br>s<br>m<br>none |
| Default | No default |

### ATTRIBUTE Lp Fi Phy lctFailCounts

| | |
|---|---|
| Access | Read only |
| Description | The *lctFailCounts* attribute contains the number of consecutive times the Link Confidence Test (LCT) has failed. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Fi Phy lerEstimate

| | |
|---|---|
| Access | Read only |
| Description | The *lerEstimate* attribute contains a long term average link error rate. The values will range from 10**-4 to 10**-15. Only the absolute value of the base 10 log is reported |
| Values | Decimal (4..15) |
| Default | No default |

### ATTRIBUTE Lp Fi Phy lemRejectCounts

| | |
|---|---|
| Access | Read only |
| Description | The *lemRejectCounts* attribute contains the number of times that a link has been rejected. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Fi Phy lemCounts

| | |
|---|---|
| Access | Read only |
| Description | The *lemCounts* attribute contains the aggregate link error monitor error count. This counter is set to zero only on station initialization. This counter will wrap around after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Fi Phy pcmState

| | |
|---|---|
| Access | Read only |
| Description | The *pcmState*, physical connection manager (PCM), state indicates the current state of the PCM state machine. |

| | |
|---|---|
| Values | off<br>break<br>trace<br>connect<br>next<br>signal<br>join<br>verify<br>active<br>maint |
| Default | No default |

### ATTRIBUTE Lp Fi Phy lerFlag

| | |
|---|---|
| Access | Read only |
| Description | The *lerFlag* attribute indicates when the link error rate estimate is less than or equal to the link error rate alarm. If ***true***, the value of the link error rate estimate is less than or equal to the link error rate alarm. If ***false***, the value of the link error rate estimate is greater than the link error rate alarm. |
| Values | true<br>false |
| Default | No default |

### ATTRIBUTE Lp Fi Phy signalState

| | |
|---|---|
| Access | Read only |
| Description | The *signalState* attribute contains the current physical connection manager (PCM) signal bit being transmitted, or was transmitted, during the PCM signal state. |
| Values | escape<br>phyTypeL<br>phyTypeH<br>accept<br>lctLengthL<br>lctLengthH<br>macAvail<br>lctResult |

macLoop
macOnPhy

## COMPONENT Lp Fi Test

| | |
|---|---|
| Groups | "GROUP Lp Fi Test PortTestOp (PTO)"<br>"GROUP Lp Fi Test Results (Results)" |
| Scope | Device |
| Description | *Lp/n Fddi/n Test*, or<br>*Lp/n Ethernet/n Test*, or<br>*Lp/n TokenRing/n Test, or*<br>*Lp/n IlsForwarder/n Test*<br>The Test component is used to do StartUp port test for LAN cards. |
| Common Verbs | Help<br>List<br>Display |

## VERB Start Lp Fi Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to start a test as per the attributes set within each subcomponent of Test. |

## VERB Stop Lp Fi Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to stop a test. |

## VERB Reset Lp Fi Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to reset the Test component. |

## GROUP Lp Fi Test PortTestOp (PTO)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanPortTest component. |

### ATTRIBUTE Lp Fi Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following: card test sets up an internal loop on the board and runs a bit error rate test; manual test assumes the line is looped back externally and a bit error rate test is performed; localLoop test loops back the local modem and performs a bit error rate test; remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test; externalLoop test loops back the line to the far end; payloadLoop test only loops back the payload data received from the incoming line; Note that localLoop, remoteLoop and payloadLoop are not supported by all function processors. |
| Values | onCard<br>normal<br>wrapA<br>wrapB<br>thruA<br>thruB<br>extWrapA<br>extWrapB<br>extThruA<br>extThruB<br>extWrapAB<br>extWrapBA |
| Default | No default |

### ATTRIBUTE Lp Fi Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Fi Test duration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration (in minutes) that test data will be transmitted. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop. |
| Values | Decimal (1..30240) |
| Units | minutes |
| Default | 1 |

### GROUP Lp Fi Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the Test component. |

### ATTRIBUTE Lp Fi Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Fi Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute. |
| Values | Decimal (0..4294967295) |
| Units | minutes |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Fi Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the reason the test is terminated. |
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning |
| Default | neverStarted |

### ATTRIBUTE Lp Fi Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Fi Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Fi Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Fi Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Fi Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of errored frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Lp DS3

| | |
|---|---|
| Instance | Decimal (0..11) |
| Groups | "GROUP Lp DS3 Provisioned (Prov)"<br>"GROUP Lp DS3 CustomerIdentifierData (CidData)"<br>"GROUP Lp DS3 AdminInfo (AdminInfo)"<br>"GROUP Lp DS3 IfEntryProv (IfEntry)"<br>"GROUP Lp DS3 OperationalStatus (OperStatus)"<br>"GROUP Lp DS3 OsiState (State)"<br>"GROUP Lp DS3 Operational (Oper)"<br>"GROUP Lp DS3 Statistics (Stats)" |
| Scope | Application |

| | |
|---|---|
| Description | Lp/n DS3/n<br>The *DS3* component controls a DS3 port on a DS3 Function Processor. Only for a 4pDS3 Frame Relay FP, determination of channelized or unchannelized card type is based on the provisioning of DS1Tribs. i.e. If no DS1Trib provisioned, it is regarded as an unchannelized FP; otherwise it is treated as a channelized FP. It should also be noticed that currently mixture of channelized and unchannelized configurations on the same 4pDS3 Frame Relay FP is not accepted. |
| Opt. Subcomp. | "COMPONENT Lp DS3 AtmCell (Cell)"<br>"COMPONENT Lp DS3 DS1"<br>"COMPONENT Lp DS3 InverseMultiplexerAtm (Ima)" |
| Dyn. Subcomp. | "COMPONENT Lp DS3 Test (Test)"<br>"COMPONENT Lp DS3 CBit"<br>"COMPONENT Lp DS3 Plcp" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Lp DS3 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for a *DS3* component. |

### ATTRIBUTE Lp DS3 cbitParity

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates if C-Bit parity has been turned ON or OFF. The *CBIT* component will appear under the *DS3* component when the *cbitParity* attribute is set to ***on***. |
| Values | off<br>on |

| | |
|---|---|
| Default | on |

### ATTRIBUTE Lp DS3 lineLength (length)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the line length for equalization calculations for the DS3 line. The range is between 0 and 450 feet (1 metre = 3.28 feet).<br>Note: There are currently only two ranges as far as the equalization calculation performed on the FP is concerned: 0 to 224ft and 225 to 450ft. |
| Values | Decimal (0..450) |
| Units | feet |
| Default | 1 |

### ATTRIBUTE Lp DS3 clockingSource

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of clocking source used for synchronizing the DS3 transmit clock: ***local*** means direct use of the local clock oscillator at its centre frequency; ***line*** means use of a signal phase-locked to the incoming DS3 line rate; ***module*** means the use of a signal phase-locked to the CP reference clock. Note that the multiport cell-based cards have one common clock source for all ports. For this reason, the following rules apply for the value of *clockingSource* across the board's three ports:<br>All three *clockingSource* values must be "***local***" OR<br>All three *clockingSource* values must be "***module***" OR<br>One *clockingSource* value must be "***line***" and the other two must be "***otherPort***".<br>If there is no *NS* component provisioned, the default value for this attribute will be ***local.*** If the *NS* component has been provisioned, the default value is ***module***, except for the ***1pDS3C*** cards.<br><br>For the ***1pDS3C*** cards, the default and only valid value for this attribute is ***local***. The *clockingSource* of the DS1 sub-component becomes the effective clocking source for this attribute. All the DS1 sub-components have the same clocking source. |

On the ***4pDS3ChAal1*** card, the only allowed values for this attribute are ***local*** and ***module***.

Values
local
line
module
otherPort

Default
No default

### ATTRIBUTE Lp DS3 applicationFramerName (framer)

Access
Read and write

Description
This attribute defines the link to the software stack. It defines which application is running on top of the *DS3* component.

Values
Link (Service, interfaceName)

Default
No default

### ATTRIBUTE Lp DS3 mapping

Access
Read and write

Description
This attribute indicates if ATM cells will be mapped directly into the DS3 payload, or whether PLCP mapping will be used. The *PLCP* component will appear under the *DS3* component when this attribute is set to ***plcp***. This attribute will be ignored when set on frame-based cards.

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***direct***.

Values
direct
plcp

Default
direct

### GROUP Lp DS3 CustomerIdentifierData (CidData)

Properties
Provisioned

Description
This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE Lp DS3 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp DS3 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp DS3 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS3 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp DS3 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp DS3 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp DS3 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp DS3 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp DS3 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp DS3 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp DS3 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp DS3 operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp DS3 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp DS3 availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Lp DS3 proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp DS3 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp DS3 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp DS3 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Lp DS3 unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Lp DS3 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for the *DS3* component. |

### ATTRIBUTE Lp DS3 losAlarm (los)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a Loss Of Signal (LOS) alarm state has been entered. An LOS alarm state is entered when LOS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOS defect is detected at the DS3 line interface upon observing 175 +/- 75 continuous pulse positions with no pulses of either positive or negative polarity. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The *DS3* component goes into an operational state of *disabled* until the LOS alarm condition is cleared. The LOS alarm state is cleared after LOS defects have been absent for a period of 10 |

seconds +/- 0.5 seconds.
The *losAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
off

### ATTRIBUTE Lp DS3 lofAlarm (lof)

Access
Read only

Description
This attribute displays whether a Loss Of Frame (LOF) alarm state has been entered. An LOF alarm state is entered when Severely Errored Frame (SEF) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A SEF defect is detected when 3 (or more) out of 16 (or fewer) F-bits are in error, or one (or more) M-bits in two (or more) out of four (or fewer) consecutive M-frames are in error. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *DS3* component goes into an operational state of *disabled* until the LOF alarm condition is cleared. The condition is cleared when framing has been achieved for a period of 10 seconds +/- 0.5 seconds. As long as SEF defects are detected, the node also transmits the far-end SEF/AIS defect indicator over the outgoing line. When not running in C-Bit Parity mode, the *txRai* attribute is also set to ***on*** when transmitting the far-end SEF/AIS defect indicator on the outgoing line.
The *lofAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
off

### ATTRIBUTE Lp DS3 rxAisAlarm (rxAis)

Access
Read only

Description

This attribute displays whether an Alarm Indication Signal (AIS) alarm state has been entered. An AIS alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is the occurrence of AIS (valid DS3 frame with payload containing the 1010...sequence and with C-Bits set to zero) in contiguous M-frames for a time greater than 100 milliseconds. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *DS3* component goes into an operational state of *disabled* until the AIS alarm condition is cleared (after AIS has been no longer detected for a period of 10 seconds +/- 0.5 seconds). As long as AIS is detected, the node also transmits the far-end SEF/AIS defect indicator over the outgoing line. When not running in C-Bit Parity mode, the *txRai* attribute is also set to *on* when transmitting the far-end SEF/AIS defect indicator on the outgoing line.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values

on
off

Default

off

### ATTRIBUTE Lp DS3 rxRaiAlarm (rxRai)

Access

Read only

Description

This attribute displays whether a Remote Alarm Indication (RAI) alarm state has been entered.
When not running the C-Bit Parity mode, the RAI alarm state is entered when the far-end SEF/AIS defect indicator has been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds on the incoming DS3 line. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The *DS3* component goes into an operational state of *disabled* until the RAI alarm condition is cleared. The condition is cleared when the far-end SEF/AIS defect indicator

has not been detected for 10 seconds +/- 0.5 seconds.
When running the C-Bit Parity mode, the RAI alarm state is entered upon detection of a far-end alarm over the Far-End Alarm and Control (FEAC) channel. The RAI alarm state is exited as soon as no more far-end alarm is detected on the FEAC channel. The far-end alarms that can be detected on the FEAC channel and that cause the RAI alarm state to be entered are: equipment failure alarm (service affecting), LOS alarm, LOF alarm, idle and AIS alarm.
The *rxRaiAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
off

### ATTRIBUTE Lp DS3 rxIdle

Access
Read only

Description
This attribute displays whether an Idle failure condition has been reported on the DS3 port. An Idle condition is reported when DS3 Idle defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The DS3 Idle defect is the occurrence of a valid DS3 frame with the information bits set to a 11001100.. sequence. If the DS3 Idle defects are intermittently occurring, the DS3 Idle defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *DS3* component goes into an operational state of *disabled* until the Idle failure condition is cleared. The failure condition is cleared when the DS3 idle pattern has not been detected for at least 10 seconds +/- 0.5 seconds.
The *rxIdle* attribute is always set to ***off*** when the component has been *locked* and left *offline*.
The idle pattern indicates that the far-end is physically connected but not put in service. For instance, DS3 idle is transmitted on the outgoing line when the *DS3* component is locked and not used for operational testing.

Values
on
off

| | |
|---|---|
| Default | off |

### ATTRIBUTE Lp DS3 txAis

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether an Alarm Indication Signal (AIS) alarm is being transmitted on the DS3 line. Currently, AIS is never transmitted by a Passport DS3 node. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp DS3 txRai

| | |
|---|---|
| Access | Read only |
| Description | When not running C-Bit Parity mode, this attribute displays whether the far-end SEF/AIS defect indicator is transmitted over the outgoing line when the *DS3* component has been unlocked or used in operational testing. When running in C-Bit Parity mode, this attribute displays whether a far-end alarm is sent over the Far-End Alarm and Control (FEAC) channel when the *DS3* component has been unlocked or used in operational testing. When the *DS3* component is locked and not used in operational testing, this attribute is always set to ***off***. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp DS3 txIdle

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the DS3 Idle signal is transmitted over the outgoing line. DS3 Idle is sent when the *DS3* component has been locked and not used in operational testing. |
| Values | on<br>off |
| Default | off |

## GROUP Lp DS3 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the specific DS3 common operational data for a *DS3* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

## ATTRIBUTE Lp DS3 runningTime (time)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of seconds since the DS3 component has been activated and been in unlocked state or used for operational testing. All the other error counts that follow as well as each *DS3* subcomponent's error counts can be updated when this count is active. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

## ATTRIBUTE Lp DS3 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the DS3 port has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp DS3 lineCodeViolations (lcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Code Violations (LCV) detected. A DS3 Line Code Violation is a B3Zs error. LCV counting is inhibited for second intervals where Line Severely Errored Second (LSES) is counted.<br>This attribute is a non-negative integer which monotonically |

| | |
|---|---|
| | increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 lineErroredSec (les)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Errored Seconds (LES) that have been counted. A LES is declared for second intervals containing one or more LCV or one or more Loss Of Signal (LOS) defects. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 lineSevErroredSec (lses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Severely Errored Seconds (LSES) that have been counted. A LSES is declared for second intervals containing more than 44 LCVs or one or more LOS defects. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 lineLosSec (loss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line LOS Seconds (LOSS) that have been counted. A LOSS is declared for second intervals containing one or more LOS defects. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 lineFailures (lf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a line failure (LOS failure) has been declared.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Path Code Violations (PCVs) detected. Each PCV corresponds to a P-bit parity error, or possibly a frame error or a disagreement between P-bits or X-bits. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Path Errored Seconds (PESs) that have been counted. A PES is declared for second intervals containing one or more Path Code Violations (PCV) or one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of Path Errored Seconds is inhibited when Path Unavailable Seconds (PUAS) is counted over the monitored second. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Path Severely Errored Seconds (PSESs) that have been counted. A PSES is declared for second intervals containing more than 44 PCVs or one or more SEF or AIS defects. Counting of PSESs is inhibited when Path Unavailable Seconds (PUAS) is counted over the monitored second. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 pathSefAisSec (psas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of SEF/AIS Seconds (PSASs). A PSAS is declared for second intervals containing one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of PSAS is inhibited when Path Unavailable Seconds (PUAS) is counted over the monitored second. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 pathUnavailSec (puas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of one second intervals for which the DS3 path is unavailable. The DS3 path becomes unavailable at the onset of 10 consecutive Path Severely Errored Seconds (PSES). The 10 PSESs are included in the unavailable time. Once unavailable, the DS3 path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second |

| | |
|---|---|
| | intervals where PUAS is counted, counting of Path Coding Violations (PCV), Path Errored Seconds (PES), Path Severely Errored Seconds (PSES) and Path Sef/Ais Seconds (PSAS) is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a path failure (LOF/AIS failure) has been declared.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 egressFrameDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames discarded at egress PQC. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp DS3 Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp DS3 Test OsiState (State)"<br>"GROUP Lp DS3 Test Setup (Setup)"<br>"GROUP Lp DS3 Test Results (Results)" |
| Scope | Application |

Description — The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port.

Common Verbs
- Help
- List
- Display

### VERB START Lp DS3 Test

Impact — Service

Description — This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

### VERB STOP Lp DS3 Test

Impact — Service

Description — This command stops a test running on the hardware component.

### GROUP Lp DS3 Test OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp DS3 Test adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component.

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp DS3 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp DS3 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp DS3 Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Lp DS3 Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

### ATTRIBUTE Lp DS3 Test type (type)

Access
Read and write

Description
This attribute is the type of test to be run. The available test types include the following:
***card*** test sets up an internal loop on the board and runs a bit error rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.

***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

## ATTRIBUTE Lp DS3 Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.

| | |
|---|---|
| | This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp DS3 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp DS3 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp DS3 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp DS3 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp DS3 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

## GROUP Lp DS3 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

## ATTRIBUTE Lp DS3 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.<br><br>a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. |

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp DS3 Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp DS3 Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp DS3 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp DS3 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp DS3 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp DS3 CBit

| | |
|---|---|
| Groups | "GROUP Lp DS3 CBit Operational"<br>"GROUP Lp DS3 CBit Statistics (Stats)" |
| Scope | Application |
| Description | *Lp/n DS3/n CBIT*<br>The *CBIT* component is configured to display all DS3 C-Bit parity related operational and statistical data. It will appear under the *DS3* component when the *DS3 cbitParity* attribute is set to ***on***. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Lp DS3 CBit Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the DS3 C-Bit Parity operational data for the *CBIT* component. |

## ATTRIBUTE Lp DS3 CBit farEndAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Far-End alarm signal that is currently received at the DS3 interface. This signal is carried over the Far-End Alarm and Control (FEAC) bits of DS3 frames. Five far-end alarm signals can be received: far-end equipment failure that is received when the far-end terminal has detected a local equipment failure; far-end Loss Of Signal (LOS) that is received when the far-end DS3 terminal has declared a LOS failure condition; far-end Loss of Frame (LOF) when the far-end DS3 terminal has declared a Loss Of Frame (LOF) failure condition; far-end Alarm Indication Signal (AIS) when the far-end has declared an AIS failure condition; far-end Idle when the far-end has declared an Idle signal condition. |
| Values | equipmentFailure<br>los<br>sef<br>ais<br>idle<br>none |
| Default | none |

## ATTRIBUTE Lp DS3 CBit loopedbackToFarEnd

| | |
|---|---|
| Access | Read only |
| Description | This indicates whether or not the DS3 component is currently looping back the incoming DS3 signal or one of its DS1 tributaries to the far-end DS3 terminal. This is activated when the far-end DS3 equipment has ordered the local terminal to do so. |

| | |
|---|---|

| Default | No default |

### ATTRIBUTE Lp DS3 CBit loopbackAtFarEndRequested

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates which DS1 tributaries are being looped back, or if the DS3 line is being looped back. Each value listed indicates a loopback request has been made. When a loopback |

deactivation command has been sent to the far end, the corresponding value will be removed from the list.

## GROUP Lp DS3 CBit Statistics (Stats)

Properties

Operational

Description

This group contains the DS3 C-Bit Parity statistical data for the *CBIT* component. Each attribute type is a non-negative integer

which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

### ATTRIBUTE Lp DS3 CBit cbitErrorFreeSec (cefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the DS3 port has not suffered any C-Bit errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 CBit cbitCodeViolations (ccv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total count of C-Bit Parity Code Violations (CCV). A CCV is obtained when the parity calculated over the previous DS3 frame and the value of the CP-bits appearing in the current DS3 frame differ. The value of this attribute will wrap around to 0 if it does reach its maximum value. CCV counting is inhibited for second intervals where C-Bit Parity Severely Errored Seconds (CSES) are counted. It is also inhibited for second intervals where C-Bit Unavailable Seconds (CUAS) are counted.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 CBit cbitErroredSec (ces)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of C-Bit Parity Errored Seconds (CES). A CES second is declared for second intervals containing one or more CCVs or when one or more SEF (Severely Errored Frame) or AIS (Alarm Indication Signal) defects. |

CES counting is inhibited for second intervals where C-Bit Unavailable Seconds (CUAS) are counted.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 CBit cbitSevErroredSec (cses)

Access: Read only

Description: This attribute indicates the total number of C-Bit Parity Severely Errored Seconds (CSES). A CSES is declared for second intervals containing more than 44 CCVs or one or more SEF or AIS defects. The occurrence of CSES in a one second interval causes the inhibition of CCV counting during that second interval. CSES counting is also inhibited for second intervals where C-Bit Unavailable Seconds (CUAS) are counted.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 CBit cbitUnavailSec (cuas)

Access: Read only

Description: This attribute indicates the total number of one second intervals for which the DS3 path is unavailable. The DS3 path becomes unavailable at the onset of 10 consecutive C-Bit Severely Errored Seconds (CSES). The 10 CSESs are included in the unavailable time. Once unavailable, the DS3 path becomes available at the onset of 10 contiguous seconds with no CSES. The 10 seconds with no CSES are excluded from the unavailable time. For second intervals where CUAS is counted, counting of C-Bit Coding Violations (CCV), C-Bit Errored Seconds (CES) and C-Bit Severely Errored Seconds (CSES) is inhibited.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 CBit farEndErrorFreeSec (feefs)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the number of seconds that the DS3 port has not suffered of any far-end errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 CBit farEndCodeViolations (fecv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total count of DS3 frames containing a Coding Violation on the Far-End (FECV), also known as a Far-End Block Error (FEBE). Each FEBE is reported over the FEBE bits each time the far-end DS3 terminal detects a C-BIT Parity error over a received DS3 frame. For second intervals where Far-End Unavailable Seconds (FEAUS) or Far-End Severely Errored Seconds (FESES) are counted, counting of FECVs is inhibited. This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 CBit farEndErroredSec (fees)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End Errored Seconds (FEES). A FEES is declared for second intervals containing with one or more FECVs or one or more far-end SEF/AIS defects. A far-end SEF/AIS defect occurs when the X-Bits of the DS3 frame are received as being set to zero. For second intervals where Far-End Unavailable Seconds (FEUAS) are counted, counting of FEESs is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 CBit farEndSevErroredSec (feses)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total number of Far-End Severely Errored Seconds (FESES). A FESES is declared for second intervals containing more than 44 FECVs or one or more far-end SEF/AIS defects. For second intervals where a FESES is counted, counting of FECVs is inhibited. For second intervals where Far-End Unavailable Seconds (FEUAS) are counted, counting of FESESs is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 CBit farEndSefAisSec (fesas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End SEF/AIS Seconds (FESAS). A FESAS is declared for second intervals containing one or more far-end SEF/AIS defects.For second intervals where Far-End Unavailable Seconds (FEUAS) are counted, counting of FESASs is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 CBit farEndUnavailSec (feuas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of one second intervals for which the DS3 far-end path is unavailable. The DS3 far-end path becomes unavailable at the onset of 10 consecutive Far-End Severely Errored Seconds (FESES). The 10 FESESs are included in the unavailable time. Once unavailable, the DS3 far-end path becomes available at the onset of 10 contiguous seconds with no FESES. The 10 seconds with no FESES are excluded from the unavailable time. For second intervals where FEUAS is counted, counting of Far-End Coding Violations (FECV), Far-End Errored Seconds (FEES), Far-End Severely Errored Seconds (FESES) and Far-End Sef/Ais Seconds (FESAS) is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 CBit farEndFailures (fef)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a far-end path failure (i.e. a Far-End SEF/AIS defect) has been declared. This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp DS3 Plcp

| | |
|---|---|
| Groups | "GROUP Lp DS3 Plcp Operational"<br>"GROUP Lp DS3 Plcp Statistics (Stats)" |
| Scope | Application |
| Description | *LP/n DS3/n PLCP*<br>*LP/n E3/n PLCP*<br>The *PLCP* component is configured to display all DS3/E3 PLCP related operational and statistical data. It will appear under the *DS3* or *E3* components when the *mapping* attribute is set to ***plcp***. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Lp DS3 Plcp Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the *PLCP* component. |

### ATTRIBUTE Lp DS3 Plcp lofAlarm (lof)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a PLCP Loss Of Frame (LOF) failure alarm state has been entered. An LOF failure is declared when a PLCP LOF defect persists for 2.5 s +/- 0.5 s. An LOF |

defect occurs when an OOF (Out of Frame) state persists for more than 1 ms. If the OOF events are intermittent, the LOF defect counter is decremented at a rate of 1/12 (for DS3 PLCP) or 1/9 (for G.751 E3 PLCP) of the incrementing rate, with all measurements based on a 200 ms polling cycle. An OOF event (also known as a PLCP SEF event) is declared when an error is detected in both the A1 and A2 octets, or when two consecutive POHIDs are found in error.
OOF is removed when two valid sets of framing octets and two valid and sequential POHID octets have been found. The LOF defect is removed when the defect counter reaches zero, i.e. when OOF events are absent for more than 12 ms (DS3 PLCP) or 9 ms (G.751 E3 PLCP). LOF failure alarm is cleared when LOF defect is absent for 10.0 s +/- 0.5 s
The *DS3* or *E3* component goes into an operational state of *disabled* until the LOF failure alarm is cleared. The terminal declaring the LOF failure alarm will transmit a PLCP RAI signal to the far-end for the duration of the alarm.
The *lofAlarm* attribute is always set to *off* when the *DS3* or *E3* component has been *locked* and left *offline*.

Values: on, off

Default: off

### ATTRIBUTE Lp DS3 Plcp rxRaiAlarm (rxrai)

Access: Read only

Description: This attribute displays whether a PLCP Remote Alarm Indication (RAI) failure alarm state has been entered. An RAI failure alarm occurs when ten consecutive PLCP RAI bits (bit 5 in the G1 byte) are high on the incoming line. An RAI failure alarm is cleared when ten consecutive RAI bits are set to 0.
Note: Some standards call this alarm RFI.
The *rxRaiAlarm* attribute is always set to *off* when the *DS3* or *E3* component has been *locked* and left *offline*.

Values: on, off

Default: off

## GROUP Lp DS3 Plcp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical data for the *PLCP* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

## ATTRIBUTE Lp DS3 Plcp errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds during which the near-end PLCP path layer had no errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp DS3 Plcp codingViolations (cv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of BIP-8 Errors, framing pattern octet errors, and path overhead identification errors detected in received PLCP frames.<br>Counting of PLCP CV is inhibited for second intervals where PLCP Severely Errored Framing Seconds (SEFS) or PLCP Unavailable Seconds (UAS) are counted.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp DS3 Plcp erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds containing one or more PLCP Coding Violations (CV) or in which a PLCP Severely Errored Framing Second (SEFS) was counted. |

| | |
|---|---|
| | Counting of PLCP ES is inhibited during second intervals where PLCP Unavailable Seconds (UAS) are counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 Plcp sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds containing 5 or more PLCPCVs or in which a PLCPSEFS was counted (i.e. a PLCP OOF event occurred).<br>Counting of PLCP SES is inhibited during second intervals where PLCP Unavailable Seconds (UAS) are counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 Plcp sevErroredFramingSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds containing one or more PLCP Severely Errored Frame (SEF) events. An SEF event is equivalent to a PLCP OOF (Out of Frame) event.<br>Counting of PLCPP SEFSs is inhibited for second intervals where PLCP Unavailable Seconds (UAS) are counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 Plcp unavailSec (uas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds when the near-end PLCP layer is unavailable. The PLCP Path Layer becomes unavailable at the declaration of PLCP LOF (Loss of Frame) failure alarm state. The PLCP Path Layer becomes available again only after clearing this condition.<br>For second intervals where PLCP UAS are counted, counting of PLCP Severely Errored Framing Seconds (SEFS), PLCP Coding |

| | |
|---|---|
| | Violations (CV), PLCP Errored Seconds (ES), PLCP Severely Errored Seconds (SES) and PLCP Far-End Severely Errored Seconds (FESES) is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 Plcp farEndErrorFreeSec (feefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds during which the far-end PLCP path layer had no errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 Plcp farEndCodingViolations (fecv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of PLCP Far-End Block Errors (FEBE) reported by the far-end terminal.<br>Counting of FEBEs is inhibited for second intervals where PLCP Far-End Unavailable Seconds (FEUAS) are counted.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 Plcp farEndErroredSec (fees)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds containing one or more PLCP Far-End Coding Violations (FECV).<br>Counting of PLCP FEES is inhibited during second intervals where PLCP Far-End Unavailable Seconds (FEUAS) are counted. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Lp DS3 Plcp farEndSevErroredSec (feses)

Access Read only

Description This attribute indicates the number of seconds containing 5 or more PLCP Far-End Coding Violations (FECV).
Counting of PLCP FESES is inhibited for second intervals where PLCP Far-End Unavailable Seconds (FEUAS) are counted.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Lp DS3 Plcp farEndUnavailableSec (feuas)

Access Read only

Description This attribute indicates the number of seconds during which the PLCP far end is unavailable. The PLCP Path Layer becomes unavailable at the declaration of PLCP RAI (Remote Alarm Indication). Service becomes available again after this condition is cleared. For second intervals where PLCP FEUAS are counted, counting of PLCP Far-End Coding Violations (FECV), PLCP Far-End Errored Seconds (FEES), and PLCP Far-End Severely Errored Seconds (FESES) is inhibited.

Values Decimal (0..4294967295)

Default 0

### COMPONENT Lp DS3 AtmCell (Cell)

Groups "GROUP Lp DS3 Cell Provisioned (Prov)"
"GROUP Lp DS3 Cell Operational (Oper)"
"GROUP Lp DS3 Cell Statistics (Stats)"

Scope Device

Description The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the

interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

Common Verbs

List
Display
Add
DELete

## GROUP Lp DS3 Cell Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioning attributes for the *AtmCell* component.

## ATTRIBUTE Lp DS3 Cell alarmActDelay (act)

Access: Read and write

Description: This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Values: Decimal (0..2000)

Units: msec

Default: No default

## ATTRIBUTE Lp DS3 Cell scrambleCellPayload (scramble)

Access: Read and write

| | |
|---|---|
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Lp DS3 Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.<br><br>Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Lp DS3 Cell clearDelay (clear)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 |

(default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Lp DS3 Cell hecSampleInterval (hSample)

Access: Read and write

Description: This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Lp DS3 Cell hecErrorLimit (hLimit)

Access: Read and write

Description: This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit

established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Lp DS3 Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..50)

Units: msec

Default: No default

### ATTRIBUTE Lp DS3 Cell hecErrorIntervalLimit (hIntLimit)

Access: Read and write

Description: This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an

alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..25)

Default: 1

### GROUP Lp DS3 Cell Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes for the *AtmCell* component.

### ATTRIBUTE Lp DS3 Cell lcdAlarm (lcd)

Access: Read only

Description: This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD

defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values: on
off

Default: off

### GROUP Lp DS3 Cell Statistics (Stats)

Properties: Operational

Description: This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

### ATTRIBUTE Lp DS3 Cell uncorrectableHeaderErrors (ucErr)

Access: Read only

Description: This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 Cell sevErroredSec (ses)

Access: Read only

Description: This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 Cell receiveCellUtilization (rxutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp DS3 Cell transmitCellUtilization (txutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.

This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp DS3 Cell correctableHeaderErrors (cErr)

Access: Read only

Description: This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected

Values: Decimal (0..4294967295)

Default: 0

### COMPONENT Lp DS3 DS1

Instance: Decimal (1..28)

Groups:
"GROUP Lp DS3 DS1 Provisioned (Prov)"
"GROUP Lp DS3 DS1 CustomerIdentifierData (CidData)"
"GROUP Lp DS3 DS1 AdminInfo (AdminInfo)"

## GROUP Lp DS3 DS1 Provisioned (Prov)

Properties Provisioned

Description This group contains all of the provisioning data for a *DS1* component.

## ATTRIBUTE Lp DS3 DS1 lineType (lineType)

Access Read and write

Description This attribute defines the framing of the DS1 tributary.
***d4*** defines a framing pattern of 12 frames per multiframe.
***esf*** defines a framing pattern of 24 frames per multiframe.
***d4Cas*** defines a framing pattern of 12 frames per multiframe with channel associated signalling.
***esfCas*** defines a framing pattern of 24 frames per multiframe with channel associated signalling.
***unframed*** defines an unknown framing pattern for clear channels.

For the ***4pDS3ChAtm*** card, only ***d4*** and ***esf*** framing patterns are permitted.

The ***4pDS3ChAal1*** card supports the ***d4*** and ***esf*** framing patterns, as well as ***unframed***.

Values
d4
esf

| | |
|---|---|
| | d4Cas<br>esfCas<br>unframed |
| Default | esf |

### ATTRIBUTE Lp DS3 DS1 zeroCoding (zeroCoding)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute defines the zero encoding on the DS1 tributary.<br>***bit7Stuffing*** sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8.<br>***none*** does no zero encoding, it does not change any value of the bits in the timeslot. The value ***none*** is compatible with any zero coding scheme which transports all 8 data bits in a timeslot (this would include both ***ami*** and ***b8zs*** values of the *DS1 zeroCoding* attribute). |
| Values | bit7Stuffing<br>none |
| Default | none |

### ATTRIBUTE Lp DS3 DS1 clockingSource (clockingSource)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the source of the transmit clock for the DS1 tributary.<br>When the clocking source is ***local***, the crystal on the port generates the clocking for the DS1 tributary.<br>When the clocking source is ***line***, the port synchronizes to the clock from the DS1 tributary.<br>When the clocking source is ***module***, the port's clock synchronizes to the clock provided by the oscillator on the active CP.<br>When the clocking source is ***sameAsDs3***, the Ds1 port's clock synchronizes to the same clock source as that of its parent Ds3 port. |

On a ***1pDS3C*** card, if the *NetworkSynchronization (NS)* component is present, the default value of this attribute will be ***module***; otherwise it will be ***line***.

On a ***2pDS3cAal*** card, the only valid values are ***local*** and ***module***. If the *NS* component is present, the default value of this attribute will be ***module***; otherwise it will be ***local***.

On the ***4pDS3Ch***, ***4pDS3ChAtm***, and ***4pDS3ChAal1*** cards, the only valid value is ***sameAsDs3***. This is because a DS1 must have the same clocking source as its parent DS3.

Values

sameAsDs3

Default
No default

## GROUP Lp DS3 DS1 CustomerIdentifierData (CidData)

Properties
Provisioned

Description
This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

## ATTRIBUTE Lp DS3 DS1 customerIdentifier (cid)

Access
Read and write

Description
This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

| | |
|---|---|
| | An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp DS3 DS1 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp DS3 DS1 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp DS3 DS1 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp DS3 DS1 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp DS3 DS1 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp DS3 DS1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp DS3 DS1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

Default up

### GROUP Lp DS3 DS1 OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp DS3 DS1 adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

## ATTRIBUTE Lp DS3 DS1 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Lp DS3 DS1 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp DS3 DS1 availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp DS3 DS1 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of: initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

### ATTRIBUTE Lp DS3 DS1 controlStatus (osiCntrl)

Access: Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp DS3 DS1 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp DS3 DS1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp DS3 DS1 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp DS3 DS1 Operational (Oper)

Properties
Operational

Description This group contains the common operational data for a component in a digital hierarchy interface.

### ATTRIBUTE Lp DS3 DS1 rxAisAlarm (rxAisAlarm)

Access Read only

Description This attribute indicates whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds
+/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Values on
off

Default off

### ATTRIBUTE Lp DS3 DS1 lofAlarm (lofAlarm)

Access Read only

Description This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (2 out of 5 framing bits in error) have been detected for 3 seconds +/- 0.5 seconds. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

| | |
|---|---|
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp DS3 DS1 rxRaiAlarm (rxRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds. The RAI alarm is usually an indication that the far end facility is unable to gain synchronization. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp DS3 DS1 txAisAlarm (txAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the tributary is in a locked state. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp DS3 DS1 txRaiAlarm (txRaiAlarm)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the tributary detects a LOF alarm condition. |
| Values | on<br>off |
| Default | off |

### GROUP Lp DS3 DS1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common statistical data for a component in a digital hierarchy interface. |

### ATTRIBUTE Lp DS3 DS1 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of seconds since the tributary was activated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of seconds that the tributary has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of errored seconds the tributary has counted since it was activated. An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error |

may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 DS1 sevErroredSec (ses)

Access: Read only

Description: This attribute counts the number of severely errored seconds the tributary has counted since it was activated. A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 DS1 sevErroredFrmSec (sefs)

Access: Read only

Description: This attribute counts the number of severely errored framing seconds the tributary has counted since it was activated A severely errored framing second occurs when a second with one or more Out Of Frame events occurs.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 DS1 unavailSec

Access: Read only

Description: This attribute counts the total number of seconds that the tributary has been in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp DS3 DS1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of CRC-6 errors. These will only be counted when the *lineType* is ***esf***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frame errors. A frame error is an error in the framing bits. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp DS3 DS1 Channel (Chan)

| | |
|---|---|
| Instance | Decimal (0..23) |
| Groups | "GROUP Lp DS3 DS1 Chan Provisioned (Prov)"<br>"GROUP Lp DS3 DS1 Chan CustomerIdentifierData (CidData)"<br>"GROUP Lp DS3 DS1 Chan IfEntryProv (IfEntry)"<br>"GROUP Lp DS3 DS1 Chan OperationalStatus (OperStatus)"<br>"GROUP Lp DS3 DS1 Chan OsiState (State)"<br>"GROUP Lp DS3 DS1 Chan Operational (Oper)"<br>"GROUP Lp DS3 DS1 Chan AdminInfo (AdminInfo)" |
| Scope | Application |

| | |
|---|---|
| Description | *Channel*<br>The *Channel* component is configured to control a group of timeslots that form a fractional group on a DS1 or E1 port. Cell-based cards allow only one channel per port, and this is automatically provisioned with all available timeslots. Similarly, the ***1pDS3C*** card type only allows one channel per port, and this is automatically provisioned with all available timeslots. |
| Opt. Subcomp. | "COMPONENT Lp DS3 DS1 Chan AtmCell (Cell)"<br>"COMPONENT Lp DS3 DS1 Chan TrunkConditioning (Tc)" |
| Dyn. Subcomp. | "COMPONENT Lp DS3 DS1 Chan Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp DS3 DS1 Chan Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisional data for a *Channel* component. |

## ATTRIBUTE Lp DS3 DS1 Chan timeslots (ts)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component.<br><br>For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function. |

| | |
|---|---|
| Set of | none<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15<br>16<br>17<br>18<br>19<br>20<br>21<br>22<br>23<br>24<br>25<br>26<br>27<br>28<br>29<br>30<br>31 |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan timeslotDataRate (dataRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

Description

This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.

When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

Values

56k
doNotOverride

Default

doNotOverride

### ATTRIBUTE Lp DS3 DS1 Chan applicationFramerName

Access

Read and write

Description

This attribute defines the link to the software stack. It defines which application is running on top of this hardware component.

Values

Link (Service, interfaceName)

Default

No default

### GROUP Lp DS3 DS1 Chan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp DS3 DS1 Chan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp DS3 DS1 Chan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp DS3 DS1 Chan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp DS3 DS1 Chan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp DS3 DS1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp DS3 DS1 Chan snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

Default up

### GROUP Lp DS3 DS1 Chan OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp DS3 DS1 Chan adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

### ATTRIBUTE Lp DS3 DS1 Chan operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp DS3 DS1 Chan usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp DS3 DS1 Chan availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

## ATTRIBUTE Lp DS3 DS1 Chan proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default
No default

### ATTRIBUTE Lp DS3 DS1 Chan controlStatus (osiCntrl)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE Lp DS3 DS1 Chan alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp DS3 DS1 Chan standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the

resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp DS3 DS1 Chan unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp DS3 DS1 Chan Operational (Oper)

Properties
Operational

Description
This group contains all of the operational data for a *Channel* component.

### ATTRIBUTE Lp DS3 DS1 Chan actualChannelSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the measured link speed of the *Channel* component. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### GROUP Lp DS3 DS1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp DS3 DS1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### COMPONENT Lp DS3 DS1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp DS3 DS1 Chan Test OsiState (State)"<br>"GROUP Lp DS3 DS1 Chan Test Setup (Setup)"<br>"GROUP Lp DS3 DS1 Chan Test Results (Results)" |
| Scope | Application |

| | |
|---|---|
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp DS3 DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp DS3 DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp DS3 DS1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp DS3 DS1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp DS3 DS1 Chan Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp DS3 DS1 Chan Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp DS3 DS1 Chan Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Lp DS3 DS1 Chan Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

### ATTRIBUTE Lp DS3 DS1 Chan Test type (type)

Access
Read and write

Description
This attribute is the type of test to be run. The available test types include the following:
***card*** test sets up an internal loop on the board and runs a bit error rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.

***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

## ATTRIBUTE Lp DS3 DS1 Chan Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values

Decimal (4..4096)

| | |
|---|---|
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp DS3 DS1 Chan Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp DS3 DS1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp DS3 DS1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |

| | |
|---|---|
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp DS3 DS1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp DS3 DS1 Chan Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp DS3 DS1 Chan Test causeOfTermination

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates either the status of the test or the cause of the test's termination:

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these

values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp DS3 DS1 Chan Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp DS3 DS1 Chan Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Lp DS3 DS1 Chan Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

| | |
|---|---|
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp DS3 DS1 Chan Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp DS3 DS1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp DS3 DS1 Chan Cell Provisioned (Prov)"<br>"GROUP Lp DS3 DS1 Chan Cell Operational (Oper)"<br>"GROUP Lp DS3 DS1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp DS3 DS1 Chan Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

Description This group contains the provisioning attributes for the *AtmCell* component.

### ATTRIBUTE Lp DS3 DS1 Chan Cell alarmActDelay (act)

Access Read and write

Description This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Values Decimal (0..2000)

Units msec

Default No default

### ATTRIBUTE Lp DS3 DS1 Chan Cell scrambleCellPayload (scramble)

Access Read and write

Description Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Values off
on

Default No default

### ATTRIBUTE Lp DS3 DS1 Chan Cell correctSingleBitHeaderErrors

Access Read and write

Description

This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values

off
on

Default

off

### ATTRIBUTE Lp DS3 DS1 Chan Cell clearDelay (clear)

Access

Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values

Decimal (0..60)

Units

minutes

Default

0

### ATTRIBUTE Lp DS3 DS1 Chan Cell hecSampleInterval (hSample)

Access

Read and write

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute,

the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Lp DS3 DS1 Chan Cell hecErrorLimit (hLimit)

Access: Read and write

Description: This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Lp DS3 DS1 Chan Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is

specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values — Decimal (1..50)

Units — msec

Default — No default

### ATTRIBUTE Lp DS3 DS1 Chan Cell hecErrorIntervalLimit (hIntLimit)

Access — Read and write

Description — This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values — Decimal (1..25)

Default — 1

### GROUP Lp DS3 DS1 Chan Cell Operational (Oper)

Properties — Operational

Description — This group contains the common operational attributes for the *AtmCell* component.

### ATTRIBUTE Lp DS3 DS1 Chan Cell lcdAlarm (lcd)

Access — Read only

| | |
|---|---|
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.<br>In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.<br>For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.<br>If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle<br>The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.<br>The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked. |
| Values | on<br>off |
| Default | off |

## GROUP Lp DS3 DS1 Chan Cell Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

### ATTRIBUTE Lp DS3 DS1 Chan Cell uncorrectableHeaderErrors (ucErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 Chan Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.<br><br>Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 Chan Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 Chan Cell transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 Chan Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |

Default 0

## COMPONENT Lp DS3 DS1 Chan TrunkConditioning (Tc)

Groups "GROUP Lp DS3 DS1 Chan Tc Provisioned (Prov)"
"GROUP Lp DS3 DS1 Chan Tc Operational (Op)"

Scope Device

Description *Lp/n Ds1/n Chan/n Tc*
*Lp/n E1/n Chan/n Tc*
*Lp/n Ds3/n Ds1/n Chan/n Tc*
*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*
*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*
*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*
*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the

following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

## GROUP Lp DS3 DS1 Chan Tc Provisioned (Prov)

Properties: Provisioned

Description: This group contains all specific provisioning data for a *Tc* component.

## ATTRIBUTE Lp DS3 DS1 Chan Tc replacementData (data)

Access: Read and write

Description: This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.

The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:
DS1 MUX Out Of Service Code = 0x1A
E1 MUX Out Of Service Code = 0xFF

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.

On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***.

Values: Hex (H.0..H.ff)

| | |
|---|---|
| Units | Hex |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Chan Tc signalOneDuration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.<br><br>If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.<br><br>The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 Chan Tc noServiceResponse (resp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:<br><br>***autoConfigure*** - automatically configure the channels response.<br>***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.<br>***ais*** - transmit AIS in the egress direction.<br>***noResponse*** - no response is sent in the egress direction.<br><br>A value of ***autoConfigure*** will result in TC being transmitted for all card types. |

| | |
|---|---|
| Values | autoConfigure<br>tc<br>ais<br>noResponse |
| Default | autoConfigure |

### ATTRIBUTE Lp DS3 DS1 Chan Tc signalOne (sigOne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### ATTRIBUTE Lp DS3 DS1 Chan Tc signalTwo (sigTwo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |

| | |
|---|---|
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### GROUP Lp DS3 DS1 Chan Tc Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all specific operational data for a *Tc* component. |

### ATTRIBUTE Lp DS3 DS1 Chan Tc ingressConditioning (inCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the ATM network.<br><br>When trunk conditioning is being locally generated towards the ATM network, *ingressConditioning* is set to ***on.***<br><br>When trunk conditioning is not being locally generated towards the ATM network, *ingressConditioning* is set to ***off***.<br><br>Trunk conditioning is transmitted towards the ATM network under the following conditions:<br>lossOfSignal (LOS)<br>lossOfFrame (LOF)<br>remoteAlarmIndication (RAI)<br>alarmIndicationSignal (AIS)<br>bufferUnderflow (BU)<br>and in addition for E1:<br>lossOfMultiframe (LOMF)<br>receiveMultiframeRemoteAlarmIndication (RMRAI) |

| | |
|---|---|
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Lp DS3 DS1 Chan Tc egressConditioning (egCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the PDH line.<br><br>When trunk conditioning is being locally generated towards the PDH line, *egressConditioning* is set to ***on.***<br><br>When trunk conditioning is not being locally generated towards the PDH line, *egressConditioning* is set to ***off***.<br><br>Trunk conditioning is transmitted towards the PDH line under the following conditions:<br>bufferUnderflow (BU)<br>AAL1 protocol errors. |
| Values | off<br>on |
| Default | off |

### COMPONENT Lp DS3 DS1 Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp DS3 DS1 Test OsiState (State)"<br>"GROUP Lp DS3 DS1 Test Setup (Setup)"<br>"GROUP Lp DS3 DS1 Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V*35, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp DS3 DS1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp DS3 DS1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp DS3 DS1 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp DS3 DS1 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp DS3 DS1 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp DS3 DS1 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp DS3 DS1 Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp DS3 DS1 Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. |

***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

### ATTRIBUTE Lp DS3 DS1 Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Lp DS3 DS1 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp DS3 DS1 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp DS3 DS1 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp DS3 DS1 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp DS3 DS1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp DS3 DS1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp DS3 DS1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination: |

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp DS3 DS1 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 DS1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp DS3 DS1 Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Lp DS3 DS1 Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

| | |
|---|---|
| Default | 0.00 |

### ATTRIBUTE Lp DS3 DS1 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp DS3 InverseMultiplexerAtm (Ima)

| | |
|---|---|
| Instance | Decimal (0..13) |
| Groups | "GROUP Lp DS3 Ima Provisioned (Prov)"<br>"GROUP Lp DS3 Ima Operational (Oper)"<br>"GROUP Lp DS3 Ima Statistics (Stats)"<br>"GROUP Lp DS3 Ima CustomerIdentifierData (CidData)"<br>"GROUP Lp DS3 Ima OsiState (State)" |
| Scope | Device |
| Description | *Lp/n InverseMultiplexerAtm/n*<br>*Lp/n Ds3/n InverseMultiplexerAtm/n*<br><br>This component is used to define an inverse multiplexing for ATM (IMA) group. IMA provides a data rate greater than DS1 E1 in increments of DS1 E1. To use IMA on an 8pDS1E1, MSA32, or 2pSTM1eCh function processor, add an *Lp/n InverseMultiplexerAtm/n* component. To use IMA on a 4pDS3ChAtm function processor, add an *Lp/n Ds3/n InverseMultiplexerAtm/n* component.<br><br>The instance range 0..7 applies to 8pDS1Atm and 8pE1Atm cards. The instance range 0..13 applies to 4pDS3ChAtm cards. The instance range 0..29 applies to MSA32 cards. The instance range 0..113 applies to 2pStm1eCh cards.<br><br>The instance number of an *IMA* group must not be the same as the instance number of a *DS1/E1* “ATM UNI port” under the |

same *Lp*. An “ATM UNI port” is a *DS1* or *E1* component with a single *Chan* whose *applicationFramer* attribute is linked to an *AtmIf* component. On an MSA32 card, ports that are used as IMA links have two immiscible sub-ranges: 0..15 and 16..31. The instance number of an *IMA* group must be in the same sub-range as all of its ports. IMA sub-ranges also exist on a 2pStm1eCh card, instances 0..56 are allowed on port SDH 0, and instances 57..113 are allowed on port SDH 1.

## GROUP Lp DS3 Ima Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes for the *Ima* component.
The default values of *linkSelectionCriterion* and *linkRetryTimeout* depend on card type.

## ATTRIBUTE Lp DS3 Ima linkSelectionCriterion (select)

Access Read and write

Description This attribute specifies the method to be used by the IMA group when selecting links to be activated. This comes into effect only when the configured links do not respect the maximum differential delay (otherwise all links are accepted).

If ***leastDelay*** is chosen, first the link having the smallest delay is selected as the reference link. The IMA group includes all links which respect the maximum differential delay relative to the reference link.

If ***maxBandwidth*** is chosen, the IMA group selects the maximum possible number of links, with each selected link respecting the maximum differential delay relative to every other selected link. When more than one possibility exists, the combination which offers the least delay is selected.

The default value for Multi-Service Access cards is ***leastDelay***, and for all other cards is ***maxBandwidth***. On Multi-Service Access cards ***leastDelay*** is the only acceptable provisionable value.

| | |
|---|---|
| Values | leastDelay<br>maxBandwidth |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima maxDiffDelay (delay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum differential delay between links acceptable in the IMA group. If a link violates that maximum differential delay, it will not be active in the IMA group and an alarm will be generated.<br><br>For the 4pDS3ChAtm card, the value must not exceed 70. |
| Values | Decimal (1..100) |
| Units | msec |
| Default | 25 |

### ATTRIBUTE Lp DS3 Ima linkRetryTimeout (retry)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the amount of time before reactivation of a link is attempted after it recovers from a failure condition.<br><br>The default value for Multi-Service Access cards is ***1***, and for all |

| | |
|---|---|
| | other cards is ***10***. On Multi-Service Access cards ***1*** is the only acceptable provisionable value. |
| Values | Decimal (0..1000) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the link to the *AtmIf* component using the *Ima*. An example is *AtmIf/31*. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima transmitClockMode (clock)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transmit clocking mode.<br>If ***itc*** (Independent Transmit Clock) is chosen, the physical ports used by the IMA group may have different clocking sources.<br>If ***ctc*** (Common Transmit Clock) is chosen, it is recommended that the physical ports used by the IMA group have the same clocking source. However, if the physical ports have different clocking sources, the operator should ensure that all the clocking sources have the same rate. |
| Values | itc<br>ctc |
| Default | itc |

### ATTRIBUTE Lp DS3 Ima protocol (prot)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies which IMA protocol the component should run. |

If ***atmForum10*** is chosen, the ATM Forum's IMA protocol (version 1.0) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA also uses the ATM Forum's IMA protocol 1.0. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used.
If ***atmForum11*** is chosen, the ATM Forum's IMA protocol (version 1.1) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA uses the ATM Forum's IMA protocol 1.0 or 1.1. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used. If the far end is 1.0, then the near end downgrades to 1.0. After the downgrade, this attribute continues to specify the provisioned protocol version, while the *activeProtocol* operational attribute of the IMA component specifies the protocol version effectively running.
If ***proprietary*** is chosen, Nortel’s proprietary IMA protocol will be used. The IMA group will come up only if the far end IMA also uses Nortel’s proprietary IMA protocol. This IMA group will not inter-operate with IMA implementations from other vendors. Feature ***ima*** must be provisioned on the LP for this protocol to be used.

The DEFAULT on 2pStm1eCh function processor is atmForum11.

| | |
|---|---|
| Values | atmForum10<br>proprietary<br>atmForum11 |
| Default | No default |

## GROUP Lp DS3 Ima Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Ima* component. |

## ATTRIBUTE Lp DS3 Ima failureCause (cause)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the cause of the current local end failure experienced by the IMA group. The failure may have occurred during a start-up procedure or during normal operation. Possible values are:
***noFailure***: no local end failure.
***noGoodLinksInStartup***: no good links were available during IMA start-up.
***badGidInStartup***: during start-up, different group identifiers (GIDs) were received on the links.
***badLidInStartup***: during start-up, duplicate link identifiers (LIDs) were received on the links.
***unsupportedFrameLengthInStartup***: during start-up, an unsupported frame length was received.
***timeoutInStartup***: a time-out has occurred during start-up.
***noGoodLinks***: no good links are available in the IMA group.
***remoteFailure***: the far end is down.
***unsupportedSymmetryInStartup***: the symmetry proposed by the far end is not supported on the near-end. This value will occur when the IMA group is running the ATM Forum protocol and the far end is proposing a group symmetry other than “symmetric configuration and operation”.
***unsupportedVersionInStartup***: the ima version proposed by the far end is not supported on the near-end.

Values

noFailure
noGoodLinksInStartup
badGidInStartup
badLidInStartup
unsupportedFrameLengthInStartup
timeoutInStartup
noGoodLinks
remoteFailure
unsupportedSymmetryInStartup
unsupportedVersionInStartup

Default

No default

## ATTRIBUTE Lp DS3 Ima remoteDefect (remDef)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the cause of the current far end defect experienced by the IMA group.<br>For the ATM Forum IMA protocol, possible values are:<br>***noDefect***: no defect.<br>***unsupportedFrameLengthInStartup***: during the far end's start-up, an unsupported frame length was received.<br>***unsupportedSymmetryInStartup***: during the far end's start-up, an unsupported symmetry configuration was received.<br>***otherAbortStartup***: the far end has aborted its start-up for another reason. This could be because different Gids were received on the links or if duplicate link identifiers (LIDs) were received.<br>***insufficientLinks***: the far end does not have sufficient links active. This value will be displayed if the far end IMA group is locked.<br>***blocked***: the far end IMA group is blocked.<br><br>For the proprietary IMA protocol, possible values are:<br>***noDefect***: no defect.<br>***noGoodLinksInStartup***: no good links were available during the far end’s start-up.<br>***badGidInStartup***: during the far end’s start-up, different GIDs were received on the links.<br>***badLidInStartup***: during the far end’s start-up, duplicate link identifiers (LIDs) were received on the links.<br>***unsupportedFrameLengthInStartup***: during the far end’s start-up, an unsupported frame length was received.<br>***timeoutInStartup***: a time out has occurred during the far end’s start-up.<br>***noGoodLinks***: no good links are available in the far end IMA group.<br>***blocked***: the far end IMA group is locked.<br>***unsupportedVersionInStartup***: the ima version proposed by the far end is not supported on the near-end. |
| Values | noDefect<br>noGoodLinksInStartup<br>badGidInStartup<br>badLidInStartup<br>unsupportedFrameLengthInStartup<br>timeoutInStartup<br>noGoodLinks |

| | |
|---|---|
| | locked<br>unsupportedSymmetryInStartup<br>otherAbortStartup<br>insufficientLinks<br>blocked<br>unsupportedVersionInStartup |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima remoteLidsConfig (remConf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates all the links which have been configured in the remote IMA group. For example, if links 1, 3 and 5 have been configured in the remote IMA group, this attribute would contain ***1 3 5***. |
| Set of | Decimal (0..31) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima remoteLidsActive (remAct)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates all the links which are active in the remote IMA group. For example, if links 1 and 5 are active in the remote IMA, this attribute would contain ***1 5***. |
| Set of | Decimal (0..31) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima cellCapacity (cap)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total cell capacity (in cells per second) which is provided to the ATM layer. This cell capacity takes into account the physical and IMA level overheads. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp DS3 Ima remoteGid (remGid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IMA group identifier (GID) used by the remote IMA. A value of 0 will be displayed if the group is not receiving IMA Control Protocol (ICP) cells.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima clockingModeMismatch (mismatch)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not both ends of the IMA group are using the same transmit clocking mode (***itc***/***ctc***). Its value will be ***yes*** if both ends are not using the same transmit clocking mode. A clocking mode mismatch does not prevent an IMA group from coming up and can be corrected by using the same clocking mode at both ends.<br>This attribute will always have a value of ***no*** if the *protocol* for the IMA group is ***proprietary***. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima activeProtocol (activeProt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates which IMA protocol the *Ima* component is effectively running.<br>This attribute is supported on the 8pDs1Atm, 8pE1Atm, 4pDS3ChAtm, and 2pStm1eCh cards. This attribute is not supported on the MSA32 cards.<br>The value of this attribute is the same as the provisioned *protocol* attribute if the IMA is operating at the provisioned protocol |

| | |
|---|---|
| | version. The value of this attribute indicates the dongraded protocol version if the IMA has gone through a protocol version downgrade upon IMA 1.1 to IMA 1.0 interworking. |
| Values | atmForum10<br>proprietary<br>atmForum11 |
| Default | No default |

### GROUP Lp DS3 Ima Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the *Ima* component. |

### ATTRIBUTE Lp DS3 Ima runningTime (running)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time (in seconds) for which the *Ima* component has been in the unlocked state or has been used for operational testing. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima unavailSec (unavail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of one second intervals during which the *Ima* component has been unlocked and out of service. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima failures (fail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of complete failures, during start-up or normal operation, that the *Ima* component has |

experienced since being added. It must be noted that a service degradation, such as 1 of the 3 links in an IMA group being down, is not counted as a failure. If an *Ima* component is in a failure loop and does not come up, this count will only increase by 1.

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Lp DS3 Ima receiveCellUtilization (rxutil)

Access: Read only

Description: This attribute indicates the ratio of the number of valid, assigned user cells received on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.

This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.***

Values: Decimal (0..100)

Units: %

Default: No default

### ATTRIBUTE Lp DS3 Ima transmitCellUtilization (txutil)

Access: Read only

Description: This attribute indicates the ratio of the number of user cells transmitted on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.

This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.***

Values: Decimal (0..100)

Units: %

Default: No default

## GROUP Lp DS3 Ima CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE Lp DS3 Ima customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

## GROUP Lp DS3 Ima OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific |

information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp DS3 Ima adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp DS3 Ima operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp DS3 Ima usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp DS3 Ima availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp DS3 Ima proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Lp DS3 Ima controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp DS3 Ima alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms

may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp DS3 Ima standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp DS3 Ima unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### COMPONENT Lp DS3 Ima Test (Test)

Groups
"GROUP Lp DS3 Ima Test OsiState (State)"
"GROUP Lp DS3 Ima Test Setup (Setup)"
"GROUP Lp DS3 Ima Test Results (Results)"

Scope
Application

Description
The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port.

Common Verbs
Help
List
Display

### VERB START Lp DS3 Ima Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp DS3 Ima Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp DS3 Ima Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp DS3 Ima Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp DS3 Ima Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp DS3 Ima Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp DS3 Ima Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp DS3 Ima Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. |

***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

## ATTRIBUTE Lp DS3 Ima Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Lp DS3 Ima Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp DS3 Ima Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp DS3 Ima Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp DS3 Ima Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp DS3 Ima Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp DS3 Ima Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp DS3 Ima Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination: |

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp DS3 Ima Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp DS3 Ima Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Lp DS3 Ima Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

| | |
|---|---|
| Default | 0.00 |

### ATTRIBUTE Lp DS3 Ima Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp DS3 Ima Link (Lk)

| | |
|---|---|
| Instance | Decimal (0..31) |
| Groups | "GROUP Lp DS3 Ima Lk Provisioned (Prov)"<br>"GROUP Lp DS3 Ima Lk Operational (Oper)"<br>"GROUP Lp DS3 Ima Lk Statistics (Stats)"<br>"GROUP Lp DS3 Ima Lk OsiState (State)" |
| Scope | Device |
| Description | *Lp/n Ima/n Link/n*<br>*Lp/n Ds3/n Ima/n Link/n*<br><br>This component is used to define a DS1/E1 link belonging to an IMA group. The instance number of the *Link* subcomponent corresponds to the link identifier (LID) used by the link in IMA Control Protocol (ICP) cells. To use Ima on an 8pDS1E1 function processor, add *Lp/n Ima/n Link/n*. To use Ima on a 4pDS3ChAtm function processor, add *Lp/n Ds3/n Ima/n Link/n*. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp DS3 Ima Lk Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes for the *Link* subcomponent. |

### ATTRIBUTE Lp DS3 Ima Lk interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute associates the *Link* subcomponent with a specific interface on a function processor, for example *Lp/5 E1/3 Chan/0*. If IMA groups and independent links coexist on a card running IMA and per-VC queueing is enabled, plan the selection of DS1 or E1 ports to be used by the IMA group carefully. For a 4pDS3ChAtm function processor there is no per-VC queueing. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

### GROUP Lp DS3 Ima Lk Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Link* subcomponent. |

### ATTRIBUTE Lp DS3 Ima Lk failureCause (cause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the failure cause on this link. Possible values are:<br>***noFailure***: there is no failure on this link.<br>***interfaceDown***: the physical port used by the link is down.<br>***lif***: the link is in loss of IMA frame (LIF) state.<br>***lods***: the link is in loss of delay synchronization (LODS) state; that is, it has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group. It must be noted that hysteresis is used for the LODS condition.<br>***protocolError***: the link is down because of a time-out or because bad values are being received in IMA Control Protocol (ICP) cells.<br>***remoteFailure***: the far end link is down.<br>***misconnected***: the link is down because the IMA group has |

declared, after using its transmit test pattern procedure, that this link is not properly connected. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
***unsupportedFrameLength***: the link is down because it is receiving from the far end a frame length which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
***unsupportedSymmetry***: the link is down because it is receiving from the far end a group symmetry which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
***noIcp***: the link is down because it is not receiving IMA Control Protocol (ICP) cells. This value can occur only if the *protocol* for the IMA group is ***atmForum10***.
***unsupportedVersion***: the link is down because it is receiving from the far end a group version that is not supported by the local IMA group.

Values

noFailure
interfaceDown
lif
lods
protocolError
remoteFailure
misconnected
unsupportedFrameLength
unsupportedSymmetry
noIcp
unsupportedVersion

Default

No default

## ATTRIBUTE Lp DS3 Ima Lk remoteDefect (remDef)

Access

Read only

Description

This attribute indicates the IMA remote defect indicator (RDI) currently being received on this link. Possible values are:
***noDefect***: no defect.
***physicalLayerDefect***: the interface used by the remote link has a physical layer defect. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
***interfaceDown***: the physical interface used by the remote link is

down.This value can occur only if the *protocol for the IMA group is* ***proprietary.***
***lif***: the remote link has a loss of IMA frame (LIF) defect.
***lods***: the remote link has a loss of delay synchronization (LODS) defect; that is, it has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group.

Values
noDefect
interfaceDown
lif
lods
physicalLayerDefect

Default
No default

### ATTRIBUTE Lp DS3 Ima Lk remoteLid (remLid)

Access
Read only

Description
This attribute indicates the link identifier (LID) used by the remote IMA group on the physical link. A value of 0 will be displayed if the link is not receiving IMA Control Protocol (ICP) cells or if the physical layer is down.

Values
Decimal (0..31)

Default
No default

### ATTRIBUTE Lp DS3 Ima Lk relativeDelay (rel)

Access
Read only

Description
This attribute indicates the latest measured differential delay (rounded up in milliseconds) between this link and the link, in the same IMA group, having the least delay. A value of 4294967295 indicates that the relative delay could not be measured. This can be due to physical layer problems or to no IMA Control Protocol (ICP) cells being received on the link.

Values
Decimal (0..4294967295)

Units
msec

Default
No default

## ATTRIBUTE Lp DS3 Ima Lk lastOifCause (oif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cause of the last out of IMA frame (OIF) anomaly on the link. It will always have a value of ***noOif*** if the *protocol* for the IMA group is ***proprietary***.<br>Possible values are:<br>***noOif***: no OIF was detected.<br>***badFrameLength***: an IMA Control Protocol (ICP) cell with an unexpected frame length was received.<br>***badGid***: an ICP cell with an unexpected group identifier (GID) was received.<br>***badLid***: an ICP cell with an unexpected link identifier (LID) was received.<br>***badOffset***: an ICP cell with an unexpected cell offset was received.<br>***badSequenceNumber***: an ICP cell with an unexpected frame sequence number was received.<br>***stuffError***: an illegal stuffing sequence was received.<br>***missingIcp***: an expected ICP cell was not received.<br>***unexpectedIcp***: an unexpected ICP cell was received.<br>***erroredIcp***: two consecutive errored ICP cells were received.<br>***noCells***: no cells are being received on the link.<br>***idleCell***: an idle cell was received on the link.<br>***badOamLabel***: an ICP cell with an unexpected oam label was received. |
| Values | noOif<br>badFrameLength<br>badGid<br>badLid<br>badOffset<br>badSequenceNumber<br>stuffError<br>missingIcp<br>unexpectedIcp<br>erroredIcp<br>noCells<br>idleCell<br>badOamLabel |

| | |
|---|---|
| Default | No default |

### GROUP Lp DS3 Ima Lk Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the *Link* subcomponent. |

### ATTRIBUTE Lp DS3 Ima Lk runningTime (running)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the length of time (in seconds) for which the *Link* component has been running. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk unavailSec (unavail)

| | |
|---|---|
| Access | Read only |
| Description | For an IMA group whose *protocol* is ***atmForum10***, this attribute counts the number of unavailable seconds. Unavailability begins at the start of 10 contiguous severely errored seconds (SES) and ends at the start of 10 contiguous seconds with no SES.<br>For an IMA group whose *protocol* is ***proprietary***, this attribute counts the number of one second intervals during which the *Link* component has been out of service. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk failures (fail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of failures, during link addition or normal operation, that the link has experienced. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk unusableSec (uus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of one second intervals during which the near end has been in an unusable state.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of one second intervals in which at least 30 percent of the IMA Control Protocol (ICP) cells were counted as ICP violations or at least one link defect (physical layer, LIF and LODS defects) was detected. This attribute will not increment during UAS (Unavailable Second) conditions.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk farEndUnusableSec (feUus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of one second intervals during which the “Tx/Rx Unusable” condition has been received from the far end.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk farEndSevErroredSec (feSes)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of one second intervals containing one or more RDI defects. This attribute will not increment during FEUAS (Far-End Unavailable Second) conditions.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk farEndUnavailSec (feUnavail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of unavailable seconds at the far end. Unavailability begins at the start of 10 contiguous severely errored seconds (SES) at the far end and ends at the start of 10 contiguous seconds at the far end with no SES.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk icpViolations (iv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of errored, invalid or missing IMA Control Protocol (ICP) cells during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp DS3 Ima Lk txStuffEvents (txStuff)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Stuff events transmitted during non-SES (Severely Errored Second) and non-UAS |

(Unavailable Seconds) conditions.
This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.***

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Lp DS3 Ima Lk rxStuffEvents (rxStuff)

Access: Read only

Description: This attribute counts the number of Stuff events received during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.
This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.***

Values: Decimal (0..4294967295)

Default: No default

### ATTRIBUTE Lp DS3 Ima Lk idleCellSec (idle)

Access: Read only

Description: This attributes counts the number of one second intervals during which one or more idle cells was received. The reception of idle cells is an abnormal condition which could be caused by the remote IMA using the Common Transmit Clock mode with ports whose clock sources are not synchronized.
This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.***

Values: Decimal (0..4294967295)

Default: No default

### GROUP Lp DS3 Ima Lk OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every

component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp DS3 Ima Lk adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Lp DS3 Ima Lk operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp DS3 Ima Lk usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp DS3 Ima Lk availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp DS3 Ima Lk proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does

initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp DS3 Ima Lk controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service

is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

### ATTRIBUTE Lp DS3 Ima Lk alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp DS3 Ima Lk standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

| | |
|---|---|
| Values | hotStandby (hot)<br>coldStandby (cold)<br>providingService (serv)<br>notSet (nSet) |
| Default | notSet |

### ATTRIBUTE Lp DS3 Ima Lk unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### COMPONENT Lp E3

| | |
|---|---|
| Instance | Decimal (0..11) |
| Groups | "GROUP Lp E3 Provisioned (Prov)"<br>"GROUP Lp E3 CustomerIdentifierData (CidData)"<br>"GROUP Lp E3 AdminInfo (AdminInfo)"<br>"GROUP Lp E3 IfEntryProv (IfEntry)"<br>"GROUP Lp E3 OperationalStatus (OperStatus)"<br>"GROUP Lp E3 OsiState (State)"<br>"GROUP Lp E3 Operational (Oper)"<br>"GROUP Lp E3 Statistics (Stats)" |
| Scope | Application |

| | |
|---|---|
| Description | *LP/n E3/n*<br>The *E3* component controls an E3 port on an E3 Function Processor. |
| Opt. Subcomp. | "COMPONENT Lp E3 G832"<br>"COMPONENT Lp E3 AtmCell (Cell)" |
| Dyn. Subcomp. | "COMPONENT Lp E3 Test (Test)"<br>"COMPONENT Lp E3 Plcp" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Lp E3 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for a *E3* component. |

### ATTRIBUTE Lp E3 lineLength (length)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the line length for equalization calculations for the E3 line. The line length range is between 0 and 300 metres (1 metres = 3.28 feet). |
| Values | Decimal (0..300) |
| Units | metres |
| Default | 1 |

### ATTRIBUTE Lp E3 clockingSource

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute defines the type of clocking source used for synchronizing the E3 transmit clock: ***local*** means direct use of the local clock oscillator at its centre frequency; ***line*** means use of a signal phase-locked to the incoming E3 line rate; ***module*** means the use of a signal phase-locked to the CP reference clock. Note that the multiport cell-based cards have one common clock source for each of the three ports. For this reason, the following rules apply for the value of *clockingSource* across the board's three ports:<br>All three *clockingSource* values must be "***local***" OR<br>All three *clockingSource* values must be "***module***" OR<br>One *clockingSource* value must be "***line***" and the other two must be "***otherPort***".<br>The default value for this attribute will be ***module*** if a CP clock is available, and ***local*** otherwise. |
| Values | local<br>line<br>module<br>otherPort |
| Default | No default |

### ATTRIBUTE Lp E3 applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the link to the software stack. It defines which application is running on top of the *E3* component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### ATTRIBUTE Lp E3 mapping

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates if ATM cells will be mapped directly into the E3 payload, or whether PLCP mapping will be used. The *PLCP* component will appear under the *E3* component when this attribute is set to ***plcp***. This attribute will be ignored when set on frame-based cards. |

| | |
|---|---|
| Values | direct<br>plcp |
| Default | direct |

### ATTRIBUTE Lp E3 framing

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates if the framing mode will be in accordance with the CCITT G.751 or G.832 specification. The *G832* component will appear under the *E3* component when this attribute is set to ***g832***. This attribute may only be set on cell-based card types. Note also that this attribute may only be set to ***g751*** if the *mapping* attribute is set to ***plcp***.<br>The default value of this attribute will be ***g751*** for frame-based cards, and ***g832*** for cell-based cards.<br>Note: when *E3 framing* is changed from ***g832*** to ***g751***, the *G832* component must be deleted. |
| Values | g751<br>g832 |
| Default | No default |

### ATTRIBUTE Lp E3 linkAlarmActivationThreshold

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval between the detection of a sustained link failure and the activation of an alarm. It is provisionable for E3 cards. |
| Values | Decimal (100..2600) |
| Units | msec |
| Default | 2200 |

### ATTRIBUTE Lp E3 linkAlarmScanInterval

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the alarm scan timer polling interval. It determines how frequently the status of the link is monitored after a first link error interrupt. It is provisionable for E3 cards. |

| | |
|---|---|
| Values | Decimal (50..250) |
| Units | msec |
| Default | 200 |

### GROUP Lp E3 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp E3 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp E3 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp E3 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp E3 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp E3 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp E3 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp E3 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp E3 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp E3 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp E3 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific |

information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp E3 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp E3 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp E3 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp E3 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp E3 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp E3 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp E3 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms

may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp E3 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp E3 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp E3 Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for *E3* component.

### ATTRIBUTE Lp E3 losAlarm (los)

Access
Read only

Description
This attribute displays whether a Loss Of Signal (LOS) alarm state has been entered. An LOS alarm state is entered when LOS defects has been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOS defect is detected at the E3 line interface upon observing N continuous pulse positions with no

pulses of either positive or negative polarity, where N is between 10 and 255. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *E3* component goes into an operational state of *disabled* until the LOS alarm condition is cleared. The LOS alarm state is cleared when the LOS defects are absent for a period of 10 seconds +/- 0.5 seconds.
The *losAlarm* attribute is always set to *off* when the component has been *locked* and left *offline*.

Values
on
off

Default
off

### ATTRIBUTE Lp E3 lofAlarm (lof)

Access
Read only

Description
This attribute displays whether a Loss Of Frame (LOF) alarm state has been entered. An LOF alarm state is entered when Severely Errored Frame (SEF) defects have been detected and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An E3 SEF defect is reported after detecting Frame Alignment Signal (FAS) errors on 4 consecutive E3 frames received on the incoming line. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *E3* component goes into an operational state of *disabled* until the LOF alarm condition is cleared. The condition is cleared when E3 framing has been achieved for a period of 10 seconds +/- 0.5 seconds. As long as SEF defects are detected, the node also transmits the far-end SEF/AIS (in G.751 E3) or FERF (in G.832) defect indicator over the outgoing line. The *txRai* attribute is set to *on* when transmitting the far-end SEF/AIS defect indicator on the outgoing line.
The *lofAlarm* attribute is always set to *off* when the component has been *locked* and left *offline*.

| | |
|---|---|
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp E3 rxAisAlarm (rxAis)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether an Alarm Indication Signal (AIS) alarm when state has been entered. An AIS alarm state is entered when AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds on the incoming E3 line. An AIS defect is the occurrence of the AIS (unframed signal with a density of zeros below a certain threshold such as defined by ITU Recommendation G.775). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The *E3* component goes into an operational state of *disabled* until the AIS alarm condition is cleared (after AIS has been no longer detected for a period of 10 seconds +/- 0.5 seconds). As long as AIS is detected on the incoming line, the node also transmits the far-end SEF/AIS (in G.751 E3) or FERF (in G.832) defect indicator over the outgoing line. The *txRai* attribute is set to *on* when transmitting the far-end SEF/AIS defect indicator on the outgoing line.<br>The *rxAisAlarm* attribute is always set to *off* when the component has been *locked* and left *offline*. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp E3 rxRaiAlarm (rxRai)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a Remote Alarm Indication (RAI) alarm state has been entered. A RAI alarm state is entered when far-end SEF/AIS defects (or Far-End Receive Failure (FERF) defects in G.832 E3 Framing mode) have been observed and |

accumulated for a period of 2.5 seconds +/- 0.5 seconds on the E3 incoming line. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *E3* component goes into an operational state of *disabled* until the RAI alarm condition is cleared. The condition is cleared when the far-end defect indicator has not been detected for 10 seconds +/- 0.5 seconds. The declaration of a RAI Alarm is usually a signal that the far end facility is unable to gain synchronization.
The *rxRaiAlarm* attribute is always set to *off* when the component has been *locked* and left *offline*.

Values
on
off

Default
off

### ATTRIBUTE Lp E3 txAis

Access
Read only

Description
This attribute displays whether an AIS alarm is being transmitted on the E3 line. AIS is transmitted on the outgoing line when the *E3* component is locked and not used for operational testing.

Values
on
off

Default
off

### ATTRIBUTE Lp E3 txRai

Access
Read only

Description
This attribute displays whether the far-end SEF/AIS defect indicator is transmitted over the outgoing line when the *E3* component has been unlocked or used in operational testing. When the *E3* component is locked and not used in operational testing, this attribute is always set to *off*. The far-end SEF/AIS defect indicator is transmitted over the outgoing line when SEF/AIS defects are detected on the incoming line. In G.832 E3 Framing mode, the FERF bit is set to ‘1’ to transmit the SEF/AIS defect indicator.

| | |
|---|---|
| Values | on<br>off |
| Default | off |

### GROUP Lp E3 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for *E3* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

### ATTRIBUTE Lp E3 runningTime (time)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of seconds since the *E3* component has been activated and been in unlocked state or used for operational testing. All the other error counts that follow as well as each E3 subcomponent's error counts can be updated when this count is active. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp E3 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the E3 port has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 lineCodeViolations (lcv)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total number of Line Code Violations (LCV) detected. An E3 Line Code Violation is an HDB3 coded signal error. LCV counting is inhibited for second intervals where a Line Severely Errored Second (LSES) is counted.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 lineErroredSec (les)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Errored Seconds (LES) that have been counted. A LES is declared for interval seconds containing one or more Line Code Violations (LCV) or one or more Loss Of Signal (LOS) defects. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 lineSevErroredSec (lses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Severely Errored Seconds (LSES) that have been counted. A LSES is declared for second intervals containing more than 34 Line Code Violations (LCV) or one or more Loss of Signal (LOS) defects. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 lineLosSec (loss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line LOS Seconds (LOSS) that have been counted. A LOSS is declared for second intervals containing one or more Loss of Signal (LOS) defects. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 lineFailures (lf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a line failure (LOS failure) has been declared.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Path Code Violations (PCV) detected. An E3 PCV is an error in the Frame Alignment (FA) signal, or, in G.832 Framing Mode, an error in the Frame Alignment signal or a BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Path Errored Seconds (PES) that have been counted. A PES is declared for second intervals containing one or more Path Code Violations (PCV) or one or more Severely Errored Frame (SEF) or Alarm Indication |

Signal (AIS) defects. Counting of Path Errored Seconds is inhibited when a Path Unavailable Second (PUAS) is counted over the monitored second.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 pathSevErroredSec (pses)

Access: Read only

Description: This attribute indicates the total number of Path Severely Errored Seconds (PSES) that have been counted. A PSES is declared for second intervals containing more than 22 (G.751 E3) or 34 (G.832 E3) Path Code Violations (PCV) or one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of PSESs is inhibited when a Path Unavailable Second (PUAS) is counted over the monitored second.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 pathSefAisSec (psas)

Access: Read only

Description: This attribute indicates the total number of Path SEF/AIS Seconds (PSAS). A PSAS is declared for second intervals containing one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of PSAS is inhibited when Path Unavailable Seconds (PUAS) is counted over the monitored second.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 pathUnavailSec (puas)

Access: Read only

Description: This attribute indicates the total number of one second intervals for which the E3 path is unavailable. The E3 path becomes unavailable at the onset of 10 consecutive Path Severely Errored

Seconds (PSES). The 10 PSESs are included in the unavailable time. Once unavailable, the E3 path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where PUAS is counted, counting of Path Code Violations (PCV), Path Errored Seconds (PES), Path Severely Errored Seconds (PSES) and Path SefAis Seconds (PSAS) is inhibited.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 pathFailures (pf)

Access: Read only

Description: This attribute indicates the total number of times that a path failure (LOF/AIS failure) has been declared.
This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Values: Decimal (0..4294967295)

Default: 0

### COMPONENT Lp E3 Test (Test)

Groups: "GROUP Lp E3 Test OsiState (State)"
"GROUP Lp E3 Test Setup (Setup)"
"GROUP Lp E3 Test Results (Results)"

Scope: Application

Description: The *Test* component is configured to control a hardware facility test on a physical (*V*35, *X21, DS1, E1, DS3, E3* etc.) or a logical port.

Common Verbs:
- Help
- List
- Display

### VERB START Lp E3 Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp E3 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp E3 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp E3 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp E3 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp E3 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp E3 Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp E3 Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp E3 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. |

***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

## ATTRIBUTE Lp E3 Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Lp E3 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp E3 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp E3 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp E3 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp E3 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp E3 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp E3 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination: |

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp E3 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E3 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E3 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp E3 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E3 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E3 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E3 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp E3 Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Lp E3 Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

| | |
|---|---|
| Default | 0.00 |

### ATTRIBUTE Lp E3 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp E3 G832

| | |
|---|---|
| Groups | "GROUP Lp E3 G832 Provisioned"<br>"GROUP Lp E3 G832 Operational"<br>"GROUP Lp E3 G832 Statistics (Stats)" |
| Scope | Application |
| Description | G832<br>The *G832* component is configured to display all E3 G832 related operational and statistical data. It will appear under the *E3* components when the *E3 framing* attribute is set to ***g832***.<br>Note: when *E3 framing* is changed from ***g832*** to ***g751***, the *G832* component must be deleted. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp E3 G832 Provisioned

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable data for the G832 component. |

### ATTRIBUTE Lp E3 G832 trailTraceTransmitted

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the E.164 address which is to be encoded in the trail access point identifier, which is transmitted using the Trail Trace (TR) field of the transmitted E3 Frame.<br>Both the expected trail access point identifier and the transmitted trail access point identifier are provisionable attributes of the *G832* component.<br>The 16 byte Trail Trace frame is composed of one byte containing a frame start marker and a CRC-7 calculation over the previous frame, and 15 bytes for transporting an E.164 address. If less than the full 15 bytes are used, the address is padded with NULL characters. |
| Values | String (0..15, ASCII) |
| Default | "" |

### ATTRIBUTE Lp E3 G832 trailTraceExpected

| | |
|---|---|
| Access | Read and write |
| Description | This attribute indicates the E.164 address which is expected in the trail access point identifier, which is transmitted using the Trail Trace (TR) field of the transmitted E3 Frame.<br>Both the expected trail access point identifier and the transmitted trail access point identifier are provisionable attributes of the *G832* component.<br>The 16 byte Trail Trace frame is composed of one byte containing a frame start marker and a CRC-7 calculation over the previous frame, and 15 bytes for transporting an E.164 address. If less than the full 15 bytes are used, the address is padded with NULL characters. |
| Values | String (0..15, ASCII) |
| Default | "" |

### GROUP Lp E3 G832 Operational

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the G832 component. |

## ATTRIBUTE Lp E3 G832 unexpectedPayloadType (upt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Unexpected Payload Type (UPT) alarm state has been entered. The UPT alarm state is entered when UPT defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The UPT defect is reported when a received frame fails to agree with the expected Payload Type. If the UPT defects are intermittently occurring, the UPT defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle..<br>The UPT alarm is cleared when the Payload Type in the received frame agrees with the expected Payload Type for a period of 10 seconds +/- 0.5 seconds.<br>The *unexpectedPayloadType* attribute is always set to *off* when the *E3* component has been *locked* and left *offline*. |
| Values | on<br>off |
| Default | No default |

## ATTRIBUTE Lp E3 G832 trailTraceMismatch (ttm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Trail Trace Mismatch (TTM) alarm state has been entered. The TTM alarm state is entered when TTM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TTM defect is reported when the trail access point identifier contained in the Trail Trace (TR) field in the received frame fails to agree with the expected identifier. If the TTM defects are intermittently occurring, the TTM defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The TTM alarm is cleared when the trail access point identifier in the received frame agrees with the expected identifier for a period of 10 seconds +/- 0.5 seconds.<br>The *trailTraceMismatch* attribute is always set to *off* when the *E3* component has been *locked* and left *offline*. |

Both the expected trail access identifier and the transmitted trail access identifier are provisionable attributes of the G832 component.

Values
on
off

Default
No default

### ATTRIBUTE Lp E3 G832 timingMarker

Access
Read only

Description
Indicates whether or not the timing source at the far-end node is traceable to a Primary Reference Clock.
The *timingMarker* indication is controlled by the timing marker bit in the G832 MA byte. If the received timing marker bit is 1 for five consecutive frames, and five consecutive 0s are not received for two seconds, the *timingMarker* indication will be set to ***not traceable***. If the received timing marker bit is 0 for five consecutive frames and five consecutive 1s are not received for two seconds, the *timingMarker* indication will be set to ***traceable***.

Values
not traceable
traceable

Default
No default

### ATTRIBUTE Lp E3 G832 trailTraceReceived

Access
Read only

Description
This attribute indicates the 15 byte E.164 address which is currently being received in the trail trace (TR) field of the E3 G832 frame. If this attribute differs from the provisioned trailTraceTransmitted string a trail trace mismatch (TTM) defect is reported, possibly resulting in a TTM alarm, as described for operational attribute *trailTraceMismatch*.

Values
String (0..15, ASCII)

Default
No default

## GROUP Lp E3 G832 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical data for the G832 component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

## ATTRIBUTE Lp E3 G832 farEndErrorFreeSec (feefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the E3 line has not suffered any G832 errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp E3 G832 farEndCodeViolations (fecv)

| | |
|---|---|
| Access | Read only |
| Description | A count of E3 frames containing a Far-End Block Error (FEBE). A FEBE is reported over the FEBE bit each time the far-end terminal detects a BIP-8 error in a received E3 frame. For second intervals where Far End Unavailable Seconds (FEUAS) or Far End Severely Errored Seconds (FESES) are counted, counting of FECVs is inhibited.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp E3 G832 farEndErroredSec (fees)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End Errored Seconds (FEES). A FEES is declared for second intervals containing with one or more Far-End Coding Violations (FECV) or one or more Far-End Receive Failure (FERF) defects. A FERF |

defect occurs when the FERF bit in the received frame is set to one. For second intervals where Far End Unavailable Seconds (FEUAS) are counted, counting of FEESs is inhibited.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 G832 farEndSevErroredSec (feses)

Access: Read only

Description: This attribute indicates the total number of Far-End Severely Errored Seconds (FESESs). A FESES is declared for second intervals containing more than 34 Far-End Coding Violations (FECV) or one or more Far-End Receive Failure (FERF) defects. For second intervals where a Far-End Severely Errored Seconds (FESES) is counted, counting of FECVs is inhibited. For second intervals where Far End Unavailable Seconds (FEUAS) are counted, counting of FESESs is inhibited.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 G832 farEndSefAisSec (fesas)

Access: Read only

Description: This attribute indicates the total number of Far-End SEF/AIS Seconds (FESAS). A FESAS is declared for second intervals containing one or more Far-End Receive Failure (FERF) defects. For second intervals where Far End Unavailable Seconds (FEUAS) are counted, counting of FESAS is inhibited.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 G832 farEndUnavailSec (feuas)

Access: Read only

Description: This attribute indicates the total number of one second intervals for which the E3 far-end path is unavailable. The E3 far-end path becomes unavailable at the onset of 10 consecutive Far End

Severely Errored Seconds (FESES). It comes available at the onset of 10 contiguous seconds with no FESES. The unavailable time includes the initial 10 seconds to enter the unavailable state but not the 10 seconds to exit the state For second intervals where FEUAS is counted, counting of Far End Coding Violations (FECV), Far-End Errored Seconds (FEES), Far-End Severely Errored Seconds (FESES) and Far-End SefAis Seconds (FESAS) are inhibited.

Values: Decimal (0..4294967295)

Default: 0

## COMPONENT Lp E3 Plcp

Groups: "GROUP Lp E3 Plcp Operational"
"GROUP Lp E3 Plcp Statistics (Stats)"

Scope: Application

Description: *LP/n DS3/n PLCP*
*LP/n E3/n PLCP*
The *PLCP* component is configured to display all DS3/E3 PLCP related operational and statistical data. It will appear under the *DS3* or *E3* components when the *mapping* attribute is set to ***plcp***.

Common Verbs:
Help
List
Display

## GROUP Lp E3 Plcp Operational

Properties: Operational

Description: This group contains the operational data for the *PLCP* component.

## ATTRIBUTE Lp E3 Plcp lofAlarm (lof)

Access: Read only

Description: This attribute displays whether a PLCP Loss Of Frame (LOF) failure alarm state has been entered. An LOF failure is declared when a PLCP LOF defect persists for 2.5 s +/- 0.5 s. An LOF

defect occurs when an OOF (Out of Frame) state persists for more than 1 ms. If the OOF events are intermittent, the LOF defect counter is decremented at a rate of 1/12 (for DS3 PLCP) or 1/9 (for G.751 E3 PLCP) of the incrementing rate, with all measurements based on a 200 ms polling cycle. An OOF event (also known as a PLCP SEF event) is declared when an error is detected in both the A1 and A2 octets, or when two consecutive POHIDs are found in error.
OOF is removed when two valid sets of framing octets and two valid and sequential POHID octets have been found. The LOF defect is removed when the defect counter reaches zero, i.e. when OOF events are absent for more than 12 ms (DS3 PLCP) or 9 ms (G.751 E3 PLCP). LOF failure alarm is cleared when LOF defect is absent for 10.0 s +/- 0.5 s
The *DS3* or *E3* component goes into an operational state of *disabled* until the LOF failure alarm is cleared. The terminal declaring the LOF failure alarm will transmit a PLCP RAI signal to the far-end for the duration of the alarm.
The *lofAlarm* attribute is always set to *off* when the *DS3* or *E3* component has been *locked* and left *offline*.

Values
on
off

Default
off

### ATTRIBUTE Lp E3 Plcp rxRaiAlarm (rxrai)

Access
Read only

Description
This attribute displays whether a PLCP Remote Alarm Indication (RAI) failure alarm state has been entered. An RAI failure alarm occurs when ten consecutive PLCP RAI bits (bit 5 in the G1 byte) are high on the incoming line. An RAI failure alarm is cleared when ten consecutive RAI bits are set to 0.
Note: Some standards call this alarm RFI.
The *rxRaiAlarm* attribute is always set to *off* when the *DS3* or *E3* component has been *locked* and left *offline*.

Values
on
off

Default
off

## GROUP Lp E3 Plcp Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical data for the *PLCP* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

## ATTRIBUTE Lp E3 Plcp errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds during which the near-end PLCP path layer had no errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp E3 Plcp codingViolations (cv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of BIP-8 Errors, framing pattern octet errors, and path overhead identification errors detected in received PLCP frames.<br>Counting of PLCP CV is inhibited for second intervals where PLCP Severely Errored Framing Seconds (SEFS) or PLCP Unavailable Seconds (UAS) are counted.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp E3 Plcp erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds containing one or more PLCP Coding Violations (CV) or in which a PLCP Severely Errored Framing Second (SEFS) was counted. |

| | |
|---|---|
| | Counting of PLCP ES is inhibited during second intervals where PLCP Unavailable Seconds (UAS) are counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 Plcp sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds containing 5 or more PLCPCVs or in which a PLCPSEFS was counted (i.e. a PLCP OOF event occurred).<br>Counting of PLCP SES is inhibited during second intervals where PLCP Unavailable Seconds (UAS) are counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 Plcp sevErroredFramingSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds containing one or more PLCP Severely Errored Frame (SEF) events. An SEF event is equivalent to a PLCP OOF (Out of Frame) event.<br>Counting of PLCPP SEFSs is inhibited for second intervals where PLCP Unavailable Seconds (UAS) are counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 Plcp unavailSec (uas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds when the near-end PLCP layer is unavailable. The PLCP Path Layer becomes unavailable at the declaration of PLCP LOF (Loss of Frame) failure alarm state. The PLCP Path Layer becomes available again only after clearing this condition.<br>For second intervals where PLCP UAS are counted, counting of PLCP Severely Errored Framing Seconds (SEFS), PLCP Coding |

| | |
|---|---|
| | Violations (CV), PLCP Errored Seconds (ES), PLCP Severely Errored Seconds (SES) and PLCP Far-End Severely Errored Seconds (FESES) is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 Plcp farEndErrorFreeSec (feefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds during which the far-end PLCP path layer had no errors. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 Plcp farEndCodingViolations (fecv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of PLCP Far-End Block Errors (FEBE) reported by the far-end terminal.<br>Counting of FEBEs is inhibited for second intervals where PLCP Far-End Unavailable Seconds (FEUAS) are counted.<br>This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E3 Plcp farEndErroredSec (fees)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds containing one or more PLCP Far-End Coding Violations (FECV).<br>Counting of PLCP FEES is inhibited during second intervals where PLCP Far-End Unavailable Seconds (FEUAS) are counted. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Lp E3 Plcp farEndSevErroredSec (feses)

Access Read only

Description This attribute indicates the number of seconds containing 5 or more PLCP Far-End Coding Violations (FECV).
Counting of PLCP FESES is inhibited for second intervals where PLCP Far-End Unavailable Seconds (FEUAS) are counted.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Lp E3 Plcp farEndUnavailableSec (feuas)

Access Read only

Description This attribute indicates the number of seconds during which the PLCP far end is unavailable. The PLCP Path Layer becomes unavailable at the declaration of PLCP RAI (Remote Alarm Indication). Service becomes available again after this condition is cleared. For second intervals where PLCP FEUAS are counted, counting of PLCP Far-End Coding Violations (FECV), PLCP Far-End Errored Seconds (FEES), and PLCP Far-End Severely Errored Seconds (FESES) is inhibited.

Values Decimal (0..4294967295)

Default 0

### COMPONENT Lp E3 AtmCell (Cell)

Groups "GROUP Lp E3 Cell Provisioned (Prov)"
"GROUP Lp E3 Cell Operational (Oper)"
"GROUP Lp E3 Cell Statistics (Stats)"

Scope Device

Description The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the

interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

Common Verbs

Help
List
Display
Add
DELete

## GROUP Lp E3 Cell Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioning attributes for the *AtmCell* component.

## ATTRIBUTE Lp E3 Cell alarmActDelay (act)

Access: Read and write

Description: This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Values: Decimal (0..2000)

Units: msec

Default: No default

## ATTRIBUTE Lp E3 Cell scrambleCellPayload (scramble)

Access: Read and write

| | |
|---|---|
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Lp E3 Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.<br><br>Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Lp E3 Cell clearDelay (clear)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 |

| | |
|---|---|
| | (default), the time is actually about 10 seconds.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..60) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp E3 Cell hecSampleInterval (hSample)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp E3 Cell hecErrorLimit (hLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit |

established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Lp E3 Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..50)

Units: msec

Default: No default

### ATTRIBUTE Lp E3 Cell hecErrorIntervalLimit (hIntLimit)

Access: Read and write

Description: This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an

alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..25)

Default: 1

### GROUP Lp E3 Cell Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes for the *AtmCell* component.

### ATTRIBUTE Lp E3 Cell lcdAlarm (lcd)

Access: Read only

Description: This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD

defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values: on
off

Default: off

### GROUP Lp E3 Cell Statistics (Stats)

Properties: Operational

Description: This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

### ATTRIBUTE Lp E3 Cell uncorrectableHeaderErrors (ucErr)

Access: Read only

Description: This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 Cell sevErroredSec (ses)

Access: Read only

Description: This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E3 Cell receiveCellUtilization (rxutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp E3 Cell transmitCellUtilization (txutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.

This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp E3 Cell correctableHeaderErrors (cErr)

Access: Read only

Description: This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected

Values: Decimal (0..4294967295)

Default: 0

### COMPONENT Lp DS1

Instance: Decimal (0..31)

Groups:
"GROUP Lp DS1 Provisioned (Prov)"
"GROUP Lp DS1 CustomerIdentifierData (CidData)"
"GROUP Lp DS1 AdminInfo (AdminInfo)"
"GROUP Lp DS1 IfEntryProv (IfEntry)"
"GROUP Lp DS1 OperationalStatus (OperStatus)"
"GROUP Lp DS1 OsiState (State)"
"GROUP Lp DS1 Operational (Oper)"
"GROUP Lp DS1 Statistics (Stats)"

Scope: Application

Description: *Lp/n DS1/n*
The *DS1* component controls and monitors a DS1 port on a Function Processor. The number of ports supported depends on

the type of card, and is usually encoded in the *Shelf Card/n cardType*, for example 4pDS1Aal1: 4 port. The lowest instance value is always ***0***.

Multi-Service cards have an instance range 0..31, except that instance values 30 and 31 are not available for an “ATM UNI port”. (A DS1 “ATM UNI port” is a *DS1* component with a single *Chan* whose *applicationFramerName* attribute is linked to an *AtmIf* component.)

The instance number of a *DS1* “ATM UNI port” must not be the same as the instance number of an *IMA* group under the same *Lp*.

Subcomponents: "COMPONENT Lp DS1 Channel (Chan)"

Dyn. Subcomp.: "COMPONENT Lp DS1 Test (Test)"
"COMPONENT Lp DS1 Dsp"

## GROUP Lp DS1 Provisioned (Prov)

Properties: Provisioned

Description: This group contains all of the provisioning data for a DS1 component.

## ATTRIBUTE Lp DS1 lineType (lineType)

Access: Read and write

Description: This attribute defines the framing of the DS1 line.
***d4*** defines a framing pattern of 12 frames per multiframe.
***esf*** defines a framing pattern of 24 frames per multiframe.
***d4Cas*** defines a framing pattern of 12 frames per multiframe with channel associated signalling.

***esfCas*** defines a framing pattern of 24 frames per multiframe with channel associated signalling.
***unframed*** defines an unknown framing pattern for clear channels.

For cell-based cards only the default option ***esf*** is permitted.

Values
d4
esf
d4Cas
esfCas
unframed

Default
esf

### ATTRIBUTE Lp DS1 zeroCoding (zeroCoding)

Access
Read and write

Criticality
Component

Description
This attribute defines the zero encoding on the DS1 line.
***bit7Stuffing*** sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8.
***b8zs*** substitutes a pattern of bipolar violations if more than 7 zeros in a row are to be transported.
***ami*** specifies Alternate Mark Inversion, in which successive marks (ones) alternate between positive and negative polarity voltage signals, and spaces (zeros) are sent as a zero amplitude signal.
When *zeroCoding* is set to ***ami*** and l*ineType* is set to ***d4***, it is recommended that *raiAlarmType* be set to ***SBit*** in order to avoid possible mimic RAI alarm.

For cell-based cards, only the default value ***b8zs*** is permitted.

The value *ami* should be used with caution. If the ones density of the traffic is not sufficiently high, the DS1 will lose clock synchronization.

Values
bit7Stuffing
b8zs
ami

Default b8zs

### ATTRIBUTE Lp DS1 clockingSource (clockingSource)

Access Read and write

Description This attribute defines the source of the transmit clock for the DS1 line.

When ***local*** is selected, the crystal on the port generates the clocking for the line.

When ***line*** is selected, the port synchronizes to the clock from the facility.

When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP.

When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***.

When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network.

When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network.

A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured***

If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pDS1Atm*** card, which it defaults to ***local***.

On a ***3pDS1Atm*** card all ports must have the same value, and be either ***local*** or ***module***.

***otherPort*** is valid only on AAL1 cards. ***srtsMode*** is valid only on

AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards.
On ***4DS1Aal1*** cards either:

all four ports' *clockingSource* values must be ***local*** OR
all four ports' *clockingSource* values must be ***module*** OR
one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. A port can only have ***srtsMode*** selected if the other ports are ***module*** or ***srtsMode***.

Values
local
line
module
otherPort
srtsMode
adaptiveMode

Default
No default

### ATTRIBUTE Lp DS1 raiAlarmType (raiType)

Access
Read and write

Description
This attribute defines the method of sending a RAI (Remote Alarm Indication) alarm on a DS1 line.
When ***SBit*** is selected, RAI alarm is sent by setting the S bit in frame 12.
When ***Bit2*** is selected, RAI alarm is sent by setting bit 2 in all timeslots to 0.
When ***fdl*** is selected, RAI alarm is sent by a repeating pattern of 00 hex and FF hex on the FDL link.
Note that for *lineType* of ***d4***, only the SBit and the Bit2 methods are applicable. Whereas for *lineType* of ***esf***, only the Bit2 and the ***fdl*** methods are applicable.
***SBit*** method is recommended if *lineType* is set to ***d4*** and *zeroCoding* is set to ***ami***. This will help to avoid potential mimic RAI alarm when 1's density is too low in the data transmitted.
For cell-based cards, only the default value ***fdl*** is permitted.

Values
sBit
bit2
fdl

| | |
|---|---|
| Default | fdl |

### ATTRIBUTE Lp DS1 lineLength (lineLength)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the line length (in feet) for equalization calculations for the DS1 line. The value ranges between 0-655. For ***8pDS1Atm*** cards the actual value used for equalization is rounded up to the nearest 110 feet; for all other card types the actual value used is rounded to the nearest 50 feet. |
| Values | Decimal (0..655) |
| Default | 0 |

### GROUP Lp DS1 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp DS1 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of |

| | |
|---|---|
| | any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp DS1 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp DS1 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS1 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp DS1 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp DS1 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp DS1 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp DS1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp DS1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp DS1 OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lp DS1 adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Lp DS1 operationalState (osiOper)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp DS1 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Lp DS1 availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp DS1 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp DS1 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp DS1 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp DS1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp DS1 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp DS1 Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for a component in a digital hierarchy interface.

### ATTRIBUTE Lp DS1 losAlarm (losAlarm)

Access
Read only

Description

This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOS alarm state.
The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds.

Values

on
off

Default

off

### ATTRIBUTE Lp DS1 rxAisAlarm (rxAisAlarm)

Access

Read only

Description

This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's density of at least 99.9% is present for a time T, where 3 ms ≤ T ≤ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state.

The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp DS1 lofAlarm (lofAlarm)

Access
Read only

Description
This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp DS1 rxRaiAlarm (rxRaiAlarm)

Access
Read only

Description
This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**, and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the

RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time).
The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

Values: on
off

Default: off

### ATTRIBUTE Lp DS1 txAisAlarm (txAisAlarm)

Access: Read only

Description: This attribute displays whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the port is in a locked state.

Values: on
off

Default: off

### ATTRIBUTE Lp DS1 txRaiAlarm (txRaiAlarm)

Access: Read only

Description: This attribute displays whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the port detects a LOF alarm condition (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: RAI is transmitted when the port detects a LOS, LOF, or AIS condition).

Values: on
off

Default: off

### GROUP Lp DS1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common statistical data for a component in a digital hierarchy interface. |

### ATTRIBUTE Lp DS1 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds since the port component was activated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds that the port has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored framing second occurs when a second with one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | The total number of seconds that the interface is in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 bpvErrors (bpvErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of Bipolar Violations. A bipolar violation is an error in the alternate mark inversion pattern (AMI) on the line. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | If the interface is a DS1 line, it is the current count of CRC-6 errors. These will only be counted when the lineType is ESF. If the interface is an E1 line, it is the total number of CRC-4 errors. These will only be counted when crc4Mode is on. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of frame errors. A frame error is an error in the framing bits |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 losStateChanges (losChanges)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line lost signal. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. This attribute is incremented for ports on the voice cards (for example the 1pDS1V and the 1pE1V function processors) only. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp DS1 Channel (Chan)

| | |
|---|---|
| Instance | Decimal (0..24) |

| | |
|---|---|
| Groups | "GROUP Lp DS1 Chan Provisioned (Prov)"<br>"GROUP Lp DS1 Chan CustomerIdentifierData (CidData)"<br>"GROUP Lp DS1 Chan IfEntryProv (IfEntry)"<br>"GROUP Lp DS1 Chan OperationalStatus (OperStatus)"<br>"GROUP Lp DS1 Chan OsiState (State)"<br>"GROUP Lp DS1 Chan Operational (Oper)"<br>"GROUP Lp DS1 Chan AdminInfo (AdminInfo)" |
| Scope | Application |
| Description | *Channel*<br>The *Channel* component is configured to control a group of timeslots that form a fractional group on a DS1 or E1 port. Cell-based cards allow only one channel per port, and this is automatically provisioned with all available timeslots. Similarly, the ***1pDS3C*** card type only allows one channel per port, and this is automatically provisioned with all available timeslots. |
| Opt. Subcomp. | "COMPONENT Lp DS1 Chan AtmCell (Cell)"<br>"COMPONENT Lp DS1 Chan TrunkConditioning (Tc)" |
| Dyn. Subcomp. | "COMPONENT Lp DS1 Chan Test (Test)" |

## GROUP Lp DS1 Chan Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisional data for a *Channel* component. |

## ATTRIBUTE Lp DS1 Chan timeslots (ts)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |

| | |
|---|---|
| Description | This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component.<br><br>For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function. |
| Set of | none<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15<br>16<br>17<br>18<br>19<br>20<br>21<br>22<br>23<br>24<br>25<br>26<br>27<br>28<br>29<br>30 |

31

Default No default

### ATTRIBUTE Lp DS1 Chan timeslotDataRate (dataRate)

Access Read and write

Criticality Component

Description This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.

When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

Values: 56k
doNotOverride

Default: doNotOverride

### ATTRIBUTE Lp DS1 Chan applicationFramerName

Access: Read and write

Description: This attribute defines the link to the software stack. It defines which application is running on top of this hardware component.

Values: Link (Service, interfaceName)

Default: No default

### GROUP Lp DS1 Chan CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE Lp DS1 Chan customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the

operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP Lp DS1 Chan IfEntryProv (IfEntry)

Properties: Provisioned

Description: This group contains the provisionable attributes for the ifEntry.

### ATTRIBUTE Lp DS1 Chan ifAdminStatus (ifState)

Access: Read and write

Description: The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.

Values:
up
down
testing

Default: up

### ATTRIBUTE Lp DS1 Chan ifIndex (ifI)

Access:
Read: Passive
Write: Debug

Criticality: Component

Description: This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.

Values: Decimal (1..65535)

Default: No default

### GROUP Lp DS1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp DS1 Chan snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp DS1 Chan OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp DS1 Chan adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp DS1 Chan operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp DS1 Chan usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp DS1 Chan availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration

activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp DS1 Chan proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp DS1 Chan controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Lp DS1 Chan alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp DS1 Chan standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Lp DS1 Chan unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Lp DS1 Chan Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Channel* component. |

### ATTRIBUTE Lp DS1 Chan actualChannelSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the measured link speed of the *Channel* component. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### GROUP Lp DS1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp DS1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### COMPONENT Lp DS1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp DS1 Chan Test OsiState (State)"<br>"GROUP Lp DS1 Chan Test Setup (Setup)"<br>"GROUP Lp DS1 Chan Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V*35, *X21, DS1, E1, DS3, E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp DS1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp DS1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp DS1 Chan Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp DS1 Chan Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp DS1 Chan Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp DS1 Chan Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).<br>***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). |

Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

### ATTRIBUTE Lp DS1 Chan Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values

Decimal (4..4096)

Units

bytes

Default

1024

### ATTRIBUTE Lp DS1 Chan Test frmPatternType (fpt)

Access

Read and write

Description

This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.
***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.
***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.

| | |
|---|---|
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp DS1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp DS1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp DS1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be |

| | |
|---|---|
| | no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp DS1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp DS1 Chan Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp DS1 Chan Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. |

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values

testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

| | |
|---|---|
| Default | neverStarted |

### ATTRIBUTE Lp DS1 Chan Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test bitErrorRate

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp DS1 Chan Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |

| | |
|---|---|
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp DS1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp DS1 Chan Cell Provisioned (Prov)"<br>"GROUP Lp DS1 Chan Cell Operational (Oper)"<br>"GROUP Lp DS1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp DS1 Chan Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

### ATTRIBUTE Lp DS1 Chan Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is |

necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Values: Decimal (0..2000)

Units: msec

Default: No default

### ATTRIBUTE Lp DS1 Chan Cell scrambleCellPayload (scramble)

Access: Read and write

Description: Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Values: off
on

Default: No default

### ATTRIBUTE Lp DS1 Chan Cell correctSingleBitHeaderErrors

Access: Read and write

Description: This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

| | |
|---|---|
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Lp DS1 Chan Cell clearDelay (clear)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..60) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp DS1 Chan Cell hecSampleInterval (hSample)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp DS1 Chan Cell hecErrorLimit (hLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..250000) |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Cell lcdStateDelay (delay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..50) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp DS1 Chan Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

### GROUP Lp DS1 Chan Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

### ATTRIBUTE Lp DS1 Chan Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.<br>In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been |

detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values: on
off

Default: off

## GROUP Lp DS1 Chan Cell Statistics (Stats)

Properties: Operational

Description: This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE Lp DS1 Chan Cell uncorrectableHeaderErrors (ucErr)

Access: Read only

Description: This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 Chan Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.<br><br>Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp DS1 Chan Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp DS1 Chan Cell transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp DS1 Chan Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp DS1 Chan TrunkConditioning (Tc)

| | |
|---|---|
| Groups | "GROUP Lp DS1 Chan Tc Provisioned (Prov)"<br>"GROUP Lp DS1 Chan Tc Operational (Op)" |
| Scope | Device |
| Description | *Lp/n Ds1/n Chan/n Tc*<br>*Lp/n E1/n Chan/n Tc*<br>*Lp/n Ds3/n Ds1/n Chan/n Tc* |

*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*
*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*
*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*
*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp DS1 Chan Tc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all specific provisioning data for a *Tc* component. |

## ATTRIBUTE Lp DS1 Chan Tc replacementData (data)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.<br><br>The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:<br>DS1 MUX Out Of Service Code = 0x1A<br>E1 MUX Out Of Service Code = 0xFF<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.<br><br>On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***. |
| Values | Hex (H.0..H.ff) |
| Units | Hex |
| Default | No default |

## ATTRIBUTE Lp DS1 Chan Tc signalOneDuration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.<br><br>If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.<br><br>The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 0 |

## ATTRIBUTE Lp DS1 Chan Tc noServiceResponse (resp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:<br><br>***autoConfigure*** - automatically configure the channels response.<br>***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.<br>***ais*** - transmit AIS in the egress direction.<br>***noResponse*** - no response is sent in the egress direction.<br><br>A value of ***autoConfigure*** will result in TC being transmitted for all card types. |
| Values | autoConfigure<br>tc<br>ais<br>noResponse |

| | |
|---|---|
| Default | autoConfigure |

### ATTRIBUTE Lp DS1 Chan Tc signalOne (sigOne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### ATTRIBUTE Lp DS1 Chan Tc signalTwo (sigTwo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

## GROUP Lp DS1 Chan Tc Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all specific operational data for a *Tc* component. |

## ATTRIBUTE Lp DS1 Chan Tc ingressConditioning (inCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the ATM network.<br><br>When trunk conditioning is being locally generated towards the ATM network, *ingressConditioning* is set to ***on.***<br><br>When trunk conditioning is not being locally generated towards the ATM network, *ingressConditioning* is set to ***off***.<br><br>Trunk conditioning is transmitted towards the ATM network under the following conditions:<br>lossOfSignal (LOS)<br>lossOfFrame (LOF)<br>remoteAlarmIndication (RAI)<br>alarmIndicationSignal (AIS)<br>bufferUnderflow (BU)<br>and in addition for E1:<br>lossOfMultiframe (LOMF)<br>receiveMultiframeRemoteAlarmIndication (RMRAI) |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Lp DS1 Chan Tc egressConditioning (egCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the PDH line. |

When trunk conditioning is being locally generated towards the PDH line, *egressConditioning* is set to ***on.***

When trunk conditioning is not being locally generated towards the PDH line, *egressConditioning* is set to ***off***.

Trunk conditioning is transmitted towards the PDH line under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

Values: off
on

Default: off

## COMPONENT Lp DS1 Test (Test)

Groups: "GROUP Lp DS1 Test OsiState (State)"
"GROUP Lp DS1 Test Setup (Setup)"
"GROUP Lp DS1 Test Results (Results)"

Scope: Application

Description: The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port.

Common Verbs:
Help
List
Display

## VERB START Lp DS1 Test

Impact: Service

Description: This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

### VERB STOP Lp DS1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp DS1 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp DS1 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp DS1 Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp DS1 Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Lp DS1 Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

## ATTRIBUTE Lp DS1 Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

## ATTRIBUTE Lp DS1 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection |

(B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

### ATTRIBUTE Lp DS1 Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Lp DS1 Test frmPatternType (fpt)

Access
Read and write

Description
This attribute defines the type of data pattern generation to use.
The following lists the available pattern types:
***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.

***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.
***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.

Values: ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default: ccitt32kBitPattern

### ATTRIBUTE Lp DS1 Test customizedPattern (cp)

Access: Read and write

Description: This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.

Values: Hex (H.0..H.ffffffff)

Units: Hex

Default: H.55555555

### ATTRIBUTE Lp DS1 Test dataStartDelay (dsd)

Access: Read and write

Description: This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.
This attribute is ignored when the test *type* is set to ***externalLoop***.

Values: Decimal (0..1814400)

Units: seconds

Default: 0

### ATTRIBUTE Lp DS1 Test displayInterval (di)

Access: Read and write

| | |
|---|---|
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp DS1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp DS1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp DS1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started. |

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values

testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning

| | |
|---|---|
| | hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp DS1 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Test bitsRx

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp DS1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp DS1 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp DS1 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp DS1 Test timeRemaining

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

## COMPONENT Lp DS1 Dsp

| | |
|---|---|
| Scope | Device |
| Description | *LogicalProcessor/n Ds1/0 Dsp*<br>The *Dsp* component presents the status of the Digital Signal Processors (DSPs) present on a voice card.<br>A voice card's *Dsp* component is created automatically whenever the parent DS1 component becomes active, and remains in existence as long as the card remains operational. *Dsp* components cannot be added or deleted. |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Lp DS1 Audio

| | |
|---|---|
| Scope | Device |
| Description | *LogicalProcessor/n Ds1/0 Audio*<br>The Audio component presents the audio status of all timeslots on a given DS1.<br>A voice card's *Audio* component is created automatically whenever the parent DS1 component becomes active, and remains in existence as long as the card remains operational. *Audio* components cannot be added or deleted. |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Lp E1

| | |
|---|---|
| Instance | Decimal (0..32) |
| Groups | "GROUP Lp E1 Provisioned (Prov)"<br>"GROUP Lp E1 CustomerIdentifierData (CidData)"<br>"GROUP Lp E1 AdminInfo (AdminInfo)"<br>"GROUP Lp E1 IfEntryProv (IfEntry)"<br>"GROUP Lp E1 OperationalStatus (OperStatus)"<br>"GROUP Lp E1 OsiState (State)"<br>"GROUP Lp E1 Operational (Oper)"<br>"GROUP Lp E1 E1Operational (E1Oper)"<br>"GROUP Lp E1 Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n E1/n*<br>*Lp/n Sdh/i Vc4/j Vc12/k,l,m E1*<br>The *E1* component controls and monitors an E1 port or tributary on a Function Processor. The number of ports supported depends on the type of card, and is usually encoded in the *Shelf Card/n cardType*, for example 4pE1Aal1: 4 port. The lowest instance value is usually ***0***, except for the ***32pE1Aal*** card when it is ***1***.<br>No instance value is used when the E1 is a STM tributary.<br>Multi-Service cards have an instance range 0..31, except that instance values 30 and 31 are not available for an “ATM UNI port”. (An E1 “ATM UNI port” is an *E1* component with a single *Chan* whose *applicationFramerName* attribute is linked to an *AtmIf* component.)<br>The instance number of an *E1* “ATM UNI port” must not be the same as the instance number of an *IMA* group under the same *Lp*. |

## GROUP Lp E1 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for an E1 component. |

## ATTRIBUTE Lp E1 lineType (lineType)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the framing of the E1 line.<br>When ***cas*** (channel associated signalling) is selected, timeslot 16 is reserved for multiframe signalling and only 30 timeslots are available for data. The signalling bits are not interpreted.<br>When ***ccs*** (common channel signalling) is selected, timeslot 16 is not reserved for multiframe signalling and 31 timeslots are available for data. The signalling bits are not interpreted.<br>When ***unframed*** is selected, a clear channel is defined whereby data from all timeslots including the framing data (in timeslot 0) and timeslot 16 are passed transparently. This value is valid only for AAL1 cards.<br><br>For cell-based cards the ATM Forum specifies that timeslot 16 be reserved, leaving 30 timeslots available for data.<br>The ***8pE1Atm*** and ***1pStm1ChSmIr*** cards support the ***ccs*** value |

only. The ***4pOC3ChSmIr*** card only supports the ***ccs*** and ***unframed*** values. For both these cards, the default value is ***ccs***. For all other cards, the default value is ***cas***.

Values
ccs
cas
unframed

Default
No default

### ATTRIBUTE Lp E1 clockingSource (clockingSource)

Access
Read and write

Description
This attribute defines the source of the transmit clock for the E1 line.

When ***local*** is selected, the crystal on the port generates the clocking for the line.

When ***line*** is selected, the port synchronizes to the clock from the facility.

When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP.

When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***.

When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network.

When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network.

A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured***

If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pE1Atm*** card, which it defaults to ***local***.
On a ***3pE1Atm*** card all ports must have the same value, and be either ***local*** or ***module***.

***otherPort*** is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards.

On ***4E1Aal1*** cards either:

all four ports' *clockingSource* values must be ***local*** OR
all four ports' *clockingSource* values must be ***module*** OR
one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. A port can only have ***srtsMode*** selected if the other ports are ***module*** or ***srtsMode***.

Values
local
line
module
otherPort
srtsMode
adaptiveMode

Default
No default

## ATTRIBUTE Lp E1 crc4Mode

Access
Read and write

Description
This attribute defines whether the CRC-4 checking and generation on the E1 line is enabled or disabled.

The default CRC-4 mode is ***off*** except for the cell-based cards which default to ***on*** as per the ATM Forum.

Values
on
off

Default
No default

### ATTRIBUTE Lp E1 sendRaiOnAis

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines whether the Remote Alarm Indicator (RAI) will be sent when receiving an AIS alarm. The value is ***yes*** by default; it can be changed to ***no*** only for ports on J2MV cards. |
| Values | no<br>yes |
| Default | yes |

### ATTRIBUTE Lp E1 raiDeclareAlarmTime

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the period of time that a Remote Alarm Indicator (RAI) must be present before declaring an RAI alarm. The value of ***auto*** sets the RAI declare time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiClearAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used. |
| Values | Decimal (1..20000)<br>auto |
| Units | msec |
| Default | 100 |

### ATTRIBUTE Lp E1 raiClearAlarmTime

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the period of time that a Remote Alarm Indicator (RAI) has been absent before clearing an RAI alarm. The value of ***auto*** sets the RAI clear time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the |

| | |
|---|---|
| | standards. If ***auto*** is set, the value of the *raiDeclareAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used. |
| Values | Decimal (1..20000)<br>auto |
| Units | msec |
| Default | 100 |

### ATTRIBUTE Lp E1 ssmE1SaNumber

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which of the five available Sa bits (Sa4 to Sa8) recommended in ITU G.704 is to be used for Synchronization Status Messages (SSM). If set to ***none***, the transmission of SSM is disabled on this port. |
| Values | Decimal (4..8)<br>none |
| Default | none |

### GROUP Lp E1 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp E1 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. |

| | |
|---|---|
| | Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp E1 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp E1 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp E1 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp E1 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp E1 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp E1 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp E1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp E1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp E1 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp E1 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp E1 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp E1 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp E1 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp E1 proceduralStatus (osiProc)

Access

Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

## ATTRIBUTE Lp E1 controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

## ATTRIBUTE Lp E1 alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. |

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp E1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not

supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp E1 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

## GROUP Lp E1 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for a component in a digital hierarchy interface. |

## ATTRIBUTE Lp E1 losAlarm (losAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOS alarm state.<br>The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | off |

## ATTRIBUTE Lp E1 rxAisAlarm (rxAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's |

density of at least 99.9% is present for a time T, where 3 ms ≤ T ≤ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp E1 lofAlarm (lofAlarm)

Access
Read only

Description
This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds).
If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp E1 rxRaiAlarm (rxRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**, and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time).<br>The RAI alarm is usually an indication that the far end facility is unable to gain synchronization. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp E1 txAisAlarm (txAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the port is in a locked state. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp E1 txRaiAlarm (txRaiAlarm)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the port detects a LOF alarm condition (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: RAI is transmitted when the port detects a LOS, LOF, or AIS condition). |
| Values | on<br>off |
| Default | off |

### GROUP Lp E1 E1Operational (E1Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a E1 component that are not defined in the DSCommonOp group. |

### ATTRIBUTE Lp E1 multifrmLofAlarm (multiLofAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a multiframe LOF (loss of frame) alarm state is entered. A multiframe LOF alarm state is entered when a multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe LOF defects are intermittently occurring, the multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds. When the multiframe LOF alarm is on, a multiframe RAI alarm indicator is transmitted on the line.<br><br>The ***8pE1Atm*** card does not support the multiframe LOF alarm. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp E1 rxMultifrmRaiAlarm (rxMultiRaiAlarm)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute displays whether a multiframe RAI (remote alarm indicator) alarm state has been entered. A multiframe RAI alarm state is entered when a multiframe RAI alarm indicator (bit 6 of timeslot 16 in frame 0 is set to a one) is observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe RAI indicator is intermittently received, the multiframe RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The multiframe RAI alarm condition is cleared when the multiframe RAI alarm indication is not received for 10 seconds +/- 0.5 seconds. The multiframe RAI alarm is usually an indication that the far end facility is unable to gain multiframe synchronization.<br><br>The ***8pE1Atm*** card does not support the multiframe RAI alarm. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp E1 txMultifrmRaiAlarm (txMultiRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a multiframe RAI (remote alarm indicator) alarm is being sent on the E1 line. This is transmitted when the E1 port detects a multiframe LOF condition.<br><br>The ***8pE1Atm*** card does not generate the multiframe RAI alarm. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp E1 ssmE1Tx

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current Synchronization Status Message (SSM) transmitted on the E1 port within the Sa byte |

defined in ITU G.704.
This attribute is filtered when *ssmE1SaNumber* is set to ***none***.

Values: Decimal (0..15)

Default: No default

### ATTRIBUTE Lp E1 multifrmCRC4LofAlarm (multiCRC4LofAlarm)

Access: Read only

Description: This attribute indicates whether E1 CRC-4 multiframe LOF (loss of frame) alarm state is entered. A CRC-4 multiframe LOF alarm state is entered when a CRC-4 multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the CRC-4 multiframe LOF defects are intermittently occurring, the CRC-4 multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds.
The *multifrmCRC4LofAlarm* is not implemented for the ***E1***, ***1pE1V***, ***1pE1Mvp***, ***1pE1Mvpe***, ***4pE1Mvpe***, ***8pE1Atm***, ***E1C*** and ***4pE1Aal1*** cards.

Values: on
off

Default: off

### GROUP Lp E1 Statistics (Stats)

Properties: Operational

Description: This group contains the common statistical data for a component in a digital hierarchy interface.

### ATTRIBUTE Lp E1 runningTime (runningTime)

Access: Read only

Description: The number of seconds since the port component was activated.

Values: Decimal (0..4294967295)

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp E1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds that the port has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E1 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E1 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored framing second occurs when a second with one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp E1 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | The total number of seconds that the interface is in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E1 bpvErrors (bpvErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of Bipolar Violations. A bipolar violation is an error in the alternate mark inversion pattern (AMI) on the line. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |
| Description | If the interface is a DS1 line, it is the current count of CRC-6 errors. These will only be counted when the lineType is ESF. If the interface is an E1 line, it is the total number of CRC-4 errors. These will only be counted when crc4Mode is on. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of frame errors. A frame error is an error in the framing bits |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp E1 losStateChanges (losChanges)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line lost signal. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp E1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. This attribute is incremented for ports on the voice cards (for example the 1pDS1V and the 1pE1V function processors) only. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp E1 Channel (Chan)

| | |
|---|---|
| Instance | Decimal (0..31) |
| Groups | "GROUP Lp E1 Chan Provisioned (Prov)"<br>"GROUP Lp E1 Chan CustomerIdentifierData (CidData)"<br>"GROUP Lp E1 Chan IfEntryProv (IfEntry)"<br>"GROUP Lp E1 Chan OperationalStatus (OperStatus)"<br>"GROUP Lp E1 Chan OsiState (State)"<br>"GROUP Lp E1 Chan Operational (Oper)"<br>"GROUP Lp E1 Chan AdminInfo (AdminInfo)" |
| Scope | Application |
| Description | *Channel*<br>The *Channel* component is configured to control a group of timeslots that form a fractional group on a DS1 or E1 port. Cell-based cards allow only one channel per port, and this is automatically provisioned with all available timeslots. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Lp E1 Chan AtmCell (Cell)"<br>"COMPONENT Lp E1 Chan TrunkConditioning (Tc)"<br>"COMPONENT Lp E1 Chan FrameLinkMonitoring (Flm)" |
| Dyn. Subcomp. | "COMPONENT Lp E1 Chan Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp E1 Chan Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisional data for a *Channel* component. |

## ATTRIBUTE Lp E1 Chan timeslots (ts)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component.<br><br>For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function. |

| | |
|---|---|
| Set of | none<br>1<br>2<br>3<br>4<br>5<br>6<br>7<br>8<br>9<br>10<br>11<br>12<br>13<br>14<br>15<br>16<br>17<br>18<br>19<br>20<br>21<br>22<br>23<br>24<br>25<br>26<br>27<br>28<br>29<br>30<br>31 |
| Default | No default |

## ATTRIBUTE Lp E1 Chan timeslotDataRate (dataRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.<br><br>When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.<br><br>When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.<br><br>On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.<br><br>One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes. |
| Values | 56k<br>doNotOverride |
| Default | doNotOverride |

## ATTRIBUTE Lp E1 Chan applicationFramerName

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute defines the link to the software stack. It defines which application is running on top of this hardware component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Lp E1 Chan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp E1 Chan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp E1 Chan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp E1 Chan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp E1 Chan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp E1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp E1 Chan snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable |

to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values
up
down
testing

Default
up

### GROUP Lp E1 Chan OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp E1 Chan adminState (osiAdmin)

Access
Read only

Description
This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp E1 Chan operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp E1 Chan usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp E1 Chan availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be

applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Lp E1 Chan proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |

Default No default

### ATTRIBUTE Lp E1 Chan controlStatus (osiCntrl)

Access Read only

Description If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default No default

### ATTRIBUTE Lp E1 Chan alarmStatus (osiAlarm)

Access Read only

Description If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Lp E1 Chan standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp E1 Chan unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

| | |
|---|---|
| Default | false |

### GROUP Lp E1 Chan Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Channel* component. |

### ATTRIBUTE Lp E1 Chan actualChannelSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the measured link speed of the *Channel* component. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### GROUP Lp E1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp E1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp E1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

## COMPONENT Lp E1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp E1 Chan Test OsiState (State)"<br>"GROUP Lp E1 Chan Test Setup (Setup)"<br>"GROUP Lp E1 Chan Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

## VERB START Lp E1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

## VERB STOP Lp E1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

## GROUP Lp E1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp E1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Lp E1 Chan Test operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Lp E1 Chan Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp E1 Chan Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp E1 Chan Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp E1 Chan Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error |

rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

### ATTRIBUTE Lp E1 Chan Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp E1 Chan Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp E1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp E1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp E1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp E1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |

Default 1.00

### GROUP Lp E1 Chan Test Results (Results)

Properties Operational

Description This group contains all the statistics related attributes of the *Test* component.

### ATTRIBUTE Lp E1 Chan Test causeOfTermination

Access Read only

Description This attribute indicates either the status of the test or the cause of the test's termination:

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission

errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp E1 Chan Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp E1 Chan Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp E1 Chan Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Chan Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Chan Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Chan Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Chan Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp E1 Chan Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp E1 Chan Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp E1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp E1 Chan Cell Provisioned (Prov)"<br>"GROUP Lp E1 Chan Cell Operational (Oper)"<br>"GROUP Lp E1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp E1 Chan Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

### ATTRIBUTE Lp E1 Chan Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp E1 Chan Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment |

which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Values
off
on

Default
No default

### ATTRIBUTE Lp E1 Chan Cell correctSingleBitHeaderErrors

Access
Read and write

Description
This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values
off
on

Default
off

### ATTRIBUTE Lp E1 Chan Cell clearDelay (clear)

Access
Read and write

Description
This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.

This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Lp E1 Chan Cell hecSampleInterval (hSample)

Access: Read and write

Description: This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Lp E1 Chan Cell hecErrorLimit (hLimit)

Access: Read and write

Description: This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm

is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Lp E1 Chan Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..50)

Units: msec

Default: No default

### ATTRIBUTE Lp E1 Chan Cell hecErrorIntervalLimit (hIntLimit)

Access: Read and write

Description: This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the

number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..25)

Default: 1

## GROUP Lp E1 Chan Cell Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes for the *AtmCell* component.

## ATTRIBUTE Lp E1 Chan Cell lcdAlarm (lcd)

Access: Read only

Description: This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the

*AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values
on
off

Default
off

### GROUP Lp E1 Chan Cell Statistics (Stats)

Properties
Operational

Description
This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

### ATTRIBUTE Lp E1 Chan Cell uncorrectableHeaderErrors (ucErr)

Access
Read only

Description
This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Values
Decimal (0..4294967295)

Default
0

### ATTRIBUTE Lp E1 Chan Cell sevErroredSec (ses)

Access
Read only

Description
This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect

HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp E1 Chan Cell receiveCellUtilization (rxutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp E1 Chan Cell transmitCellUtilization (txutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

| | |
|---|---|
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp E1 Chan Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp E1 Chan TrunkConditioning (Tc)

| | |
|---|---|
| Groups | "GROUP Lp E1 Chan Tc Provisioned (Prov)"<br>"GROUP Lp E1 Chan Tc Operational (Op)" |
| Scope | Device |
| Description | *Lp/n Ds1/n Chan/n Tc*<br>*Lp/n E1/n Chan/n Tc*<br>*Lp/n Ds3/n Ds1/n Chan/n Tc*<br>*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*<br>*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*<br>*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*<br>*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*<br><br>The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.<br><br>Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also |

substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

## GROUP Lp E1 Chan Tc Provisioned (Prov)

Properties: Provisioned

Description: This group contains all specific provisioning data for a *Tc* component.

## ATTRIBUTE Lp E1 Chan Tc replacementData (data)

Access: Read and write

| | |
|---|---|
| Description | This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.<br><br>The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:<br>DS1 MUX Out Of Service Code = 0x1A<br>E1 MUX Out Of Service Code = 0xFF<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.<br><br>On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***. |
| Values | Hex (H.0..H.ff) |
| Units | Hex |
| Default | No default |

### ATTRIBUTE Lp E1 Chan Tc signalOneDuration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.<br><br>If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.<br><br>The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 0 |

## ATTRIBUTE Lp E1 Chan Tc noServiceResponse (resp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:<br><br>***autoConfigure*** - automatically configure the channels response.<br>***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.<br>***ais*** - transmit AIS in the egress direction.<br>***noResponse*** - no response is sent in the egress direction.<br><br>A value of ***autoConfigure*** will result in TC being transmitted for all card types. |
| Values | autoConfigure<br>tc<br>ais<br>noResponse |
| Default | autoConfigure |

## ATTRIBUTE Lp E1 Chan Tc signalOne (sigOne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |

Default (1, 1, 1, 1)

### ATTRIBUTE Lp E1 Chan Tc signalTwo (sigTwo)

Access Read and write

Description This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined.

For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.

Vector of Decimal (0..1)

Index
D
C
B
A

Default (1, 1, 1, 1)

### GROUP Lp E1 Chan Tc Operational (Op)

Properties Operational

Description This group contains all specific operational data for a *Tc* component.

### ATTRIBUTE Lp E1 Chan Tc ingressConditioning (inCon)

Access Read only

Description This attribute indicates the status of locally generated trunk conditioning towards the ATM network.

When trunk conditioning is being locally generated towards the ATM network, *ingressConditioning* is set to ***on.***

When trunk conditioning is not being locally generated towards the ATM network, *ingressConditioning* is set to ***off***.

Trunk conditioning is transmitted towards the ATM network

under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

Values
off
on

Default
off

### ATTRIBUTE Lp E1 Chan Tc egressConditioning (egCon)

Access
Read only

Description
This attribute indicates the status of locally generated trunk conditioning towards the PDH line.

When trunk conditioning is being locally generated towards the PDH line, *egressConditioning* is set to ***on.***

When trunk conditioning is not being locally generated towards the PDH line, *egressConditioning* is set to ***off***.

Trunk conditioning is transmitted towards the PDH line under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

Values
off
on

Default
off

### COMPONENT Lp E1 Chan FrameLinkMonitoring (Flm)

Groups
"GROUP Lp E1 Chan Flm Provisioned (Prov)"
"GROUP Lp E1 Chan Flm Operational (Op)"

| | |
|---|---|
| Scope | Device |
| Description | *Lp/n E1/n Chan/n FrameLinkMonitoring*<br><br>This component provides a monitoring function specific to a Frame Relay Channel on an E1 line. It combines the status of E1 channel-associated-signalling A-bits and HDLC frame defect. |

| Access | Read and write |
| Description | This attribute controls the monitoring of HDLC defect. |
| Values | disabled<br>enabled |
| Default | No default |

## GROUP Lp E1 Chan Flm Operational (Op)

| | |
|---|---|
| Properties | Operational |

Description — This group contains all specific operational data for an *Flm* component.

### ATTRIBUTE Lp E1 Chan Flm flmStatus (status)

Access — Read only

Description — This attribute indicates the status of a Frame Relay channel on an E1 line. By combining the E1 channel-associated-signalling (CAS) A-bits status, and HDLC defect, a single value indicates the likely cause of the failure. This mechanism assumes that the far end equipment loops back signaling A-bits for some or all of the timeslots in a channel. The A-bits in channel are transmitted as ‘0’. If they are all received as ‘0’, it is assumed that the E1 link is up in both directions. The presence of HDLC frames indicates that the service is connected.

When A-bits and HDLC frames are correctly received, ***frameLinkUp*** is indicated.

When neither are received, ***frameLinkDown*** is indicated.

When HDLC frames are not receive but A-bits are not at fault, ***lossOfHdlc*** is indicated.

When HDLC frames are received, but there is a fault in any of timeslot’s A-bits on a channel ***lossOfAbit*** is indicated.

Values — notMonitoring
frameLinkUp
frameLinkDown
lossOfHdlc
lossOfAbit

Default — No default

"GROUP Lp E1 Test Setup (Setup)"
"GROUP Lp E1 Test Results (Results)"

Scope — Application

| | |
|---|---|
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp E1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp E1 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp E1 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp E1 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp E1 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp E1 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp E1 Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Lp E1 Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

### ATTRIBUTE Lp E1 Test type (type)

Access
Read and write

Description
This attribute is the type of test to be run. The available test types include the following:
***card*** test sets up an internal loop on the board and runs a bit error rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.

***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

## ATTRIBUTE Lp E1 Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.

| | |
|---|---|
| | This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp E1 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp E1 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp E1 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp E1 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp E1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

## GROUP Lp E1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

## ATTRIBUTE Lp E1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.<br><br>a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. |

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp E1 Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp E1 Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp E1 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp E1 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp E1 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp E1 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp E1 Dsp

| | |
|---|---|
| Scope | Device |
| Description | *LogicalProcessor/n E1/0 Dsp*<br>The *Dsp* component presents the status of the Digital Signal Processors (DSPs) present on a voice card.<br>A voice card's *Dsp* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Dsp* components cannot be added or deleted. |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Lp E1 Audio

| | |
|---|---|
| Scope | Device |
| Description | *LogicalProcessor/n E1/0 Audio*<br>The *Audio* component presents the audio status of the channels on a voice card.<br>A voice card's *Audio* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Audio* components cannot be added or deleted. |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Lp V35

| | |
|---|---|
| Instance | Decimal (0..7) |
| Groups | "GROUP Lp V35 Provisioned (Prov)"<br>"GROUP Lp V35 CustomerIdentifierData (CidData)"<br>"GROUP Lp V35 AdminInfo (AdminInfo)"<br>"GROUP Lp V35 IfEntryProv (IfEntry)"<br>"GROUP Lp V35 OperationalStatus (OperStatus)"<br>"GROUP Lp V35 OsiState (State)"<br>"GROUP Lp V35 Operational (Oper)" |
| Scope | Application |
| Description | *Lp/n V35/n*<br><br>The *V35* component controls a Passport V.35 interface. |

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Lp V35 Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Lp V35 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all specific provisioning data for a *V35* component. |

### ATTRIBUTE Lp V35 linkMode (mode)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the intended gender of the V.35 interface. The actual gender of the interface is determined by the physical connection to the patch panel. If the hardware setup does not match this attribute, an alarm will be generated.<br><br>In ***dte*** mode, the RTS line signal is driven as specified by the attribute *readyLineState* when the interface passes its initial diagnostics. Then, the RTS line signal will be driven as specified in the attribute *dataTransferLineState* when the application is ready to transfer data. On the other hand, the input line signals (RFS, DSR, and DCD) are compared against those specified in the attributes *readyLineState* and *dataTransferLineState*. The application will be notified when the specified input line states are observed.<br><br>In ***dce*** mode, the *V35* component behaves similarly as when it is in ***dte*** mode. However, it will be driving the DCE line signals (RFS, DSR, and DCD) and monitoring the DTE line signal (RTS) |

| | |
|---|---|
| | as specified by the attributes *readyLineState* and *dataTransferLineState*. |
| Values | dte<br>dce |
| Default | dte |

### ATTRIBUTE Lp V35 readyLineState (rls)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the line signals originating from the V.35 interface that will always be turned on, provided the interface passes its diagnostics. This set of signals is generally required for maintaining the connection. Note that both DTE and DCE signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the *actualLinkMode*.<br>See also *linkMode*. |
| Set of | rfs<br>dsr<br>dcd<br>rts |
| Default | (rfs, dsr, dcd, rts) |

### ATTRIBUTE Lp V35 dataTransferLineState (dtls)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the line signals required to indicate that the external equipment is in a good state (that is, data transfer can proceed). Note that both DTE and DCE signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the *actualLinkMode*. The value of this attribute must be a superset of that of the *readyLineState* attribute.<br>See also *linkMode*. |

| | |
|---|---|
| Set of | rfs<br>dsr<br>dcd<br>rts |
| Default | (rfs, dsr, dcd, rts) |

### ATTRIBUTE Lp V35 lineStatusTimeOut (lsto)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the time that the line state must be stable (good or bad) before a line state change is declared. |
| Values | Decimal (10..20000) |
| Units | msec |
| Default | 1000 |

### ATTRIBUTE Lp V35 lineSpeed (speed)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the speed of the line for source clocking. This attribute is ignored if the interface is not providing a clock. The clock rate is rounded up to the nearest available value. Note that the actual clock rates are available in the operational attributes *actualTxLineSpeed* and *actualRxLineSpeed*. The actual lineSpeeds configurable on a V.35 DCE interface are: 3840000, 2560000, 2048000, 1920000, 1536000, 1344000, 1280000, 1024000, 960000, 768000, 672000, 640000, 512000, 448000, 384000, 336000, 320000, 256000, 224000, 192000, 168000, 128000, 112000, 64000, 56000, 48000, 32000, 19200, 9600. Note that linespeeds of 1024000 and 2048000 cannot be provisioned on cards that have ports provisioned at 3840000, 2560000, 1920000, 1280000, 960000, 640000 or 320000. |
| Values | Decimal (9600..3840000) |
| Units | bit/s |

| | |
|---|---|
| Default | 192000 |

### ATTRIBUTE Lp V35 clockingSource (clockingSource)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the source of synchronization of the outgoing clocks. This attribute is only used when the *actualLinkMode* is ***dce***.<br><br>If the value of the attribute is ***local***, the outgoing clocks are synchronized to a local oscillator on the FP.<br><br>If the value of the attribute is ***module***, the outgoing clocks are synchronized to the oscillator on the active CP. |
| Values | local<br>module |
| Default | No default |

### ATTRIBUTE Lp V35 dteDataClockSource (rxClk)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is only used when the *actualLinkMode* is ***dce***. It is used to determine the clock to be used to recover the receive data. A DTE interface uses TSET(DCE) and RSET(DCE) for timing.<br><br>If the value of the attribute is ***fromDce***, the DCE uses the internally generated transmit clock to supply both TSET(DCE) and RSET(DCE).<br><br>If the value of the attribute is ***fromDte***, the DCE still uses the internally generated transmit clock to supply TSET(DCE), but the receive timing is derived from TSET(DTE) on the link.<br><br>The ***fromDte*** mode is recommended when the DTE is far away from the DCE interface. Note that TSET(DTE) is CCITT V.24 circuit 113; TSET(DCE) is CCITT V.24 circuit 114; and RSET(DCE) is CCITT V.24 circuit 115. |
| Values | fromDce<br>fromDte |

| | |
|---|---|
| Default | fromDce |

### ATTRIBUTE Lp V35 applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains the component name of a *Framer* which is associated with the *V35* component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### ATTRIBUTE Lp V35 enableDynamicSpeed (dynamic)

| | |
|---|---|
| Access | Read and write |
| Description | When set to ***yes***, this attribute specifies that the transmit link speed should be set to the calculated receiver link speed. This attribute can be set to ***yes*** only if the *linkMode* is ***dce*** and the *dteDataClockSource* is ***fromDte***. |
| Values | yes<br>no |
| Default | no |

### GROUP Lp V35 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp V35 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. |

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp V35 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp V35 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp V35 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp V35 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp V35 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp V35 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp V35 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp V35 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp V35 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp V35 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp V35 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp V35 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp V35 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

## ATTRIBUTE Lp V35 proceduralStatus (osiProc)

Access

Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

## ATTRIBUTE Lp V35 controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

## ATTRIBUTE Lp V35 alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. |

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp V35 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not

supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp V35 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

## GROUP Lp V35 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all specific operational data for a *V35* component. |

## ATTRIBUTE Lp V35 actualLinkMode

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the actual link mode defined by the hardware. Note that the hardware overrides the provisionable data. The interface behaves as a DCE or DTE according to the *actualLinkMode*. |
| Values | dte<br>dce |
| Default | No default |

## ATTRIBUTE Lp V35 lineState

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the current state of the interface signals. |
| Set of | rfs<br>dsr<br>dcd<br>rts |
| Default | No default |

## ATTRIBUTE Lp V35 actualTxLineSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the measured speed of the transmit clock. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Lp V35 actualRxLineSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the measured speed of the receive clock. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Lp V35 dataXferStateChanges

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times that the line has entered or exited the data transfer state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp V35 Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp V35 Test OsiState (State)"<br>"GROUP Lp V35 Test Setup (Setup)"<br>"GROUP Lp V35 Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp V35 Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp V35 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp V35 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp V35 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp V35 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp V35 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp V35 Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp V35 Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp V35 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. |

***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

## ATTRIBUTE Lp V35 Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Lp V35 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp V35 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp V35 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp V35 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp V35 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp V35 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp V35 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination: |

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp V35 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp V35 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp V35 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp V35 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp V35 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp V35 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp V35 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp V35 Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Lp V35 Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

| | |
|---|---|
| Default | 0.00 |

### ATTRIBUTE Lp V35 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp X21

| | |
|---|---|
| Instance | Decimal (0..7) |
| Groups | "GROUP Lp X21 Provisioned (Prov)"<br>"GROUP Lp X21 CustomerIdentifierData (CidData)"<br>"GROUP Lp X21 AdminInfo (AdminInfo)"<br>"GROUP Lp X21 IfEntryProv (IfEntry)"<br>"GROUP Lp X21 OperationalStatus (OperStatus)"<br>"GROUP Lp X21 OsiState (State)"<br>"GROUP Lp X21 Operational (Oper)" |
| Scope | Application |
| Description | *Lp/n X21/n*<br><br>The *X21* component controls a Passport V.11 interface. |
| Dyn. Subcomp. | "COMPONENT Lp X21 Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp X21 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all specific provisioning data for an *X21* component. |

## ATTRIBUTE Lp X21 linkMode (mode)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the intended gender of the *X21* component (V.11 interface). The actual gender of the interface is determined by the physical connection to the patch panel. If the hardware setup does not match this attribute, an alarm will be generated.<br><br>In ***dte*** mode, the ***control*** line signal is driven as specified by the attribute *readyLineState* when the interface passes its initial diagnostics. Then, the ***control*** line signal will be driven as specified in the attribute *dataTransferLineState* when the application is ready to transfer data. On the other hand, the input line signal (***indication***) is compared against those specified in the attributes *readyLineState* and *dataTransferLineState*. The application will be notified when the specified line states are observed.<br><br>In ***dce*** mode, the *X21* component behaves similarly as when it is in ***dte*** mode. However, it will be driving the DCE line signal (***indication***) and monitoring the DTE line signal (***control***) as specified by the attributes *readyLineState* and *dataTransferLineState*. |
| Values | dte<br>dce |
| Default | dte |

## ATTRIBUTE Lp X21 readyLineState (rls)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the line signals originating from the V.11 interface that will always be turned on, provided the interface |

passes its diagnostics. This set of signals is generally required to maintain the connection. Note that both DTE and DCE signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the *actualLinkMode*.
See also *linkMode*.

Set of: indication
control

Default: (indication, control)

### ATTRIBUTE Lp X21 dataTransferLineState (dtls)

Access: Read and write

Description: The state of the line signals required to indicate that the external equipment is in a good state (that is, data transfer can proceed). Note that both DTE and DCE signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the *actualLinkMode*. The value of this attribute must be a superset of that of the *readyLineState* attribute.
See also *linkMode*.

Set of: indication
control

Default: (indication, control)

### ATTRIBUTE Lp X21 lineStatusTimeOut (lsto)

Access: Read and write

Description: This attribute defines the time the line state must be stable (good or bad) before a state change is declared.

Values: Decimal (10..20000)

Units: msec

Default: 1000

### ATTRIBUTE Lp X21 lineSpeed (speed)

Access: Read and write

| | |
|---|---|
| Description | This attribute defines the speed of the line for source clocking. This attribute is ignored if the interface is not providing a clock. The clock rate is rounded up to the nearest available value. Note that the actual clock rates are available in the operational attributes *actualTxLineSpeed* and *actualRxLineSpeed*. The actual lineSpeeds configurable on a V.11 DCE interface are: 7680000, 3840000, 2560000, 2048000, 1920000, 1536000, 1344000, 1280000, 1024000, 960000, 768000, 672000, 640000, 512000, 448000, 384000, 336000, 320000, 256000, 224000, 192000, 168000, 128000, 112000, 64000, 56000, 48000, 32000, 19200, 9600. Note that linespeeds of 1024000 and 2048000 cannot be provisioned on cards that have ports provisioned at 3840000, 2560000, 1920000, 1280000, 960000, 640000 or 320000. |
| Values | Decimal (9600..7680000) |
| Units | bit/s |
| Default | 192000 |

### ATTRIBUTE Lp X21 clockingSource (clockingSource)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the source of synchronization of the outgoing clocks. This attribute is only used when the *actualLinkMode* is ***dce***.<br><br>If the value of the attribute is *local*, the outgoing clocks are synchronized to a local oscillator on the FP.<br><br>If the value of the attribute is *module*, the outgoing clocks are synchronized to the oscillator on the active CP. |
| Values | local<br>module |
| Default | No default |

### ATTRIBUTE Lp X21 dteDataClockSource (rxClk)

| | |
|---|---|
| Access | Read and write |

Description

This attribute is only used when the *actualLinkMode* is ***dce***. It is used to determine the clock to be used to recover the receive data. Note that a V.11 DTE interface uses the S clock (see X.21 standard) for both receive data and transmit data timing. The DTE interface always loops the received S clock back to the DCE as the X clock (see X.21 standard).

If the value of the attribute is ***fromDce***, the DCE V.11 interface uses the internally generated transmit clock as the S clock and for both receive and transmit data timing. The X clock is ignored.

If the value of the attribute is ***fromDte***, the DCE still uses the internally generated transmit clock as the S clock and for transmit data timing, but the receive data timing is derived from the X clock.

The ***fromDte*** mode is recommended when the DTE is far away from the DCE interface.

Values

fromDce
fromDte

Default

fromDce

### ATTRIBUTE Lp X21 lineTerminationRequired (ltr)

Access

Read and write

Description

This attribute specifies whether termination is required for this interface. If the hardware setup does not match this attribute, an alarm will be generated.

Values

yes
no

Default

yes

### ATTRIBUTE Lp X21 applicationFramerName (framer)

Access

Read and write

Description

This attribute contains the component name of a *Framer* which is associated with the *X21* component.

| | |
|---|---|
| Values | Link (Service, interfaceName) |
| Default | No default |

### ATTRIBUTE Lp X21 enableDynamicSpeed (dynamic)

| | |
|---|---|
| Access | Read and write |
| Description | When set to ***yes***, this attribute specifies that the transmit link speed should be set to the calculated receiver link speed. This attribute can be set to ***yes*** only if the *linkMode* is ***dce*** and the *dteDataClockSource* is ***fromDte***.. |
| Values | yes<br>no |
| Default | no |

### GROUP Lp X21 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp X21 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of |

| | |
|---|---|
| | any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp X21 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp X21 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp X21 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp X21 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp X21 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp X21 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp X21 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp X21 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp X21 OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp X21 adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Lp X21 operationalState (osiOper)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp X21 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Lp X21 availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp X21 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp X21 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE Lp X21 alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp X21 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp X21 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp X21 Operational (Oper)

Properties
Operational

Description
This group contains all specific operational data for an *X21* component.

### ATTRIBUTE Lp X21 actualLinkMode

Access
Read only

| | |
|---|---|
| Description | This attribute contains the actual link mode defined by the hardware. Note that the hardware overrides the provisionable data. The interface behaves as a DCE or DTE according to the *actualLinkMode*. |
| Values | dte<br>dce |
| Default | No default |

### ATTRIBUTE Lp X21 lineState

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the current state of the interface signals. |
| Set of | indication<br>control |
| Default | No default |

### ATTRIBUTE Lp X21 actualTxLineSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the measured speed of the transmit clock. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Lp X21 actualRxLineSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the measured speed of the receive clock. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Lp X21 dataXferStateChanges

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute contains the number of times that the line has entered or exited the data transfer state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp X21 Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp X21 Test OsiState (State)"<br>"GROUP Lp X21 Test Setup (Setup)"<br>"GROUP Lp X21 Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp X21 Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp X21 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp X21 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state |

combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp X21 Test adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Lp X21 Test operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available

for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp X21 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp X21 Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Lp X21 Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp X21 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).<br>***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).<br>Note that not all test types are not supported by all function processors. |
| Values | card<br>manual<br>localLoop<br>remoteLoop<br>externalLoop<br>payloadLoop<br>remoteLoopThisTrib<br>v54RemoteLoop |

pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default card

### ATTRIBUTE Lp X21 Test frmSize (size)

Access Read and write

Description This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values Decimal (4..4096)

Units bytes

Default 1024

### ATTRIBUTE Lp X21 Test frmPatternType (fpt)

Access Read and write

Description This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.
***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.
***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.

Values ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default ccitt32kBitPattern

### ATTRIBUTE Lp X21 Test customizedPattern (cp)

Access Read and write

Description This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the

| | |
|---|---|
| | attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp X21 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp X21 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp X21 Test duration

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp X21 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp X21 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. |

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp X21 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp X21 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp X21 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp X21 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp X21 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp X21 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp X21 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp X21 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate |

| | |
|---|---|
| | the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp X21 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp X21 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

## COMPONENT Lp TokenRing (Tr)

| | |
|---|---|
| Instance | Decimal (0..5) |

| | |
|---|---|
| Groups | "GROUP Lp Tr CustomerIdentifierData (CidData)"<br>"GROUP Lp Tr IfEntryProv (IfEntry)"<br>"GROUP Lp Tr Provisioned (Prov)"<br>"GROUP Lp Tr AdminInfo (AdminInfo)"<br>"GROUP Lp Tr OsiState (State)"<br>"GROUP Lp Tr OperationalStatus (OperStatus)"<br>"GROUP Lp Tr Operational (Oper)"<br>"GROUP Lp Tr Statistics (Stats)"<br>"GROUP Lp Tr NcMacOperational (NcMacOper)" |
| Scope | Device |
| Description | Lp/n TokenRing/n<br>This component defines an instance of a Token Ring interface attached to a ring. One instance of this component must be created for each hardware interface. Each interface must be provisioned prior to inserting into the ring. |
| Subcomponents | "COMPONENT Lp Tr LanTest (Lt)"<br>"COMPONENT Lp Tr Test" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Tr CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE Lp Tr customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID). |

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP Lp Tr IfEntryProv (IfEntry)

Properties: Provisioned

Description: This group contains the provisionable attributes for the ifEntry.

### ATTRIBUTE Lp Tr ifAdminStatus (ifState)

Access: Read and write

Description: The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.

Values:
up
down
testing

Default: up

### ATTRIBUTE Lp Tr ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Tr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the Token Ring port. |

### ATTRIBUTE Lp Tr ringSpeed (rspd)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the ring speed at the next insertion into the ring. Note that all the interfaces on a ring must operate at the same speed. |
| Values | fourMegabit<br>sixteenMegabit |
| Default | sixteenMegabit |

### ATTRIBUTE Lp Tr monitorParticipate (mntr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute determines whether the interface will participate in the active monitor selection process. |
| Values | true<br>false |

| | |
|---|---|
| Default | false |

### ATTRIBUTE Lp Tr functionalAddress

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains a bit mask of all token ring functional addresses for which this interface will accept frames. The address is displayed in canonical form. |
| Values | String (6, Dashed Hex) |
| Default | 03-00-fe-ff-8f-01 |

### ATTRIBUTE Lp Tr nodeAddress (nAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute identifies the primary, node specific address recognized by this interface. If an operator does not provision a MAC address, the interface will use a predefined, permanently assigned address.<br>A valid node address must not be any of the following: a broadcast address, a group address, a functional address or a null address. A node address should be entered in the canonical form. |
| Values | String (6, Dashed Hex) |
| Default | 00-00-00-00-00-00 |

### ATTRIBUTE Lp Tr groupAddress (gAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute identifies the group address for which this interface will accept frames. The address is displayed in canonical form. For a valid group address, the least significant bit of the first octet should be set to 1. Currently, only one group address can be provisioned for one interface. |

| | |
|---|---|
| Values | String (6, Dashed Hex) |
| Default | 03-00-01-00-00-00 |

### ATTRIBUTE Lp Tr productId

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute is used to identify the host system attached to this interface. This information is transmitted in response to Request Station Attachment MAC frames. |
| Values | String (0..18, ASCII) |
| Default | "LAN Token Ring" |

### ATTRIBUTE Lp Tr applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute contains the component name of a Framer which is associated with the *Tr* component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Lp Tr AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Tr vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Tr commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Tr OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Tr adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Tr operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Tr usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Tr OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Tr snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Tr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the Token Ring component. |

### ATTRIBUTE Lp Tr macAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the actual MAC address. The value is assigned by the system if *nodeAddress* is not provisioned. This address is displayed in canonical form. The non-canonical version of this address is indicated in *ncMacAddress*. |
| Values | String (6, Dashed Hex) |

| | |
|---|---|
| Default | 00-00-00-00-00-00 |

### ATTRIBUTE Lp Tr ringState

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the value of the current interface state with respect to entering or leaving the ring. |
| Values | opened<br>closed<br>opening<br>closing<br>openFailure<br>ringFailure |
| Default | ringFailure |

### ATTRIBUTE Lp Tr ringStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the value of the current interface status after the station has entered the ring. The value is a sum of values, one for each currently applicable condition. Before the station attempts an open this attribute has the value of ***noStatus***.<br>***noProblems*** = 0,<br>***ringRecovery*** = 32,<br>***singleStation*** = 64,<br>***removeReceived*** = 256,<br>***reserved*** = 512,<br>***autoRemovalError*** = 1024,<br>***lobeWireFault*** = 2048,<br>***transmitBeacon*** = 4096,<br>***softError*** = 8192,<br>***hardError*** = 16384,<br>***signalLoss*** = 32768,<br>***noStatus*** = 131072 |

| | |
|---|---|
| Set of | noProblems<br>ringRecovery<br>singleStation<br>removeReceived<br>reserved<br>autoRemovalError<br>lobeWireFault<br>transmitBeacon<br>softError<br>hardError<br>signalLoss<br>noStatus |
| Default | (noStatus) |

### ATTRIBUTE Lp Tr ringOpenStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates what happened the last time the station attempted to enter into the ring. |
| Values | noOpen<br>badParam<br>lobeFailed<br>signalLoss<br>insertionTimeout<br>ringFailed<br>beaconing<br>duplicateMac<br>requestFailed<br>removeReceived<br>open |
| Default | noOpen |

### ATTRIBUTE Lp Tr upStream

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the MAC address of the station's up-stream neighbor. This address is displayed in canonical form. The non-canonical version of this address is indicated in *ncUpStream*. |
| Values | String (6, Dashed Hex) |
| Default | 00-00-00-00-00-00 |

### ATTRIBUTE Lp Tr chipSet

| | |
|---|---|
| Access | Read only |
| Description | This attribute identifies the hardware chip set in use by an interface. |
| Values | ibm16<br>titms380<br>titms380c16<br>titms380c26 |
| Default | titms380c16 |

### ATTRIBUTE Lp Tr lastTimeBeaconSent

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time at which a Beacon frame was last transmitted on this interface. |
| Values | Time (DHMS) |
| Default | No default |

### GROUP Lp Tr Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical information for the Token Ring port. |

### ATTRIBUTE Lp Tr lineErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of frames or tokens copied or repeated by a station where there is a non-data bit or a FCS error. This counter wraps around when the maximum value is reached. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr burstErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times the station detects the absence of transitions for five consecutive half-bit times. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr acErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times that a station can not set the AC bits properly. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr abortTransErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of aborted frames. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr internalErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of internal errors. When the value of the counter soars up quickly, it indicates a potential hardware problem. This counter wraps around when the maximum value is reached. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr lostFrameErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times a station is transmitting and its TRR timer expires. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr receiveCongestions

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times a station is supposed to receive a frame but cannot due to lack of buffer space. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr frameCopiedErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times a station receives a frame addressed to its specific address and detects that the A bit is set. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr tokenErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times a station acting as the active monitor recognizes an error condition that needs a token |

| | |
|---|---|
| | transmission. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr softErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of soft errors or the number of Report Error Mac frames the station has transmitted. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr hardErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times this interface has detected an immediately recoverable fatal error. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr signalLoss

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times signal condition has been lost. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr transmitBeacons

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute contains the number of beacon frames transmitted. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr ringRecoverys

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times the ring has been purged. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr lobeWires

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times the interface has detected a short circuit in the lobe data path. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr removeRings

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of Remove Ring Station Mac frames received. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr singleStation

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute contains the number of times the station has determined it is the only one on the ring. This is not necessarily an error. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Tr freqErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of signal frequency errors detected. This counter wraps around when the maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Lp Tr NcMacOperational (NcMacOper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *TokenRing* port component related to non-canonical MAC addresses. |

### ATTRIBUTE Lp Tr ncMacAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the actual MAC address. The value is assigned by the system if *nodeAddress* is not provisioned. This address is displayed in non-canonical form. The canonical version of this address is indicated in *macAddress*. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Tr ncUpStream

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the MAC address of the station's up-stream neighbor. This address is displayed in non-canonical form. The canonical version of this address is indicated in *upStream*. |
| Values | String (6, Dashed Hex) |
| Default | No default |

## COMPONENT Lp Tr LanTest (Lt)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt TestOp (Top)" |
| Scope | Device |
| Description | *Lp/n Fddi/n LanTest*, or<br>*Lp/n Ethernet/n LanTest*, or<br>*Lp/n TokenRing/n LanTest, or*<br>*Lp/n IlsForwarder/n LanTest*<br>The LanTest component is used to control testing on LAN interfaces. This includes LLC layer loopback, on-card loopback, SNMP required tests, and any testing to be done in the lab or manufacturing. |
| Dyn. Subcomp. | "COMPONENT Lp Tr Lt FrameCompare (FrmCmp)"<br>"COMPONENT Lp Tr Lt FrameCopy (FrmCpy)"<br>"COMPONENT Lp Tr Lt PortConfig (PrtCfg)"<br>"COMPONENT Lp Tr Lt FrameBuild (Fb)"<br>"COMPONENT Lp Tr Lt Control (Cntl)" |
| Common Verbs | Help<br>List<br>Display |

## VERB Start Lp Tr Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to start a test as per the attributes set within each subcomponent of LanTest. |

### VERB Stop Lp Tr Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to stop a test. |

### VERB Reset Lp Tr Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to reset the LanTest component. |

### VERB Get Lp Tr Lt

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Tr Lt

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to an attribute. |

### GROUP Lp Tr Lt TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Tr Lt FrameCompare (FrmCmp)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt FrmCmp TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component compares frames received from the hardware and emulator during testing. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Tr Lt FrmCmp

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FrameCompare component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Tr Lt FrmCmp

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt FrmCmp TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt FrmCmp tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Tr Lt FrameCopy (FrmCpy)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt FrmCpy TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component receives its input from FrameBuild and places it upon the hardware which sends it to the appropriate emulator. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Tr Lt FrmCpy

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FrameCopy component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Tr Lt FrmCpy

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt FrmCpy TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt FrmCpy tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Tr Lt PortConfig (PrtCfg)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt PrtCfg TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component controls the emulator and hardware to ensure frames output from each will match in FrameCompare. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Tr Lt PrtCfg

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest PortConfig component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Tr Lt PrtCfg

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt PrtCfg TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt PrtCfg tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Tr Lt FrameBuild (Fb)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb TestOp (Top)" |
| Scope | Device |
| Description | LanTest Framebuild<br>This component controls the building of all frames built and sent |

by the LanTest component. Each component under FrameBuild builds a portion of a packet or frame.

Dyn. Subcomp.

"COMPONENT Lp Tr Lt Fb TransmitInfo (TxInfo)"

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt Fb TxInfo TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt Fb TxInfo tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

## COMPONENT Lp Tr Lt Fb FddiMac (MacFddi)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb MacFddi TestOp (Top)" |
| Scope | Device |
| Description | LanTest FddiMac<br>This component builds an FDDI MAC header which is attached to all FDDI frames. |
| Common Verbs | Help<br>List<br>Display |

## VERB Get Lp Tr Lt Fb MacFddi

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FddiMac component. This includes attributes set using the Set verb. |

## VERB Tlist Lp Tr Lt Fb MacFddi

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

## GROUP Lp Tr Lt Fb MacFddi TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

## ATTRIBUTE Lp Tr Lt Fb MacFddi tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

## COMPONENT Lp Tr Lt Fb EthernetMac (MacEnet)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb MacEnet TestOp (Top)" |
| Scope | Device |
| Description | LanTest EthernetMac<br>This component builds an Ethernet MAC header which is attached to all Ethernet frames. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Tr Lt Fb MacEnet

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters LanTest EthernetMac component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Tr Lt Fb MacEnet

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt Fb MacEnet TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt Fb MacEnet tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

## COMPONENT Lp Tr Lt Fb TokenRingMac (MacTr)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb MacTr TestOp (Top)" |
| Scope | Device |
| Description | LanTest TokenRingMac<br>This component builds a Token Ring MAC header which is attached to all Token Ring frames. |
| Common Verbs | Help<br>List<br>Display |

## VERB Get Lp Tr Lt Fb MacTr

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest TokenRingMac component. This includes attributes set using the Set verb. |

## VERB Tlist Lp Tr Lt Fb MacTr

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

## GROUP Lp Tr Lt Fb MacTr TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

## ATTRIBUTE Lp Tr Lt Fb MacTr tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

## COMPONENT Lp Tr Lt Fb DataField (Data)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb Data TestOp (Top)" |
| Scope | Device |
| Description | This component adds a data field to frame. |
| Common Verbs | Help<br>List<br>Display |

## VERB Get Lp Tr Lt Fb Data

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest DataField component. This includes attributes set using the Set verb. |

## VERB Tlist Lp Tr Lt Fb Data

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

## GROUP Lp Tr Lt Fb Data TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

## ATTRIBUTE Lp Tr Lt Fb Data tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

## COMPONENT Lp Tr Lt Fb IpHeader (IpH)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb IpH TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | LanTest IpHeader<br>This component adds an IP header to a frame or packet. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Tr Lt Fb IpH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest IpHeader component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Tr Lt Fb IpH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt Fb IpH TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt Fb IpH tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Tr Lt Fb LlcHeader (Llch)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb Llch TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | LanTest LlcHeader<br>This component adds an LLC 802.2 or Ethernet header to a frame or packet. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Tr Lt Fb Llch

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest LlcHeader component. This includes attributes set using the SET verb. |

### VERB Tlist Lp Tr Lt Fb Llch

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt Fb Llch TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt Fb Llch tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Tr Lt Fb AppleHeader (AppleH)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb AppleH TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component adds an AppleTalk header to a frame or packet. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Tr Lt Fb AppleH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest AppleHeader component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Tr Lt Fb AppleH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt Fb AppleH TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt Fb AppleH tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Tr Lt Fb IpxHeader (IpxH)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Fb IpxH TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component adds an IPX header to a frame or packet. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Tr Lt Fb IpxH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters forLanTest IpxHeader component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Tr Lt Fb IpxH

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Tr Lt Fb IpxH TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Tr Lt Fb IpxH tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Tr Lt Control (Cntl)

| | |
|---|---|
| Groups | "GROUP Lp Tr Lt Cntl TestOp (Top)" |
| Scope | Device |
| Description | LanTest Control<br>This component controls the overall testing by telling the |

FrameBuild component to start and check the FrameCompare component to see if the test is complete.

### VERB Get Lp Tr Lt Cntl

Impact: Passive

Description: This verb is used to get and display operational parameters for the LanTest Control component. This includes attributes set using the Set verb.

### VERB Tlist Lp Tr Lt Cntl

Impact: Passive

Description: This verb is used to display the list of arguments to a component.

### GROUP Lp Tr Lt Cntl TestOp (Top)

Properties: Operational

Description: This group contains the operational data for the LanTest component and its subcomponents.

### ATTRIBUTE Lp Tr Lt Cntl tData (td)

Access: Read and write

Description: This attribute is used to display and set attributes.

Values: String (0..255, ASCII)

Default: No default

### COMPONENT Lp Tr Test

Groups: "GROUP Lp Tr Test PortTestOp (PTO)"
"GROUP Lp Tr Test Results (Results)"

Scope: Device

| | |
|---|---|
| Description | *Lp/n Fddi/n Test*, or<br>*Lp/n Ethernet/n Test*, or<br>*Lp/n TokenRing/n Test, or*<br>*Lp/n IlsForwarder/n Test*<br>The Test component is used to do StartUp port test for LAN cards. |
| Common Verbs | Help<br>List<br>Display |

### VERB Start Lp Tr Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to start a test as per the attributes set within each subcomponent of Test. |

### VERB Stop Lp Tr Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to stop a test. |

### VERB Reset Lp Tr Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to reset the Test component. |

### GROUP Lp Tr Test PortTestOp (PTO)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanPortTest component. |

### ATTRIBUTE Lp Tr Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following: card test sets up an internal loop on the board and runs a bit error rate test; manual test assumes the line is looped back externally and a bit error rate test is performed; |

localLoop test loops back the local modem and performs a bit error rate test; remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test; externalLoop test loops back the line to the far end; payloadLoop test only loops back the payload data received from the incoming line; Note that localLoop, remoteLoop and payloadLoop are not supported by all function processors.

Values

onCard
normal

thruA
thruB
extWrapA
extWrapB
extThruA
extThruB
extWrapAB
extWrapBA

Default

No default

### ATTRIBUTE Lp Tr Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.

Values

Decimal (4..4096)

Units

bytes

Default

1024

### ATTRIBUTE Lp Tr Test duration (duration)

Access

Read and write

Description

This attribute is the duration (in minutes) that test data will be transmitted. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop.

| | |
|---|---|
| Values | Decimal (1..30240) |
| Units | minutes |
| Default | 1 |

### GROUP Lp Tr Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the Test component. |

### ATTRIBUTE Lp Tr Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Tr Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Tr Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the reason the test is terminated. |
| Values | testTimeExpired<br>stoppedByOperator |

| | |
|---|---|
| | unknown<br>neverStarted<br>testRunning |
| Default | neverStarted |

### ATTRIBUTE Lp Tr Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Tr Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Tr Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Tr Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits received during the test period. This counter is not expected to reach its maximum value. |

| | |
|---|---|
| | The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Tr Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of errored frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Lp Sonet

| | |
|---|---|
| Instance | Decimal (0..15) |
| Groups | "GROUP Lp Sonet Provisioned (Prov)"<br>"GROUP Lp Sonet CustomerIdentifierData (CidData)"<br>"GROUP Lp Sonet AdminInfo (AdminInfo)"<br>"GROUP Lp Sonet IfEntryProv (IfEntry)"<br>"GROUP Lp Sonet OperationalStatus (OperStatus)"<br>"GROUP Lp Sonet OsiState (State)"<br>"GROUP Lp Sonet Operational (Oper)"<br>"GROUP Lp Sonet Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n Sonet/n*<br>This component controls a port on a SONET Card. In particular, it deals with SONET medium, section, and line layers.<br>Note that there can be *Sonet* and *Sdh* components coexisting under the same LP. However they cannot use the same instance.<br><br>DEFAULTS escape creates a *Path* component under the *Sonet* in Passport 7000. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Lp Sonet Path"<br>"COMPONENT Lp Sonet Sts"<br>"COMPONENT Lp Sonet OpticalModule (Om)" |
| Dyn. Subcomp. | "COMPONENT Lp Sonet Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Sonet Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data for a *Sonet* or *Sdh* component. |

## ATTRIBUTE Lp Sonet clockingSource

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of clocking source used for synchronizing the transmit clock: ***local*** means direct use of the local clock oscillator at its centre frequency; ***line*** means the use of a signal phase-locked to the incoming line rate; ***module*** means the use of a signal phase-locked to the CP reference clock.<br><br>When adding a *Sonet* or *Sdh* component, the *clockingSource* attribute is set to ***module*** if the *NetworkSynchronization* component has been added and is set to ***local*** otherwise.<br><br>Note that the multiport cell-based cards have one common clock source for each of the three ports when either the clocking source ***local*** or ***module*** is selected. For this reason, it is not allowed to have at the same time the *clockingSource* attribute set to ***local*** on one port and ***module*** on another port. Furthermore, the |

*clockingSource* attribute cannot be set to ***module*** if the *NetworkSynchronization* component has not been added.

Values
local
line
module

Default
No default

### ATTRIBUTE Lp Sonet lineAutomaticProtectionSwitch (laps)

Access
Read and write

Criticality
Process

Description
This attribute specifies the name of the *Laps* component. In the case of intra-card configurations, the specified *Laps* component is used to provide sparing of lines which use this port and its mate; in the case of inter-card configurations, the specified *Laps* component is used to provide sparing of lines only.

Values
Link

Default
No default

### ATTRIBUTE Lp Sonet txSectionTrace

Access
Read and write

Description
This attribute specifies the section identifier. The string must be constructed with 7-bit characters only. The section identifier is prefixed by a CRC byte and padded with null characters if necessary to form the 16-octet section trace message transmitted in byte J0 of 16 outgoing frames. At the remote end, the section trace is reassembled, the CRC is checked and the message is compared to the *expectedRxSectionTrace* attribute. If a mismatch is detected, an alarm is issued.

Usage guidelines for the section trace are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.

The functionality supported by this attribute is not available.

Values
String (0..15, Extended ASCII)

| | |
|---|---|
| Default | "" |

### ATTRIBUTE Lp Sonet expectedRxSectionTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected section trace identifier which is used to identify the fiber connected to the associated port. This attribute must match the corresponding *txSectionTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..15, Extended ASCII) |
| Default | "" |

### ATTRIBUTE Lp Sonet s1RxDefault

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default S1 byte reported by the port when the received S1 byte is 0 (quality unknown). No default is applied when this attribute is set to ***none***. |
| Values | Decimal (0..15)<br>none |
| Default | none |

### ATTRIBUTE Lp Sonet s1TxOverride

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the S1 byte transmitted on the port regardless of the Synchronization Status Message (SSM) value provided by the *NetworkSynchronization* component. Changes in SSM value from the *NetworkSynchronization* component are ignored when this attribute is set to a value other than ***none***. |
| Values | Decimal (0..15)<br>none |
| Default | none |

### ATTRIBUTE Lp Sonet s1RxOverride

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the S1 byte value reported by the port regardless of the received value. Changes in S1 byte on the port are ignored when this attribute is set to a value other than ***none***. |
| Values | Decimal (0..15)<br>none |
| Default | none |

### GROUP Lp Sonet CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Sonet customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |

| | |
|---|---|
| Default | 0 |

### GROUP Lp Sonet AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Sonet vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sonet commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Sonet IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Sonet ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

### ATTRIBUTE Lp Sonet ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sonet OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sonet snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Sonet OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values |

and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Sonet adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Lp Sonet operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for

operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sonet usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp Sonet availabilityStatus (osiAvail)

Access
Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is

one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

### ATTRIBUTE Lp Sonet proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn’t initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has

not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default
No default

## ATTRIBUTE Lp Sonet controlStatus (osiCntrl)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but

tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Lp Sonet alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Sonet standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the

role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Sonet unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Sonet Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for a *Sonet* or *Sdh* component.

### ATTRIBUTE Lp Sonet losAlarm (los)

Access
Read only

Description
This attribute indicates whether a Loss Of Signal (LOS) alarm state has been entered. An LOS alarm state is entered when LOS defects have been observed and accumulated for a period of 2.5

seconds +/- 0.5 seconds, or if an LOS defect is present when the criteria for LOF failure declaration have been met. An LOS defect is declared when 20+/-3 us of all-zeros pattern is detected. The LOS defect is cleared when two valid framing words are detected and no Loss of Signal condition is detected during an interval of 20+/-3 us. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the LOS alarm condition is cleared. The LOS alarm state is cleared after LOS defects have been absent for a period of 10 seconds +/- 0.5 seconds.
The *losAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet lofAlarm (lof)

Access
Read only

Description
This attribute displays whether a Loss Of Frame (LOF) alarm state has been entered. An LOF alarm state is entered when LOF defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds, except when an LOS defect or failure is present. An LOF defect is detected when getting contiguous errored frame alignment for at least 3 msec. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the LOF alarm condition is cleared. The condition is cleared when framing has been achieved for a period of 10 seconds +/- 0.5 seconds.
The *lofAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet rxAisAlarm (ais)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a Line Alarm Indication Signal (L-AIS) alarm state has been entered. An L-AIS alarm state is entered when L-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The L-AIS defect is the occurrence of the L-AIS signal in five contiguous STS (STM) frames (111 pattern in bits 6,7, and 8 of the K2 bytes). If the L-AIS defects are intermittently occurring, the L-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The *Sonet/Sdh* component goes into an operational state of *disabled* until the L-AIS alarm condition is cleared. The condition is cleared after not detecting the L-AIS signal for a period of 10 seconds +/- 0.5 seconds.<br>The *rxAisAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet rxRfiAlarm (rfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a Line Remote Failure Indication (LRFI) alarm state has been entered. An L-RFI alarm state is entered when Line Remote Failure Indication (L-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The L-RDI defect is the occurrence of the L-RDI signal in five contiguous valid STS (STM) frame (110 pattern in bits 6,7, and 8 of the K2 bytes). If the L-RDI defects are intermittently occurring, the L-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm |

integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the L-RFI alarm condition is cleared. The condition is cleared after not detecting the L-RDI signal for a period of 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet txAis

Access
Read only

Description
This attribute displays whether the Line Alarm Indication Signal (L-AIS) signal is being transmitted on the outgoing line. This signal is transmitted when the *Sonet/Sdh* is *locked* and left *offline*.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet txRdi

Access
Read only

Description
This attribute displays whether the Line Remote Defect Indicator (L-RDI) signal is being transmitted over the OC-3 line. The L-RDI signal is transmitted upon the detection of the LOS, LOF or L-AIS defect. This attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet unusableTxClockRefAlarm (utcr)

Access
Read only

| | |
|---|---|
| Description | This attribute displays whether an Unusable Transmit Clock Reference (UTCR) alarm state has been entered. A UTCR alarm state is entered when a Sonet/Sdh port provisioned to act as a transmit clock reference has received the code “do not use for synchronization” in the S1 byte (in the SONET/ SDH line overhead) for 2.5 +/- 0.5 seconds.<br>The condition is cleared after not detecting the “do not use for synchronization” code for a period of 10 +/- 0.5 seconds or when the port is no longer provisioned to act as a transmit clock reference.<br>A port is acting as a transmit clock reference if it is provisioned with a) a *clockingSource* of *line*, or b) it has been provisioned as a primaryReference, secondaryReference or tertiaryReference in the NetworkSynchronization component.<br>The *unusableTxClockRefAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet s1Rx (s1R)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current S1 byte received on the port. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Lp Sonet s1Tx (s1T)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current S1 byte transmitted on the port. |
| Values | Decimal (0..15) |
| Default | No default |

## GROUP Lp Sonet Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for a *Sonet* or *Sdh* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

## ATTRIBUTE Lp Sonet runningTime (time)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of seconds since the *Sonet/Sdh* component has been activated and been in unlocked state. All the other error counts that follow can be updated when this count is active. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp Sonet errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the *Sonet/Sdh* component has been in a near-end error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp Sonet sectCodeViolations (scv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Section Code Violations (SCVs) detected. A SCV corresponds to section BIP-8 error. SCV counting is inhibited for second intervals where a Section Severely Errored Second (SSES) is counted. The count wraps at its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Sonet sectErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Section Errored Seconds (SESs) that have been counted. A SES is declared for second intervals containing one or more SCVs or one or more Loss Of Signal (LOS) or Severely Errored Frame (SEF) defects. A SEF defect is the occurrence of 4 contiguous errored STS or STM frame alignment words. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet sectSevErroredSec (sses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Section Severely Errored Seconds (SSESs) that have been counted. A SSES is declared for second intervals containing more than *x* SCVs or one or more LOS or SEF defects. The value of *x* is 16 for 155 Mbit/s interface. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet sectLosSec (sloss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Section LOS Seconds (SLOSSs) that have been counted. A SLOSS is declared for second intervals containing one or more LOS defects. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE Lp Sonet sectSevErroredFrmSec (ssefs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total number of Section Severely Errored Frame Seconds (SSEFSs) that have been counted. A SSEFS is declared for second intervals containing one or more SEF defects. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet sectFailures (sf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a section failure (LOS or LOF failure) has been declared. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet lineCodeViolations (lcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Code Violations (LCVs) detected. A LCV corresponds to a line BIP-24 errors. LCV counting is inhibited for second intervals where a Line Severely Errored Second (LSES) is counted. Counting of LCVs is also inhibited over second intervals where a Line Unavailable Second (LUAS) is counted. The count wraps when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet lineErroredSec (les)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Errored Seconds (LESs) that have been counted. A LES is declared for second intervals containing one or more LCVs or one or more line AIS defects. Counting of LES is inhibited over second intervals where a LUAS is counted. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet lineSevErroredSec (lses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Severely Errored Seconds (LSESs) that have been counted. A LSES is declared for second intervals containing more than *x* LCVs or one or more L-AIS defects. The value of *x* is 32 for 155 Mbits/sec interface. Counting of LSES is inhibited over second intervals where a LUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet lineAisSec (laiss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line AIS Seconds (LAISSs) that have been counted. A LAISS is declared for second intervals containing one or more L-AIS defects. Counting of LAISS is inhibited over second intervals where a LUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet lineUnavailSec (luas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of one second intervals for which the STS line is unavailable. The STS line becomes unavailable at the onset of 10 consecutive LSESs. The 10 LSESs are included in the unavailable time. Once unavailable, the STS line becomes available at the onset of 10 contiguous seconds with no LSES. The 10 seconds with no LSES are excluded from the unavailable time. For second intervals where a Line Unavailable |

| | |
|---|---|
| | Second (LUAS) is counted, counting of LCV, LES, LSES and LAISS is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet lineFailures (lf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a line failure (L-AIS failure) has been declared. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet farEndLineErrorFreeSec (felefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the *Sonet* or *Sdh* component has been in a far-end error free state. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sonet farEndLineCodeViolations (felcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of line FEBE detected from the incoming line. The counting of line FEBE is inhibited for second intervals where a Far-End Line Severely Errored Second (FELSES) is counted. Counting of FELCVs is also inhibited over second intervals where a Far-End Line Unavailable Second (FELUAS) is counted. The count wraps at its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet farEndLineErroredSec (feles)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End Line Errored Seconds (FELESs) that have been counted. A FELES is declared for second intervals containing one or more Far-End Line CVs (FELCVs) or one or more L-RDI defects. Counting of FELES is inhibited over second intervals where a FELUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet farEndLineSevErroredSec (felses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End Line Severely Errored Seconds (FELSESs) that have been counted. A FELSES is declared for second intervals containing more than *x* FELCVs or one or more L-RDI defects. The value of *x* is 32 for 155 Mbit/s interface. Counting of FELSES is inhibited over second intervals where a FELUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet farEndLineAisSec (felaiss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End Line AIS Seconds (FELAISSs) that have been counted. A FELAISS is declared for second intervals one or more L-RDI defects. Counting of FELAISS is inhibited over second intervals where a FELUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet farEndLineUnavailSec (feluas)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total number of one second intervals for which the STS far-end line is unavailable. The STS far-end line becomes unavailable at the onset of 10 consecutive FELSESs. The 10 FELSESs are included in the unavailable time. Once unavailable, the STS far-end line becomes available at the onset of 10 contiguous seconds with no FELSES. The 10 seconds with no FELSES are excluded from the unavailable time. For second intervals where a Far-End Line Unavailable Second (FELUAS) is counted, counting of FELCV, FELES, FELSES and FELAISS is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet farEndLineFailures (felf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a far-end line failure (L-RFI failure) has been declared. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Sonet Path

| | |
|---|---|
| Instance | Decimal (0..0) |
| Groups | "GROUP Lp Sonet Path Provisioned (Prov)"<br>"GROUP Lp Sonet Path CustomerIdentifierData (CidData)"<br>"GROUP Lp Sonet Path OsiState (State)"<br>"GROUP Lp Sonet Path IfEntryProv (IfEntry)"<br>"GROUP Lp Sonet Path OperationalStatus (OperStatus)"<br>"GROUP Lp Sonet Path Operational (Oper)"<br>"GROUP Lp Sonet Path Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n Sonet/n Path/0*<br>*Lp/n Sdh/n Path/0*<br>This component controls a path signal that is carried within a SONET or SDH signal. The *Path* component can only be added under a *Sonet* or *Sdh* component. |

The migration escape renames the Path component under a Sonet to Sts, and the Path component under an Sdh to Vc4 in a passport 15000, but do not alter it in a passport 7000.
The check escape is added to disallow provisioning of a Path in a Passport 15000. The path cdl exists in a Passport 15000 for the purpose of renaming Path to Sts or Vc4.

## GROUP Lp Sonet Path Provisioned (Prov)

Properties Provisioned

Description This group contains all of the provisioning data for the component.

## ATTRIBUTE Lp Sonet Path applicationFramerName (framer)

Access Read only

Description This attribute defines which application is running on the path.

Values Link

Default No default

## GROUP Lp Sonet Path CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

## ATTRIBUTE Lp Sonet Path customerIdentifier (cid)

Access Read and write

Description

This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values

Decimal (0; 1..8191)

Default

0

## GROUP Lp Sonet Path OsiState (State)

Properties

Operational

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lp Sonet Path adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or

*Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Sonet Path operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

| | |
|---|---|
| Default | disabled |

### ATTRIBUTE Lp Sonet Path usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp Sonet Path availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can |

be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration

activation is in progress, making the component unavailable for other activities until the migration is complete.

### ATTRIBUTE Lp Sonet Path proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Lp Sonet Path controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Lp Sonet Path alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Lp Sonet Path standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Lp Sonet Path unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Lp Sonet Path IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Sonet Path ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sonet Path ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |

| | |
|---|---|
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sonet Path OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sonet Path snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Sonet Path Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for the component. |

### ATTRIBUTE Lp Sonet Path lopAlarm (lop)

| | |
|---|---|
| Access | Read only |

Description

This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values

on
off

Default

No default

## ATTRIBUTE Lp Sonet Path rxAisAlarm (ais)

Access

Read only

Description

This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one’s in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared

after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet Path rxRfiAlarm (rfi)

Access
Read only

Description
This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet Path signalLabelMismatch (slm)

Access
Read only

Description

This attribute displays whether the Path Signal Label Mismatch (P-SLM) failure condition has been entered. A P-SLM failure condition is entered when P-SLM defects have been observed and accumulated for period of 2.5 seconds +/- 0.5 seconds. A P-SLM defect occurs when detecting an unexpected path signal label. The expected Path signal labels are “Mapping for ATM” or “Equipped - Non Specific Payload”. If the P-SLM defects are intermittently occurring, the P-SLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Signal Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values

on
off

Default

No default

## ATTRIBUTE Lp Sonet Path txAis

Access

Read only

Description

This attribute displays whether the Path Alarm Indication Signal (P-AIS) signal is being transmitted on the path. The P-AIS signal is transmitted when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values

on
off

Default

No default

## ATTRIBUTE Lp Sonet Path txRdi

Access

Read only

| | |
|---|---|
| Description | This attribute displays whether the Path Remote Defect Indicator (P-RDI) signal is being transmitted over the path signal. The P-RDI signal is transmitted over the outgoing line upon detection of LOP, P-AIS or the occurrence of the LCD state. This attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |
| Values | on<br>off |
| Default | No default |

### GROUP Lp Sonet Path Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the component. |

### ATTRIBUTE Lp Sonet Path pathErrorFreeSec (pefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a near-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path pathAisLopSec (pals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path pathUnavailSec (puas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path farEndPathSevErroredSec (fepses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. |

Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Path farEndPathAisLopSec (fepals)

Access: Read only

Description: This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Path farEndPathUnavailSec (fepuas)

Access: Read only

Description: This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Path farEndPathFailures (fepf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Sonet Path AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp Sonet Path Cell Provisioned (Prov)"<br>"GROUP Lp Sonet Path Cell Operational (Oper)"<br>"GROUP Lp Sonet Path Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Lp Sonet Path Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

### ATTRIBUTE Lp Sonet Path Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp Sonet Path Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Lp Sonet Path Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. |

Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values: off
on

Default: off

### ATTRIBUTE Lp Sonet Path Cell clearDelay (clear)

Access: Read and write

Description: This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Lp Sonet Path Cell hecSampleInterval (hSample)

Access: Read and write

Description: This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot

be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Lp Sonet Path Cell hecErrorLimit (hLimit)

Access: Read and write

Description: This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Lp Sonet Path Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.

| | |
|---|---|
| | This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..50) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp Sonet Path Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

### GROUP Lp Sonet Path Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

### ATTRIBUTE Lp Sonet Path Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a |

period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values: on
off

Default: off

## GROUP Lp Sonet Path Cell Statistics (Stats)

Properties: Operational

Description: This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE Lp Sonet Path Cell uncorrectableHeaderErrors (ucErr)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.<br><br>Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Path Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization |

is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp Sonet Path Cell transmitCellUtilization (txutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp Sonet Path Cell correctableHeaderErrors (cErr)

Access: Read only

Description: This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected

Values: Decimal (0..4294967295)

Default: 0

## COMPONENT Lp Sonet Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Sonet Test OsiState (State)"<br>"GROUP Lp Sonet Test Setup (Setup)"<br>"GROUP Lp Sonet Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

## VERB START Lp Sonet Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

## VERB STOP Lp Sonet Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

## GROUP Lp Sonet Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp Sonet Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Lp Sonet Test operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Lp Sonet Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Sonet Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp Sonet Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sonet Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error |

rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

### ATTRIBUTE Lp Sonet Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Sonet Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Sonet Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Sonet Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sonet Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Sonet Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |

Default 1.00

## GROUP Lp Sonet Test Results (Results)

Properties Operational

Description This group contains all the statistics related attributes of the *Test* component.

## ATTRIBUTE Lp Sonet Test causeOfTermination

Access Read only

Description This attribute indicates either the status of the test or the cause of the test's termination:

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission

errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp Sonet Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp Sonet Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp Sonet Test erroredFrmRx

Access: Read only

Description: This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp Sonet Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable

| | |
|---|---|
| | test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sonet Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Sonet Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp Sonet Sts

| | |
|---|---|
| Instance | Decimal (0..11) |
| Groups | "GROUP Lp Sonet Sts Provisioned (Prov)"<br>"GROUP Lp Sonet Sts CustomerIdentifierData (CidData)"<br>"GROUP Lp Sonet Sts OsiState (State)"<br>"GROUP Lp Sonet Sts IfEntryProv (IfEntry)"<br>"GROUP Lp Sonet Sts OperationalStatus (OperStatus)"<br>"GROUP Lp Sonet Sts Operational (Oper)"<br>"GROUP Lp Sonet Sts Statistics (Stats)"<br>"GROUP Lp Sonet Sts Provisioned (Prov)" |

| | |
|---|---|
| Scope | Device |
| Description | *Lp/n Sonet/n Sts/n*<br>*Laps/n Sts/n*<br>This component controls a path signal that is carried within a SONET signal. The instance number of *Sts* component must be 0 for components on unchannelized cards. On channelized cards, the index of an *Sts* component must be outside the range defined by [j,j+C-1], where j is the index of another *Sts* component (under the same parent *Sonet* component, or if under the *Laps* component, the same working line), and C is the concatenation level defined for that other *Sts* component. On channelized cards, the maximum value of the index of an *Sts* component must be less than or equal to the bandwidth number of the line minus 1. For example, the maximum index value for an *Sts* component under an OC-12 *Sonet* component is 11. On channelized cards, the sum of concatenation values over all *Sts* subcomponents under a *Sonet* component (or the working line if under an *Laps* component) must not be greater than the concatenation level for that *Sonet* component. |
| Opt. Subcomp. | "COMPONENT Lp Sonet Sts AtmCell (Cell)"<br>"COMPONENT Lp Sonet Sts Vt1dot5" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Sonet Sts Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for the component. |

## ATTRIBUTE Lp Sonet Sts applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute defines which application is running on the path. |
| Values | Link |
| Default | No default |

### GROUP Lp Sonet Sts CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Sonet Sts customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Sonet Sts OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lp Sonet Sts adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Lp Sonet Sts operationalState (osiOper)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Sonet Sts usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE Lp Sonet Sts availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Lp Sonet Sts proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp Sonet Sts controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

## ATTRIBUTE Lp Sonet Sts alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Lp Sonet Sts standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

notSet

### ATTRIBUTE Lp Sonet Sts unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Sonet Sts IfEntryProv (IfEntry)

Properties
Provisioned

Description
This group contains the provisionable attributes for the ifEntry.

### ATTRIBUTE Lp Sonet Sts ifAdminStatus (ifState)

Access
Read and write

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sonet Sts ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sonet Sts OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sonet Sts snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

Default up

## GROUP Lp Sonet Sts Operational (Oper)

Properties Operational

Description This group contains the common operational data for the component.

## ATTRIBUTE Lp Sonet Sts lopAlarm (lop)

Access Read only

Description This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values on
off

Default No default

## ATTRIBUTE Lp Sonet Sts rxAisAlarm (ais)

Access Read only

Description This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is

entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet Sts rxRfiAlarm (rfi)

Access
Read only

Description
This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.

The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet Sts signalLabelMismatch (slm)

Access
Read only

Description
This attribute displays whether the Path Signal Label Mismatch (P-SLM) failure condition has been entered. A P-SLM failure condition is entered when P-SLM defects have been observed and accumulated for period of 2.5 seconds +/- 0.5 seconds. A P-SLM defect occurs when detecting an unexpected path signal label. The expected Path signal labels are “Mapping for ATM” or “Equipped - Non Specific Payload”. If the P-SLM defects are intermittently occurring, the P-SLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Signal Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sonet Sts txAis

Access
Read only

| | |
|---|---|
| Description | This attribute displays whether the Path Alarm Indication Signal (P-AIS) signal is being transmitted on the path. The P-AIS signal is transmitted when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts txRdi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Path Remote Defect Indicator (P-RDI) signal is being transmitted over the path signal. The P-RDI signal is transmitted over the outgoing line upon detection of LOP, P-AIS or the occurrence of the LCD state. This attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |
| Values | on<br>off |
| Default | No default |

### GROUP Lp Sonet Sts Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the component. |

### ATTRIBUTE Lp Sonet Sts pathErrorFreeSec (pefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a near-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Lp Sonet Sts pathAisLopSec (pals)

Access Read only

Description This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Lp Sonet Sts pathUnavailSec (puas)

Access Read only

Description This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Lp Sonet Sts pathFailures (pf)

Access Read only

Description This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).

The counter wraps to 0 when it exceeds its maximum value.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts farEndPathSevErroredSec (fepses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts farEndPathAisLopSec (fepals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts farEndPathUnavailSec (fepuas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous |

seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Sts farEndPathFailures (fepf)

Access: Read only

Description: This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### GROUP Lp Sonet Sts Provisioned (ChProv)

Properties: Provisioned

Description: This group contains the provisioning data for *Sts* components provisioned under *Sonet* components that support channelization..

### ATTRIBUTE Lp Sonet Sts txPathTrace

Access: Read and write

Description: This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. The path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SONET frames. At the remote end, the path trace is reassembled, and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued.

The functionality supported by this attribute is not available.

| | |
|---|---|
| Values | String (0..64, ASCII) |
| Default | "" |

### ATTRIBUTE Lp Sonet Sts expectedRxPathTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..64, ASCII) |
| Default | "" |

### ATTRIBUTE Lp Sonet Sts concatNumber

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the STS concatenation level for the *Sts* component on channelized cards. It must be set to a concatenation level supported by the FP upon which the *Sts* is defined, except for non-channelized cards, in which case it must be set to 0. For example, a value of 1 in this attribute would represent STS-1 concatenation, while a value of 3 would represent STS-3c, a value of 12 would represent STS-12c, and so forth. *Sts* channelization to the tributary level is supported only if this attribute is set to 1. |
| Values | Decimal (0; 1; 3; 12; 48) |
| Default | No default |

### COMPONENT Lp Sonet Sts AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp Sonet Sts Cell Provisioned (Prov)"<br>"GROUP Lp Sonet Sts Cell Operational (Oper)"<br>"GROUP Lp Sonet Sts Cell Statistics (Stats)" |
| Scope | Device |

| | |
|---|---|
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp Sonet Sts Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

### ATTRIBUTE Lp Sonet Sts Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.<br><br>Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm. |
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Lp Sonet Sts Cell clearDelay (clear)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the |

port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Lp Sonet Sts Cell hecSampleInterval (hSample)

Access: Read and write

Description: This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Lp Sonet Sts Cell hecErrorLimit (hLimit)

Access: Read and write

Description: This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval*

attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values — Decimal (1..250000)

Default — No default

### ATTRIBUTE Lp Sonet Sts Cell lcdStateDelay (delay)

Access — Read and write

Description — This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values — Decimal (1..50)

Units — msec

Default — No default

### ATTRIBUTE Lp Sonet Sts Cell hecErrorIntervalLimit (hIntLimit)

Access — Read and write

Description — This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if

there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..25)

Default: 1

## GROUP Lp Sonet Sts Cell Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes for the *AtmCell* component.

## ATTRIBUTE Lp Sonet Sts Cell lcdAlarm (lcd)

Access: Read only

Description: This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm

condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values: on
off

Default: off

## GROUP Lp Sonet Sts Cell Statistics (Stats)

Properties: Operational

Description: This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE Lp Sonet Sts Cell uncorrectableHeaderErrors (ucErr)

Access: Read only

Description: This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Values: Decimal (0..4294967295)

Default: 0

## ATTRIBUTE Lp Sonet Sts Cell sevErroredSec (ses)

Access: Read only

Description: This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Sts Cell receiveCellUtilization (rxutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp Sonet Sts Cell transmitCellUtilization (txutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.

This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp Sonet Sts Cell correctableHeaderErrors (cErr)

Access: Read only

Description: This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected

Values: Decimal (0..4294967295)

Default: 0

## GROUP Lp Sonet Sts Vt1dot5 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

## ATTRIBUTE Lp Sonet Sts Vt1dot5 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Sonet Sts Vt1dot5 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |

| | |
|---|---|
| Default | unlocked |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Lp Sonet Sts Vt1dot5 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Lp Sonet Sts Vt1dot5 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the

resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Sonet Sts Vt1dot5 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Sonet Sts Vt1dot5 IfEntryProv (IfEntry)

Properties
Provisioned

Description
This group contains the provisionable attributes for the ifEntry.

### ATTRIBUTE Lp Sonet Sts Vt1dot5 ifAdminStatus (ifState)

Access
Read and write

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sonet Sts Vt1dot5 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

### GROUP Lp Sonet Sts Vt1dot5 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for the component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 rxAisAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Tributary Unit Alarm Indication Signal (TU-AIS) alarm state has been entered. A TU-AIS alarm state is entered when TU-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-AIS defect occurs when three consecutive TU pointers are in the all 1's state. This alarm is cleared after no TU-AIS defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 rxRdiAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Remote Defect Indicator (LP-RDI) alarm state has been entered. An LP-RDI alarm state is entered when LP-RDI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RDI defect occurs when RDI conditions are detected in five consecutive frames. This alarm is cleared after no LP-RDI defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 rxRfiAlarm

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates whether a Low Order Path Remote Failure Indicator (LP-RFI) alarm state has been entered. An LP-RFI alarm state is entered when LP-RFI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RFI defect occurs when a RFI condition is detected. This alarm is cleared after no LP-RFI defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 unequippedAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Unequipped (LP-UNEQ) alarm state has been entered. An LP-UNEQ alarm state is entered when LP-UNEQ defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-UNEQ defect occurs when an unequipped condition is detected for five consecutive multi frames. This alarm is cleared after no LP-UNEQ defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 traceIdMismatchAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Trace Identification Mismatch (LP-TIM) alarm state has been entered. An LP-TIM alarm state is entered when LP-TIM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-TIM defect occurs when a TIM condition is detected. This alarm is cleared after no LP-TIM defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 lopAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Tributary Unit Loss of Pointer (TU-LOP) alarm state has been entered. An TU-LOP alarm state is entered when TU-LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-LOP defect occurs when eight consecutive invalid pointer values or eight consecutive New Data Flag (NDF) pointers are detected. This alarm is cleared after no TU-LOP defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 txAis

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the Low order Path Alarm Indication Signal (LP-AIS) is being transmitted on the low order path. The LP-AIS signal is transmitted when the component *adminState* is *locked* or *operationalState* is *disabled* and *availabilityStatus* is *dependency.* |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 txRdi

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the Low Order Path Remote Defect Indication (LP-RDI) is being transmitted on the low order path. The LP-RDI signal is transmitted upon detection of TU-LOP, TU-AIS, LP-TIM or LP-UNEQ. The value is *off* when the component *adminState* is *locked* or *operationalState* is *disabled* and *availabilityStatus* is *dependency.* |

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### GROUP Lp Sonet Sts Vt1dot5 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 pathErrorFreeSec (pefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a near-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more |

PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Sts Vt1dot5 pathSevErroredSec (pses)

Access: Read only

Description: This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Sts Vt1dot5 pathAisLopSec (pals)

Access: Read only

Description: This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Sts Vt1dot5 pathUnavailSec (puas)

Access: Read only

Description: This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at

| | |
|---|---|
| | the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV |

counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Sts Vt1dot5 farEndPathErroredSec (fepes)

Access: Read only

Description: This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Sts Vt1dot5 farEndPathSevErroredSec (fepses)

Access: Read only

Description: This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sonet Sts Vt1dot5 farEndPathAisLopSec (fepals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 farEndPathUnavailSec (fepuas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 farEndPathFailures (fepf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

## COMPONENT Lp Sonet Sts Vt1dot5 DS1

| | |
|---|---|
| Groups | "GROUP Lp Sonet Sts Vt1dot5 DS1 Provisioned (Prov)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 CustomerIdentifierData (CidData)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 AdminInfo (AdminInfo)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 IfEntryProv (IfEntry)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 OperationalStatus (OperStatus)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 OsiState (State)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 Operational (Oper)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 Statistics (Stats)" |
| Scope | Application |
| Description | *Lp/n DS3/n DS1/n*<br>The *DS1* component controls and monitors a DS1 tributary of a channelized DS3 port on a Function Processor that supports channelization of a DS3. |
| Subcomponents | "COMPONENT Lp Sonet Sts Vt1dot5 DS1 Channel (Chan)" |
| Dyn. Subcomp. | "COMPONENT Lp Sonet Sts Vt1dot5 DS1 Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Sonet Sts Vt1dot5 DS1 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for a *DS1* component. |

## ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 lineType (lineType)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute defines the framing of the DS1 tributary.<br>***d4*** defines a framing pattern of 12 frames per multiframe.<br>***esf*** defines a framing pattern of 24 frames per multiframe.<br>***d4Cas*** defines a framing pattern of 12 frames per multiframe with channel associated signalling.<br>***esfCas*** defines a framing pattern of 24 frames per multiframe with channel associated signalling.<br>***unframed*** defines an unknown framing pattern for clear channels.<br><br>For the ***4pDS3ChAtm*** card, only ***d4*** and ***esf*** framing patterns are permitted.<br><br>The ***4pDS3ChAal1*** card supports the ***d4*** and ***esf*** framing patterns, as well as ***unframed***. |
| Values | d4<br>esf<br>d4Cas<br>esfCas<br>unframed |
| Default | esf |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 zeroCoding (zeroCoding)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute defines the zero encoding on the DS1 tributary.<br>***bit7Stuffing*** sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8.<br>***none*** does no zero encoding, it does not change any value of the bits in the timeslot. The value ***none*** is compatible with any zero coding scheme which transports all 8 data bits in a timeslot (this would include both ***ami*** and ***b8zs*** values of the *DS1 zeroCoding* attribute). |
| Values | bit7Stuffing<br>none |
| Default | none |

## ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 clockingSource (clockingSource)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the source of the transmit clock for the DS1 tributary.<br>When the clocking source is ***local***, the crystal on the port generates the clocking for the DS1 tributary.<br>When the clocking source is ***line***, the port synchronizes to the clock from the DS1 tributary.<br>When the clocking source is ***module***, the port's clock synchronizes to the clock provided by the oscillator on the active CP.<br>When the clocking source is ***sameAsDs3***, the Ds1 port's clock synchronizes to the same clock source as that of its parent Ds3 port.<br><br>On a ***1pDS3C*** card, if the *NetworkSynchronization (NS)* component is present, the default value of this attribute will be ***module***; otherwise it will be ***line***.<br><br>On a ***2pDS3cAal*** card, the only valid values are ***local*** and ***module***. If the *NS* component is present, the default value of this attribute will be ***module***; otherwise it will be ***local***.<br><br>On the ***4pDS3Ch***, ***4pDS3ChAtm***, and ***4pDS3ChAal1*** cards, the only valid value is ***sameAsDs3***. This is because a DS1 must have the same clocking source as its parent DS3. |
| Values | local<br>line<br>module<br>sameAsDs3 |
| Default | No default |

## GROUP Lp Sonet Sts Vt1dot5 DS1 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Sonet Sts Vt1dot5 DS1 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 commentText

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Sonet Sts Vt1dot5 DS1 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sonet Sts Vt1dot5 DS1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Sonet Sts Vt1dot5 DS1 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 proceduralStatus (osiProc)

Access Read only

Description If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

| | |
|---|---|
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component. |
| Set of | underRepair (repair)<br>critical (crit)<br>major<br>minor<br>alarmOutstanding (outst) |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 standbyStatus (osiStby)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Standby status of the component.<br><br>The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.<br><br>The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.<br><br>The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.<br><br>The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource. |
| Values | hotStandby (hot)<br>coldStandby (cold)<br>providingService (serv)<br>notSet (nSet) |
| Default | notSet |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. |

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Sonet Sts Vt1dot5 DS1 Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for a component in a digital hierarchy interface.

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 rxAisAlarm (rxAisAlarm)

Access
Read only

Description
This attribute indicates whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds
+/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 lofAlarm (lofAlarm)

Access
Read only

Description
This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (2 out of 5 framing bits in error) have been detected for 3 seconds +/- 0.5 seconds. If the LOF defects are intermittently

occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 rxRaiAlarm (rxRaiAlarm)

Access
Read only

Description
This attribute indicates whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds. The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

Values
on
off

Default
off

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 txAisAlarm (txAisAlarm)

Access
Read only

Description
This attribute indicates whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the tributary is in a locked state.

| | |
|---|---|
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 txRaiAlarm (txRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the tributary detects a LOF alarm condition. |
| Values | on<br>off |
| Default | off |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common statistical data for a component in a digital hierarchy interface. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of seconds since the tributary was activated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of seconds that the tributary has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of errored seconds the tributary has counted since it was activated. An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of severely errored seconds the tributary has counted since it was activated. A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of severely errored framing seconds the tributary has counted since it was activated A severely errored framing second occurs when a second with one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of seconds that the tributary has been in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely |

| | |
|---|---|
| | Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of CRC-6 errors. These will only be counted when the *lineType* is ***esf***. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frame errors. A frame error is an error in the framing bits. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Sonet Sts Vt1dot5 DS1 Channel (Chan)

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan timeslotDataRate (dataRate)

Access Read and write

Criticality Component

Description This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.

When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this

attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

Values: 56k
doNotOverride

Default: doNotOverride

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan applicationFramerName

Access: Read and write

Description: This attribute defines the link to the software stack. It defines which application is running on top of this hardware component.

Values: Link (Service, interfaceName)

Default: No default

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

| | |
|---|---|
| | An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |

Description — This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan snmpOperStatus

Access — Read only

Description — The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values — up
down
testing

Default — up

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan usageState (osiUsage)

Access
Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan availabilityStatus (osiAvail)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Channel* component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan actualChannelSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the measured link speed of the *Channel* component. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### COMPONENT Lp Sonet Sts Vt1dot5 DS1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test OsiState (State)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test Setup (Setup)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V*35, *X21, DS1, E1, DS3, E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp Sonet Sts Vt1dot5 DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp Sonet Sts Vt1dot5 DS1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).<br>***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). |

Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test frmPatternType (fpt)

Access
Read and write

Description
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.
***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.
***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.

| | |
|---|---|
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be |

| | |
|---|---|
| | no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time |

specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values

testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

| | |
|---|---|
| Default | neverStarted |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. |

For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

Default: 0.00

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test timeRemaining

Access: Read only

Description: This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.

Values: Decimal (0.00..30240.00)

Units: minutes

Default: 0.00

## COMPONENT Lp Sonet Sts Vt1dot5 DS1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Cell Provisioned (Prov)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Cell Operational (Oper)"<br>"GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

## ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects |

caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Values: Decimal (0..2000)

Units: msec

Default: No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell scrambleCellPayload (scramble)

Access: Read and write

Description: Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Values: off
on

Default: No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell correctSingleBitHeaderErrors

Access: Read and write

Description: This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

| | |
|---|---|
| Values | off<br>on |
| Default | off |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell clearDelay (clear)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..60) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell hecSampleInterval (hSample)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell hecErrorLimit (hLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..250000) |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell lcdStateDelay (delay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..50) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.<br>In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected. |

For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values
on
off

Default
off

## GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Cell Statistics (Stats)

Properties
Operational

Description
This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell uncorrectableHeaderErrors (ucErr)

Access
Read only

Description
This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.<br><br>Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |

Default 0

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell transmitCellUtilization (txutil)

Access Read only

Description This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values Decimal (0..100)

Units %

Default 0

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell correctableHeaderErrors (cErr)

Access Read only

Description This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected

Values Decimal (0..4294967295)

Default 0

### COMPONENT Lp Sonet Sts Vt1dot5 DS1 Chan TrunkConditioning (Tc)

Groups "GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Tc Provisioned (Prov)"
"GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Tc Operational (Op)"

Scope Device

Description *Lp/n Ds1/n Chan/n Tc*
*Lp/n E1/n Chan/n Tc*
*Lp/n Ds3/n Ds1/n Chan/n Tc*
*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*

*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*
*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*
*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

### GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Tc Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all specific provisioning data for a *Tc* component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc replacementData (data)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.<br><br>The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:<br>DS1 MUX Out Of Service Code = 0x1A<br>E1 MUX Out Of Service Code = 0xFF<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.<br><br>On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***. |
| Values | Hex (H.0..H.ff) |
| Units | Hex |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc signalOneDuration (duration)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.<br><br>If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.<br><br>The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds. |
| Values | Decimal (0..60) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc noServiceResponse (resp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:<br><br>***autoConfigure*** - automatically configure the channels response.<br>***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.<br>***ais*** - transmit AIS in the egress direction.<br>***noResponse*** - no response is sent in the egress direction.<br><br>A value of ***autoConfigure*** will result in TC being transmitted for all card types. |
| Values | autoConfigure<br>tc<br>ais<br>noResponse |
| Default | autoConfigure |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc signalOne (sigOne)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc signalTwo (sigTwo)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined.<br><br>For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively. |
| Vector of | Decimal (0..1) |
| Index | D<br>C<br>B<br>A |
| Default | (1, 1, 1, 1) |

## GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Tc Operational (Op)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all specific operational data for a *Tc* component. |

## ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc ingressConditioning (inCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the ATM network.<br><br>When trunk conditioning is being locally generated towards the ATM network, *ingressConditioning* is set to ***on.***<br><br>When trunk conditioning is not being locally generated towards the ATM network, *ingressConditioning* is set to ***off***.<br><br>Trunk conditioning is transmitted towards the ATM network under the following conditions:<br>lossOfSignal (LOS)<br>lossOfFrame (LOF)<br>remoteAlarmIndication (RAI)<br>alarmIndicationSignal (AIS)<br>bufferUnderflow (BU)<br>and in addition for E1:<br>lossOfMultiframe (LOMF)<br>receiveMultiframeRemoteAlarmIndication (RMRAI) |
| Values | off<br>on |
| Default | off |

## ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc egressConditioning (egCon)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of locally generated trunk conditioning towards the PDH line.<br><br>When trunk conditioning is being locally generated towards the |

PDH line, *egressConditioning* is set to ***on.***

When trunk conditioning is not being locally generated towards the PDH line, *egressConditioning* is set to ***off***.

Trunk conditioning is transmitted towards the PDH line under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

Values
off
on

Default
off

## COMPONENT Lp Sonet Sts Vt1dot5 DS1 Test (Test)

Groups

## VERB START Lp Sonet Sts Vt1dot5 DS1 Test

Impact
Service

Description
This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

## VERB STOP Lp Sonet Sts Vt1dot5 DS1 Test

Impact
Service

Description
This command stops a test running on the hardware component.

### GROUP Lp Sonet Sts Vt1dot5 DS1 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp Sonet Sts Vt1dot5 DS1 Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test purpose (purpose)

Access
Read and write

| | |
|---|---|
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).<br>***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).<br>Note that not all test types are not supported by all function processors. |
| Values | card<br>manual<br>localLoop<br>remoteLoop |

externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default: card

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test frmSize (size)

Access: Read and write

Description: This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values: Decimal (4..4096)

Units: bytes

Default: 1024

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test frmPatternType (fpt)

Access: Read and write

Description: This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.
***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.
***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.

Values:
ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default: ccitt32kBitPattern

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |

| | |
|---|---|
| Default | 5 |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp Sonet Sts Vt1dot5 DS1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a |

loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test bitsTx

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test bytesRx

| | |

| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported |

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

Default: 0.00

### ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test timeRemaining

Access: Read only

Description: This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.

Values: Decimal (0.00..30240.00)

Units: minutes

Default: 0.00

## COMPONENT Lp Sonet OpticalModule (Om)

## GROUP Lp Sonet Om Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data for the *OpticalModule* component. |

## ATTRIBUTE Lp Sonet Om type

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected optical module type. The values for the *type* and *insertedType* attributes must match; otherwise, an alarm is raised and the *OpticalModule* component is disabled.<br><br>***none***: This value indicates that no optical module type is specified..<br><br>***LX***: This value indicates that the optical module is a gigabit ethernet type using long wavelength laser devices over multimode and single-mode fiber.<br><br>***SX***: This value indicates that the optical module is a gigabit |

ethernet type using short wavelength laser devices over multimode fiber.

***OC3SmLr***: This value indicates that the optical module is an OC3 type using long wavelength laser devices over singlemode fiber.

***OC3SmIr***: This value indicates that the optical module is an OC3 type using intermediate wavelength laser devices over singlemode fiber.

***OC3MmSr***: This value indicates that the optical module is an OC3 type using short wavelength laser devices over multimode fiber.

Values
none
LX
SX
OC3SmLr
OC3SmIr
OC3MmSr

Default
none

## GROUP Lp Sonet Om OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lp Sonet Om adminState (osiAdmin)

Access
Read only

Description
This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Sonet Om operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sonet Om usageState (osiUsage)

Access
Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values

idle
active (activ)
busy

Default

idle

## GROUP Lp Sonet Om Operational (Oper)

Properties

Operational

Description

This group contains the operational data for the *OpticalModule* component.

## ATTRIBUTE Lp Sonet Om insertedType

Access

Read only

Description

This attribute indicates the inserted optical module type.

***none***: This value indicates that there is no optical module inserted to the card.

***LX***: This value indicates that the optical module is a gigabit ethernet type using long wavelength laser devices over multimode and single-mode fiber.

***SX***: This value indicates that the optical module is a gigabit ethernet type using short wavelength laser devices over multimode fiber.

***OC3SmLr***: This value indicates that the optical module is an OC3 type using long wavelength laser devices over singlemode

fiber.

***OC3SmIr***: This value indicates that the optical module is an OC3 type using intermediate wavelength laser devices over singlemode fiber.

***OC3MmSr***: This value indicates that the optical module is an OC3 type using short wavelength laser devices over multimode fiber.

Values
none
LX
SX
OC3SmLr
OC3SmIr
OC3MmSr

Default
none

### ATTRIBUTE Lp Sonet Om serialNumber

Access
Read only

Description
This attribute indicates the serial number of the inserted optical module.

Values
String (0..64, Extended ASCII)

Default
""

### ATTRIBUTE Lp Sonet Om failureCause

Access
Read only

Description
This attribute indicates the cause for the optical module's failure. The possible values are:

***typeMismatch***: This error indicates a mismatch between the *type* and *insertedType* attributes.

***internalError***: This error indicates an internal diagnostic failure of the optical module.

***unsupportedOm:*** This error indicates that the inserted optical

module is not supported on this card.

***absentOm***: This error indicates that no optical module are currently present on this port.

***noFailure***: There is no failure.

Values
typeMismatch
internalError
unsupportedOm
absentOm
noFailure

Default
noFailure

## COMPONENT Lp Sdh

Instance
Decimal (0..15)

Groups
"GROUP Lp Sdh Provisioned (Prov)"
"GROUP Lp Sdh CustomerIdentifierData (CidData)"
"GROUP Lp Sdh AdminInfo (AdminInfo)"

"GROUP Lp Sdh OsiState (State)"
"GROUP Lp Sdh Operational (Oper)"
"GROUP Lp Sdh Statistics (Stats)"

Scope
Device

Description
*Lp/n Sdh/n*
This component controls a port on an SDH card. In particular, it deals with SDH medium, section and line layers.
Note that there can be *Sonet* and *Sdh* components coexisting under the same LP. However they cannot use the same instance.

A *Path* or *Vc4* component is automatically created when an *Sdh* component is added on a Passport 7000 FP.The *Path* component is used only on FPs that do not support Virtual Container (VC).

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Lp Sdh Path"<br>"COMPONENT Lp Sdh Vc4"<br>"COMPONENT Lp Sdh OpticalModule (Om)" |
| Dyn. Subcomp. | "COMPONENT Lp Sdh Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Sdh Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data for a *Sonet* or *Sdh* component. |

## ATTRIBUTE Lp Sdh clockingSource

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of clocking source used for synchronizing the transmit clock: ***local*** means direct use of the local clock oscillator at its centre frequency; ***line*** means the use of a signal phase-locked to the incoming line rate; ***module*** means the use of a signal phase-locked to the CP reference clock.<br><br>When adding a *Sonet* or *Sdh* component, the *clockingSource* attribute is set to ***module*** if the *NetworkSynchronization* component has been added and is set to ***local*** otherwise.<br><br>Note that the multiport cell-based cards have one common clock source for each of the three ports when either the clocking source ***local*** or ***module*** is selected. For this reason, it is not allowed to have at the same time the *clockingSource* attribute set to ***local*** on one port and ***module*** on another port. Furthermore, the |

*clockingSource* attribute cannot be set to ***module*** if the *NetworkSynchronization* component has not been added.

Values
local
line
module

Default
No default

### ATTRIBUTE Lp Sdh lineAutomaticProtectionSwitch (laps)

Access
Read and write

Criticality
Process

Description
This attribute specifies the name of the *Laps* component. In the case of intra-card configurations, the specified *Laps* component is used to provide sparing of lines which use this port and its mate; in the case of inter-card configurations, the specified *Laps* component is used to provide sparing of lines only.

Values
Link

Default
No default

### ATTRIBUTE Lp Sdh txSectionTrace

Access
Read and write

Description
This attribute specifies the section identifier. The string must be constructed with 7-bit characters only. The section identifier is prefixed by a CRC byte and padded with null characters if necessary to form the 16-octet section trace message transmitted in byte J0 of 16 outgoing frames. At the remote end, the section trace is reassembled, the CRC is checked and the message is compared to the *expectedRxSectionTrace* attribute. If a mismatch is detected, an alarm is issued.

Usage guidelines for the section trace are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.

The functionality supported by this attribute is not available.

Values
String (0..15, Extended ASCII)

| | |
|---|---|
| Default | "" |

### ATTRIBUTE Lp Sdh expectedRxSectionTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected section trace identifier which is used to identify the fiber connected to the associated port. This attribute must match the corresponding *txSectionTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..15, Extended ASCII) |
| Default | "" |

### ATTRIBUTE Lp Sdh s1RxDefault

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default S1 byte reported by the port when the received S1 byte is 0 (quality unknown). No default is applied when this attribute is set to ***none***. |
| Values | Decimal (0..15)<br>none |
| Default | none |

### ATTRIBUTE Lp Sdh s1TxOverride

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the S1 byte transmitted on the port regardless of the Synchronization Status Message (SSM) value provided by the *NetworkSynchronization* component. Changes in SSM value from the *NetworkSynchronization* component are ignored when this attribute is set to a value other than ***none***. |
| Values | Decimal (0..15)<br>none |
| Default | none |

### ATTRIBUTE Lp Sdh s1RxOverride

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the S1 byte value reported by the port regardless of the received value. Changes in S1 byte on the port are ignored when this attribute is set to a value other than ***none***. |
| Values | Decimal (0..15)<br>none |
| Default | none |

### GROUP Lp Sdh CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Sdh customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |

| | |
|---|---|
| Default | 0 |

### GROUP Lp Sdh AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Sdh vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sdh commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Sdh IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Sdh ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

| | |
|---|---|
| Default | up |

### ATTRIBUTE Lp Sdh ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sdh OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sdh snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Sdh OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values |

and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Sdh adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Lp Sdh operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for

operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sdh usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp Sdh availabilityStatus (osiAvail)

Access
Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is

one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Lp Sdh proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has

not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Lp Sdh controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but

tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Lp Sdh alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Sdh standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the

role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Sdh unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Sdh Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for a *Sonet* or *Sdh* component.

### ATTRIBUTE Lp Sdh losAlarm (los)

Access
Read only

Description
This attribute indicates whether a Loss Of Signal (LOS) alarm state has been entered. An LOS alarm state is entered when LOS defects have been observed and accumulated for a period of 2.5

seconds +/- 0.5 seconds, or if an LOS defect is present when the criteria for LOF failure declaration have been met. An LOS defect is declared when 20+/-3 us of all-zeros pattern is detected. The LOS defect is cleared when two valid framing words are detected and no Loss of Signal condition is detected during an interval of 20+/-3 us. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the LOS alarm condition is cleared. The LOS alarm state is cleared after LOS defects have been absent for a period of 10 seconds +/- 0.5 seconds.
The *losAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
No default

## ATTRIBUTE Lp Sdh lofAlarm (lof)

Access
Read only

Description
This attribute displays whether a Loss Of Frame (LOF) alarm state has been entered. An LOF alarm state is entered when LOF defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds, except when an LOS defect or failure is present. An LOF defect is detected when getting contiguous errored frame alignment for at least 3 msec. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the LOF alarm condition is cleared. The condition is cleared when framing has been achieved for a period of 10 seconds +/- 0.5 seconds.
The *lofAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh rxAisAlarm (ais)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a Line Alarm Indication Signal (L-AIS) alarm state has been entered. An L-AIS alarm state is entered when L-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The L-AIS defect is the occurrence of the L-AIS signal in five contiguous STS (STM) frames (111 pattern in bits 6,7, and 8 of the K2 bytes). If the L-AIS defects are intermittently occurring, the L-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The *Sonet/Sdh* component goes into an operational state of *disabled* until the L-AIS alarm condition is cleared. The condition is cleared after not detecting the L-AIS signal for a period of 10 seconds +/- 0.5 seconds.<br>The *rxAisAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh rxRfiAlarm (rfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a Line Remote Failure Indication (LRFI) alarm state has been entered. An L-RFI alarm state is entered when Line Remote Failure Indication (L-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The L-RDI defect is the occurrence of the L-RDI signal in five contiguous valid STS (STM) frame (110 pattern in bits 6,7, and 8 of the K2 bytes). If the L-RDI defects are intermittently occurring, the L-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm |

integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the L-RFI alarm condition is cleared. The condition is cleared after not detecting the L-RDI signal for a period of 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sdh txAis

Access
Read only

Description
This attribute displays whether the Line Alarm Indication Signal (L-AIS) signal is being transmitted on the outgoing line. This signal is transmitted when the *Sonet/Sdh* is *locked* and left *offline*.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sdh txRdi

Access
Read only

Description
This attribute displays whether the Line Remote Defect Indicator (L-RDI) signal is being transmitted over the OC-3 line. The L-RDI signal is transmitted upon the detection of the LOS, LOF or L-AIS defect. This attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sdh unusableTxClockRefAlarm (utcr)

Access
Read only

| | |
|---|---|
| Description | This attribute displays whether an Unusable Transmit Clock Reference (UTCR) alarm state has been entered. A UTCR alarm state is entered when a Sonet/Sdh port provisioned to act as a transmit clock reference has received the code “do not use for synchronization” in the S1 byte (in the SONET/ SDH line overhead) for 2.5 +/- 0.5 seconds.<br>The condition is cleared after not detecting the “do not use for synchronization” code for a period of 10 +/- 0.5 seconds or when the port is no longer provisioned to act as a transmit clock reference.<br>A port is acting as a transmit clock reference if it is provisioned with a) a *clockingSource* of *line*, or b) it has been provisioned as a primaryReference, secondaryReference or tertiaryReference in the NetworkSynchronization component.<br>The *unusableTxClockRefAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh s1Rx (s1R)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current S1 byte received on the port. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE Lp Sdh s1Tx (s1T)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current S1 byte transmitted on the port. |
| Values | Decimal (0..15) |
| Default | No default |

## GROUP Lp Sdh Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for a *Sonet* or *Sdh* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

## ATTRIBUTE Lp Sdh runningTime (time)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of seconds since the *Sonet/Sdh* component has been activated and been in unlocked state. All the other error counts that follow can be updated when this count is active. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp Sdh errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the *Sonet/Sdh* component has been in a near-end error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp Sdh sectCodeViolations (scv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Section Code Violations (SCVs) detected. A SCV corresponds to section BIP-8 error. SCV counting is inhibited for second intervals where a Section Severely Errored Second (SSES) is counted. The count wraps at its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Sdh sectErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Section Errored Seconds (SESs) that have been counted. A SES is declared for second intervals containing one or more SCVs or one or more Loss Of Signal (LOS) or Severely Errored Frame (SEF) defects. A SEF defect is the occurrence of 4 contiguous errored STS or STM frame alignment words. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh sectSevErroredSec (sses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Section Severely Errored Seconds (SSESs) that have been counted. A SSES is declared for second intervals containing more than *x* SCVs or one or more LOS or SEF defects. The value of *x* is 16 for 155 Mbit/s interface. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh sectLosSec (sloss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Section LOS Seconds (SLOSSs) that have been counted. A SLOSS is declared for second intervals containing one or more LOS defects. |
| Values | Decimal (0..429496729) |
| Default | 0 |

### ATTRIBUTE Lp Sdh sectSevErroredFrmSec (ssefs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total number of Section Severely Errored Frame Seconds (SSEFSs) that have been counted. A SSEFS is declared for second intervals containing one or more SEF defects. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh sectFailures (sf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a section failure (LOS or LOF failure) has been declared. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh lineCodeViolations (lcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Code Violations (LCVs) detected. A LCV corresponds to a line BIP-24 errors. LCV counting is inhibited for second intervals where a Line Severely Errored Second (LSES) is counted. Counting of LCVs is also inhibited over second intervals where a Line Unavailable Second (LUAS) is counted. The count wraps when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh lineErroredSec (les)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Errored Seconds (LESs) that have been counted. A LES is declared for second intervals containing one or more LCVs or one or more line AIS defects. Counting of LES is inhibited over second intervals where a LUAS is counted. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh lineSevErroredSec (lses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line Severely Errored Seconds (LSESs) that have been counted. A LSES is declared for second intervals containing more than *x* LCVs or one or more L-AIS defects. The value of *x* is 32 for 155 Mbits/sec interface. Counting of LSES is inhibited over second intervals where a LUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh lineAisSec (laiss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Line AIS Seconds (LAISSs) that have been counted. A LAISS is declared for second intervals containing one or more L-AIS defects. Counting of LAISS is inhibited over second intervals where a LUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh lineUnavailSec (luas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of one second intervals for which the STS line is unavailable. The STS line becomes unavailable at the onset of 10 consecutive LSESs. The 10 LSESs are included in the unavailable time. Once unavailable, the STS line becomes available at the onset of 10 contiguous seconds with no LSES. The 10 seconds with no LSES are excluded from the unavailable time. For second intervals where a Line Unavailable |

| | |
|---|---|
| | Second (LUAS) is counted, counting of LCV, LES, LSES and LAISS is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh lineFailures (lf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a line failure (L-AIS failure) has been declared. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh farEndLineErrorFreeSec (felefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the *Sonet* or *Sdh* component has been in a far-end error free state. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sdh farEndLineCodeViolations (felcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of line FEBE detected from the incoming line. The counting of line FEBE is inhibited for second intervals where a Far-End Line Severely Errored Second (FELSES) is counted. Counting of FELCVs is also inhibited over second intervals where a Far-End Line Unavailable Second (FELUAS) is counted. The count wraps at its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh farEndLineErroredSec (feles)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End Line Errored Seconds (FELESs) that have been counted. A FELES is declared for second intervals containing one or more Far-End Line CVs (FELCVs) or one or more L-RDI defects. Counting of FELES is inhibited over second intervals where a FELUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh farEndLineSevErroredSec (felses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End Line Severely Errored Seconds (FELSESs) that have been counted. A FELSES is declared for second intervals containing more than *x* FELCVs or one or more L-RDI defects. The value of *x* is 32 for 155 Mbit/s interface. Counting of FELSES is inhibited over second intervals where a FELUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh farEndLineAisSec (felaiss)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Far-End Line AIS Seconds (FELAISSs) that have been counted. A FELAISS is declared for second intervals one or more L-RDI defects. Counting of FELAISS is inhibited over second intervals where a FELUAS is counted. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh farEndLineUnavailSec (feluas)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total number of one second intervals for which the STS far-end line is unavailable. The STS far-end line becomes unavailable at the onset of 10 consecutive FELSESs. The 10 FELSESs are included in the unavailable time. Once unavailable, the STS far-end line becomes available at the onset of 10 contiguous seconds with no FELSES. The 10 seconds with no FELSES are excluded from the unavailable time. For second intervals where a Far-End Line Unavailable Second (FELUAS) is counted, counting of FELCV, FELES, FELSES and FELAISS is inhibited. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh farEndLineFailures (felf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that a far-end line failure (L-RFI failure) has been declared. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Sdh Path

| | |
|---|---|
| Instance | Decimal (0..0) |
| Groups | "GROUP Lp Sdh Path Provisioned (Prov)"<br>"GROUP Lp Sdh Path CustomerIdentifierData (CidData)"<br>"GROUP Lp Sdh Path OsiState (State)"<br>"GROUP Lp Sdh Path IfEntryProv (IfEntry)"<br>"GROUP Lp Sdh Path OperationalStatus (OperStatus)"<br>"GROUP Lp Sdh Path Operational (Oper)"<br>"GROUP Lp Sdh Path Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n Sonet/n Path/0*<br>*Lp/n Sdh/n Path/0*<br>This component controls a path signal that is carried within a SONET or SDH signal. The *Path* component can only be added under a *Sonet* or *Sdh* component. |

The migration escape renames the Path component under a Sonet to Sts, and the Path component under an Sdh to Vc4 in a passport 15000, but do not alter it in a passport 7000.
The check escape is added to disallow provisioning of a Path in a Passport 15000. The path cdl exists in a Passport 15000 for the purpose of renaming Path to Sts or Vc4.

### GROUP Lp Sdh Path Provisioned (Prov)

Properties Provisioned

Description This group contains all of the provisioning data for the component.

### ATTRIBUTE Lp Sdh Path applicationFramerName (framer)

Access Read only

Description This attribute defines which application is running on the path.

Values Link

Default No default

### GROUP Lp Sdh Path CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE Lp Sdh Path customerIdentifier (cid)

Access Read and write

Description

This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values

Decimal (0; 1..8191)

Default

0

## GROUP Lp Sdh Path OsiState (State)

Properties

Operational

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lp Sdh Path adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or

*Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Sdh Path operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default disabled

### ATTRIBUTE Lp Sdh Path usageState (osiUsage)

Access Read only

Description This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values idle
active (activ)
busy

Default idle

### ATTRIBUTE Lp Sdh Path availabilityStatus (osiAvail)

Access Read only

Description If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can

be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |

### ATTRIBUTE Lp Sdh Path proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp Sdh Path controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Lp Sdh Path alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Sdh Path standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Lp Sdh Path unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Lp Sdh Path IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Sdh Path ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sdh Path ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |

| | |
|---|---|
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sdh Path OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sdh Path snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Sdh Path Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for the component. |

### ATTRIBUTE Lp Sdh Path lopAlarm (lop)

| | |
|---|---|
| Access | Read only |

Description

This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values

on
off

Default

No default

## ATTRIBUTE Lp Sdh Path rxAisAlarm (ais)

Access

Read only

Description

This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared

after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sdh Path rxRfiAlarm (rfi)

Access
Read only

Description
This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sdh Path signalLabelMismatch (slm)

Access
Read only

Description

This attribute displays whether the Path Signal Label Mismatch (P-SLM) failure condition has been entered. A P-SLM failure condition is entered when P-SLM defects have been observed and accumulated for period of 2.5 seconds +/- 0.5 seconds. A P-SLM defect occurs when detecting an unexpected path signal label. The expected Path signal labels are “Mapping for ATM” or “Equipped - Non Specific Payload”. If the P-SLM defects are intermittently occurring, the P-SLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Signal Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values

Default

No default

### ATTRIBUTE Lp Sdh Path txAis

Access

Read only

Description

This attribute displays whether the Path Alarm Indication Signal (P-AIS) signal is being transmitted on the path. The P-AIS signal is transmitted when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values

on
off

Default

No default

### ATTRIBUTE Lp Sdh Path txRdi

Access

Read only

| | |
|---|---|
| Description | This attribute displays whether the Path Remote Defect Indicator (P-RDI) signal is being transmitted over the path signal. The P-RDI signal is transmitted over the outgoing line upon detection of LOP, P-AIS or the occurrence of the LCD state. This attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |
| Values | on<br>off |
| Default | No default |

### GROUP Lp Sdh Path Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the component. |

### ATTRIBUTE Lp Sdh Path pathErrorFreeSec (pefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a near-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path pathAisLopSec (pals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path pathUnavailSec (puas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path farEndPathSevErroredSec (fepses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. |

Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sdh Path farEndPathAisLopSec (fepals)

Access: Read only

Description: This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sdh Path farEndPathUnavailSec (fepuas)

Access: Read only

Description: This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sdh Path farEndPathFailures (fepf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Sdh Path AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp Sdh Path Cell Provisioned (Prov)"<br>"GROUP Lp Sdh Path Cell Operational (Oper)"<br>"GROUP Lp Sdh Path Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Lp Sdh Path Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

### ATTRIBUTE Lp Sdh Path Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp Sdh Path Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |
| Default | No default |

### ATTRIBUTE Lp Sdh Path Cell correctSingleBitHeaderErrors

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. |

Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values: off
on

Default: off

### ATTRIBUTE Lp Sdh Path Cell clearDelay (clear)

Access: Read and write

Description: This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..60)

Units: minutes

Default: 0

### ATTRIBUTE Lp Sdh Path Cell hecSampleInterval (hSample)

Access: Read and write

Description: This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot

be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (0..25)

Units: seconds

Default: 0

### ATTRIBUTE Lp Sdh Path Cell hecErrorLimit (hLimit)

Access: Read and write

Description: This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Lp Sdh Path Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm,

3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

| | |
|---|---|
| Values | Decimal (1..50) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp Sdh Path Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

### GROUP Lp Sdh Path Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

### ATTRIBUTE Lp Sdh Path Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered |

when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values: on
off

Default: off

## GROUP Lp Sdh Path Cell Statistics (Stats)

Properties: Operational

Description: This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

### ATTRIBUTE Lp Sdh Path Cell uncorrectableHeaderErrors (ucErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.<br><br>Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path Cell transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp Sdh Path Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

## COMPONENT Lp Sdh Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Sdh Test OsiState (State)"<br>"GROUP Lp Sdh Test Setup (Setup)"<br>"GROUP Lp Sdh Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

## VERB START Lp Sdh Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

## VERB STOP Lp Sdh Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

## GROUP Lp Sdh Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Sdh Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Sdh Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Sdh Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Sdh Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp Sdh Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

## ATTRIBUTE Lp Sdh Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).<br>***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).<br>Note that not all test types are not supported by all function processors. |
| Values | card<br>manual<br>localLoop<br>remoteLoop<br>externalLoop<br>payloadLoop<br>remoteLoopThisTrib<br>v54RemoteLoop<br>pn127RemoteLoop<br>lineBIP8Error |

| | |
|---|---|
| | sectionBIP8Error<br>pathBIP8Error<br>pathBIP2Error |
| Default | card |

### ATTRIBUTE Lp Sdh Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Sdh Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Sdh Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |

| | |
|---|---|
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Sdh Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sdh Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Sdh Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that |

the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.

| | |
|---|---|
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp Sdh Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp Sdh Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have |

been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp Sdh Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost |

| | |
|---|---|
| | frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sdh Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Sdh Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp Sdh Vc4

| | |
|---|---|
| Instance | Decimal (0..3) |
| Groups | "GROUP Lp Sdh Vc4 Provisioned (Prov)"<br>"GROUP Lp Sdh Vc4 CustomerIdentifierData (CidData)"<br>"GROUP Lp Sdh Vc4 OsiState (State)" |

| | |
|---|---|
| | "GROUP Lp Sdh Vc4 IfEntryProv (IfEntry)"<br>"GROUP Lp Sdh Vc4 OperationalStatus (OperStatus)"<br>"GROUP Lp Sdh Vc4 Operational (Oper)"<br>"GROUP Lp Sdh Vc4 Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n Sdh/n Vc4/n*<br>*Laps/n Vc4/n*<br>This component controls a *Vc4* path signal that is carried within an SDH signal. The *Vc4* component may only be defined on Passport 15000 cards that support STM and the 2pSTM1eCh card on the Passport 7000. |
| Opt. Subcomp. | "COMPONENT Lp Sdh Vc4 AtmCell (Cell)"<br>"COMPONENT Lp Sdh Vc4 Vc12" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Lp Sdh Vc4 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for the component. |

### ATTRIBUTE Lp Sdh Vc4 applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines which application is running on the path. |
| Values | Link |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 pathTraceLength

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transmitted path trace message length. The *pathTraceLength* attribute at transmitting and receiving end must match. |
| Values | 16<br>64 |
| Default | 16 |

### ATTRIBUTE Lp Sdh Vc4 txPathTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. If *pathTraceLength* is 16, the path identifier is prefixed with a CRC byte and padded by null characters if necessary to form a 16-octet path trace message transmitted in byte J1 of 16 outgoing SDH frames. If *pathTraceLength* is 64, the path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SDH frames. At the remote end, the path trace is reassembled, the CRC is checked if necessary and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued.<br><br>Usage guidelines for path trace message are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..64, Extended ASCII) |
| Default | "" |

### ATTRIBUTE Lp Sdh Vc4 expectedRxPathTrace

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued.<br><br>The functionality supported by this attribute is not available. |
| Values | String (0..64, Extended ASCII) |
| Default | "" |

### ATTRIBUTE Lp Sdh Vc4 concatNumber

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of contiguous Administration Unit 4 (AU-4) concatenated together. AU-4s can be concatenated together to form an AU-4-4c or AU-4-16c (4 or 16 concatenated AU-4s) which can transport payloads requiring greater capacity than one Container-4 capacity.<br><br>Only *Vc4/0* can have *concatNumber* set to 16 and only *Vc4/0*, *Vc4/4*, *Vc4/8* or *Vc4/12* can have *concatNumber* set to 4.<br><br>When a *Vc4* uses concatenation, the other concatenated *Vc4* instance number cannot be used. For example, if *Vc4/0 concatNumber* is 4, the next provisionable *Vc4* is *Vc4/4*.<br><br>*Vc4* channelization, indicated by provisioning subcomponents such as *Vc12*, is allowed only if this attribute is set to 1. This value must be set to 0 for card types which do not support the use of this attribute. |
| Values | 0<br>1<br>4<br>16 |
| Default | No default |

### GROUP Lp Sdh Vc4 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Sdh Vc4 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Sdh Vc4 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the |

appropriate NTP.

### ATTRIBUTE Lp Sdh Vc4 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Sdh Vc4 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sdh Vc4 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp Sdh Vc4 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp Sdh Vc4 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Lp Sdh Vc4 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp Sdh Vc4 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms

may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Lp Sdh Vc4 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Sdh Vc4 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Sdh Vc4 IfEntryProv (IfEntry)

Properties
Provisioned

Description
This group contains the provisionable attributes for the ifEntry.

### ATTRIBUTE Lp Sdh Vc4 ifAdminStatus (ifState)

Access
Read and write

Description
The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sdh Vc4 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sdh Vc4 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sdh Vc4 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Sdh Vc4 Operational (Oper)

| | |
|---|---|
| Properties | Operational |

Description — This group contains the common operational data for the component.

### ATTRIBUTE Lp Sdh Vc4 lopAlarm (lop)

Access — Read only

Description — This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values — on
off

Default — No default

### ATTRIBUTE Lp Sdh Vc4 rxAisAlarm (ais)

Access — Read only

Description — This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one’s in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect

accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values
on
off

Default

### ATTRIBUTE Lp Sdh Vc4 rxRfiAlarm (rfi)

Access
Read only

Description
This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 signalLabelMismatch (slm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Path Signal Label Mismatch (P-SLM) failure condition has been entered. A P-SLM failure condition is entered when P-SLM defects have been observed and accumulated for period of 2.5 seconds +/- 0.5 seconds. A P-SLM defect occurs when detecting an unexpected path signal label. The expected Path signal labels are “Mapping for ATM” or “Equipped - Non Specific Payload”. If the P-SLM defects are intermittently occurring, the P-SLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The component goes into an operational state of *disabled* until the Path Signal Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.<br><br>The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 txAis

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Path Alarm Indication Signal (P-AIS) signal is being transmitted on the path. The P-AIS signal is transmitted when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 txRdi

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Path Remote Defect Indicator (P-RDI) signal is being transmitted over the path signal. The P-RDI signal is transmitted over the outgoing line upon detection of LOP, P-AIS or the occurrence of the LCD state. This attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed. |
| Values | on<br>off |
| Default | No default |

### GROUP Lp Sdh Vc4 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the component. |

### ATTRIBUTE Lp Sdh Vc4 pathErrorFreeSec (pefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a near-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 pathAisLopSec (pals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 pathUnavailSec (puas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Lp Sdh Vc4 farEndPathSevErroredSec (fepses)

Access Read only

Description This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Lp Sdh Vc4 farEndPathAisLopSec (fepals)

Access Read only

Description This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Lp Sdh Vc4 farEndPathUnavailSec (fepuas)

Access Read only

Description This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals

where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sdh Vc4 farEndPathFailures (fepf)

Access: Read only

Description: This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).

The counter wraps to 0 when it exceeds its maximum value.

Values: Decimal (0..4294967295)

Default: 0

### COMPONENT Lp Sdh Vc4 AtmCell (Cell)

Groups:
"GROUP Lp Sdh Vc4 Cell Provisioned (Prov)"
"GROUP Lp Sdh Vc4 Cell Operational (Oper)"
"GROUP Lp Sdh Vc4 Cell Statistics (Stats)"

Scope: Device

Description: The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

## GROUP Lp Sdh Vc4 Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

## ATTRIBUTE Lp Sdh Vc4 Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

## ATTRIBUTE Lp Sdh Vc4 Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.<br>It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.<br>Note that this setting must be the same at both ends of the link. |
| Values | off<br>on |

Default — No default

### ATTRIBUTE Lp Sdh Vc4 Cell correctSingleBitHeaderErrors

Access — Read and write

Description — This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values — off
on

Default — off

### ATTRIBUTE Lp Sdh Vc4 Cell clearDelay (clear)

Access — Read and write

Description — This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values — Decimal (0..60)

Units — minutes

Default — 0

### ATTRIBUTE Lp Sdh Vc4 Cell hecSampleInterval (hSample)

Access — Read and write

| | |
|---|---|
| Description | This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Cell hecErrorLimit (hLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..250000) |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Cell lcdStateDelay (delay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..50) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Cell hecErrorIntervalLimit (hIntLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (1..25) |
| Default | 1 |

## GROUP Lp Sdh Vc4 Cell Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational attributes for the *AtmCell* component. |

## ATTRIBUTE Lp Sdh Vc4 Cell lcdAlarm (lcd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.<br>In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.<br>For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.<br>If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle<br>The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.<br>The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked. |
| Values | on<br>off |
| Default | off |

## GROUP Lp Sdh Vc4 Cell Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

## ATTRIBUTE Lp Sdh Vc4 Cell uncorrectableHeaderErrors (ucErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## ATTRIBUTE Lp Sdh Vc4 Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.<br><br>If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects. |

| | |
|---|---|
| | Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Cell receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Cell transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.<br>This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## COMPONENT Lp Sdh Vc4 Vc12

| | |
|---|---|
| Instance | k [Decimal (1..3)]<br>l [Decimal (1..7)]<br>m [Decimal (1..3)] |
| Groups | "GROUP Lp Sdh Vc4 Vc12 Provisioned (Prov)"<br>"GROUP Lp Sdh Vc4 Vc12 CustomerIdentifierData (CidData)"<br>"GROUP Lp Sdh Vc4 Vc12 OsiState (State)"<br>"GROUP Lp Sdh Vc4 Vc12 IfEntryProv (IfEntry)"<br>"GROUP Lp Sdh Vc4 Vc12 OperationalStatus (OperStatus)"<br>"GROUP Lp Sdh Vc4 Vc12 Operational (Oper)"<br>"GROUP Lp Sdh Vc4 Vc12 Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n Sdh/n Vc4/n Vc12/k,l,m*<br>This component controls the *Vc12* low order path signal that is carried within an SDH signal. The *Vc12* component may only be defined on Passport 15000 cards that support STM and the 2pSTM1eCh card on the Passport 7000. |

| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Sdh Vc4 Vc12 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for the component. |

## ATTRIBUTE Lp Sdh Vc4 Vc12 txPathTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the low order path identifier. The string must be constructed with 7-bit characters only. The path identifier is prefixed with a CRC byte and padded by null characters if necessary to form a 16-octet path trace message transmitted in byte J2 of 16 outgoing SDH frames. At the remote end, the path trace is reassembled, the CRC is checked and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected and the *expectedRxPathTrace* attribute is not an empty string (default value), an alarm is issued.<br><br>Usage guidelines for path trace message are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.<br><br>The functionality supported by this attribute is available on the *4pOC3Ch* functional processor. |
| Values | String (0..15, Extended ASCII) |
| Default | "" |

## ATTRIBUTE Lp Sdh Vc4 Vc12 expectedRxPathTrace

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the expected path trace identifier which is used to identify the low order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. If an empty string (default value) is provisioned, the Low Order Path Trace Identification Mismatch (LP-TIM) defect is ignored. |

The functionality supported by this attribute is available on the *4pOC3Ch* functional processor.

Values: String (0..15, Extended ASCII)

Default: ""

### GROUP Lp Sdh Vc4 Vc12 CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

### ATTRIBUTE Lp Sdh Vc4 Vc12 customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values: Decimal (0; 1..8191)

Default: 0

### GROUP Lp Sdh Vc4 Vc12 OsiState (State)

Properties: Operational

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lp Sdh Vc4 Vc12 adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Lp Sdh Vc4 Vc12 operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values: enabled (ena)
disabled (dis)

Default: disabled

### ATTRIBUTE Lp Sdh Vc4 Vc12 usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values: idle
active (activ)
busy

Default: idle

## ATTRIBUTE Lp Sdh Vc4 Vc12 availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the

component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which

doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Lp Sdh Vc4 Vc12 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE Lp Sdh Vc4 Vc12 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization

activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Sdh Vc4 Vc12 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Sdh Vc4 Vc12 IfEntryProv (IfEntry)

Properties
Provisioned

Description
This group contains the provisionable attributes for the ifEntry.

### ATTRIBUTE Lp Sdh Vc4 Vc12 ifAdminStatus (ifState)

Access
Read and write

Description
The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sdh Vc4 Vc12 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sdh Vc4 Vc12 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Sdh Vc4 Vc12 Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the common operational data for the component. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 rxAisAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Tributary Unit Alarm Indication Signal (TU-AIS) alarm state has been entered. A TU-AIS alarm state is entered when TU-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-AIS defect occurs when three consecutive TU pointers are in the all 1's state. This alarm is cleared after no TU-AIS defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 rxRdiAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Remote Defect Indicator (LP-RDI) alarm state has been entered. An LP-RDI alarm state is entered when LP-RDI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RDI defect occurs when RDI conditions are detected in five consecutive frames. This alarm is cleared after no LP-RDI defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 rxRfiAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Remote Failure Indicator (LP-RFI) alarm state has been entered. An LP-RFI alarm state is entered when LP-RFI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RFI defect occurs when a RFI condition is detected. This |

alarm is cleared after no LP-RFI defect has been detected for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 rxReiAlarm

Access
Read only

Description
This attribute indicates whether a Low Order Path Remote Error Indicator (LP-REI) alarm state has been entered. An LP-REI alarm state is entered when LP-REI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-REI defect occurs when a REI condition is detected. This alarm is cleared after no LP-REI defect has been detected for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 bip2Alarm

Access
Read only

Description
This attribute indicates whether a Low Order Path Error Monitoring (BIP-2) alarm state has been entered. An BIP-2 alarm state is entered when BIP-2 defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The BIP-2 defect occurs when a mismatch between the calculated and received BIP-2 is detected. This alarm is cleared after no BIP-2 defect has been detected for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 unequippedAlarm

Access
Read only

| | |
|---|---|
| Description | This attribute indicates whether a Low Order Path Unequipped (LP-UNEQ) alarm state has been entered. An LP-UNEQ alarm state is entered when LP-UNEQ defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-UNEQ defect occurs when an unequipped condition is detected for five consecutive multi frames. This alarm is cleared after no LP-UNEQ defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 traceIdMismatchAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Low Order Path Trace Identification Mismatch (LP-TIM) alarm state has been entered. An LP-TIM alarm state is entered when LP-TIM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-TIM defect occurs when a TIM condition is detected. This alarm is cleared after no LP-TIM defect has been detected for 10 seconds +/- 0.5 seconds. |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 lopAlarm

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Tributary Unit Loss of Pointer (TU-LOP) alarm state has been entered. An TU-LOP alarm state is entered when TU-LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-LOP defect occurs when eight consecutive invalid pointer values or eight consecutive New Data Flag (NDF) pointers are detected. This alarm is cleared after no TU-LOP defect has been detected for 10 seconds +/- 0.5 seconds. |

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 txAis

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the Low order Path Alarm Indication Signal (LP-AIS) is being transmitted on the low order path. The LP-AIS signal is transmitted when the component *adminState* is ***locked*** or *operationalState* is ***disabled*** and *availabilityStatus* is *dependency.* |
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 txRdi

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the Low Order Path Remote Defect Indication (LP-RDI) is being transmitted on the low order path. The LP-RDI signal is transmitted upon detection of TU-LOP, TU-AIS, LP-TIM or LP-UNEQ. The value is ***off*** when the component *adminState* is ***locked*** or *operationalState* is ***disabled*** and *availabilityStatus* is ***dependency****.* |
| Values | on<br>off |
| Default | No default |

### GROUP Lp Sdh Vc4 Vc12 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the component. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 pathErrorFreeSec (pefs)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the one second intervals that the component has been in a near-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 pathCodeViolations (pcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 pathErroredSec (pes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 pathSevErroredSec (pses)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than *x* PCVs or one or more LOP or path AIS defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 pathAisLopSec (pals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 pathUnavailSec (puas)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 pathFailures (pf)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 farEndPathErrorFreeSec (fepefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the one second intervals that the component has been in a far-end error free state.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 farEndPathCodeViolations (fepcv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 farEndPathErroredSec (fepes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 farEndPathSevErroredSec (fepses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than *x* FEPCVs or one or more P-RDI defects. The value of *x* is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 farEndPathAisLopSec (fepals)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.<br><br>The counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE Lp Sdh Vc4 Vc12 farEndPathUnavailSec (fepuas)

Access Read only

Description This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### ATTRIBUTE Lp Sdh Vc4 Vc12 farEndPathFailures (fepf)

Access Read only

Description This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).

The counter wraps to 0 when it exceeds its maximum value.

Values Decimal (0..4294967295)

Default 0

### COMPONENT Lp Sdh Vc4 Vc12 E1

Groups "GROUP Lp Sdh Vc4 Vc12 E1 Provisioned (Prov)"

"GROUP Lp Sdh Vc4 Vc12 E1 Statistics (Stats)"

Scope: Device

Description:

*Lp/n E1/n*
*Lp/n Sdh/i Vc4/j Vc12/k,l,m E1*
The *E1* component controls and monitors an E1 port or tributary on a Function Processor. The number of ports supported depends on the type of card, and is usually encoded in the *Shelf Card/n cardType*, for example 4pE1Aal1: 4 port. The lowest instance value is usually ***0***, except for the ***32pE1Aal*** card when it is ***1***.
No instance value is used when the E1 is a STM tributary.
Multi-Service cards have an instance range 0..31, except that instance values 30 and 31 are not available for an “ATM UNI port”. (An E1 “ATM UNI port” is an *E1* component with a single *Chan* whose *applicationFramerName* attribute is linked to an *AtmIf* component.)
The instance number of an *E1* “ATM UNI port” must not be the same as the instance number of an *IMA* group under the same *Lp*.

## GROUP Lp Sdh Vc4 Vc12 E1 Provisioned (Prov)

Properties: Provisioned

Description: This group contains all of the provisioning data for an E1 component.

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 lineType (lineType)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the framing of the E1 line.<br>When ***cas*** (channel associated signalling) is selected, timeslot 16 is reserved for multiframe signalling and only 30 timeslots are available for data. The signalling bits are not interpreted.<br>When ***ccs*** (common channel signalling) is selected, timeslot 16 is not reserved for multiframe signalling and 31 timeslots are available for data. The signalling bits are not interpreted.<br>When ***unframed*** is selected, a clear channel is defined whereby data from all timeslots including the framing data (in timeslot 0) and timeslot 16 are passed transparently. This value is valid only for AAL1 cards.<br><br>For cell-based cards the ATM Forum specifies that timeslot 16 be reserved, leaving 30 timeslots available for data.<br>The ***8pE1Atm*** and ***1pStm1ChSmIr*** cards support the ***ccs*** value only. The ***4pOC3ChSmIr*** card only supports the ***ccs*** and ***unframed*** values. For both these cards, the default value is ***ccs***. For all other cards, the default value is ***cas***. |
| Values | ccs<br>cas<br>unframed |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 clockingSource (clockingSource)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the source of the transmit clock for the E1 line.<br><br>When ***local*** is selected, the crystal on the port generates the clocking for the line.<br><br>When ***line*** is selected, the port synchronizes to the clock from the facility.<br><br>When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP. |

When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***.

When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network.

When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network.

A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured***

If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pE1Atm*** card, which it defaults to ***local***.
On a ***3pE1Atm*** card all ports must have the same value, and be either ***local*** or ***module***.

***otherPort*** is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards.

On ***4E1Aal1*** cards either:

all four ports' *clockingSource* values must be ***local*** OR
all four ports' *clockingSource* values must be ***module*** OR
one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. A port can only have ***srtsMode*** selected if the other ports are ***module*** or ***srtsMode***.

Values

local
line
module
otherPort
srtsMode
adaptiveMode

Default — No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 crc4Mode

Access — Read and write

Description — This attribute defines whether the CRC-4 checking and generation on the E1 line is enabled or disabled.

The default CRC-4 mode is ***off*** except for the cell-based cards which default to ***on*** as per the ATM Forum.

Values — on
off

Default — No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 sendRaiOnAis

Access — Read and write

Description — This attribute defines whether the Remote Alarm Indicator (RAI) will be sent when receiving an AIS alarm. The value is ***yes*** by default; it can be changed to ***no*** only for ports on J2MV cards.

Values — no
yes

Default — yes

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 raiDeclareAlarmTime

Access — Read and write

Description — This attribute specifies the period of time that a Remote Alarm Indicator (RAI) must be present before declaring an RAI alarm. The value of ***auto*** sets the RAI declare time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiClearAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used.

| | |
|---|---|
| Values | Decimal (1..20000)<br>auto |
| Units | msec |
| Default | 100 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 raiClearAlarmTime

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the period of time that a Remote Alarm Indicator (RAI) has been absent before clearing an RAI alarm. The value of ***auto*** sets the RAI clear time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiDeclareAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used. |
| Values | Decimal (1..20000)<br>auto |
| Units | msec |
| Default | 100 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 ssmE1SaNumber

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which of the five available Sa bits (Sa4 to Sa8) recommended in ITU G.704 is to be used for Synchronization Status Messages (SSM). If set to ***none***, the transmission of SSM is disabled on this port. |
| Values | Decimal (4..8)<br>none |
| Default | none |

### GROUP Lp Sdh Vc4 Vc12 E1 CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Sdh Vc4 Vc12 E1 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Sdh Vc4 Vc12 E1 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sdh Vc4 Vc12 E1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |

Description — This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 snmpOperStatus

Access — Read only

Description — The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Values — up
down
testing

Default — up

### GROUP Lp Sdh Vc4 Vc12 E1 OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users

only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 usageState (osiUsage)

Access
Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 availabilityStatus (osiAvail)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default notSet

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 unknownStatus (osiUnknw)

Access Read only

Description This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values false
true

Default false

### GROUP Lp Sdh Vc4 Vc12 E1 Operational (Oper)

Properties Operational

Description This group contains the common operational data for a component in a digital hierarchy interface.

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 losAlarm (losAlarm)

Access Read only

Description This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far

end for the duration of the LOS alarm state.
The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 rxAisAlarm (rxAisAlarm)

Access
Read only

Description
This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's density of at least 99.9% is present for a time T, where 3 ms ≤ T ≤ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 lofAlarm (lofAlarm)

Access
Read only

Description
This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**,

**8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Values
on
off

Default
off

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 rxRaiAlarm (rxRaiAlarm)

Access
Read only

Description
This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**, and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time).
The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

Values
on
off

Default
off

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 txAisAlarm (txAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the port is in a locked state. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 txRaiAlarm (txRaiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the port detects a LOF alarm condition (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: RAI is transmitted when the port detects a LOS, LOF, or AIS condition). |
| Values | on<br>off |
| Default | off |

### GROUP Lp Sdh Vc4 Vc12 E1 E1Operational (E1Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a E1 component that are not defined in the DSCommonOp group. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 multifrmLofAlarm (multiLofAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a multiframe LOF (loss of frame) alarm state is entered. A multiframe LOF alarm state is entered when a multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe LOF defects are intermittently occurring, the multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements |

based on a 200 ms polling cycle.
The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds. When the multiframe LOF alarm is on, a multiframe RAI alarm indicator is transmitted on the line.

The ***8pE1Atm*** card does not support the multiframe LOF alarm.

Values
on
off

Default
off

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 rxMultifrmRaiAlarm (rxMultiRaiAlarm)

Access
Read only

Description
This attribute displays whether a multiframe RAI (remote alarm indicator) alarm state has been entered. A multiframe RAI alarm state is entered when a multiframe RAI alarm indicator (bit 6 of timeslot 16 in frame 0 is set to a one) is observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe RAI indicator is intermittently received, the multiframe RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The multiframe RAI alarm condition is cleared when the multiframe RAI alarm indication is not received for 10 seconds +/- 0.5 seconds. The multiframe RAI alarm is usually an indication that the far end facility is unable to gain multiframe synchronization.

The ***8pE1Atm*** card does not support the multiframe RAI alarm.

Values
on
off

Default
off

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 txMultifrmRaiAlarm (txMultiRaiAlarm)

Access
Read only

Description
This attribute displays whether a multiframe RAI (remote alarm indicator) alarm is being sent on the E1 line. This is transmitted when the E1 port detects a multiframe LOF condition.

The ***8pE1Atm*** card does not generate the multiframe RAI alarm.

Values
on
off

Default
off

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 ssmE1Tx

Access
Read only

Description
This attribute indicates the current Synchronization Status Message (SSM) transmitted on the E1 port within the Sa byte defined in ITU G.704.
This attribute is filtered when *ssmE1SaNumber* is set to ***none***.

Values
Decimal (0..15)

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 multifrmCRC4LofAlarm (multiCRC4LofAlarm)

Access
Read only

Description
This attribute indicates whether E1 CRC-4 multiframe LOF (loss of frame) alarm state is entered. A CRC-4 multiframe LOF alarm state is entered when a CRC-4 multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the CRC-4 multiframe LOF defects are intermittently occurring, the CRC-4 multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds.
The *multifrmCRC4LofAlarm* is not implemented for the ***E1***, ***1pE1V***, ***1pE1Mvp***, ***1pE1Mvpe***, ***4pE1Mvpe***, ***8pE1Atm***, ***E1C*** and ***4pE1Aal1*** cards.

Values
on
off

Default
off

### GROUP Lp Sdh Vc4 Vc12 E1 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common statistical data for a component in a digital hierarchy interface. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds since the port component was activated. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | The number of seconds that the port has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 erroredSec (es)

| | |
|---|---|
| Access | Read only |
| Description | An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | A severely errored framing second occurs when a second with one or more Out Of Frame events occurs. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | The total number of seconds that the interface is in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 bpvErrors (bpvErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of Bipolar Violations. A bipolar violation is an error in the alternate mark inversion pattern (AMI) on the line. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 crcErrors (crcErrors)

| | |
|---|---|
| Access | Read only |
| Description | If the interface is a DS1 line, it is the current count of CRC-6 errors. These will only be counted when the lineType is ESF. If the interface is an E1 line, it is the total number of CRC-4 errors. These will only be counted when crc4Mode is on. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 frmErrors (frmErrors)

| | |
|---|---|
| Access | Read only |
| Description | The current count of frame errors. A frame error is an error in the framing bits |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 losStateChanges (losChanges)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line lost signal. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 slipErrors (slipErrors)

| | |
|---|---|
| Access | Read only |
| Description | The total number of times that the line experienced a controlled frame slip. This attribute is incremented for ports on the voice cards (for example the 1pDS1V and the 1pE1V function processors) only. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Sdh Vc4 Vc12 E1 Channel (Chan)

| | |
|---|---|
| Instance | Decimal (0..31) |
| Groups | "GROUP Lp Sdh Vc4 Vc12 E1 Chan Provisioned (Prov)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan CustomerIdentifierData (CidData)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan IfEntryProv (IfEntry)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan OperationalStatus (OperStatus)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan OsiState (State)" |

| | |
|---|---|
| | "GROUP Lp Sdh Vc4 Vc12 E1 Chan Operational (Oper)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan AdminInfo (AdminInfo)" |
| Scope | Application |
| Description | *Channel*<br>The *Channel* component is configured to control a group of timeslots that form a fractional group on a DS1 or E1 port. Cell-based cards allow only one channel per port, and this is automatically provisioned with all available timeslots. |
| Opt. Subcomp. | "COMPONENT Lp Sdh Vc4 Vc12 E1 Chan AtmCell (Cell)"<br>"COMPONENT Lp Sdh Vc4 Vc12 E1 Chan TrunkConditioning (Tc)"<br>"COMPONENT Lp Sdh Vc4 Vc12 E1 Chan FrameLinkMonitoring (Flm)" |
| Dyn. Subcomp. | "COMPONENT Lp Sdh Vc4 Vc12 E1 Chan Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Lp Sdh Vc4 Vc12 E1 Chan Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisional data for a *Channel* component. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan timeslots (ts)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component. |

For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan timeslotDataRate (dataRate)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.<br><br>When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.<br><br>When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.<br><br>On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.<br><br>On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.<br><br>One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes. |
| Values | 56k<br>doNotOverride |
| Default | doNotOverride |

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan applicationFramerName

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute defines the link to the software stack. It defines which application is running on top of this hardware component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Lp Sdh Vc4 Vc12 E1 Chan CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Sdh Vc4 Vc12 E1 Chan IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Sdh Vc4 Vc12 E1 Chan OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Sdh Vc4 Vc12 E1 Chan OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine

operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan proceduralStatus (osiProc)

Access

Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. |

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is

present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Sdh Vc4 Vc12 E1 Chan Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Channel* component. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan actualChannelSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the measured link speed of the *Channel* component. |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | 0 |

### GROUP Lp Sdh Vc4 Vc12 E1 Chan AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

## COMPONENT Lp Sdh Vc4 Vc12 E1 Chan Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Sdh Vc4 Vc12 E1 Chan Test OsiState (State)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan Test Setup (Setup)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

## VERB START Lp Sdh Vc4 Vc12 E1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

## VERB STOP Lp Sdh Vc4 Vc12 E1 Chan Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

## GROUP Lp Sdh Vc4 Vc12 E1 Chan Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Sdh Vc4 Vc12 E1 Chan Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test. |

***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |

Default 1.00

## GROUP Lp Sdh Vc4 Vc12 E1 Chan Test Results (Results)

Properties Operational

Description This group contains all the statistics related attributes of the *Test* component.

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test causeOfTermination

Access Read only

Description This attribute indicates either the status of the test or the cause of the test's termination:

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission

errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

| | |

|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp Sdh Vc4 Vc12 E1 Chan AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Provisioned (Prov)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Operational (Oper)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* |

component appears under all port components running on ATM cards.

## GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioning attributes for the *AtmCell* component.

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell alarmActDelay (act)

Access: Read and write

Description: This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Values: Decimal (0..2000)

Units: msec

Default: No default

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell scrambleCellPayload (scramble)

Access: Read and write

Description: Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload.

This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Values
off
on

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell correctSingleBitHeaderErrors

Access
Read and write

Description
This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values
off
on

Default
off

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell clearDelay (clear)

Access
Read and write

Description
This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

| | |
|---|---|
| Values | Decimal (0..60) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell hecSampleInterval (hSample)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell hecErrorLimit (hLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* |

attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..50)

Units: msec

Default: No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell hecErrorIntervalLimit (hIntLimit)

Access: Read and write

Description: This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.

This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..25)

Default: 1

### GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes for the *AtmCell* component.

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell lcdAlarm (lcd)

Access: Read only

Description: This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also

| | |
|---|---|
| | happen when the *Path* or *Channel* component has been suspended since its parent has been locked. |
| Values | on<br>off |
| Default | off |

### GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero. |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell uncorrectableHeaderErrors (ucErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.<br><br>In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. |

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell receiveCellUtilization (rxutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell transmitCellUtilization (txutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

| | |
|---|---|
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Sdh Vc4 Vc12 E1 Chan TrunkConditioning (Tc)

| | |
|---|---|
| Groups | "GROUP Lp Sdh Vc4 Vc12 E1 Chan Tc Provisioned (Prov)"<br>"GROUP Lp Sdh Vc4 Vc12 E1 Chan Tc Operational (Op)" |
| Scope | Device |
| Description | *Lp/n Ds1/n Chan/n Tc*<br>*Lp/n E1/n Chan/n Tc*<br>*Lp/n Ds3/n Ds1/n Chan/n Tc*<br>*Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc*<br>*Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc*<br>*Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c*<br>*Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*<br><br>The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.<br><br>Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined. |

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

## GROUP Lp Sdh Vc4 Vc12 E1 Chan Tc Provisioned (Prov)

Properties: Provisioned

Description: This group contains all specific provisioning data for a *Tc* component.

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Tc replacementData (data)

Access: Read and write

Description: This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.

The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:
DS1 MUX Out Of Service Code = 0x1A
E1 MUX Out Of Service Code = 0xFF

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.

On the ***4pOC3ChSmIr*** and ***2pOC3ChSmIrVsp3*** cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***.

Values: Hex (H.0..H.ff)

Units: Hex

Default: No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Tc signalOneDuration (duration)

Access: Read and write

Description: This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.

If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.

The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds.

Values: Decimal (0..60)

Units: seconds

Default: 0

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Tc noServiceResponse (resp)

Access: Read and write

Description

This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available:

***autoConfigure*** - automatically configure the channels response.
***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction.
***ais*** - transmit AIS in the egress direction.
***noResponse*** - no response is sent in the egress direction.

A value of ***autoConfigure*** will result in TC being transmitted for all card types.

Values

autoConfigure
tc
ais
noResponse

Default

autoConfigure

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Tc signalOne (sigOne)

Access

Read and write

Description

This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.

For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.

Vector of

Decimal (0..1)

Index

Description: This group contains all specific operational data for an *Flm* component.

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Flm flmStatus (status)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of a Frame Relay channel on an E1 line. By combining the E1 channel-associated-signalling (CAS) A-bits status, and HDLC defect, a single value indicates the likely cause of the failure. This mechanism assumes that the far end equipment loops back signaling A-bits for some or all of the timeslots in a channel. The A-bits in channel are transmitted as ‘0’. If they are all received as ‘0’, it is assumed that the E1 link is up in both directions. The presence of HDLC frames indicates that the service is connected.<br><br>When A-bits and HDLC frames are correctly received, ***frameLinkUp*** is indicated.<br><br>When neither are received, ***frameLinkDown*** is indicated.<br><br>When HDLC frames are not receive but A-bits are not at fault, ***lossOfHdlc*** is indicated.<br><br>When HDLC frames are received, but there is a fault in any of timeslot’s A-bits on a channel ***lossOfAbit*** is indicated. |
| Values | notMonitoring<br>frameLinkUp<br>frameLinkDown<br>lossOfHdlc<br>lossOfAbit |
| Default | No default |

### VERB START Lp Sdh Vc4 Vc12 E1 Test

Impact — Service

Description — This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

### VERB STOP Lp Sdh Vc4 Vc12 E1 Test

Impact — Service

Description — This command stops a test running on the hardware component.

### GROUP Lp Sdh Vc4 Vc12 E1 Test OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in

use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp Sdh Vc4 Vc12 E1 Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test type (type)

Access
Read and write

Description
This attribute is the type of test to be run. The available test types include the following:
***card*** test sets up an internal loop on the board and runs a bit error rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.

***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

| | |
|---|---|
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting |

| | |
|---|---|
| | up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp Sdh Vc4 Vc12 E1 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

## ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.<br><br>a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.<br><br>a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.<br><br>Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on |

other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test frmTx

Access
Read only

Description
This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.

| | |
|---|---|
| | This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test elapsedTime

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp Sdh Vc4 Vc12 E1 Dsp

| | |
|---|---|
| Scope | Device |
| Description | *LogicalProcessor/n E1/0 Dsp*<br>The *Dsp* component presents the status of the Digital Signal Processors (DSPs) present on a voice card.<br>A voice card's *Dsp* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Dsp* components cannot be added or deleted. |
| Common Verbs | Help<br>List<br>Display |

### COMPONENT Lp Sdh Vc4 Vc12 E1 Audio

| | |
|---|---|
| Scope | Device |
| Description | *LogicalProcessor/n E1/0 Audio*<br>The *Audio* component presents the audio status of the channels on a voice card. |

A voice card's *Audio* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Audio* components cannot be added or deleted.

## GROUP Lp Sdh Om Provisioned (Prov)

Properties

Provisioned

Description

This group contains the provisioning data for the *OpticalModule* component.

## ATTRIBUTE Lp Sdh Om type

Access

Read and write

Description

This attribute specifies the expected optical module type. The values for the *type* and *insertedType* attributes must match; otherwise, an alarm is raised and the *OpticalModule* component is disabled.

***none***: This value indicates that no optical module type is specified..

***LX***: This value indicates that the optical module is a gigabit ethernet type using long wavelength laser devices over multimode and single-mode fiber.

***SX***: This value indicates that the optical module is a gigabit ethernet type using short wavelength laser devices over multimode fiber.

***OC3SmLr***: This value indicates that the optical module is an OC3 type using long wavelength laser devices over singlemode fiber.

***OC3SmIr***: This value indicates that the optical module is an OC3 type using intermediate wavelength laser devices over singlemode fiber.

***OC3MmSr***: This value indicates that the optical module is an OC3 type using short wavelength laser devices over multimode fiber.

Values
none
LX
SX
OC3SmLr
OC3SmIr
OC3MmSr

Default
none

## GROUP Lp Sdh Om OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component

which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Sdh Om adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE Lp Sdh Om operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the

component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Sdh Om usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp Sdh Om Operational (Oper)

Properties
Operational

Description
This group contains the operational data for the *OpticalModule* component.

### ATTRIBUTE Lp Sdh Om insertedType

Access
Read only

Description
This attribute indicates the inserted optical module type.

***none***: This value indicates that there is no optical module inserted to the card.

***LX***: This value indicates that the optical module is a gigabit ethernet type using long wavelength laser devices over multimode and single-mode fiber.

***SX***: This value indicates that the optical module is a gigabit ethernet type using short wavelength laser devices over multimode fiber.

***OC3SmLr***: This value indicates that the optical module is an OC3 type using long wavelength laser devices over singlemode fiber.

***OC3SmIr***: This value indicates that the optical module is an OC3 type using intermediate wavelength laser devices over singlemode fiber.

***OC3MmSr***: This value indicates that the optical module is an OC3 type using short wavelength laser devices over multimode fiber.

| | |
|---|---|
| Values | none<br>LX<br>SX<br>OC3SmLr<br>OC3SmIr<br>OC3MmSr |
| Default | none |

### ATTRIBUTE Lp Sdh Om serialNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the serial number of the inserted optical module. |
| Values | String (0..64, Extended ASCII) |
| Default | "" |

### ATTRIBUTE Lp Sdh Om failureCause

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the cause for the optical module's failure. The possible values are:<br><br>***typeMismatch***: This error indicates a mismatch between the *type* and *insertedType* attributes.<br><br>***internalError***: This error indicates an internal diagnostic failure of the optical module.<br><br>***unsupportedOm:*** This error indicates that the inserted optical module is not supported on this card.<br><br>***absentOm***: This error indicates that no optical module are currently present on this port.<br><br>***noFailure***: There is no failure. |
| Values | typeMismatch<br>internalError<br>unsupportedOm<br>absentOm<br>noFailure |
| Default | noFailure |

## COMPONENT Lp JT2

| | |
|---|---|
| Instance | Decimal (0..1) |
| Groups | "GROUP Lp JT2 CustomerIdentifierData (CidData)"<br>"GROUP Lp JT2 Provisioned (Prov)"<br>"GROUP Lp JT2 IfEntryProv (IfEntry)"<br>"GROUP Lp JT2 OperationalStatus (OperStatus)"<br>"GROUP Lp JT2 OsiState (State)"<br>"GROUP Lp JT2 Operational (Oper)"<br>"GROUP Lp JT2 Statistics (Stats)"<br>"GROUP Lp JT2 AdminInfo (AdminInfo)" |
| Scope | Device |
| Description | *Lp/n JT2/n*<br>The *JT2* component controls and monitors a JT2 port on a |

2pJ6MAtm Function Processor. Up to two ports may be provisioned on the 2pJ6MAtm interface card.

## GROUP Lp JT2 CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

## ATTRIBUTE Lp JT2 customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of

| | |
|---|---|
| | any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp JT2 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the JT2 specific provisioning data for a JT2 component. |

### ATTRIBUTE Lp JT2 clockingSource (clockingSource)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the source of the transmit clock for the JT2 line.<br>When the clocking source is selected from ***local***, the oscillator on the port generates the clocking for the line.<br>When the clocking source is selected from ***line***, the port synchronizes to the clock recovered from the incoming line signal.<br>When the clocking source is selected from ***module***, the port’s clock synchronizes to the clock provided by the oscillator on the active CP.<br>Note:- that when one port is set to ***local***, the other port must also be set to ***local***, and when one port is set to ***module***, the other port must also be set to ***module***. If one of the ports is set to ***line***, the other port must be set to ***otherPort***.<br>Also, if a CP reference clock is available when the JT2 component is added, the clocking source defaults to ***module***, whereas if a CP reference clock is not available when the component is added, the clocking source defaults to ***local***. |
| Values | local<br>line<br>module<br>otherPort |
| Default | No default |

### ATTRIBUTE Lp JT2 lineLength (length)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the line length for equalization calculations for the JT2 line. The range is between 0 and 480 feet (1 metre = 3.28 feet). |
| Values | Decimal (0..480) |
| Units | feet |
| Default | 0 |

### ATTRIBUTE Lp JT2 applicationFramerName

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the link to the software stack. It defines which application is running on top of the *JT2* component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Lp JT2 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp JT2 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp JT2 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp JT2 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp JT2 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp JT2 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific |

information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp JT2 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp JT2 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. |

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp JT2 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp JT2 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is

defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a

rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

### ATTRIBUTE Lp JT2 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp JT2 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp JT2 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms

may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

## ATTRIBUTE Lp JT2 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp JT2 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp JT2 Operational (Oper)

Properties
Operational

Description
This group contains the JT2 specific operational data for a JT2 component in a digital hierarchy interface.

### ATTRIBUTE Lp JT2 losAlarm (los)

Access
Read only

Description
This attribute displays whether a LOS (Loss of Signal) alarm state is entered. An LOS alarm state is entered when LOS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOS defect is declared at the JT2 line interface when the input data is zero for 20 - 32 clock cycles. If

the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
An LOS failure alarm is cleared when the LOS defect is absent for a period of 10 seconds +/- 0.5 seconds. The JT2 port goes into an *operationalState* of ***disabled*** for the duration of the LOS alarm condition. While the port is in the LOS alarm state, the port also transmits the far-end RAI defect indicator on the out-going JT2 line.

Values
on
off

Default
off

### ATTRIBUTE Lp JT2 lofAlarm (lof)

Access
Read only

Description
This attribute indicates whether a LOF (Loss of Frame) alarm state is entered. A LOF alarm state is entered when LOF defects are observed and accumulated for 2.5 seconds +/- 0.5 seconds or more. A LOF defect occurs when seven or more consecutive incorrect frame alignment patterns (4 multiframes) are received. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The LOF alarm is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds. The port goes into an *operationalState* of ***disabled*** for the duration of the LOF alarm condition. While the port is in the LOF alarm state, the node also transmits the far-end RAI defect indicator on the out-going JT2 line.

Values
on
off

Default
off

### ATTRIBUTE Lp JT2 rxAisPhysicalAlarm (rxAisPhys)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates whether a Physical AIS alarm state is entered. A Physical AIS alarm state is entered when a Physical AIS defect is observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A Physical AIS defect is declared when the incoming signal has two or less zeros in a sequence of 3,156 bits (0.5 ms). If the physical AIS defects are intermittently occurring, the physical AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>A Physical AIS alarm is cleared when the Physical AIS defect is absent for a period of 10 seconds +/- 0.5 seconds. The port goes into an *operationalState* of ***disabled*** until the AIS alarm condition is cleared. While the port is in the Physical AIS alarm state, the node also transmits the far-end RAI defect indicator on the out-going JT2 line. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp JT2 rxAisPayloadAlarm (rxAisPayld)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Payload AIS alarm state is entered. A Payload AIS alarm state is entered when a Payload AIS defect persists for a period of 2.5 seconds +/- 0.5 seconds. A Payload AIS defect is declared when the incoming signal of the 6312 kbit/s frame payload (TS1 - TS96) has two or less zeros in a sequence of 3,072 bits (0.5 ms). If the payload AIS defects are intermittently occurring, the payload AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>A Payload AIS failure alarm is cleared when the Payload AIS defect is absent for a period of 10 seconds +/- 0.5 seconds. The port goes into an *operationalState* of ***disabled*** until the AIS alarm condition is cleared. While the port is in the Payload AIS alarm state, the node also transmits the far-end RAI defect indicator on the out-going JT2 line. |

| | |
|---|---|
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp JT2 rxRaiAlarm (rxRai)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a Received RAI alarm state is entered. A received RAI alarm state is entered when the RAI signal is detected on the incoming JT2 Line (when 16 or more consecutive RAI patterns of 1111111100000000 are received on the 4 kbit/s data channel (m-bits) within the framing bits of the JT2 frame). The JT2 port goes into an *operationalState* of ***Disabled*** until the RAI alarm condition is cleared. The RAI alarm is cleared when four or more consecutive non-RAI patterns (anything other than 1111111100000000) are received. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp JT2 txAisPhysicalAlarm (txAisPhys)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an AIS (Alarm Indication Signal) alarm is being transmitted on the outgoing JT2 line. Currently the JT2 port only transmits a Physical AIS (no Payload AIS) on the outgoing JT2 line.<br>Since there is no Idle signal defined for JT2, the AIS signal is transmitted when the JT2 port is in the *operationalState* of ***locked.*** The AIS signal may also be transmitted for diagnostic testing. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp JT2 txRaiAlarm (txRai)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates whether an RAI defect indication pattern is being sent on the out-going JT2 line. The RAI alarm pattern is transmitted in the 4 kbit/s data channel (m-bits) when the port detects a LOS, AIS or LOF alarm condition. |
| Values | on<br>off |
| Default | off |

### GROUP Lp JT2 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical data for a JT2 component in a digital hierarchy interface. |

### ATTRIBUTE Lp JT2 runningTime (runningTime)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds since the JT2 component was activated and placed in an ***unlocked*** state or used for operational testing. All the other error counts that follow as well as each *JT2* subcomponent's error counts can be updated when this count is active. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp JT2 errorFreeSec (efs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of seconds that the JT2 port has been in an error free state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp JT2 erroredSec (es)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the total number of errored seconds for the JT2 port. An errored second is declared when a second with one or more Code Violation Error events, or one or more LOF or LOS defects occur. A code violation error may be a cyclic redundancy check (CRC) error or a bipolar violation (BPV) error. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp JT2 sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of severely errored seconds for the JT2 port. A severely errored second occurs when a second with 255 or more Code Violation Error events or one or more LOF or LOS defects occur. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp JT2 sevErroredFrmSec (sefs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of severely errored framing seconds for the JT2 port. A severely errored framing second occurs when a second with one or more Framing Errors occur. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp JT2 unavailSec

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of seconds that the interface has been in an unavailable state. An unavailable state occurs at the onset of 10 consecutive Severely Errored Seconds. When the unavailable state is entered, the 10 Severely Errored Seconds are immediately transfered to the count of unavailableSeconds by incrementing the count of unavailSec by |

| | |
|---|---|
| | 10 and decrementing the count of sevErroredSec by 10. Whilst in the unavailable state, an unavailableSecond is counted for each SES or SEFS that occurs, and the count of SES and SEFS are both inhibited. The unavailable state is cleared at the onset of 10 consecutive seconds which are not Severely Errored Seconds. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp JT2 bpvErrors (bpv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total count of bipolar violations (BPV). A bipolar violation is an error in the alternate mark inversion pattern (AMI) on the line. The value of this attribute will wrap to zero when it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp JT2 crcErrors (crcErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of cyclic redundancy check (CRC-5) errors detected on the incoming JT2 line. The value of this attribute will wrap to 0 when its maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE Lp JT2 frameErrors (frmErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Framing Errors that have occured on the JT2 port. A Framing Error is an error in the framing bits. The value of this attribute will wrap to 0 when its maximum value is reached. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp JT2 losStateChanges (losChanges)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of times that the incoming signal on the JT2 line has been lost. The value of this attribute will wrap to 0 when its maximum value is reached. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### GROUP Lp JT2 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp JT2 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp JT2 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### COMPONENT Lp JT2 Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp JT2 Test OsiState (State)"<br>"GROUP Lp JT2 Test Setup (Setup)"<br>"GROUP Lp JT2 Test Results (Results)" |
| Scope | Application |

| | |
|---|---|
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp JT2 Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp JT2 Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp JT2 Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp JT2 Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp JT2 Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp JT2 Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp JT2 Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

### ATTRIBUTE Lp JT2 Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

### ATTRIBUTE Lp JT2 Test type (type)

Access
Read and write

Description
This attribute is the type of test to be run. The available test types include the following:
***card*** test sets up an internal loop on the board and runs a bit error rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.

***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

## ATTRIBUTE Lp JT2 Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.

| | |
|---|---|
| | This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp JT2 Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp JT2 Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp JT2 Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp JT2 Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp JT2 Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

## GROUP Lp JT2 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

## ATTRIBUTE Lp JT2 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.<br><br>a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. |

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp JT2 Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp JT2 Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp JT2 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp JT2 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp JT2 Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp JT2 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp JT2 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp JT2 Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp JT2 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp JT2 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp JT2 AtmCell (Cell)

| | |
|---|---|
| Groups | "GROUP Lp JT2 Cell Provisioned (Prov)"<br>"GROUP Lp JT2 Cell Operational (Oper)"<br>"GROUP Lp JT2 Cell Statistics (Stats)" |
| Scope | Device |
| Description | The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display |

## GROUP Lp JT2 Cell Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning attributes for the *AtmCell* component. |

## ATTRIBUTE Lp JT2 Cell alarmActDelay (act)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs. |
| Values | Decimal (0..2000) |
| Units | msec |
| Default | No default |

## ATTRIBUTE Lp JT2 Cell scrambleCellPayload (scramble)

| | |
|---|---|
| Access | Read and write |
| Description | Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is |

scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Values
off
on

Default
No default

### ATTRIBUTE Lp JT2 Cell correctSingleBitHeaderErrors

Access
Read and write

Description
This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Values
off
on

Default
off

### ATTRIBUTE Lp JT2 Cell clearDelay (clear)

Access
Read and write

Description
This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

| | |
|---|---|
| Values | Decimal (0..60) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp JT2 Cell hecSampleInterval (hSample)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.<br>This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm. |
| Values | Decimal (0..25) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp JT2 Cell hecErrorLimit (hLimit)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the |

mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..250000)

Default: No default

### ATTRIBUTE Lp JT2 Cell lcdStateDelay (delay)

Access: Read and write

Description: This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..50)

Units: msec

Default: No default

### ATTRIBUTE Lp JT2 Cell hecErrorIntervalLimit (hIntLimit)

Access: Read and write

Description: This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next

instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, and 3pE3Atm.

Values: Decimal (1..25)

Default: 1

### GROUP Lp JT2 Cell Operational (Oper)

Properties: Operational

Description: This group contains the common operational attributes for the *AtmCell* component.

### ATTRIBUTE Lp JT2 Cell lcdAlarm (lcd)

Access: Read only

Description: This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the

*AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values
on
off

Default
off

### GROUP Lp JT2 Cell Statistics (Stats)

Properties
Operational

Description
This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

### ATTRIBUTE Lp JT2 Cell uncorrectableHeaderErrors (ucErr)

Access
Read only

Description
This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Values
Decimal (0..4294967295)

Default
0

### ATTRIBUTE Lp JT2 Cell sevErroredSec (ses)

Access
Read only

Description
This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect

HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Values: Decimal (0..4294967295)

Default: 0

### ATTRIBUTE Lp JT2 Cell receiveCellUtilization (rxutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Values: Decimal (0..100)

Units: %

Default: 0

### ATTRIBUTE Lp JT2 Cell transmitCellUtilization (txutil)

Access: Read only

Description: This attribute is the ratio of the number of valid, assigned cells transmitted on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen

| | |
|---|---|
| | when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*. |
| Values | Decimal (0..100) |
| Units | % |
| Default | 0 |

### ATTRIBUTE Lp JT2 Cell correctableHeaderErrors (cErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of correctable ATM cell header errors that have been detected and corrected. Counting of *correctableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected |
| Values | Decimal (0..4294967295) |
| Default | 0 |

## GROUP Lp Hssi Provisioned (Prov)

Properties Provisioned

Description This group contains the specific provisioning data for a *Hssi* component.

## ATTRIBUTE Lp Hssi linkMode (mode)

Access Read and write

Description This attribute defines the intended gender of the HSSI port. The actual gender of the port is determined by the hardware setup.

In ***dte*** mode, the *ta* line signal is driven as specified by the attribute *readyLineState* when the HSSI port passes its diagnostics. The *ta* line signal is then driven as specified by the attribute *dataTransferLineState* when the application is ready to transfer data. On the other hand, the input line signal *ca* is compared against those specified in the attributes *readyLineState* and *dataTransferLineState*. The application will be notified when the specified input line states are observed.

In ***dce*** mode, the ***Hssi*** component behaves similarly as when it is in ***dte*** mode. However, it will be driving the ***dce*** line signal ***(ca)*** and monitoring the ***dte*** line signal (*ta*) as specified by the attributes *readyLineState* and *dataTransferLineState*.

| | |
|---|---|
| Values | dte<br>dce |
| Default | dce |

### ATTRIBUTE Lp Hssi readyLineState (rls)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the line signal originating from the HSSI interface that will always be turned on, provided the HSSI interface passes it diagnostics. This set of signal is generally required for maintaining the connection. Note that both *dte* and *dce* signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the operational attribute *actualLinkMode.* See also *linkMode*. |
| Set of | ca<br>ta |
| Default | (ca, ta) |

### ATTRIBUTE Lp Hssi dataTransferLineState (dtls)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the line signals required to indicate that the external equipment is in a good state (that is, data transfer can proceed). Note that both ***dte*** and ***dce*** signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the operational attribute *actualLinkMode*. The value of this attribute must be a superset of that of the *readyLineState* attribute.<br>See also *linkMode*. |
| Set of | ca<br>ta |
| Default | (ca, ta) |

### ATTRIBUTE Lp Hssi lineSpeed (speed)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute defines the speed of the line for source clocking. This attribute is ignored if the interface is not providing a clock. Note that the actual clock rate are available in the operational attributes *actualTxLineSpeed* and *actualRxLineSpeed*. |
| Values | Decimal (1000000..50000000) |
| Units | bit/s |
| Default | 45000000 |

### ATTRIBUTE Lp Hssi applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains the component name of a *Framer* which is associated with the *Hssi* component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### GROUP Lp Hssi CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Hssi customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those |

| | |
|---|---|
| | components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Hssi AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Hssi vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Hssi commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Hssi IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Hssi ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Hssi ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Hssi OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Hssi snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

Default up

### GROUP Lp Hssi OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Hssi adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

### ATTRIBUTE Lp Hssi operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Hssi usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp Hssi availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)

migrating

Default

No default

### ATTRIBUTE Lp Hssi proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

No default

### ATTRIBUTE Lp Hssi controlStatus (osiCntrl)

Access
Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Lp Hssi alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Hssi standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Hssi unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Hssi Operational (Oper)

Properties
Operational

| | |
|---|---|
| Description | This group contains all specific operational data for a *Hssi* component. |

### ATTRIBUTE Lp Hssi actualLinkMode

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the actual link mode defined by the hardware. Note that the hardware overrides the provisionable data. The port behaves as a ***dce*** or ***dte*** according to the *actualLinkMode*. |
| Values | dte<br>dce |
| Default | No default |

### ATTRIBUTE Lp Hssi lineState

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the state of the interface signals. |
| Set of | ca<br>ta<br>tm<br>la<br>lb |
| Default | No default |

### ATTRIBUTE Lp Hssi actualTxLineSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the measured speed of the transmit clock. Note the reported transmit speed is in an error of +/- 10000 bit/s |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Lp Hssi actualRxLineSpeed

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute is the measured speed of the receive clock. Note the reported receive speed is in an error of +/- 10000 bit/s |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE Lp Hssi dataXferStateChanges

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the number of times that the line has entered or exited the data transfer state. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Hssi Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Hssi Test OsiState (State)"<br>"GROUP Lp Hssi Test Setup (Setup)"<br>"GROUP Lp Hssi Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V*35, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp Hssi Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp Hssi Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp Hssi Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Hssi Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Hssi Test operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Hssi Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Lp Hssi Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

## ATTRIBUTE Lp Hssi Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

## ATTRIBUTE Lp Hssi Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.<br>***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).<br>***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).<br>***pathBIP8Error*** tests path BIP 8 error generation and detection |

(B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

## ATTRIBUTE Lp Hssi Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

## ATTRIBUTE Lp Hssi Test frmPatternType (fpt)

Access
Read and write

Description
This attribute defines the type of data pattern generation to use.
The following lists the available pattern types:
***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.

***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.
***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.

Values: ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default: ccitt32kBitPattern

### ATTRIBUTE Lp Hssi Test customizedPattern (cp)

Access: Read and write

Description: This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.

Values: Hex (H.0..H.ffffffff)

Units: Hex

Default: H.55555555

### ATTRIBUTE Lp Hssi Test dataStartDelay (dsd)

Access: Read and write

Description: This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.
This attribute is ignored when the test *type* is set to ***externalLoop***.

Values: Decimal (0..1814400)

Units: seconds

Default: 0

### ATTRIBUTE Lp Hssi Test displayInterval (di)

Access: Read and write

| | |
|---|---|
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Hssi Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp Hssi Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp Hssi Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started. |

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values

testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning

| | |
|---|---|
| | hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp Hssi Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Hssi Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Hssi Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Hssi Test bitsRx

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Hssi Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Hssi Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Hssi Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Hssi Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Hssi Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Hssi Test timeRemaining

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

## COMPONENT Lp IlsForwarder (IlsFwdr)

| | |
|---|---|
| Instance | Decimal (0) |
| Groups | "GROUP Lp IlsFwdr Provisioned (Prov)"<br>"GROUP Lp IlsFwdr IfEntryProv (IfEntry)"<br>"GROUP Lp IlsFwdr OsiState (State)"<br>"GROUP Lp IlsFwdr OperationalStatus (OperStatus)"<br>"GROUP Lp IlsFwdr Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n IlsForwarder/0*<br>This component defines an instance of a IlsForwarder. At least one instance of this component must be provisioned if there is any *AtmMpe* component provisioned. |
| Subcomponents | "COMPONENT Lp IlsFwdr LanTest (Lt)"<br>"COMPONENT Lp IlsFwdr Test" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp IlsFwdr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data for *IlsForwarder* component. |

### ATTRIBUTE Lp IlsFwdr linkToTrafficSource

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains a list of components that are using this *IlsForwarder.* |
| List of | Link (Service, ilsForwarder) |
| List Size | 256 |
| Default | No default |

### GROUP Lp IlsFwdr IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp IlsFwdr ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp IlsFwdr ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

## GROUP Lp IlsFwdr OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp IlsFwdr adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Lp IlsFwdr operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp IlsFwdr usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp IlsFwdr OperationalStatus (OperStatus)

Properties
Operational

Description
This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

## ATTRIBUTE Lp IlsFwdr snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

## GROUP Lp IlsFwdr Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational frame statistics related attributes of the *IlsForwarder* component. |

## ATTRIBUTE Lp IlsFwdr framesReceived

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of frames that have been received by this card. This counter will wrap around after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Lp IlsFwdr processedCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames successfully processed by this card. This counter will wrap around after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Lp IlsFwdr errorCount

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of internal errors detected in transferring frames from an ATM card to this card. A continuous increment of this count indicates that the hardware may probably be defective. This counter will wrap around after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Lp IlsFwdr framesDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which are discarded due to local buffer congestion. This counter will wrap around after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

## COMPONENT Lp IlsFwdr LanTest (Lt)

| | |
|---|---|
| Groups | "GROUP Lp IlsFwdr Lt TestOp (Top)" |
| Scope | Device |
| Description | *Lp/n Fddi/n LanTest*, or<br>*Lp/n Ethernet/n LanTest*, or<br>*Lp/n TokenRing/n LanTest, or*<br>*Lp/n IlsForwarder/n LanTest*<br>The LanTest component is used to control testing on LAN interfaces. This includes LLC layer loopback, on-card loopback, SNMP required tests, and any testing to be done in the lab or manufacturing. |

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Lp IlsFwdr Lt FrameCompare (FrmCmp)"<br>"COMPONENT Lp IlsFwdr Lt FrameCopy (FrmCpy)"<br>"COMPONENT Lp IlsFwdr Lt PortConfig (PrtCfg)"<br>"COMPONENT Lp IlsFwdr Lt FrameBuild (Fb)"<br>"COMPONENT Lp IlsFwdr Lt Control (Cntl)" |
| Common Verbs | Help<br>List<br>Display |

### VERB Start Lp IlsFwdr Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to start a test as per the attributes set within each subcomponent of LanTest. |

### VERB Stop Lp IlsFwdr Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to stop a test. |

### VERB Reset Lp IlsFwdr Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to reset the LanTest component. |

### VERB Get Lp IlsFwdr Lt

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest component. This includes attributes set using the Set verb. |

### VERB Tlist Lp IlsFwdr Lt

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to an attribute. |

### GROUP Lp IlsFwdr Lt TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp IlsFwdr Lt tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp IlsFwdr Lt FrameCompare (FrmCmp)

| | |
|---|---|
| Groups | "GROUP Lp IlsFwdr Lt FrmCmp TestOp (Top)" |
| Scope | Device |
| Description | This component compares frames received from the hardware and emulator during testing. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp IlsFwdr Lt FrmCmp

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FrameCompare component. This includes attributes set using the Set verb. |

### VERB Tlist Lp IlsFwdr Lt FrmCmp

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp IlsFwdr Lt FrmCmp TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp IlsFwdr Lt FrmCmp tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp IlsFwdr Lt FrameCopy (FrmCpy)

| | |
|---|---|
| Groups | "GROUP Lp IlsFwdr Lt FrmCpy TestOp (Top)" |
| Scope | Device |
| Description | This component receives its input from FrameBuild and places it upon the hardware which sends it to the appropriate emulator. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp IlsFwdr Lt FrmCpy

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FrameCopy component. This includes attributes set using the Set verb. |

### VERB Tlist Lp IlsFwdr Lt FrmCpy

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp IlsFwdr Lt FrmCpy TestOp (Top)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp IlsFwdr Lt FrmCpy tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp IlsFwdr Lt PortConfig (PrtCfg)

| | |
|---|---|

|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational data for the LanPortTest component. |

### ATTRIBUTE Lp IlsFwdr Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following: card test sets up an internal loop on the board and runs a bit error rate test; manual test assumes the line is looped back externally and a bit error rate test is performed; localLoop test loops back the local modem and performs a bit error rate test; remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test; externalLoop test loops back the line to the far end; payloadLoop test only loops back the payload data received from the incoming line; Note that localLoop, remoteLoop and payloadLoop are not supported by all function processors. |
| Values | onCard<br>normal<br>wrapA<br>wrapB<br>thruA<br>thruB<br>extWrapA<br>extWrapB<br>extThruA<br>extThruB<br>extWrapAB<br>extWrapBA |
| Default | No default |

### ATTRIBUTE Lp IlsFwdr Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes. |
| Values | Decimal (4..4096) |
| Units | bytes |

| | |
|---|---|
| Default | 1024 |

### ATTRIBUTE Lp IlsFwdr Test duration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration (in minutes) that test data will be transmitted. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop. |
| Values | Decimal (1..30240) |
| Units | minutes |
| Default | 1 |

### GROUP Lp IlsFwdr Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the Test component. |

### ATTRIBUTE Lp IlsFwdr Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp IlsFwdr Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp IlsFwdr Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the reason the test is terminated. |
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning |
| Default | neverStarted |

### ATTRIBUTE Lp IlsFwdr Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp IlsFwdr Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp IlsFwdr Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received during the test period. This counter is not expected to reach its maximum |

| | |
|---|---|
| | value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp IlsFwdr Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp IlsFwdr Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of errored frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

## COMPONENT Lp InverseMultiplexerAtm (Ima)

| | |
|---|---|
| Instance | Decimal (0..113) |
| Groups | "GROUP Lp Ima Provisioned (Prov)"<br>"GROUP Lp Ima Operational (Oper)"<br>"GROUP Lp Ima Statistics (Stats)"<br>"GROUP Lp Ima CustomerIdentifierData (CidData)"<br>"GROUP Lp Ima OsiState (State)" |
| Scope | Device |

Description

*Lp/n InverseMultiplexerAtm/n*
*Lp/n Ds3/n InverseMultiplexerAtm/n*

This component is used to define an inverse multiplexing for ATM (IMA) group. IMA provides a data rate greater than DS1 E1 in increments of DS1 E1. To use IMA on an 8pDS1E1, MSA32, or 2pSTM1eCh function processor, add an *Lp/n InverseMultiplexerAtm/n* component. To use IMA on a 4pDS3ChAtm function processor, add an *Lp/n Ds3/n InverseMultiplexerAtm/n* component.

The instance range 0..7 applies to 8pDS1Atm and 8pE1Atm cards. The instance range 0..13 applies to 4pDS3ChAtm cards. The instance range 0..29 applies to MSA32 cards. The instance range 0..113 applies to 2pStm1eCh cards.

The instance number of an *IMA* group must not be the same as the instance number of a *DS1*/*E1* “ATM UNI port” under the same *Lp*. An “ATM UNI port” is a *DS1* or *E1* component with a single *Chan* whose *applicationFramer* attribute is linked to an *AtmIf* component. On an MSA32 card, ports that are used as IMA links have two immiscible sub-ranges: 0..15 and 16..31. The instance number of an *IMA* group must be in the same sub-range as all of its ports. IMA sub-ranges also exist on a 2pStm1eCh card, instances 0..56 are allowed on port SDH 0, and instances 57..113 are allowed on port SDH 1.

## GROUP Lp Ima Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Ima* component.<br>The default values of *linkSelectionCriterion* and *linkRetryTimeout* depend on card type. |

## ATTRIBUTE Lp Ima linkSelectionCriterion (select)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the method to be used by the IMA group when selecting links to be activated. This comes into effect only when the configured links do not respect the maximum differential delay (otherwise all links are accepted).<br><br>If ***leastDelay*** is chosen, first the link having the smallest delay is selected as the reference link. The IMA group includes all links which respect the maximum differential delay relative to the reference link.<br><br>If ***maxBandwidth*** is chosen, the IMA group selects the maximum possible number of links, with each selected link respecting the maximum differential delay relative to every other selected link. When more than one possibility exists, the combination which offers the least delay is selected.<br><br>The default value for Multi-Service Access cards is ***leastDelay***, and for all other cards is ***maxBandwidth***. On Multi-Service Access cards ***leastDelay*** is the only acceptable provisionable value. |
| Values | leastDelay<br>maxBandwidth |
| Default | No default |

## ATTRIBUTE Lp Ima maxDiffDelay (delay)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the maximum differential delay between links acceptable in the IMA group. If a link violates that maximum differential delay, it will not be active in the IMA group and an alarm will be generated.<br><br>For the 4pDS3ChAtm card, the value must not exceed 70. |
| Values | Decimal (1..100) |
| Units | msec |
| Default | 25 |

### ATTRIBUTE Lp Ima linkRetryTimeout (retry)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the amount of time before reactivation of a link is attempted after it recovers from a failure condition.<br><br>The default value for Multi-Service Access cards is ***1***, and for all other cards is ***10***. On Multi-Service Access cards ***1*** is the only acceptable provisionable value. |
| Values | Decimal (0..1000) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lp Ima applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the link to the *AtmIf* component using the *Ima*. An example is *AtmIf/31*. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### ATTRIBUTE Lp Ima transmitClockMode (clock)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the transmit clocking mode.<br>If ***itc*** (Independent Transmit Clock) is chosen, the physical ports used by the IMA group may have different clocking sources.<br>If ***ctc*** (Common Transmit Clock) is chosen, it is recommended that the physical ports used by the IMA group have the same clocking source. However, if the physical ports have different clocking sources, the operator should ensure that all the clocking sources have the same rate. |
| Values | itc<br>ctc |
| Default | itc |

### ATTRIBUTE Lp Ima protocol (prot)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies which IMA protocol the component should run.<br>If ***atmForum10*** is chosen, the ATM Forum's IMA protocol (version 1.0) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA also uses the ATM Forum's IMA protocol 1.0. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used.<br>If ***atmForum11*** is chosen, the ATM Forum's IMA protocol (version 1.1) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA uses the ATM Forum's IMA protocol 1.0 or 1.1. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used. If the far end is 1.0, then the near end downgrades to 1.0. After the downgrade, this attribute continues to specify the provisioned protocol version, while the *activeProtocol* operational attribute of the IMA component specifies the protocol version effectively running.<br>If ***proprietary*** is chosen, Nortel’s proprietary IMA protocol will be used. The IMA group will come up only if the far end IMA also uses Nortel’s proprietary IMA protocol. This IMA group will not inter-operate with IMA implementations from other vendors. Feature ***ima*** must be provisioned on the LP for this protocol to be |

used.

The DEFAULT on 2pStm1eCh function processor is atmForum11.

Values: atmForum10
proprietary
atmForum11

Default: No default

### GROUP Lp Ima Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *Ima* component.

### ATTRIBUTE Lp Ima failureCause (cause)

Access: Read only

Description: This attribute indicates the cause of the current local end failure experienced by the IMA group. The failure may have occurred during a start-up procedure or during normal operation. Possible values are:
***noFailure***: no local end failure.
***noGoodLinksInStartup***: no good links were available during IMA start-up.
***badGidInStartup***: during start-up, different group identifiers (GIDs) were received on the links.
***badLidInStartup***: during start-up, duplicate link identifiers (LIDs) were received on the links.
***unsupportedFrameLengthInStartup***: during start-up, an unsupported frame length was received.
***timeoutInStartup***: a time-out has occurred during start-up.
***noGoodLinks***: no good links are available in the IMA group.
***remoteFailure***: the far end is down.
***unsupportedSymmetryInStartup***: the symmetry proposed by the far end is not supported on the near-end. This value will occur when the IMA group is running the ATM Forum protocol and the far end is proposing a group symmetry other than “symmetric configuration and operation”.

***unsupportedVersionInStartup***: the ima version proposed by the far end is not supported on the near-end.

Values

noFailure
noGoodLinksInStartup
badGidInStartup
badLidInStartup
unsupportedFrameLengthInStartup
timeoutInStartup
noGoodLinks
remoteFailure
unsupportedSymmetryInStartup
unsupportedVersionInStartup

Default

No default

## ATTRIBUTE Lp Ima remoteDefect (remDef)

Access

Read only

Description

This attribute indicates the cause of the current far end defect experienced by the IMA group.
For the ATM Forum IMA protocol, possible values are:
***noDefect***: no defect.
***unsupportedFrameLengthInStartup***: during the far end's start-up, an unsupported frame length was received.
***unsupportedSymmetryInStartup***: during the far end's start-up, an unsupported symmetry configuration was received.
***otherAbortStartup***: the far end has aborted its start-up for another reason. This could be because different Gids were received on the links or if duplicate link identifiers (LIDs) were received.
***insufficientLinks***: the far end does not have sufficient links active. This value will be displayed if the far end IMA group is locked.
***blocked***: the far end IMA group is blocked.

For the proprietary IMA protocol, possible values are:
***noDefect***: no defect.
***noGoodLinksInStartup***: no good links were available during the far end’s start-up.
***badGidInStartup***: during the far end’s start-up, different GIDs were received on the links.

***badLidInStartup***: during the far end's start-up, duplicate link identifiers (LIDs) were received on the links.
***unsupportedFrameLengthInStartup***: during the far end's start-up, an unsupported frame length was received.
***timeoutInStartup***: a time out has occurred during the far end's start-up.
***noGoodLinks***: no good links are available in the far end IMA group.
***blocked***: the far end IMA group is locked.
***unsupportedVersionInStartup***: the ima version proposed by the far end is not supported on the near-end.

Values

noDefect
noGoodLinksInStartup
badGidInStartup
badLidInStartup
unsupportedFrameLengthInStartup
timeoutInStartup
noGoodLinks
locked
unsupportedSymmetryInStartup
otherAbortStartup
insufficientLinks
blocked
unsupportedVersionInStartup

Default

No default

### ATTRIBUTE Lp Ima remoteLidsConfig (remConf)

Access

Read only

Description

This attribute indicates all the links which have been configured in the remote IMA group. For example, if links 1, 3 and 5 have been configured in the remote IMA group, this attribute would contain ***1 3 5***.

Set of

Decimal (0..31)

Default

No default

### ATTRIBUTE Lp Ima remoteLidsActive (remAct)

Access

Read only

| | |
|---|---|
| Description | This attribute indicates all the links which are active in the remote IMA group. For example, if links 1 and 5 are active in the remote IMA, this attribute would contain ***1 5***. |
| Set of | Decimal (0..31) |
| Default | No default |

### ATTRIBUTE Lp Ima cellCapacity (cap)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total cell capacity (in cells per second) which is provided to the ATM layer. This cell capacity takes into account the physical and IMA level overheads. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |
| Default | No default |

### ATTRIBUTE Lp Ima remoteGid (remGid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IMA group identifier (GID) used by the remote IMA. A value of 0 will be displayed if the group is not receiving IMA Control Protocol (ICP) cells.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE Lp Ima clockingModeMismatch (mismatch)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether or not both ends of the IMA group are using the same transmit clocking mode (***itc***/***ctc***). Its value will be ***yes*** if both ends are not using the same transmit clocking mode. A clocking mode mismatch does not prevent an IMA group from coming up and can be corrected by using the same clocking mode at both ends. |

| | |
|---|---|
| | This attribute will always have a value of ***no*** if the *protocol* for the IMA group is ***proprietary***. |
| Values | no<br>yes |
| Default | No default |

### ATTRIBUTE Lp Ima activeProtocol (activeProt)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates which IMA protocol the *Ima* component is effectively running.<br>This attribute is supported on the 8pDs1Atm, 8pE1Atm, 4pDS3ChAtm, and 2pStm1eCh cards. This attribute is not supported on the MSA32 cards.<br>The value of this attribute is the same as the provisioned *protocol* attribute if the IMA is operating at the provisioned protocol version. The value of this attribute indicates the dongraded protocol version if the IMA has gone through a protocol version downgrade upon IMA 1.1 to IMA 1.0 interworking. |
| Values | atmForum10<br>proprietary<br>atmForum11 |
| Default | No default |

### GROUP Lp Ima Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the *Ima* component. |

### ATTRIBUTE Lp Ima runningTime (running)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time (in seconds) for which the *Ima* component has been in the unlocked state or has been used for operational testing. |
| Values | Decimal (0..4294967295) |
| Units | seconds |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Ima unavailSec (unavail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of one second intervals during which the *Ima* component has been unlocked and out of service. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima failures (fail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of complete failures, during start-up or normal operation, that the *Ima* component has experienced since being added. It must be noted that a service degradation, such as 1 of the 3 links in an IMA group being down, is not counted as a failure. If an *Ima* component is in a failure loop and does not come up, this count will only increase by 1. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima receiveCellUtilization (rxutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ratio of the number of valid, assigned user cells received on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.<br><br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Ima transmitCellUtilization (txutil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ratio of the number of user cells transmitted on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.<br><br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### GROUP Lp Ima CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Ima customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager |

(referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Values — Decimal (0; 1..8191)

Default — 0

### GROUP Lp Ima OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Ima adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Ima operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Ima usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp Ima availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Lp Ima proceduralStatus (osiProc)

Access

Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.<br><br>The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***. |
| Set of | initializationRequired (initRq)<br>notInitialized (notInit)<br>initializing (init)<br>reporting (report)<br>terminating (term) |
| Default | No default |

### ATTRIBUTE Lp Ima controlStatus (osiCntrl)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Lp Ima alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. |

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Ima standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not

supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Ima unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

## COMPONENT Lp Ima Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Ima Test OsiState (State)"<br>"GROUP Lp Ima Test Setup (Setup)"<br>"GROUP Lp Ima Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

## VERB START Lp Ima Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

## VERB STOP Lp Ima Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

## GROUP Lp Ima Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp Ima Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Lp Ima Test operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Lp Ima Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Ima Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp Ima Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Ima Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error |

rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

### ATTRIBUTE Lp Ima Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Ima Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Ima Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Ima Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Ima Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Ima Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |

| | |
|---|---|
| Default | 1.00 |

### GROUP Lp Ima Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp Ima Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.<br><br>a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission |

errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp Ima Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp Ima Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ima Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ima Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ima Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ima Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp Ima Test erroredFrmRx

Access: Read only

Description: This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp Ima Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable

| | |
|---|---|
| | test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Ima Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Ima Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp Ima Link (Lk)

| | |
|---|---|
| Instance | Decimal (0..31) |
| Groups | "GROUP Lp Ima Lk Provisioned (Prov)"<br>"GROUP Lp Ima Lk Operational (Oper)"<br>"GROUP Lp Ima Lk Statistics (Stats)"<br>"GROUP Lp Ima Lk OsiState (State)" |
| Scope | Device |
| Description | *Lp/n Ima/n Link/n*<br>*Lp/n Ds3/n Ima/n Link/n* |

This component is used to define a DS1/E1 link belonging to an IMA group. The instance number of the *Link* subcomponent corresponds to the link identifier (LID) used by the link in IMA Control Protocol (ICP) cells. To use Ima on an 8pDS1E1 function processor, add *Lp/n Ima/n Link/n*. To use Ima on a 4pDS3ChAtm function processor, add *Lp/n Ds3/n Ima/n Link/n*.

Common Verbs

DELete

## GROUP Lp Ima Lk Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for the *Link* subcomponent.

## ATTRIBUTE Lp Ima Lk interfaceName

Access: Read and write

Criticality: Component

Description: This attribute associates the *Link* subcomponent with a specific interface on a function processor, for example *Lp/5 E1/3 Chan/0*. If IMA groups and independent links coexist on a card running IMA and per-VC queueing is enabled, plan the selection of DS1 or E1 ports to be used by the IMA group carefully. For a 4pDS3ChAtm function processor there is no per-VC queueing.

Values: Link (Hardware, applicationFramerName)

Default: No default

## GROUP Lp Ima Lk Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *Link* subcomponent.

## ATTRIBUTE Lp Ima Lk failureCause (cause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the failure cause on this link. Possible values are:<br>***noFailure***: there is no failure on this link.<br>***interfaceDown***: the physical port used by the link is down.<br>***lif***: the link is in loss of IMA frame (LIF) state.<br>***lods***: the link is in loss of delay synchronization (LODS) state; that is, it has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group. It must be noted that hysteresis is used for the LODS condition.<br>***protocolError***: the link is down because of a time-out or because bad values are being received in IMA Control Protocol (ICP) cells.<br>***remoteFailure***: the far end link is down.<br>***misconnected***: the link is down because the IMA group has declared, after using its transmit test pattern procedure, that this link is not properly connected. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***<br>***unsupportedFrameLength***: the link is down because it is receiving from the far end a frame length which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***<br>***unsupportedSymmetry***: the link is down because it is receiving from the far end a group symmetry which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***<br>***noIcp***: the link is down because it is not receiving IMA Control Protocol (ICP) cells. This value can occur only if the *protocol* for the IMA group is ***atmForum10***.<br>***unsupportedVersion***: the link is down because it is receiving from the far end a group version that is not supported by the local IMA group. |
| Values | noFailure<br>interfaceDown<br>lif<br>lods<br>protocolError<br>remoteFailure |

| | |
|---|---|
| | misconnected<br>unsupportedFrameLength<br>unsupportedSymmetry<br>noIcp<br>unsupportedVersion |
| Default | No default |

### ATTRIBUTE Lp Ima Lk remoteDefect (remDef)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IMA remote defect indicator (RDI) currently being received on this link. Possible values are:<br>***noDefect***: no defect.<br>***physicalLayerDefect***: the interface used by the remote link has a physical layer defect. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***<br>***interfaceDown***: the physical interface used by the remote link is down.This value can occur only if the *protocol for the IMA group is* ***proprietary.***<br>***lif***: the remote link has a loss of IMA frame (LIF) defect.<br>***lods***: the remote link has a loss of delay synchronization (LODS) defect; that is, it has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group. |
| Values | noDefect<br>interfaceDown<br>lif<br>lods<br>physicalLayerDefect |
| Default | No default |

### ATTRIBUTE Lp Ima Lk remoteLid (remLid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the link identifier (LID) used by the remote IMA group on the physical link. A value of 0 will be displayed if the link is not receiving IMA Control Protocol (ICP) cells or if the physical layer is down. |

| | |
|---|---|
| Values | Decimal (0..31) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk relativeDelay (rel)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the latest measured differential delay (rounded up in milliseconds) between this link and the link, in the same IMA group, having the least delay. A value of 4294967295 indicates that the relative delay could not be measured. This can be due to physical layer problems or to no IMA Control Protocol (ICP) cells being received on the link. |
| Values | Decimal (0..4294967295) |
| Units | msec |
| Default | No default |

### ATTRIBUTE Lp Ima Lk lastOifCause (oif)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cause of the last out of IMA frame (OIF) anomaly on the link. It will always have a value of ***noOif*** if the *protocol* for the IMA group is ***proprietary***.<br>Possible values are:<br>***noOif***: no OIF was detected.<br>***badFrameLength***: an IMA Control Protocol (ICP) cell with an unexpected frame length was received.<br>***badGid***: an ICP cell with an unexpected group identifier (GID) was received.<br>***badLid***: an ICP cell with an unexpected link identifier (LID) was received.<br>***badOffset***: an ICP cell with an unexpected cell offset was received.<br>***badSequenceNumber***: an ICP cell with an unexpected frame sequence number was received.<br>***stuffError***: an illegal stuffing sequence was received.<br>***missingIcp***: an expected ICP cell was not received.<br>***unexpectedIcp***: an unexpected ICP cell was received.<br>***erroredIcp***: two consecutive errored ICP cells were received. |

***noCells***: no cells are being received on the link.
***idleCell***: an idle cell was received on the link.
***badOamLabel***: an ICP cell with an unexpected oam label was received.

Values
noOif
badFrameLength
badGid
badLid
badOffset
badSequenceNumber
stuffError
missingIcp
unexpectedIcp
erroredIcp
noCells
idleCell
badOamLabel

Default: No default

### GROUP Lp Ima Lk Statistics (Stats)

Properties: Operational

Description: This group contains the statistics data for the *Link* subcomponent.

### ATTRIBUTE Lp Ima Lk runningTime (running)

Access: Read only

Description: This attribute counts the length of time (in seconds) for which the *Link* component has been running.

Values: Decimal (0..4294967295)

Units: seconds

Default: No default

### ATTRIBUTE Lp Ima Lk unavailSec (unavail)

Access: Read only

| | |
|---|---|
| Description | For an IMA group whose *protocol* is ***atmForum10***, this attribute counts the number of unavailable seconds. Unavailability begins at the start of 10 contiguous severely errored seconds (SES) and ends at the start of 10 contiguous seconds with no SES.<br>For an IMA group whose *protocol* is ***proprietary***, this attribute counts the number of one second intervals during which the *Link* component has been out of service. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk failures (fail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of failures, during link addition or normal operation, that the link has experienced. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk unusableSec (uus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of one second intervals during which the near end has been in an unusable state.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk sevErroredSec (ses)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of one second intervals in which at least 30 percent of the IMA Control Protocol (ICP) cells were counted as ICP violations or at least one link defect (physical layer, LIF and LODS defects) was detected. This attribute will not increment during UAS (Unavailable Second) conditions. |

| | |
|---|---|
| | This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk farEndUnusableSec (feUus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of one second intervals during which the “Tx/Rx Unusable” condition has been received from the far end.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk farEndSevErroredSec (feSes)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of one second intervals containing one or more RDI defects. This attribute will not increment during FEUAS (Far-End Unavailable Second) conditions.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk farEndUnavailSec (feUnavail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of unavailable seconds at the far end. Unavailability begins at the start of 10 contiguous severely errored seconds (SES) at the far end and ends at the start of 10 contiguous seconds at the far end with no SES.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk icpViolations (iv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of errored, invalid or missing IMA Control Protocol (ICP) cells during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions. This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk txStuffEvents (txStuff)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Stuff events transmitted during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk rxStuffEvents (rxStuff)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Stuff events received during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Ima Lk idleCellSec (idle)

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the number of one second intervals during which one or more idle cells was received. The reception of idle cells is an abnormal condition which could be caused by the remote IMA using the Common Transmit Clock mode with ports whose clock sources are not synchronized.<br>This attribute will always have a value of 0 if the *protocol for the IMA group is* ***proprietary.*** |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Lp Ima Lk OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Ima Lk adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. |

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Ima Lk operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Ima Lk usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp Ima Lk availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Lp Ima Lk proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE Lp Ima Lk controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp Ima Lk alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Ima Lk standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default notSet

### ATTRIBUTE Lp Ima Lk unknownStatus (osiUnknw)

Access Read only

Description This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values false
true

Default false

### COMPONENT Lp Engineering (Eng)

Scope Device

Description *Lp Engineering*
This component has various subcomponents which hold engineering/control parameters and corresponding indicator statistics for this LP. The subcomponents can be defined for selected services or be common to a number of services.

This component has no data of its own.

Description "COMPONENT Lp Eng DataStream (Ds)"
"COMPONENT Lp Eng FrameRelaySystem (Frs)"
"COMPONENT Lp Eng HuntGroupService (Hgs)"
"COMPONENT Lp Eng AtmResourceControl (Arc)"
"COMPONENT Lp Eng FrameCoreResourceControl (Fcrc)"
"COMPONENT Lp Eng AtmPathTrace (PTrace)"
"COMPONENT Lp Eng ActiveAlarmList (AAList)"

| Opt. Subcomp. | "COMPONENT Lp Eng Ds Override (Ov)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Eng Ds Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for the *DataStream* components under *Lp Engineering*. |

## ATTRIBUTE Lp Eng Ds agentQueueSize (agentQ)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum size of the DCS Agent queue size maximum for a DCS data stream on the LP. It is the maximum size to which the *Agent*'s *currentQueueSize* can grow. When the queue is full and more data is offered to the *Agent*, it will be discarded. |

The following are the system defaults (in number of records):
- alarm: 100
- accounting: 10000
- debug: 0
- log: 50
- scn: 200
- trap: 50
- stats: 0
- rtStats: 0
- applicationSpecific: 200

To override the system defaults, see *Lp Eng Ds Ov*'s *agentQueueSize* attribute.

Values: Decimal (0..4294967295)

Default: No default

## COMPONENT Lp Eng Ds Override (Ov)

Groups: "GROUP Lp Eng Ds Ov Provisioned (Prov)"

Scope: Device

Description: *Lp Eng Ds/<type> Override*
This component holds provisionable engineering parameters used by DCS on this LP for a particular DCS stream.

Common Verbs:
Help
List
Display
Add
DELete

## GROUP Lp Eng Ds Ov Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisionable attributes for the *DataStream Ov* components under *Lp Engineering*.

## ATTRIBUTE Lp Eng Ds Ov agentQueueSize (agentQ)

Access: Read and write

Description

This attribute specifies the maximum size of the DCS Agent's queue for this data stream on this LP. For more details on the defaults and other information, refer to the parent component's *agentQueueSize* attribute.
The size should be set to 0 if absolutely no data is to be accepted from applications. There are threshold alarms based on the value of the Agent's *currentQueueSize* attribute (a Set when the queue becomes 75% full and a Clear after dropping back to 50% full). To properly determine what to set this to, consult the "Magellan Passport Engineering Notes and Guidelines".

Values: Decimal (0..4294967295)

Default: No default

## COMPONENT Lp Eng FrameRelaySystem (Frs)

Groups: "GROUP Lp Eng Frs Operational (Oper)"

Scope: Device

Description: *Lp Eng FrameRelaySystem*
This component holds engineering parameters and statistics used by Frame Relay on this LP.

Opt. Subcomp.: "COMPONENT Lp Eng Frs Override (Ov)"

Common Verbs:
- Help
- List
- Display
- Add
- DELete

## GROUP Lp Eng Frs Operational (Oper)

Properties: Operational

Description: This group contains the Frame Relay default or current engineering parameters and statistics for this LP.

## ATTRIBUTE Lp Eng Frs maxCalls

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the maximum number of Frame Relay (FR) calls of any type (PVC, SPVC, or SVC) which can be simultaneously “current” on the LP. Note that “current” doesn’t necessarily mean that the call is in data transfer. It minimally means that such a call can subsequently generate accounting records. When the value of *currentCalls* reaches the value of *maxCalls* for FR on this LP, subsequent call attempts are rejected by the FR service. |
| Values | Decimal (0..1000000) |
| Default | 1000000 |

### ATTRIBUTE Lp Eng Frs headroomCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates a number which allows a network engineer to do some statistical multiplexing for admitting calls when certain overload conditions are reached. For setting this, refer to the Engineering Guidelines. It depends on conditions such as the expected sustained SVC call setup/clear rates and how conservative one wants to be in certain “error” conditions where many calls are cleared simultaneously. |
| Values | Decimal (0..1000000) |
| Default | 1000000 |

### ATTRIBUTE Lp Eng Frs currentCalls

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of Frame Relay calls (initially just FrUni and FrNni) which are “current”. Note that “current” doesn’t necessarily mean that the call is in data transfer. It minimally means that such a call can subsequently generate accounting records. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eng Frs callsRefused

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of call connections (including calls from the link as well as calls from the subnet) that have been refused because *currentCalls* has reached the limits, as specified by the engineering formulas for *Frs* on this LP. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Lp Eng Frs Override (Ov)

| | |
|---|---|
| Groups | "GROUP Lp Eng Frs Ov Provisioned (Prov)" |
| Scope | Device |
| Description | *Lp Eng Frs Override*<br>This component holds provisionable engineering parameters used by Frame Relay on this LP. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp Eng Frs Ov Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the Frame Relay provisionable engineering parameters for this LP. |

### ATTRIBUTE Lp Eng Frs Ov maxCalls

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of Frame Relay calls of any type (PVC, SPVC, or SVC) which can be simultaneously “current” on this LP. Note that “current” doesn’t necessarily mean that the call is in data transfer. It minimally |

means that such a call can subsequently generate accounting records. When the value of *currentCalls* reaches the value of *maxCalls* for FR on this LP, subsequent call attempts are rejected by the FR services.

Values: Decimal (0..1000000)

Default: 1000000

### ATTRIBUTE Lp Eng Frs Ov headroomCalls

Access: Read and write

Description: This attribute specifies a number which allows a network engineer to do some statistical multiplexing for admitting calls when certain overload conditions are reached. For setting this, refer to the Engineering Guidelines. It depends on conditions such as the expected sustained SVC call setup/clear rates and how conservative one wants to be in certain “error” conditions where many calls are cleared simultaneously.

Values: Decimal (0..1000000)

Default: 1000000

### COMPONENT Lp Eng HuntGroupService (Hgs)

Groups: "GROUP Lp Eng Hgs Operational"

Scope: Device

Description: *Lp Eng HuntGroupService*
The *HuntGroupService* component contains engineering statistics for all hunt groups on the FP.

Common Verbs:
Help

DELete

### GROUP Lp Eng Hgs Operational

Properties: Operational

| | |
|---|---|
| Description | The *Operational* group contains attributes for all hunt groups on the LP. |

### ATTRIBUTE Lp Eng Hgs huntGroups

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of hunt groups provisioned on the LP. |
| Values | Decimal (0..65535) |
| Default | 0 |

### ATTRIBUTE Lp Eng Hgs huntAttempts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of hunt attempts made by all hunt groups. The count includes both initial and subsequent hunt attempts. Individual hunt groups maintain this counter within the *huntAttempts* attribute of the *Hg/n* component. This counter wraps to 0 when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### COMPONENT Lp Eng AtmResourceControl (Arc)

| | |
|---|---|
| Groups | "GROUP Lp Eng Arc Operational (Oper)" |
| Scope | Device |
| Description | *Lp/n Eng AtmResourceControl*<br>This component describes the usage of ATM-specific resources on an FP running ATM services. This component is always dynamically created under any *LP Eng* which supports an FP. |

| | |
|---|---|
| Opt. Subcomp. | "COMPONENT Lp Eng Arc Override (Ov)" |
| Opt. Subcomp. | "COMPONENT Lp Eng Arc Cqc (Cqc)"<br>"COMPONENT Lp Eng Arc Aqm (Aqm)"<br>"COMPONENT Lp Eng Arc Apc (Apc)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Eng Arc Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group describes the usage of ATM-specific resources on a Logical Processor running ATM services.<br>The attributes listed represent Queue Controller resource usage for all ATM cards (CQC for CQC based cards and PQC for ATM IP cards). |

## ATTRIBUTE Lp Eng Arc multicastBranchesAvailable (mcastAvail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of available multicast branches for unspared *AtmIf*s on this FP. |
| Values | Decimal (0..16384) |
| Default | No default |

## ATTRIBUTE Lp Eng Arc multicastBranchesUsage (mcastUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of multicast branches that are in use on this FP for unspared *AtmIf*s. |
| Values | Decimal (0..16384) |

Default No default

### ATTRIBUTE Lp Eng Arc txCellMemoryAllocation (txCell)

Access Read only

Description This attribute indicates the fraction of the transmit memory which is allocated for the transmission of cells on the FP. Cell memory is used for ATM Bearer Services, ATM SVCs and ATM PVCs.

The remaining transmit memory is allocated for the transmission of frames. Frame memory is used for trunks, ATM VCC testing and for inter-card communication.

This attribute is not available on APC-based and QRD-based FPs. On APC-based and QRD-based FPs, Tx cell memory is completely separated among individual ports.

Values Decimal (1..99)

Units %

Default No default

### ATTRIBUTE Lp Eng Arc txCellMemoryCongestionState (txCellCong)

Access Read only

Description This attribute indicates the congestion state of the transmit cell memory for this FP.

This attribute indicates which *txCellMemoryThresholds* corresponds to the current value of *txCellMemoryUsage*. The congestion state is used to determine if cells of a particular discard priority (DP) are discarded before being queued for transmit.

The congestion state of transmit cell memory is indicated by a numeric value ranging from 3 to 0. When transmit cell memory is in congestion state “x”, traffic with DP > “x” is discarded before transmit. Traffic with DP < “x” may be queued for transmit, depending on the congestion level of the connection transmit

queue. Traffic with DP = “x” may be either queued or discarded depending on how close the value of *txCellMemoryUsage* is to the next threshold as displayed in *txCellMemoryThresholds*. For example, CLP1 traffic is queued until the value indicated by *txCellMemoryUsage* equals the value indicated in *txCellMemoryThresholds* 3. At that point, CLP1 traffic is discarded.

This attribute is not displayed on APC-based and QRD-based FPs.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Lp Eng Arc rxCellMemoryAllocation (rxCell)

Access: Read only

Description: This attribute indicates the fraction of the receive memory which is allocated for the reception of cells on the FP. Cell memory is used for ATM Bearer Services, ATM SVCs and ATM PVCs.

The remaining receive memory is allocated to the reception of frame. Frame memory is used for trunks, ATM VCC testing and for inter-card communication.

This attribute is not available on APC-based and QRD-based FPs.

Values: Decimal (1..99)

Units: %

Default: No default

### ATTRIBUTE Lp Eng Arc rxCellMemoryCongestionState (rxCellCong)

Access: Read only

Description: This attribute indicates the congestion state of the receive cell memory on this FP.

This attribute indicates which *rxCellMemoryThresholds*

corresponds to the current value of *rxCellMemoryUsage*. The congestion state is used to determine if cells of a particular discard priority (DP) are discarded before being queued for processing on this FP.

The congestion state of receive cell memory is indicated by a numeric value ranging from 3 to 0. When receive cell memory is in congestion state “x”, traffic with DP > “x” is discarded before processing. Traffic with DP < “x” may be queued for processing, depending on the congestion level of the processor or bus queue. Traffic with DP = “x” may be either queued or discarded depending on how close the value of *rxCellMemoryUsage* is to the next threshold as displayed in *rxCellMemoryThresholds*. For example, CLP1 traffic is queued until the value indicated by *rxCellMemoryUsage* equals the value indicated in *rxCellMemoryThresholds* 3. At that point, CLP1 traffic is discarded.

This attribute is not displayed on APC-based and QRD-based FPs.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Lp Eng Arc protectedConnectionPoolAvailable (protConnAvail)

Access: Read only

Description: This attribute indicates the number of available connection resources for spared *AtmIfs* (VCC and VPC) that can be used on this FP.

One resource is used for VCC and VPC connections.

Values: Decimal (0..64000)

Default: No default

### ATTRIBUTE Lp Eng Arc protectedConnectionPoolUsage (protConnUsage)

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the number of connection resources in use on this FP for spared *AtmIfs* (VCC and VPC). |
| Values | Decimal (0..64000) |
| Default | No default |

### ATTRIBUTE Lp Eng Arc protectedMcastBranchesAvailable (protMcastAvail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of available multicast branches for spared *AtmIfs* on this FP. |
| Values | Decimal (0..16384) |
| Default | No default |

### ATTRIBUTE Lp Eng Arc protectedMcastBranchesUsage (protMcastUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of multicast branches that are in use on this FP for spared *AtmIfs*. |
| Values | Decimal (0..16384) |
| Default | No default |

### ATTRIBUTE Lp Eng Arc connectionPoolAvailable (connAvail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of available connection resources for use by unspared *AtmIfs* (VCC, VPC, and VPT) and for spared *AtmIfs* (VPT only) on this FP.<br><br>One resource is used for VCC and VPC connections, two resources for a basic VPT and three resources for a standard VPT. |
| Values | Decimal (0..64000) |
| Default | No default |

### ATTRIBUTE Lp Eng Arc connectionPoolUsage (connUsage)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the number of connection resources in use on this FP for unspared *AtmIfs* (VCC, VPC, and VPT) and for spared *AtmIfs* (VPT only). |
| Values | Decimal (0..64000) |
| Default | No default |

### ATTRIBUTE Lp Eng Arc txCellMemoryMaxUsage (txCellMaxUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number which has recently occurred for the *txCellMemoryUsage* attribute.<br><br>On CQC-based ATM FPs, this number indicates the maximum usage of transmit cells for all ports on this FP.<br><br>On ATM IP FPs, this number indicates the maximum usage of transmit cells in the Passport Queue Controller (PQC) ASIC. Queuing of ATM cells for transmit normally occurs in the ATM Queue Manager (AQM) ASIC, which is indicated in the *Lp Eng Arc Aqm/*x *txCellMemoryUsage* attribute. Transmit cells should only be queued in the PQC under circumstances of extreme transient congestion.<br><br>This attribute is not available on APC-based and QRD-based FPs. On APC-based and QRD-based FPs, Tx cell memory is completely separated among individual ports. The max Tx cell memory usage is available on a per-APC basis under each individual Lp Eng Arc Apc/x component.<br><br>This value is reset to the current usage every 15 minutes and when the card is reset. |
| Values | Decimal (0..163839) |
| Units | cells |
| Default | No default |

### ATTRIBUTE Lp Eng Arc txCellMemoryUsage (txCellUsage)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the current number of transmit cells which are in use for this FP.<br><br>On CQC-based ATM FPs, this number indicates the total transmit cells which are in use for all ports on this FP.<br><br>On ATM IP FPs, this number indicates the number of transmit cells which are in use in the Passport Queue Controller (PQC) ASIC. Queuing of ATM cells for transmit normally occurs in the ATM Queue Manager (AQM) ASIC, which is indicated in the *Lp Eng Arc Aqm/x txCellMemoryUsage* attribute. Transmit cells should only be queued in the PQC under circumstances of extreme transient congestion.<br><br>This attribute is not available on APC-based and QRD-based FPs. On APC-based FPs, Tx cell memory is completely separated among individual ports. |
| Values | Decimal (0..163839) |
| Units | cells |
| Default | No default |

### ATTRIBUTE Lp Eng Arc rxCellMemoryMaxUsage (rxCellMaxUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum usage of receive cells for all ports on this FP. Receive cell memory is used for storing ATM cells received by this FP which are currently queued either for handling by the processor on this FP or queued for transmitting over the backplane to other FPs.<br><br>This value is reset to the current usage every 15 minutes and when the card is reset.<br><br>This attribute is not displayed on APC-based and QRD-based FPs. |
| Values | Decimal (0..163839) |
| Units | cells |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Eng Arc rxCellMemoryUsage (rxCellUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of receive cells which are in use for all ports on this FP. Receive cell memory is used for storing ATM cells received by this FP which are currently queued either for handling by the processor on this FP or queued for transmitting over the backplane to other FPs on this switch.<br><br>This attribute is not displayed on APC-based and QRD-based FPs. |
| Values | Decimal (0..163839) |
| Units | cells |
| Default | No default |

### ATTRIBUTE Lp Eng Arc perVcQueueAvailable (queueAvail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of available perVc queue resources for use by connections on this FP.<br><br>Whether or not a connection requires a perVc queue resource is determined by the connection's ATM service category provisioning. A perVc queue resource is required when the ATM service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc*** and also when the ATM service category has the *unshapedTransmitQueueing* attribute provisioned as ***perVc***.<br><br>This attribute is only applicable to the 16pOC3PosAtm card and is filtered from the display on all other cards |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Lp Eng Arc perVcQueueUsage (queueUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of perVC queue resources in use by connections on this FP.<br><br>Whether or not a connection requires a perVc queue resource is determined by the connection's ATM service category provisioning. A perVc queue resource is required when the ATM service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc*** and also when the ATM service category has the *unshapedTransmitQueueing* attribute provisioned as ***perVc***.<br><br>This attribute is only applicable to the 16pOC3PosAtm card and is filtered from the display on all other cards. |
| Values | Decimal (0..32767) |
| Default | No default |

### ATTRIBUTE Lp Eng Arc txCellMemoryThresholds (txCellThresh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is a vector which indicates the size and three discard thresholds for transmit cell memory for this FP. The transmit cell memory is used for storing ATM cells to be transmitted by this FP.<br><br>This attribute is not applicable and is not displayed on APC-based and QRD-based FPs.<br><br>The first value indicates the transmit cell memory size. This is derived based on the total transmit memory capacity of this FP, and the value of the *connectionPoolCapacity* and the *txCellMemoryAllocation* attributes.<br><br>The current value of *txCellMemoryUsage* together with the vector of values in *txCellMemoryThresholds* determines the *txCellMemoryCongestionState*. The congestion state determines whether cells of a given discard priority (DP) are discarded or |

queued for transmit.

When the *txCellMemoryUsage* attribute is between threshold 0 and threshold 1, the *txCellMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 1 and threshold 2, the *txCellMemoryCongestionState* indicates the value 1. In congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set approximately at 85 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 2 and threshold 3, the *txCellMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is below threshold 3, the *txCellMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued.

| | |
|---|---|
| Vector of | Decimal (0..163839) |
| Units | cells |
| Index | Decimal (0..3) |
| Default | No default |

### ATTRIBUTE Lp Eng Arc rxCellMemoryThresholds (rxCellThresh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is a vector which indicates the size and three discard thresholds for receive cell memory for this FP. Receive cell memory is used for storing ATM cells received by this FP which are queued either for handling by the processor on this FP or queued for transmitting over the backplane to other FPs on this switch. |

The first value indicates the receive cell memory size. This is derived based on the total receive memory capacity of this FP, and the value of the *connectionPoolCapacity* and the *rxCellMemoryAllocation* attributes.

The current value of *rxCellMemoryUsage* together with the vector of values in *rxCellMemoryThresholds* determines the *rxCellMemoryCongestionState*. The congestion state determines whether cells of a given discard priority (DP) are discarded or queued.

When the *rxCellMemoryUsage* attribute is between threshold 0 and threshold 1, the *rxCellMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total receive cell memory size.

When the *rxCellMemoryUsage* attribute is between threshold 1 and threshold 2, the *rxCellMemoryCongestionState* indicates the value 1. In congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set approximately at 85 percent of threshold 0, the total receive cell memory size.

When the *rxCellMemoryUsage* attribute is between threshold 2 and threshold 3, the *rxCellMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total receive cell memory size.

When the *rxCellMemoryUsage* attribute is below threshold 3, the *rxCellMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued.

This attribute is not displayed on APC-based and QRD-based FPs.

| | |
|---|---|
| Vector of | Decimal (0..163839) |
| Units | cells |
| Index | Decimal (0..3) |

| | |
|---|---|
| Default | No default |

## COMPONENT Lp Eng Arc Override (Ov)

| | |
|---|---|
| Groups | "GROUP Lp Eng Arc Ov Provisioned (Prov)" |
| Scope | Device |
| Description | *Lp/n Eng Arc Override*<br>This component is used to configure the usage of ATM-specific resources on a Logical Processor running ATM services. The attributes listed represent Queue Controller resource configuration for all ATM cards (CQC for CQC based cards and PQC for ATM IP cards). This component is only permitted under the Logical Processors which are linked to ATM card types. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Eng Arc Ov Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group specifies the configuration of processor-wide ATM-specific resources on a Logical Processor running ATM services on ATM cards. Note that altering any of these parameters will result in a card reboot. |

## ATTRIBUTE Lp Eng Arc Ov multicastBranchesCapacity (mcastCap)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of multicast branches that can be established for all unspared *AtmIfs* on this FP.<br><br>A multicast branch is used for cell replication on a VCC connection whose *Vcc distributionType* is ***pointToMultipoint***. A branch represents one ATM destination for the replicated cells. |

Increasing the value of this attribute reduces the memory available for the cell and frame memory.

This attribute is ignored for the ***1pOC48ChSmIrAtm*** card as it does not support multicast connections.

For CQC-based ATM FPs, the maximum value for this attribute is 10752.

Values: Decimal (0..16384)

Default: 0

### ATTRIBUTE Lp Eng Arc Ov txCellMemoryAllocation (txCell)

Access: Read and write

Criticality: Process

Description: This attribute specifies the fraction of the transmit memory which should be allocated to the transmission of cells on an FP. The remaining memory is allocated for the transmission of frames. Frame memory is used for trunks, ATM VCC testing and for inter-card communication. Cell memory is used for ATM Bearer Service, ATM SVCs and ATM PVCs.

There is an absolute minimum quantity of frame buffers which is required by ATM software on the FP. If the value of this attribute is smaller than the absolute minimum, the ATM software allocates the minimum required, rather than the actual number requested.

The actual percentage of the transmit memory allocated to the transmit cell memory is indicated by the *Arc txCellMemoryAllocation* attribute. A difference between the provisioned and the operational values may exist due to the requirement for a minimum number of frame buffers or rounding during computation within the FP.

Values: Decimal (1..99)

Units: %

Default: 50

### ATTRIBUTE Lp Eng Arc Ov rxCellMemoryAllocation (rxCell)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the fraction of the receive memory which should be allocated to the reception of cells on an FP. The remaining receive memory is allocated for the reception of frames. Frame memory is used for trunks, ATM VCC testing and for inter-card communication. Cell memory is used for ATM Bearer Service, ATM SVCs and ATM PVCs.<br><br>There is an absolute minimum quantity of frame buffers which is required by ATM software on the FP. If the value of this attribute is smaller than the absolute minimum, the ATM software allocates the minimum required, rather than the actual number requested.<br><br>The actual percentage of the receive memory allocated to the receive cell memory is indicated by the *Arc rxCellMemoryAllocation* attribute. A difference between the provisioned and the operational values may exist due to the requirement for a minimum number of frame buffers or rounding during computation within the FP. |
| Values | Decimal (1..99) |
| Units | % |
| Default | 20 |

### ATTRIBUTE Lp Eng Arc Ov protectedMcastBranchesCapacity (protMcastCap)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of multicast branches that can be established for all spared *AtmIfs* on this FP.<br><br>A multicast branch is used for cell replication on a VCC connection whose *Vcc distributionType* is ***pointToMultipoint***. A branch represents one ATM destination for the replicated cells. |

This attribute can only be non-zero if the *LogicalProcessor* is associated with a *Card* of one of the following *cardTypes*: ***4pOC3SmIrAtm***, ***4pOC3MmAtm***, ***12pDS3Atm***, ***12pE3Atm***, or ***1pOC12SmLrAtm***.

If any port on the *LogicalProcessor* is provisioned in an intercard *LAPS* configuration, then this attribute must have the same value on both associated *LogicalProcessors*

Increasing the value of this attribute reduces the memory available for the cell and frame memory.

Values: Decimal (0..16384)

Default: 0

## ATTRIBUTE Lp Eng Arc Ov connectionPoolCapacity (connCap)

Access: Read and write

Criticality: Process

Description: This attribute specifies the maximum number of unspared *AtmIf* connections (VCC, VPC, and VPT) that can be established on this FP. One connection resource is used for VCC and VPC connections, two connection resources for a basic VPT and three connection resources for a standard VPT.

If the Logical Processor is associated with a card of a card type other than one of the following: ***3pE3Atm***, ***3pDS3Atm***, ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE1Atm***, ***3pDS1Atm***, ***2pJ6MAtm***; the value of the attribute restricts the sum of the (*maxVccs + maxVpcs+ (maxVpts * 3) + 1)* for all *AtmIfs* bound to this Logical Processor.

If the Logical Processor is associated with a card of one of the following card types: ***3pE3Atm***, ***3pDS3Atm***, ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE1Atm***, ***3pDS1Atm***, ***2pJ6MAtm***; the number of available connections are distributed equally across the ports on the FP. The number of connections associated to a particular port limits the size of the VCC space which can be defined by the *ConnMap* of the *AtmIf* linked to the port. If the *ConnMap*

component does not exist, its default settings are used for this check. Furthermore, the value of this attribute is restricted based on the number of ports on the card. For one port cards, the minimum is 512, the maximum is 4096 and the value must be divisible by 256. For two port cards, the minimum is 1024, the maximum is 8192 and the value must be divisible by 512. For three port cards, the minimum is 1536, the maximum is 7680 and the value must be divisible by 768.

If the Logical Processor is associated with a card of one of the following card types: ***8pE1Atm*** *or* ***8pDS1Atm***, the maximum value for this attribute is 10752.

If the Logical Processor is associated with a card of one of the following card types: ***32pDS1Msa*** or ***32pE1Msa***, the default value of the attribute is 4096.

If the Logical Processor is associated with a card of one of the following card types: ***1pOC48SmSrPos*** or ***1pOC48SmIrPos***, the maximum value for this attribute is 24000.

If the Logical Processor is associated with a card of one of the following card types: ***32pDS1MsaMtp***, ***32pE1MsaMtp***, ***32pDS1MsaMt, 32pE1MsaMt, 32pDS1MsaStp, 32pE1MsaStp, 32pDS1MsaSt*** *or* ***32pE1MsaSt***; the default value of the attribute is 8192.

The default value of the attribute is 3072 for Logical Processor associated with all other card types.

The maximum number of supported connections per APC is 16000 for ***16pOC3SmIrAtm, 4pOC12SmIrAtm,*** and ***4pOC12SmLrAtm*** cards.

For ATM IP cards, the *Connmap* attributes are set to their default values.

Increasing the value of this attribute reduces the memory available for cell and frame memory.

This attribute must be set to 0 if the *connectionPoolCapacity*

attribute of the *Arc Cqc Ov* component is set to non-zero values.

The actual size of the pool is reflected in the *Lp Eng Arc connnectionPoolAvailable* attribute.

If the Logical Processor is associated with a card of one of the following card types: ***16pOC3SmIrAtm, 4pOC12SmIrAtm***, ***4pOC12SmLrAtm, 1pOC48ChSmIrAtm***, the maximum value for operational attribute *connectionPoolAvailable* is 56000.

To achieve the maximum *connectionPoolAvailable*, the *Lp Eng Fcrc Pqc* Ov *ipRoutesPoolCapacity* must be provisioned to 0. This requires there to be no IP features in the relevant *sw lpt featurelist.*

If the total number of connections defined by adding the values of the *protectedConnectionPoolCapacity* and the *connectionPoolCapacity* attributes can not be satisfied, then the *protectedConnectionPoolCapacity* requirements are satisfied before the requirements of the *connectionPoolCapacity.*

| | |
|---|---|
| Values | Decimal (0..64000) |
| Default | No default |

## ATTRIBUTE Lp Eng Arc Ov protectedConnectionPoolCapacity (protConnCap)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum number of spared *AtmIf* connections (VCC, VPC, and VPT) that can be established on this FP. One connection resource is used for VCC and VPC connections. Three connection resources are used for a VPT connection.<br><br>This attribute can only be non-zero if the *LogicalProcessor* is associated with a *Card* of one of the following *cardTypes*: ***4pOC3SmIrAtm***, ***4pOC3MmAtm***, ***12pDS3Atm***, ***12pE3Atm***, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, |

***1pOC48ChSmIrAtm***, ***4pDS3ChAtm***, *or* ***2pSTM1eCh***.

If the Logical Processor is associated with ***2pSTM1eCh***, the default value of the attribute is 3072.

The default value of the attribute is 0 for Logical Processor associated with all other card types.

If any port on the *LogicalProcessor* is provisioned in an intercard *LAPS* configuration, then this attribute must have the same value on both associated *LogicalProcessors*

The value of the attribute restricts the sum of the (*maxVccs* + *maxVpcs* + 3**maxVpts* + 1) across all spared *AtmIfs* bound to this *LogicalProcessor.*

The maximum number of supported connections per APC is 16000 for ***16pOC3SmIrAtm, 4pOC12SmIrAtm***, and ***4pOC12SmLrAtm*** cards.

Increasing the value of this attribute reduces the memory available for cell and frame memory.

The actual size of the pool is reflected in the *Lp Eng Arc protectedConnectionPoolAvailable* attribute.

If the *LogicalProcessor* is associated with a card of one of the following card types: ***16pOC3SmIrAtm, 4pOC12SmIrAtm***, ***4pOC12SmLrAtm, 1pOC48ChSmIrAtm,*** the maximum value for operational attribute *protectedConnectionPoolAvailable* is 56000.

To achieve the maximum *protectedConnectionPoolAvailable*, the *Lp Eng Fcrc Pqc* Ov *ipRoutesPoolCapacity* must be provisioned to 0. This requires there to be no IP features in the relevant *sw lpt featurelist.*

If the total number of connections defined by adding the values of the *protectedConnectionPoolCapacity* and the *connectionPoolCapacity* attributes can not be satisfied, then the *protectedConnectionPoolCapacity* requirements are satisfied before the requirements of the *connectionPoolCapacity.*

Provisioned

Description
This group specifies the configuration of processor-wide ATM-specific resources on a Logical Processor running ATM services. Note that altering any of these parameters will result in a card reboot.

### ATTRIBUTE Lp Eng Arc Cqc Ov perVcQueueInterfaces (perVcIf)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the number of independent ports or IMA components which support shaping and per-VC queuing on this FP.<br><br>When this attribute is not zero, at most 4 independent ports or 4 *Ima* virtual links are supported, regardless of whether or not traffic shaping is enabled on the associated *AtmIf* components. In this case only independent port instances 0-3 or *Ima* instances 0-3 can be supported on an associated *AtmIf* component.<br><br>For 2 ports cards, the valid values for this attribute are 0, 1, or 2.<br>For 3 ports cards, the valid values for this attribute are 0, 1, 2 or 3.<br>For 8 ports cards, the valid values for this attribute are 0, 1, 2, or 4. |
| Values | Decimal (0..4) |
| Default | 0 |

### ATTRIBUTE Lp Eng Arc Cqc Ov shapingScalingFactor (scFactor)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the scaling factor which is to be applied to all shaping rates for this FP. The scaling factor is an inverse factor which is applied to the chosen shaping rate to produce an actual shaping rate. For example, if a shaping rate of 25 Mbit/s is used with a scaling factor of 2, the actual shaping rate is 12.5 Mbit/s. |
| Values | Decimal (1.0; 1.4; 2.0; 2.8; 4.0; 5.6) |
| Default | 1.0 |

## ATTRIBUTE Lp Eng Arc Cqc Ov cdvReduction (cdv)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the reduction of the maximum Cell Delay Variation (CDV) of shaped transmit traffic.<br><br>When the value of this attribute is set to ***disabled,*** the CDV value can be determined by the following equation:<br><br>CDV <= 2/ASR + 1/LS<br><br>where ASR is the Actual Shaping Rate of the connection and LS is the Link Speed of the interface.<br><br>When the value of this attribute is set to ***enabled,*** the CDV relationship changes to the following equation:<br><br>CDV <= 1/ASR + 1/LS<br><br>As can be noted from the equations above, setting this attribute to ***enabled*** can reduce the CDV significantly. CDV reduction may be used to conform to policers which have strict Cell Delay Variance Tolerance (CDVT). However using this function reduces the transmit bandwidth utilization of the following cards: ***3pDS3Atm***, ***3pOC3Atm***, ***2pJ6MAtm.***<br><br>When the value is ***cardDependent***, CDV reduction is disabled for cardtypes ***3pDS3Atm***, ***3pOC3Atm***, ***2pJ6MAtm***, ***4pDs1Aal1***, ***4pE1Aal1*** and enabled for all other cards. |
| Values | disabled<br>enabled<br>cardDependent |
| Default | cardDependent |

## ATTRIBUTE Lp Eng Arc Cqc Ov portCongestionPolicy (portCong)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

Description

This attribute specifies the congestion behavior of all ports on this FP. It applies only to transmit traffic served on the common queues and does not apply to per-VC queues.

When the value is ***aggregate***, the enqueue decision of cells or frames to a common queue is based upon the congestion state of the entire port to which the queue belongs. A port is defined to be as congested as the most congested queue amongst all its common queues: the low, medium and high emission priority queues. Thus, for example, if the low priority queue is congested, the high priority queue also experiences discards even though the high priority queue may itself not be congested. Setting this attribute to ***aggregate*** assures that the low priority queues are also serviced in the event of congestion.

When the value of this attribute is set to ***individualQueue***, the enqueue decision of cells or frames to a common queue is based solely upon the congestion state of that queue, not the port. This setting assures that the absolute priority of the traffic is taken into account, regardless of whether the lower priority queues are being served.

Values

aggregate
individualQueue

Default

aggregate

## ATTRIBUTE Lp Eng Arc Cqc Ov connectionPoolCapacity (connCap)

Access

Read and write

Criticality

Process

Description

This attribute is provided for backward compatibility and can only be used if the *LogicalProcessor* is associated with a *Card* of one of the following card types: ***3pE3Atm***, ***3pDS3Atm***, ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE1Atm***, ***3pDS1Atm***, ***2pJ6MAtm***. This attribute can be used when the desired distribution of connections across ports cannot be achieved using the *connectionPoolCapacity* attribute of the *Lp Eng Arc Ov* component.

This attribute defines the maximum number of connections (VCC, VPC and VPT) that are available on each port. VCC and VPC connections use one resource, whereas a basic *VPT* uses two connection resources. The entries are indexed by port number. This number limits the range of the *ConnMap* entries. If the *Connmap* component does not exist, its default settings are used for this check. Note that the value of this attribute must be evenly divisible by 256, and that port 2 supports at most 2560 connections, not the full 4096.

The connection pool for each port must be set to 0 if the *connectionPoolCapacity* attribute in the *Lp Eng Arc Ov* component is set to a non-zero value.

| | |
|---|---|
| Vector of | Decimal (0; 512..4096) |
| Index | Decimal (0..2) |
| Default | ([3] 0) |

## COMPONENT Lp Eng Arc Aqm (Aqm)

| | |
|---|---|
| Instance | Decimal (0..3) |
| Groups | "GROUP Lp Eng Arc Aqm Operational (Oper)" |
| Scope | Device |
| Description | *Lp/n Eng Arc Aqm/n*<br>The *Aqm* component describes the usage of ATM-specific resources on a *LogicalProcessor* running ATM services for a specific ATM Queue Manager. This component is always dynamically created under any *LP Eng* which supports an ATM IP FP. The number of instances depends upon the type of card.<br><br>For the 4-port OC3 cards, in unprotected mode one *AQM* instance is used per *Sonet* or *SDH* port, where the *AQM* instance is the same as the *Sonet* or *SDH* port instance. For example, Sonet/0 uses AQM/0. In protected mode, ports 0 and 1 work together and ports 2 and 3 work together. If ports 0 and 1 are a protection pair, then AQM/0 is used. AQM/1 is dormant. If ports 2 and 3 are a protection pair, then AQM/2 is used. AQM/3 is dormant. |

For the ***32pE1MsaMtp, 32pE1MsaMt, 32pDS1MsaMtp, 32pDS1MsaMt, 32pE1MsaStp, 32pE1MsaSt, 32pDS1MsaStp*** *and* ***32pDS1MsaSt*** cards, AQM/0 exists for the *E1* or *DS1* electrical ports and AQM/1 exisits for the *Sonet* or *SDH* optical ports. Optical ports 0 and 1 can only both exist, as a protected pair.

For the ***32pE1Msa*** *and* ***32pDS1Msa*** cards, only AQM/0 exists for the *E1* or *DS1* electrical ports.

For the ***1pOC12SmLrAtm*** card, only AQM/0 exists. Two physical ports exist, but if both ports are provisioned the second may be used for protection only.

For ***12pDS3Atm*** and ***12pE3Atm*** cards, an *AQM* instance exists for each set of three ports. As clarification, DS3/0, DS3/1, and DS3/2 use AQM/0. DS3/3, DS3/4, and DS3/5 use AQM/1. DS3/6, DS3/7, and DS3/8 use AQM/2. DS3/9, DS3/10, and DS3/11 use AQM/3.

## GROUP Lp Eng Arc Aqm Operational (Oper)

Properties: Operational

Description: This group describes the usage of ATM-specific resources for a specific AQM or APC on a Logical Processor running ATM services.

## ATTRIBUTE Lp Eng Arc Aqm connectionPoolAvailable (connPoolAvail)

Access: Read only

Description: This attribute indicates the number of connection resources available (VCC, VPC and VPT) that can be configured on the AQM or APC instance of the *LogicalProcessor.*

One connection resource is used for VCC and VPC connections, two connection resources for a basic VPT and three connection resources for a standard VPT.

Values: Decimal (0..16000)

Default: No default

### ATTRIBUTE Lp Eng Arc Aqm connectionPoolUsage (connPoolUsage)

Access: Read only

Description: This attribute indicates the total number of configured VCCs and VPCs in *AtmIf components* associated with the AQM or APC instance of the *LogicalProcessor*.

One connection resource is used for VCC and VPC connections, two connection resources for a basic VPT and three connection resources for a standard VPT.

Values: Decimal (0..16000)

Default: No default

### ATTRIBUTE Lp Eng Arc Aqm txCellMemoryCongestionState (txCellCong)

Access: Read only

Description: This attribute indicates the congestion state of the transmit cell memory for the ATM Queue Manager (AQM) ASIC on this FP.

This attribute indicates which *txCellMemoryThresholds* corresponds to the current value of *txCellMemoryUsage*. The congestion state is used to determine if cells of a particular discard priority (DP) are discarded before being queued for transmit.

The congestion state of transmit cell memory is indicated by a numeric value ranging from 3 to 0. When transmit cell memory is in congestion state “x”, traffic with DP > “x” is discarded before transmit. Traffic with DP < “x” may be queued for transmit, depending on the congestion level of the connection transmit queue. Traffic with DP = “x” may be either queued or discarded

depending on how close the value of *txCellMemoryUsage* is to the next threshold as displayed in *txCellMemoryThresholds*. For example, CLP1 traffic is queued until the value indicated by *txCellMemoryUsage* equals the value indicated in *txCellMemoryThresholds* 3. At that point, CLP1 traffic is discarded.

This attribute is not available on APC-based and QRD-based FPs since the txCellMemoryUsage attribute is not available.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Lp Eng Arc Aqm txCellMemoryMaxUsage (txCellMaxUsage)

Access: Read only

Description: This attribute indicates the maximum number which has recently occurred for the *txCellMemoryUsage* attribute.

Transmit cell memory is used for storing ATM cells to be transmitted by connections for the ATM Queue Manager (AQM) or APC ASIC on this FP. It includes all cells in all connections at all service categories.

This attribute is not available on APC-based and QRD-based FPs.

This attribute is reset to the current usage every 15 minutes and when the card is reset.

Values: Decimal (0..163839)

Units: cells

Default: No default

### ATTRIBUTE Lp Eng Arc Aqm txCellMemoryUsage (txCellUsage)

Access: Read only

Description: This attribute indicates the current number of transmit cells which are in use on this FP.

Transmit cell memory is used for storing ATM cells to be

transmitted by connections for the ATM Queue Manager (AQM) ASIC on this FP. It includes all cells in all connections at all service categories.

This attribute is not available on APC-based and QRD-based FPs. On APC-based FPs, Tx cell memory per APC device is completely partitioned among emission priorities (and also among the ports per-APC). The usage of cell memory per APC device does not adequately reflect the usage of cell memory for individual emission priorities.

Values: Decimal (0..163839)

Units: cells

Default: No default

### ATTRIBUTE Lp Eng Arc Aqm txCellMemoryThresholds (txCellThresh)

Access: Read only

Description: This attribute is a vector which indicates the size and three discard thresholds for transmit cell memory for the ATM Queue Manager (AQM) ASIC on this FP. Transmit cell memory is used for storing ATM cells to be transmitted by connections. It includes all cells in all connections at all service categories.

The first value indicates the transmit cell memory size. It is the amount of transmit memory which is available for cell queuing, after the amount of memory specified by *connectionPoolCapacity.*

The current value of *txCellMemoryUsage* together with the vector of values in *txCellMemoryThresholds* determines the *txCellMemoryCongestionState*. The congestion state determines whether cells of a given discard priority (DP) are discarded or queued for transmit.

When the *txCellMemoryUsage* attribute is between threshold 0 and threshold 1, the *txCellMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 1 and threshold 2, the *txCellMemoryCongestionState* indicates the value 1. In congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set approximately at 85 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 2 and threshold 3, the *txCellMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is below threshold 3, the *txCellMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued.

This attribute is not available on APC-based and QRD-basedFPs since the txCellMemoryUsage attribute is not available.

## ATTRIBUTE Lp Eng Arc Aqm Ov connectionPoolCapacity (connCap)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the maximum number of connections (VCC, VPC, and VPT) that can be configured on the AQM instance of the *LogicalProcessor*. One connection resource is used for VCC and VPC connections, two connection resources for a basic VPT and three connection resources for a standard VPT.<br><br>The value of this attribute restricts the sum of the (maxVccs + maxVpcs + ( maxVpts * 3 ) + 1) across all *AtmIf components* bound to this AQM instance. Note that 3 connections are used for each standard VPT and 2 for each basic VPT.<br><br>The value of this attribute should be less than or equal to the sum of the *connectionPoolCapacity* plus the *protectedConnectionPoolCapacity* attributes of the *Arc* component.<br><br>The default value ***derivedFromArc*** is obtained using the following equation: |

*(connectionPoolCapacity + protectedConnectionPoolCapacity)/* number of AQM components on the FP.)

Values: Decimal (1..16000)
derivedFromArc

Default: derivedFromArc

### ATTRIBUTE Lp Eng Arc Aqm Ov highPriorityEpdOffset (hiEpdO)

Access: Read and write

Criticality: Process

Description: This attribute specifies the high priority Early Packet Discard (EPD) offset for connection queues. On ATM IP FPs a given connection queue is associated with one of eight emission priorities (EP). These include six unshaped EPs, one exclusive VBR shaper EP and one ABR/VBR shaper EP. This attribute specifies the EPD offset for the exclusive VBR shaper EP and the first four (higher priority) unshaped EPs.

This offset is used to derive a connection EPD threshold for a given Congestion Control (CC) level by subtracting the offset from the All Packet Discard (APD) threshold at the same CC level. The APD thresholds are themselves derived from the transmit queue limit.

The EPD threshold only applies to a connection if the Packet-Wise Discard feature is requested. The Packet-Wise Discard feature can be enabled only if the transmit queue limit is at least 5.71 times the EPD offset. This ensures that the derived EPD threshold will never be less than 17.5 % of the transmit queue limit. If this condition is not satisfied, the Packet-Wise Discard feature for the connection is automatically disabled.

Due to the above constraint, if the operator wishes to decrease the transmit queue limit and still have Packet-Wise Discard feature enabled on the connection then this offset must be set to a lower value that meets the above requirement.

Due to hardware granularity the actual value of the EPD offset may not match exactly the value provisioned. The actual value is

displayed under the ATM Connection Administrator service category subcomponents on ATM IP FPs.

This attribute does not apply to CQC FPs.

Values: Decimal (5..1024)

Units: cells

Default: 28

### ATTRIBUTE Lp Eng Arc Aqm Ov lowPriorityEpdOffset (loEpdO)

Access: Read and write

Criticality: Process

Description: This attribute specifies the low priority Early Packet Discard (EPD) offset for connection queues. On ATM IP FPs a given connection queue is associated with one of eight emission priorities (EP). These include six unshaped EPs, one exclusive VBR shaper EP and one ABR/VBR shaper EP. This attribute specifies the EPD offset for the exclusive ABR/VBR shaper EP and the last two (lower priority) unshaped EPs.

This offset is used to derive a connection EPD threshold for a given Congestion Control (CC) level by subtracting the offset from the All Packet Discard (APD) threshold at the same CC level. The APD thresholds are themselves derived from the transmit queue limit.

The EPD threshold only applies to a connection if the Packet-Wise Discard feature is requested. The Packet-Wise Discard feature can be enabled only if the transmit queue limit is at least 5.71 times the EPD offset. This ensures that the derived EPD threshold will never be less than 17.5 % of the transmit queue limit. If this condition is not satisfied, the Packet-Wise Discard feature for the connection is automatically disabled.

Due to the above constraint, if the operator wishes to decrease the transmit queue limit and still have the Packet-Wise Discard feature enabled on the connection then this offset must be set to a lower value that meets the above requirement.

Due to hardware granularity the actual value of the EPD offset may not match exactly the value provisioned. The actual value is displayed under the ATM Connection Administrator service category subcomponents on ATM IP FPs.

This attribute does not apply to CQC FPs.

Values: Decimal (5..1024)

Units: cells

Default: 200

## ATTRIBUTE Lp Eng Arc Aqm Ov portCongestionPolicy (portCong)

Access: Read and write

Criticality: Process

Description: This attribute specifies the congestion behavior of all ports on this FP. It applies only to transmit traffic and does not apply to the CBR service category.

When the value is ***aggregate***, the enqueue decision of cells or frames to a queue is based upon the congestion state of the entire port to which the queue belongs. A port is defined to be as congested as the most congested queue amongst all its queues. Thus, for example, if an nrt-VBR queue is congested, the rt-VBR queue also experiences discards even though the rt-VBR queue may itself not be congested. Setting this attribute to ***aggregate*** assures that the low priority queues are also serviced in the event of congestion. If this attribute is set to ***aggregate*** then rt-VBR must not be configured to do common queuing and its emissionPriority should be set to a number numerically smaller than or equal to 3. Another impact of setting this attribute to ***aggregate*** is that the per connection queue limits for nrt-VBR and UBR connections will be increased to the link pool size and their discard thresholds will be modified to be aligned with the free list discard thresholds.

When the value of this attribute is set to ***individualQueue***, the enqueue decision of cells or frames to a queue is based solely

upon the congestion state of that queue, not the port. This setting assures that the absolute priority of the traffic is taken into account, regardless of whether the lower priority queues are being served. On 3pOC3SmAtm2 and 3pOC3MmAtm2 cards, if more than one override component exists, they must have the same setting for this attribute. Otherwise, setting the attribute under one override component applies to the entire card.

On APC-based FPs, Tx cell memory per APC device is completely partitioned among emission priorities (and also among the ports per-APC). The usage of cell memory per APC device does not adequately reflect the usage of cell memory for individual emission priorities. |
| Values | Decimal (0..163839) |
| Units | cells |
| Default | No default |

### ATTRIBUTE Lp Eng Arc Apc txCellMemoryThresholds (txCellThresh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is a vector which indicates the size and three discard thresholds for transmit cell memory for the ATM Queue Manager (AQM) ASIC on this FP. Transmit cell memory is used for storing ATM cells to be transmitted by connections. It includes all cells in all connections at all service categories.<br><br>The first value indicates the transmit cell memory size. It is the amount of transmit memory which is available for cell queuing, after the amount of memory specified by *connectionPoolCapacity.*<br><br>The current value of *txCellMemoryUsage* together with the vector of values in *txCellMemoryThresholds* determines the *txCellMemoryCongestionState*. The congestion state determines whether cells of a given discard priority (DP) are discarded or |

queued for transmit.

When the *txCellMemoryUsage* attribute is between threshold 0 and threshold 1, the *txCellMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 1 and threshold 2, the *txCellMemoryCongestionState* indicates the value 1. In congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set approximately at 85 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 2 and threshold 3, the *txCellMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is below threshold 3, the *txCellMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued.

This attribute is not available on APC-based and QRD-basedFPs since the txCellMemoryUsage attribute is not available.

## GROUP Lp Eng Arc Apc Ov Provisioned (Prov)

Properties

Provisioned

Description

This group specifies the configuration of processor-wide ATM-specific resources on a Logical Processor running ATM services on APC-based cards. Note that altering any of these parameters results in a card reboot.

## ATTRIBUTE Lp Eng Arc Apc Ov connectionPoolCapacity (connCap)

Access

Read and write

Criticality

Process

Description

This attribute specifies the maximum number of connections (VCC, VPC, and VPT) that can be configured on the APC instance of the *LogicalProcessor.* One connection resource is used for VCC and VPC connections, two connection resources for a basic VPT and three connection resources for a standard VPT.

The value of this attribute restricts the sum of the (maxVccs + maxVpcs + ( maxVpts * 3 ) + 1) across all *AtmIf* components bound to this APC instance. Note that 3 connections are used for each standard VPT and 2 for each basic VPT.

The value of this attribute should be less than or equal to the sum of the *connectionPoolCapacity* plus the *protectedConnectionPoolCapacity* of the *Arc* component.

The default value ***derivedFromArc*** is obtained using the following equation:

*(connectionPoolCapacity* + p*rotectedConnectionPoolCapacity*)/ number of APC components on the FP.

Values — Decimal (1..16000)
derivedFromArc

Default — derivedFromArc

### ATTRIBUTE Lp Eng Arc Apc Ov highPriorityEpdOffset (hiEpdO)

Access — Read and write

Criticality — Process

Description — This attribute specifies the high priority Early Packet Discard (EPD) offset for connection queues. On ATM IP FPs a given connection queue is associated with one of eight emission priorities (EP). These include six unshaped EPs, one exclusive VBR shaper EP and one ABR/VBR shaper EP. This attribute specifies the EPD offset for the exclusive VBR shaper EP and the first four (higher priority) unshaped EPs.

This offset is used to derive a connection EPD threshold for a given Congestion Control (CC) level by subtracting the offset from the All Packet Discard (APD) threshold at the same CC level. The APD thresholds are themselves derived from the transmit queue limit.

The EPD threshold only applies to a connection if the Packet-Wise Discard feature is requested. The Packet-Wise Discard feature can be enabled only if the transmit queue limit is at least 5.71 times the EPD offset. This ensures that the derived EPD threshold will never be less than 17.5 % of the transmit queue limit. If this condition is not satisfied, the Packet-Wise Discard feature for the connection is automatically disabled.

Due to the above constraint, if the operator wishes to decrease the transmit queue limit and still have the Packet-Wise Discard feature enabled on the connection then this offset must be set to a lower value that meets the above requirement.

Due to hardware granularity the actual value of the EPD offset may not match exactly the value provisioned. The actual value is

displayed under the ATM Connection Administrator service category subcomponents on ATM IP FPs.

This attribute does not apply to CQC FPs.

Values: Decimal (5..1024)

Units: cells

Default: 28

### ATTRIBUTE Lp Eng Arc Apc Ov lowPriorityEpdOffset (loEpdO)

Access: Read and write

Criticality: Process

Description: This attribute specifies the low priority Early Packet Discard (EPD) offset for connection queues. On ATM IP FPs a given connection queue is associated with one of eight emission priorities (EP). These include six unshaped EPs, one exclusive VBR shaper EP and one ABR/VBR shaper EP. This attribute specifies the EPD offset for the exclusive ABR/VBR shaper EP and the last two (lower priority) unshaped EPs.

This offset is used to derive a connection EPD threshold for a given Congestion Control (CC) level by subtracting the offset from the All Packet Discard (APD) threshold at the same CC level. The APD thresholds are themselves derived from the transmit queue limit.

The EPD threshold only applies to a connection if the Packet-Wise Discard feature is requested. The Packet-Wise Discard feature can be enabled only if the transmit queue limit is at least 5.71 times the EPD offset. This ensures that the derived EPD threshold will never be less than 17.5 % of the transmit queue limit. If this condition is not satisfied, the Packet-Wise Discard feature for the connection is automatically disabled.

Due to the above constraint, if the operator wishes to decrease the transmit queue limit and still have the Packet-Wise Discard feature enabled on the connection then this offset must be set to a lower value that meets the above requirement.

Due to hardware granularity the actual value of the EPD offset may not match exactly the value provisioned. The actual value is displayed under the ATM Connection Administrator service category subcomponents on ATM IP FPs.

This attribute does not apply to CQC FPs.

Values: Decimal (5..1024)

Units: cells

Default: 200

### ATTRIBUTE Lp Eng Arc Apc Ov portCongestionPolicy (portCong)

Access: Read and write

Criticality: Process

Description: This attribute specifies the congestion behavior of all ports on this FP. It applies only to transmit traffic and does not apply to the CBR service category.

When the value is ***aggregate***, the enqueue decision of cells or frames to a queue is based upon the congestion state of the entire port to which the queue belongs. A port is defined to be as congested as the most congested queue amongst all its queues. Thus, for example, if an nrt-VBR queue is congested, the rt-VBR queue also experiences discards even though the rt-VBR queue may itself not be congested. Setting this attribute to ***aggregate*** assures that the low priority queues are also serviced in the event of congestion. If this attribute is set to ***aggregate*** then rt-VBR must not be configured to do common queuing and its emissionPriority should be set to a number numerically smaller than or equal to 3. Another impact of setting this attribute to ***aggregate*** is that the per connection queue limits for nrt-VBR and UBR connections will be increased to the link pool size and their discard thresholds will be modified to be aligned with the free list discard thresholds.

When the value of this attribute is set to ***individualQueue***, the enqueue decision of cells or frames to a queue is based solely

upon the congestion state of that queue, not the port. This setting assures that the absolute priority of the traffic is taken into account, regardless of whether the lower priority queues are being served. On 3pOC3SmAtm2 and 3pOC3MmAtm2 cards, if more than one override component exists, they must have the same setting for this attribute. Otherwise, setting the attribute under one override component applies to the entire card.

Values: aggregate
individualQueue

Default: individualQueue

### ATTRIBUTE Lp Eng Arc Apc Ov bufferLimitPerEP (buffPerEP)

Access: Read and write

Criticality: Process

Description: This attribute specifies the maximum buffer size allowed for each of the eight emission priorities of traffic towards the link.

A class buffer pool limit is designed to prevent one emission priority from consuming all the available buffer space. The eight *bufferLimitPerEP* values represent maximum buffer size per emission priority, in number of cells. To guarantee proper buffer isolation among emission priorities, the sum of *bufferLimitPerEP* values for all emission priorities must not exceed the total buffer space available, which is 261118 cells.

The default values are approximately 15%, 0%, 15%, 50%, 15%, 0%, 0%, and 5% of total available buffer space for emission priorities 0 through 7 respectively.

Vector of: Decimal (0..523264)

Units: cells

Index: Decimal (0..7)

Default: (39168, 0, 39168, 130559, 39168, 0, 0, 13055)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of sub-connections available for the *LogicalProcessor.*<br><br>A sub-connection is used for interworking the ATM services with the frame oriented services such as Frame Relay and Path Oriented Routing System (PORS). When a frame is received at a sub-connection, the frame header is modified to be compatible with the service it is to be forwarded to.<br><br>This pool is used for connection oriented services only. Each of the following components uses one sub-connection from this pool: |

*FrAtm/n Dlci/n Siwf*
*McsMgr Frf5EpG/n Frf5Ep/n Lmi*
*McsMgr Frf5EpG/n Frf5Ep/n Dlci/n*

Note: When the value of this attribute reaches zero, no more connections are accepted for any of the services which utilize this pool. To increase the size of this pool, use the *Lp Eng Fcrc Ov subConnectionPoolCapacity* attribute.

Values: Decimal (0..49152)

Default: No default

### ATTRIBUTE Lp Eng Fcrc subConnectionPoolUsage (subConnUsage)

Access: Read only

Description: This attribute indicates the number of sub-connections being utilized by the *LogicalProcessor*. It is only applicable to PQC-based ATM IP cards.

A sub-connection is used for interworking the ATM services with the frame oriented services such as Frame Relay and Path Oriented Routing System (PORS). When a frame is received at a sub-connection, the frame header is modified to be compatible with the service it is to be forwarded to.

This pool is used for connection oriented services only. Each of the following components uses one sub-connection from this pool:
*FrAtm/n Dlci/n Siwf*
*McsMgr Frf5EpG/n Frf5Ep/n Lmi*
*McsMgr Frf5EpG/n Frf5Ep/n Dlci/n*

Values: Decimal (0..49152)

Default: No default

### ATTRIBUTE Lp Eng Fcrc InnConnectionPoolAvailable (InnConnAvail)

Access: Read only

Description: This attribute indicates the number of resource records available for the connections which utilize Logical Network Number

(LNN) on the *LogicalProcessor.*

A logical network is a subset of Passport modules together with a subset of trunks that interconnect those modules. It carries the traffic for a defined set of network protocols. An LNN is used to identify a logical network. The connectionless services which utilize the logical networks require some processing at the intermediate nodes. This pool is allocated at the intermediate nodes to sustain these connectionless services.

If the *McsMgr DprsMcsEpG/n Ep/n EpD transportConnectionPreference* attribute is set to ***atmOnly***, each instance of the *McsMgr DprsMcsEpG/n Ep/n* component uses one resource record from this pool, otherwise it does not use this pool.

When the value of this attribute reaches zero, no more connections are accepted for any of the services which utilize this pool. To increase the size of this pool, use the *Fcrc Ov lnnConnectionPoolCapacity* attribute.

Values — Decimal (0..2048)

Default — No default

### ATTRIBUTE Lp Eng Fcrc lnnConnectionPoolUsage (lnnConnUsage)

Access — Read only

Description — This attribute indicates the number of resource records being utilized for the connections which use Logical Network Number (LNN) on the *LogicalProcessor.* It is only applicable to PQC-based ATM IP cards.

A logical network is a subset of Passport modules together with a subset of trunks that interconnect those modules. It carries the traffic for a defined set of network protocols. An LNN is used to identify a logical network. The connectionless services which utilize the logical networks require some processing at the intermediate nodes. This pool is applied at the intermediate nodes to sustain these connectionless services.

If the *McsMgr DprsMcsEpG/n Ep/n EpD transportConnectionPreference* attribute is set to ***atmOnly***, each instance of the *McsMgr DprsMcsEpG/n Ep/n* component uses one resource record from this pool, otherwise it does not use this pool.

Values: Decimal (0..2048)

Default: No default

### ATTRIBUTE Lp Eng Fcrc txFrameMemoryCongestionState (txFrCong)

Access: Read only

Description: This attribute indicates the congestion state of the transmit frame memory for this FP.

This attribute indicates which *txFrameMemoryThresholds* corresponds to the current value of *txFrameMemoryUsage*. The congestion state is used to determine if frames of a particular discard priority (DP) are discarded before being queued for transmit.

The congestion state of transmit frame memory is indicated by a numeric value ranging from 3 to 0. When transmit frame memory is in congestion state “x”, traffic with DP > “x” is discarded before transmit. Traffic with DP < “x” may be queued for transmit, depending on the congestion level of the transmit queue. Traffic with DP = “x” may be either queued or discarded depending on how close the value of *txFrameMemoryUsage* is to the next threshold as displayed in *txFrameMemoryThresholds*. For example, DP=3 traffic is queued until the value indicated by *txFrameMemoryUsage* equals the value indicated in *txFrameMemoryThresholds* 3. At that point, DP=3 traffic is discarded.

Values: Decimal (0..3)

Default: No default

### ATTRIBUTE Lp Eng Fcrc rxFrameMemoryCongestionState (rxFrCong)

Access: Read only

Description

This attribute indicates the congestion state of the receive frame memory for this FP.

This attribute indicates which *rxFrameMemoryThresholds* corresponds to the current value of *rxFrameMemoryUsage*. The congestion state is used to determine if frames of a particular discard priority (DP) are discarded before being queued for processing on this FP.

The congestion state of receive frame memory is indicated by a numeric value ranging from 3 to 0. When receive frame memory is in congestion state “x”, traffic with DP > “x” is discarded before processing. Traffic with DP < “x” may be queued for processing, depending on the congestion level of the processor or bus queue. Traffic with DP = “x” may be either queued or discarded depending on how close the value of *rxFrameMemoryUsage* is to the next threshold as displayed in *rxFrameMemoryThresholds*. For example, DP=3 traffic is queued until the value indicated by *rxFrameMemoryUsage* equals the value indicated in *rxFrameMemoryThresholds* 3. At that point, DP=3 traffic is discarded.

Values

Decimal (0..3)

Default

No default

### ATTRIBUTE Lp Eng Fcrc txFrameMemoryMaxUsage (txFrMaxUsage)

Access

Read only

Description

This attribute indicates the maximum number which has recently occurred for the *txFrameMemoryUsage* attribute.

On CQC-based ATM FPs, this number indicates the maximum usage of transmit frames for all ports on this FP.

On ATM IP FPs, this number indicates the maximum usage of transmit frames in the Passport Queue Controller (PQC) ASIC. Queuing of frames for transmit only occurs in the PQC.

This value is reset to the current usage every 15 minutes and when the card is reset.

## GROUP Lp Eng Fcrc Ov Provisioned (Prov)

Properties: Provisioned

Description: This group contains frame services provisionable engineering parameters for this *LogicalProcessor.* Note that altering any of these parameters will result in a card reset.

## ATTRIBUTE Lp Eng Fcrc Ov subConnectionPoolCapacity (subConnCap)

Access: Read and write

Criticality: Process

Description: This attribute indicates the maximum number of sub-connections for the *LogicalProcessor.*

A sub-connection is used for interworking the ATM services with the frame oriented services such as Frame Relay and Path Oriented Routing System (PORS). When a frame is received at a sub-connection, the frame header is modified to be compatible with the service it is to be forwarded to.

Due to limited resources, not all of the sub-connections requested by this attribute may be allocated. The desired number of sub-connections allocated is indicated by the sum of *fcrc subConnectionPoolAvailable* and *fcrc subConnectionPoolUsage* attributes.

This pool is used for connection oriented services only. Each of the following components uses one sub-connection from this pool:
*FrAtm/n Dlci/n Siwf*
*McsMgr Frf5EpG/n Frf5Ep/n Lmi*

*McsMgr Frf5EpG/n Frf5Ep/n Dlci/n*

When the sub-connection pool is exhausted, no more connections are accepted from the services which utilize this pool.

Note: Ip Routing entries also compete for this memory.

The maximum size of this pool is 8192 for CQC based cards. The default ***cardDependent*** has the effect of setting *subConnectionPoolCapacity* to 1024 for both CQC cards and SGAF cards.

| | |
|---|---|
| Values | Decimal (0..49152)<br>cardDependent |
| Default | cardDependent |

### ATTRIBUTE Lp Eng Fcrc Ov InnConnectionPoolCapacity (InnConnCap)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute indicates the maximum number of resource records for the connections which utilize Logical Network Number (LNN) on the *LogicalProcessor.* |

A logical network is a subset of passport modules together with a subset of trunks that interconnect those modules. It carries the traffic for a defined set of network protocols. An LNN is used to identify a logical network. The connectionless services which utilize the logical networks require some processing at the intermediate nodes. This pool is allocated at the intermediate nodes to sustain these connectionless services.

If the *McsMgr DprsMcsEpG/n Ep/n EpD transportConnectionPreference* attribute is set to ***atmOnly***, each instance of the *McsMgr DprsMcsEpG/n Ep/n* component uses one resource record from this pool, otherwise it does not use this pool.

Note: Frame and Cell queues also compete for this memory.

Each DPRS instance requires two resource records from this pool.
The maximum size of this pool is 256 for CQC based cards. The default ***cardDependent*** has the effect of setting *lnnConnectionPoolCapacity* to 128 for CQC cards and 256 for SGAF cards.

Values: Decimal (1..2048)
cardDependent

Default: cardDependent

## COMPONENT Lp Eng Fcrc Pqc (Pqc)

Description: This group describes the usage of resources specific to frame services on a PQC based FP.

## ATTRIBUTE Lp Eng Fcrc Pqc ipRoutesPoolSize (ipRts)

Access: Read only

Description: This attribute indicates the number of IP routing entries permitted on the Logical Processor. If there are enough resources on the card, this value is equal to the provisioned attribute (in *Fcrc Pqc Ov*) *ipRoutesPoolCapacity.*

| | |
|---|---|
| Values | Decimal (0..100000) |
| Default | No default |

### ATTRIBUTE Lp Eng Fcrc Pqc ipRoutesPoolUsage (ipRtsUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute represents the current number of IP routing entries that are in use. |
| Values | Decimal (0..100000) |
| Default | No default |

### ATTRIBUTE Lp Eng Fcrc Pqc ipRoutesPoolAvailableEst (ipRtsAvail)

| | |
|---|---|
| Access | Read only |
| Description | Each IP routing resource can hold between one and three IP routing entries. Therefore, it is not possible to know exactly how many more IP routing entries can be added to the IP routing table. This attribute specifies the estimated number of IP routing entries that are available on the Logical Processor. It is an approximation based on the current average number of IP routing entries per IP routing resource. |
| Values | Decimal (0..100000) |
| Default | No default |

### ATTRIBUTE Lp Eng Fcrc Pqc ipInputRecordsPoolSize (ipInput)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the maximum number of IP input records that are available on a PQC based Logical Processor. IP input records are used by IP-aware media associated to a *Vr Pp* component. In general, one IP input record is used per Layer 2 connection used by IP-aware media. |
| Values | Decimal (0..32768) |
| Default | No default |

### ATTRIBUTE Lp Eng Fcrc Pqc ipInputRecordsPoolUsage (ipInputUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of IP input records that are used by the IP instances on this Logical Processor.If this number exceeds *ipInputRecordsPoolSize*, some IP-aware media protocol ports will not be able to receive traffic. |
| Values | Decimal (0..32768) |
| Default | No default |

### ATTRIBUTE Lp Eng Fcrc Pqc ipOutputRecordsPoolSize (ipOutput)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the maximum number of IP output records that are available on this Logical Processor. |
| Values | Decimal (0..32768) |
| Default | No default |

### ATTRIBUTE Lp Eng Fcrc Pqc ipOutputRecordsPoolUsage (ipOutputUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the current number of IP output records that are used by the IP instances currently active on a PQC based Logical Processor. IP output records are used by every active IP next hop onto which a flow has been exercised. If Equal-Cost Multi-Path (ECMP) IP routes are used on this node, IP output records can become exhausted rapidly. ECMP can be turned off by setting *Vr Ip Ospf ecmpStatus* attribute to ***disabled***. |
| Values | Decimal (0..32768) |
| Default | No default |

| | |
|---|---|
| Description | *Lp/n Eng AtmPathTrace*<br>This component holds the path trace engineering parameters and statistics for the following features: ***AtmUni***, ***AtmPnni***, and ***AtmIisp*** on this *Lp*. |
| Opt. Subcomp. | "COMPONENT Lp Eng PTrace Override (Ov)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Eng PTrace Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the current engineering parameters and statistics for path trace for the following features: ***AtmUni***, ***AtmPnni,*** and ***AtmIisp*** on this *Lp*. |

## ATTRIBUTE Lp Eng PTrace maxTraceRecords (mRecords)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of path trace records that are allowed to be stored on this *Lp*. Once the maximum has been reached, each *AtmPathTraceFilter* component manages the records it owns. |
| Values | Decimal (0..200) |
| Default | No default |

## ATTRIBUTE Lp Eng PTrace currentTraceRecords (cRecords)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of Path Trace records that are stored on this *Lp*. |
| Values | Decimal (0..200) |
| Default | No default |

### ATTRIBUTE Lp Eng PTrace maxConcurrentTraceRequests (mcRequests)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of concurrent trace requests on this *Lp*. Once the maximum has been reached, the Trace Transit List IE in the connection setup request is dropped and the setup request proceeds. |
| Values | Decimal (1..200) |
| Default | No default |

### ATTRIBUTE Lp Eng PTrace currentTraceRequests (cRequests)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of active current trace requests on this *Lp*. |
| Values | Decimal (0..200) |
| Default | No default |

### COMPONENT Lp Eng PTrace Override (Ov)

| | |
|---|---|
| Groups | "GROUP Lp Eng PTrace Ov Provisioned (Prov)" |
| Scope | Device |
| Description | *Lp Eng PTrace Override*<br>This component holds provisionable engineering parameters used to override the default maximum values allowed on this *Lp*. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp Eng PTrace Ov Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |

| | |
|---|---|
| Description | This group contains the provisionable engineering parameters for this *Lp*. |

### ATTRIBUTE Lp Eng PTrace Ov maxTraceRecords

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute specifies the maximum number of records allowed to be stored on this *Lp*. Once the maximum has been reached, each *AtmPathTraceFilter* component manages the records it owns.<br><br>If the value is set to zero, all *AtmPathTraceFilter* components are removed.<br><br>If the existing value is changed from a higher value to a lower value by a difference of 20, all records on the *Lp* are lost<br><br>If the existing value is changed from a lower value to a higher value, all records remain. |
| Values | Decimal (0..200) |
| Default | 0 |

### ATTRIBUTE Lp Eng PTrace Ov maxConcurrentTraceRequests

| | |
|---|---|
| Access | Read: All<br>Write: All |
| Description | This attribute indicates the maximum number of concurrent trace requests on this *Lp*. Once the maximum has been reached, the Trace Transit List IE in the connection setup request is dropped and the setup request proceeds. |
| Values | Decimal (1..200) |
| Default | 20 |

### COMPONENT Lp Eng ActiveAlarmList (AAList)

| | |
|---|---|
| Groups | "GROUP Lp Eng AAList Operational (Oper)" |
| Scope | Device |

| | |
|---|---|
| Description | *Lp Eng ActiveAlarmList*<br>This component holds the engineering parameters and operational statistics for the active alarms on this LP. |
| Opt. Subcomp. | "COMPONENT Lp Eng AAList Override (Ov)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Eng AAList Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes for the ActiveAlarmList component. |

## ATTRIBUTE Lp Eng AAList maxListSize (size)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum number of active alarms this LP can hold.<br><br>**Possible Values:**<br>*Disabled:*Do not store active alarms on this LP.<br>*10..200*:<br>*Unlimited*: This value indicates that the system should not limit the number of active alarms on this LP. Alarms can still be discarded if the memory resources are congested. |
| Values | Decimal (10..200)<br>disabled (dis)<br>unlimited (unl) |
| Default | No default |

## ATTRIBUTE Lp Eng AAList alarmsRx

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the active alarms that have been received from this LP. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eng AAList alarmsDiscarded

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the active alarms that have been discarded on this LP.<br><br>Alarms are discarded when the number of active alarms received on this LP exceeds what it can hold, or the memory resource of the LP is congested. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eng AAList currentListSize

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current number of active alarms stored on this LP. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eng AAList peakListSize (peak)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the peak number of the active alarms that have been received on this LP since the last time the LP came up. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Lp Eng AAList Override (Ov)

| | |
|---|---|
| Groups | "GROUP Lp Eng AAList Ov Provisioned (Prov)" |

| | |
|---|---|
| Scope | Device |
| Description | *Lp Eng AAList Override*<br>This component holds provisionable engineering parameters for the active alarms on this LP. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Eng AAList Ov Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisionable attributes for the *ActiveAlarmList Override* components under the *Lp Engineering* component. |

## ATTRIBUTE Lp Eng AAList Ov maxListSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of active alarms on this LP. For more details on the default and other information, refer to the parent component's *maxListSize* attribute.<br><br>**Possible Values:**<br>*Disabled:* Do not store active alarms on this LP.<br>*10..200*:<br>*AutoConfigured*: System Supplied. A value of 100 is selected in this release.<br>*Unlimited*: This value indicates that the system should not limit the number of active alarms on this LP. Alarms can still be discarded if the memory resources are congested. |
| Values | Decimal (10..200)<br>disabled (dis)<br>autoConfigured (auto)<br>unlimited (unl) |
| Default | autoConfigured |

## COMPONENT Lp VoiceServicesProcessor (Vsp)

| | |
|---|---|
| Groups | "GROUP Lp Vsp Provisioned (Op)"<br>"GROUP Lp Vsp OsiState (State)" |
| Scope | Device |
| Description | *Lp/n VoiceServicesProcessor*<br>*Dlep/n VoiceServicesProcessor*<br><br>This component represents a Voice Services Processor FP.<br><br>When added, *PModule* subcomponents are added automatically. For the ***12mVspAal*** and ***Vsp2*** cards, 12 *PModule* instances are added.<br>For the ***2pGeMmSrVsp3*** card, 24 *PModule* instances are added.<br>For the ***2pOc3ChSmIrVsp3*** card, 23 *PModule* instances are added. |
| Subcomponents | "COMPONENT Lp Vsp ProcessingModule (PModule)" |
| Opt. Subcomp. | "COMPONENT Lp Vsp Ethernet1000BaseSX (GigE)" |
| Dyn. Subcomp. | "COMPONENT Lp Vsp Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Vsp Provisioned (Op)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioning data for the *Vsp* Component. |

## ATTRIBUTE Lp Vsp linkToApplication (lta)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

| | |
|---|---|
| Description | This attribute specifies a service link to an *Nsta* component that defines the application services available in the VSP card. |
| Values | Link (Service, linkToServer) |
| Default | No default |

### GROUP Lp Vsp OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Vsp adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Vsp operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Vsp usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## COMPONENT Lp Vsp ProcessingModule (PModule)

| | |
|---|---|
| Instance | Decimal (1..24) |
| Groups | "GROUP Lp Vsp PModule Provisioned (Prov)"<br>"GROUP Lp Vsp PModule OsiState (State)"<br>"GROUP Lp Vsp PModule Operational (Oper)" |
| Scope | Device |
| Description | *Lp/n Vsp ProcessingModule/n*<br>*Dlep/n Vsp ProcessingModule/n*<br><br>A *ProcessingModule* (*PModule*) component instance represents a distinct physical processing module on a Voice Services Processor (VSP) FP.<br><br>Each *PModule* instance is uniquely identified by a number that corresponds to a specific physical location on the VSP FP. |
| Dyn. Subcomp. | "COMPONENT Lp Vsp PModule ProcessingBlock (PBlock)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Vsp PModule Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioning data for a *ProcessingModule*. |

## ATTRIBUTE Lp Vsp PModule moduleType (modType)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the type of processing module expected for this *ProcessingModule* instance.<br><br>A value of ***vpm*** refers to a processing module instance that is |

capable of processing voice, voiceband data, and data.
A value of ***spm*** refers to a processing module instance that is capable of processing signaling, and hosting a media or signaling gateway.
A value of ***none*** refers to a processing module instance that is unavailable for use.

Values
none
vpm
spm

Default
none

### GROUP Lp Vsp PModule OsiState (State)

Properties
Operational

Description
This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Vsp PModule adminState (osiAdmin)

Access
Read only

Description
This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Vsp PModule operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Vsp PModule usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Vsp PModule Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group indicates operational information for a *ProcessingModule*. |

### ATTRIBUTE Lp Vsp PModule insertedModuleType (insModType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of processing module currently present in the physical position on a Voice Services Processor FP.<br><br>A value of ***vpm*** indicates the presence of a processing module capable of processing voice, voiceband data, and data.<br>A value of ***spm*** indicates the presence of a processing module capable of processing signaling, and hosting a media or signaling gateway.<br>A value of ***none*** indicates that no processing module is present.<br>A value of ***unknown*** indicates the presence of a processing module with capabilities not known by the software. |
| Values | none<br>unknown<br>vpm<br>spm |
| Default | No default |

### ATTRIBUTE Lp Vsp PModule productCode (prc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the product engineering code and release of the *ProcessingModule*. |
| Values | String (0..12, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Vsp PModule failureCause (failCause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason why the physical processing module has failed.<br>The various failure causes are:<br>***none*** - There is no failure.<br>***cannotLoadFirmware*** - A module has been detected, but the firmware load operation failed.<br>***failedDiagnostics*** - The diagnostics cycle has completed and an error has been detected within the module.<br>***mismatched*** - The *insertedModuleType* of the *PModule* does not match its provisioned *moduleType*.<br>***connectivityFailed*** - The test cycle has run and an error has been detected on one of the *PBlock*s within the *PModule*.<br>***notResponding*** - One of the *PBlock*s within the *PModule* is not responding. |
| Values | none<br>cannotLoadFirmware<br>failedDiagnostics<br>mismatched<br>connectivityFailed<br>notResponding |
| Default | none |

### COMPONENT Lp Vsp PModule ProcessingBlock (PBlock)

| | |
|---|---|
| Instance | Decimal (1..2) |
| Groups | "GROUP Lp Vsp PModule PBlock Operational (Oper)"<br>"GROUP Lp Vsp PModule PBlock Utilization (Util)" |
| Scope | Device |
| Description | *Lp/n Vsp PModule/n ProcessingBlock/n*<br>*Dlep/n Vsp PModule/n ProcessingBlock/n*<br><br>This dynamic component represents a block of Data Processors within a *ProcessingModule*. |

The Processing Block is the smallest unit on the Voice Services Processor (VSP) FP on which different Data Processing software algorithms may be executed, or on which diagnostics may be performed.

Common Verbs

Help
List
Display

### GROUP Lp Vsp PModule PBlock Operational (Oper)

Properties: Operational

Description: This group contains status information about the *ProcessingBlock* component.

### ATTRIBUTE Lp Vsp PModule PBlock serviceList (servList)

Access: Read only

Description: This attribute indicates the components that have resources allocated on this *ProcessingBlock* component.

This attribute is not displayed if the *Shelf Card cardType* attribute is set to ***2pOc3ChSmIrVsp3***.

List of: The name of the component

Default: No default

### GROUP Lp Vsp PModule PBlock Utilization (Util)

Properties: Operational

Description: This group contains information about processing utilization of this *PBlock* component.

This group is filtered if the *modType* attribute of the parent *PModule* component is not set to ***spm***, or on the ***12mVspAal*** card.

### ATTRIBUTE Lp Vsp PModule PBlock timeInterval

Access: Read only

| | |
|---|---|
| Description | This attribute indicates the time period for which the average, minimum, and maximum utilization values are calculated.<br><br>If the associated *Vsp* component is locked this attribute will be reset to ***0***.<br><br>This attribute is reset to ***0*** every 15 minutes. |
| Values | Decimal (0..14) |
| Units | minutes |
| Default | No default |

### ATTRIBUTE Lp Vsp PModule PBlock cpuUtil

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the approximate processing utilization of this *PBlock* component. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Vsp PModule PBlock cpuUtilAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Vsp PModule PBlock cpuUtilAvgMin

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the minimum average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Vsp PModule PBlock cpuUtilAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### COMPONENT Lp Vsp Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Vsp Test OsiState (State)"<br>"GROUP Lp Vsp Test Setup (Setup)"<br>"GROUP Lp Vsp Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V*35, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp Vsp Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp Vsp Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp Vsp Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Vsp Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is |

administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Vsp Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Vsp Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Vsp Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp Vsp Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Vsp Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error rate test.<br>***manual*** test assumes the line is looped back externally and a bit error rate test is performed.<br>***localLoop*** test loops back the local modem and performs a bit error rate test.<br>***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.<br>***externalLoop*** test loops back the line to the far end.<br>***payloadLoop*** test only loops back the payload data received from the incoming line.<br>***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.<br>***v54RemoteLoop*** initiates a V.54 Remote Loopback test.<br>***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. |

***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

## ATTRIBUTE Lp Vsp Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.
This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values
Decimal (4..4096)

Units
bytes

Default
1024

### ATTRIBUTE Lp Vsp Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Vsp Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Vsp Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |

| | |
|---|---|
| Default | 0 |

### ATTRIBUTE Lp Vsp Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Vsp Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

### GROUP Lp Vsp Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

### ATTRIBUTE Lp Vsp Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination: |

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp Vsp Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Vsp Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. |

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp Vsp Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Values: String (5, ASCII)

Default: No default

### ATTRIBUTE Lp Vsp Test elapsedTime

Access: Read only

Description: This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values: Decimal (0.00..30240.00)

Units: minutes

| | |
|---|---|
| Default | 0.00 |

### ATTRIBUTE Lp Vsp Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp Vsp Ethernet1000BaseSX (GigE)

| | |
|---|---|
| Instance | Decimal (0..1) |
| Groups | "GROUP Lp Vsp GigE OsiState (State)"<br>"GROUP Lp Vsp GigE Eth1000Operational (Oper)"<br>"GROUP Lp Vsp GigE Eth1000Statistics (Stats)" |
| Scope | Device |
| Description | *Lp/n Vsp GigE/n*<br><br>This component monitors and provides access to statistical measurements of the *VspEth1000BaseSX* ports on the card, when the ***vspIpGigE*** or the ***vgpIpG729GigE*** feature is provisioned.<br><br>Two *VspEth1000BaseSX* ports are supported on the ***2pGeMmSrVsp3*** Function Processor. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP Lp Vsp GigE OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Vsp GigE adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

### ATTRIBUTE Lp Vsp GigE operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be

providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Vsp GigE usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### GROUP Lp Vsp GigE Eth1000Operational (Oper)

Properties
Operational

Description
This group contains the port operational attributes of the *VspEth1000BaseSX* component.

### ATTRIBUTE Lp Vsp GigE macAddress (macAdd)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the medium access controller address. The value of this attribute will be assigned by the system. The medium access controller address is displayed in canonical format. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE autoNegotiationStatus (negStatus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the auto negotiation at the physical level.<br><br>Possible values are:<br><br>***succeeded*** – auto-negotiation has completed successfully.<br><br>***failed*** – auto-negotiation has failed to negotiate a compatible set of capabilities.<br><br>***inProgress*** – auto-negotiation is currently in progress.<br><br>***disabled*** – the port has detected that the far end does not support auto-negotiation. |
| Values | succeeded<br>failed<br>inProgress<br>disabled |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE ingressFlowControlStatus (ingFcStatus)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the ingress flow control has been successfully negotiated with the link partner.<br><br>Possible values are: |

***enabled*** - this state will generate pause frames when internal congestion is detected.

***disabled*** - in this state, no pause frames are generated. In addition, there is a risk that the received packets may be discarded due to lack of internal resources.

Values: enabled
disabled

Default: No default

### ATTRIBUTE Lp Vsp GigE lossofSyncAlarm (syncAlarm)

Access: Read only

Description: This attribute indicates whether the loss of synchronization alarm is ***on*** or ***off***.

Possible values are:

***on*** - the alarm is set.

***off*** - the alarm is clear.

Values: on
off

Default: No default

### ATTRIBUTE Lp Vsp GigE autoNegIncompleteAlarm (negAlarm)

Access: Read only

Description: This attribute indicates whether the auto-negotiation incomplete alarm is ***on*** or ***off***.

Possible values are:

***on*** - the alarm is set.

***off*** - the alarm is clear.

| | |
|---|---|
| Values | on<br>off |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE remoteFaultIndicationAlarm (remFaultAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the remote fault indication alarm is ***on*** or ***off***.<br><br>Possible values are:<br><br>***on*** - the alarm is set.<br><br>***off*** - the alarm is clear. |
| Values | on<br>off |
| Default | No default |

### GROUP Lp Vsp GigE Eth1000Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics for the *VspEth1000BaseSX* component. |

### ATTRIBUTE Lp Vsp GigE framesTransmittedOk (frmTxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames that were transmitted without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE framesReceivedOk (frmRxOk)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of frames that were received without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE octetsTransmittedOk (octetsTxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets that were transmitted without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE octetsReceivedOk (octetsRxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets that were received without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE pauseFramesTransmitted (txPause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the pause medium access controller control frames transmitted. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE pauseFramesReceived (rxPause)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the pause medium access controller control frames received. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE undersizeFrames (underFrm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames that were received but were less than the minimum size (64 bytes). This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE framesTooLong (longFrm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames that were received but were greater than the maximum size. The count includes frames which have a bad frame check sequence. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE frameCheckSequenceErrors (fcsErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received that were an integral number of octets in length and did not pass the FCS check. This count does not include frames received that were too long or too short. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE symbolErrors (symErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the times a valid length frame was received and had at least one occurance of a data reception or symbol error. This counter increments once per valid Carrier Event as defined by the specification IEEE 802.3 - 2000 edition. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE broadcastFramesReceivedOk (bcastRxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the valid broadcast frames received without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Vsp GigE discardedFrames (discFrm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the valid frames discarded because of a lack of resources available to receive them. This counter wraps to zero after it reaches its maximum value. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Lp Ethernet100BaseT (Eth100)

| | |
|---|---|
| Instance | Decimal (0..1) |
| Groups | "GROUP Lp Eth100 CustomerIdentifierData (CidData)"<br>"GROUP Lp Eth100 IfEntryProv (IfEntry)"<br>"GROUP Lp Eth100 Provisioned (Prov)"<br>"GROUP Lp Eth100 AdminInfo (AdminInfo)" |

"GROUP Lp Eth100 OsiState (State)"
"GROUP Lp Eth100 OperationalStatus (OperStatus)"
"GROUP Lp Eth100 Operational (Oper)"
"GROUP Lp Eth100 Eth100Statistics (Eth100Stats)"
"GROUP Lp Eth100 Statistics (Stats)"

Scope: Device

Description: *Lp/n Ethernet100BaseT/n*
This component defines an instance of a 100BaseT Ethernet station attached to a bus. One instance of this component must be created for each hardware interface.

Subcomponents: "COMPONENT Lp Eth100 LanTest (Lt)"
"COMPONENT Lp Eth100 Test"

Common Verbs:

- Display
- Add
- DELete
- LOCK
- Unlock

## GROUP Lp Eth100 CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

## ATTRIBUTE Lp Eth100 customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

| | |
|---|---|
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Eth100 IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Eth100 ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Eth100 ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |

| | |
|---|---|
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Eth100 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Eth100BaseT* component. |

### ATTRIBUTE Lp Eth100 duplexMode

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duplex mode of the port. This attribute is ignored if auto negotiation is successful. |
| Values | half<br>full |
| Default | half |

### ATTRIBUTE Lp Eth100 lineSpeed

| | |
|---|---|
| Access | Read and write |
| Description | This attribute sets the operating speed for the Ethernet 100BaseT port. This attribute is ignored if auto negotiation is successful. |
| Values | Decimal (10; 100) |
| Units | Mbit/s |
| Default | 100 |

### ATTRIBUTE Lp Eth100 autoNegotiation

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to select whether or not the port does auto negotiation. The provisionable values of *duplexMode* and *lineSpeed* are ignored if auto negotiation is successful. Refer to the operational attribute *autoNegStatus* for auto negotiation results. |

| | |
|---|---|
| Values | enabled<br>disabled |
| Default | enabled |

### ATTRIBUTE Lp Eth100 applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute contains the component name of a Framer which is associated with the Eth100BaseT component. This defines which Lan Application will be using this Eth100BaseT interface. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### ATTRIBUTE Lp Eth100 switchoverOnFailure (switch)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if a FP switchover should occur when a port or link failure is detected by the initial test process or if a steady state link failure is observed. The switchover occurs only if the standby FP's port is operational. This value '***enabled***' specifies that a switchover should take place if a port or link failure is detected. This value '***disabled***' specifies that a switchover should not take place when a port or link failure is detected. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Lp Eth100 switchoverHoldoff (soHoldoff)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval between detection of a port or link failure and initiation of FP switchover. This attribute is ignored if *switchoverOnFailure* is ***disabled***. The switchover occurs only if the standby FP's port is operational. The attribute gives the customer a choice to have a switchover immediate upon changing cable or hold-off time up to 3 minutes. The default |

| | |
|---|---|
| | value is 0 (no hold-off). Note that a non-zero value will result in outage but will allow the link time to recover before initiating a switchover. |
| Values | Decimal (0..180) |
| Units | seconds |
| Default | 0 |

### GROUP Lp Eth100 AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Eth100 vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Eth100 commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Eth100 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp Eth100 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Lp Eth100 operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Eth100 usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Eth100 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Eth100 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |

| | |
|---|---|
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp Eth100 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the Port operational attributes of the *Eth100BaseT* component. |

### ATTRIBUTE Lp Eth100 macAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the medium access controller (MAC) address. The MAC address is displayed in canonical format. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp Eth100 autoNegStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the status of the auto negotiation at the Phy level. |
| Values | succeeded<br>failed<br>disabled |
| Default | No default |

### ATTRIBUTE Lp Eth100 actualLineSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the line speed of the Eth100BaseT port. |
| Values | Decimal (10; 100) |
| Units | Mbit/s |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Eth100 actualDuplexMode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether the hardware is in half duplex or full duplex mode. |
| Values | half<br>full |
| Default | No default |

### ATTRIBUTE Lp Eth100 activeStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the Ethernet port on the active FP. |
| Values | available<br>notavailable |
| Default | No default |

### ATTRIBUTE Lp Eth100 standbyStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the Ethernet port on the standby FP. |
| Values | available<br>notavailable |
| Default | No default |

### GROUP Lp Eth100 Eth100Statistics (Eth100Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistical attributes for the *Eth100BaseT* component. |

### ATTRIBUTE Lp Eth100 framesTransmittedOk (frmTxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which were transmitted without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 framesReceivedOk (frmRxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which were received without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 octetsTransmittedOk (octetsTxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets which were transmitted without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 octetsReceivedOk (octetsRxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets which were received without errors. This counter wraps to zero after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 undersizeFrames (undersizeFrm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames that were received but were less than the minimum size (64 bytes). This counter wraps to zero after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 receivedOctetsIntoRouterBr (rxOctetsRtrBr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of octets that were not hardware switched but were passed the Router or Bridge software. This counter wraps to zero after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 receivedFramesIntoRouterBr (rxFrmRtrBr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of frames which were not hardware switched but were passed to the Router or Bridge software. This counter wraps to zero after it reaches its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Lp Eth100 Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes for the *Ethernet* component. |

### ATTRIBUTE Lp Eth100 alignmentErrors

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The *alignmentErrors* counter indicates the number of frames received which were not an integral number of octets in length. Frames will be checked for *alignmentErrors* before they are checked for Frame Check Sequence (FCS) errors. If there is an alignment error, the error will only be counted here and not in *fcsErrors*. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 fcsErrors

| | |
|---|---|
| Access | Read only |
| Description | The *fcsErrors*, Frame Check Sequence (FCS) error, counter indicates the number of frames received which were an integral number of octets in length and did not pass the FCS check. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 singleCollisionFrames

| | |
|---|---|
| Access | Read only |
| Description | The *singleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced exactly one collision. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 multipleCollisionFrames

| | |
|---|---|
| Access | Read only |
| Description | The *multipleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced more than one collision. This counter wraps around after it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 sqeTestErrors

| | |
|---|---|
| Access | Read only |
| Description | The *sqeTestErrors*, Signal Quality Error (SQE) Test errors, counter indicates the number of times the “SQE Test Error” message has been generated for the station. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 deferredTransmissions

| | |
|---|---|
| Access | Read only |
| Description | The *deferredTransmissions* counter indicates the number of frames which experienced a transmission delay because the medium was busy. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 lateCollisions

| | |
|---|---|
| Access | Read only |
| Description | The *lateCollisions* counter indicates the number of times a collision was detected later than 512 bit-times into the transmission of a packet. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 excessiveCollisions

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The *excessiveCollisions* counter indicates the number of frames which failed to get transmitted due to excessive collisions. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 macTransmitErrors

| | |
|---|---|
| Access | Read only |
| Description | The Medium Access Controller (MAC) transmit error counter indicates the number of times that a transmission failed due to internal MAC transmit errors. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 carrierSenseErrors

| | |
|---|---|
| Access | Read only |
| Description | The carrier sense error counter indicates the number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Eth100 frameTooLongs

| | |
|---|---|
| Access | Read only |
| Description | The frame too long counter indicates the number of frames received which exceeded the maximum frame size. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## ATTRIBUTE Lp Eth100 macReceiveErrors

| | |
|---|---|
| Access | Read only |
| Description | The Medium Access Controller (MAC) receive error counter indicates the number of times a receive failed due to internal MAC receive errors. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

## COMPONENT Lp Eth100 LanTest (Lt)

| | |
|---|---|
| Groups | "GROUP Lp Eth100 Lt TestOp (Top)" |
| Scope | Device |
| Description | *Lp/n Fddi/n LanTest*, or<br>*Lp/n Ethernet/n LanTest*, or<br>*Lp/n TokenRing/n LanTest, or*<br>*Lp/n IlsForwarder/n LanTest*<br>The LanTest component is used to control testing on LAN interfaces. This includes LLC layer loopback, on-card loopback, SNMP required tests, and any testing to be done in the lab or manufacturing. |
| Dyn. Subcomp. | "COMPONENT Lp Eth100 Lt FrameCompare (FrmCmp)"<br>"COMPONENT Lp Eth100 Lt FrameCopy (FrmCpy)"<br>"COMPONENT Lp Eth100 Lt PortConfig (PrtCfg)"<br>"COMPONENT Lp Eth100 Lt FrameBuild (Fb)"<br>"COMPONENT Lp Eth100 Lt Control (Cntl)" |

## VERB Start Lp Eth100 Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to start a test as per the attributes set within each subcomponent of LanTest. |

### VERB Stop Lp Eth100 Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to stop a test. |

### VERB Reset Lp Eth100 Lt

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to reset the LanTest component. |

### VERB Get Lp Eth100 Lt

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Eth100 Lt

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to an attribute. |

### GROUP Lp Eth100 Lt TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Eth100 Lt tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Eth100 Lt FrameCompare (FrmCmp)

| | |
|---|---|
| Groups | "GROUP Lp Eth100 Lt FrmCmp TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component compares frames received from the hardware and emulator during testing. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Eth100 Lt FrmCmp

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FrameCompare component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Eth100 Lt FrmCmp

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Eth100 Lt FrmCmp TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Eth100 Lt FrmCmp tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Eth100 Lt FrameCopy (FrmCpy)

| | |
|---|---|
| Groups | "GROUP Lp Eth100 Lt FrmCpy TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component receives its input from FrameBuild and places it upon the hardware which sends it to the appropriate emulator. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Eth100 Lt FrmCpy

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest FrameCopy component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Eth100 Lt FrmCpy

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Eth100 Lt FrmCpy TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Eth100 Lt FrmCpy tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Eth100 Lt PortConfig (PrtCfg)

| | |
|---|---|
| Groups | "GROUP Lp Eth100 Lt PrtCfg TestOp (Top)" |
| Scope | Device |

| | |
|---|---|
| Description | This component controls the emulator and hardware to ensure frames output from each will match in FrameCompare. |
| Common Verbs | Help<br>List<br>Display |

### VERB Get Lp Eth100 Lt PrtCfg

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to get and display operational parameters for the LanTest PortConfig component. This includes attributes set using the Set verb. |

### VERB Tlist Lp Eth100 Lt PrtCfg

| | |
|---|---|
| Impact | Passive |
| Description | This verb is used to display the list of arguments to a component. |

### GROUP Lp Eth100 Lt PrtCfg TestOp (Top)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanTest component and its subcomponents. |

### ATTRIBUTE Lp Eth100 Lt PrtCfg tData (td)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to display and set attributes. |
| Values | String (0..255, ASCII) |
| Default | No default |

### COMPONENT Lp Eth100 Lt FrameBuild (Fb)

| | |
|---|---|
| Groups | "GROUP Lp Eth100 Lt Fb TestOp (Top)" |
| Scope | Device |
| Description | LanTest Framebuild<br>This component controls the building of all frames built and sent |

by the LanTest component. Each component under FrameBuild builds a portion of a packet or frame.

Dyn. Subcomp.

Description: This group contains the operational data for the LanTest component and its subcomponents.

### ATTRIBUTE Lp Eth100 Lt Cntl tData (td)

Access: Read and write

Description: This attribute is used to display and set attributes.

Values: String (0..255, ASCII)

Default: No default

### COMPONENT Lp Eth100 Test

Groups: "GROUP Lp Eth100 Test PortTestOp (PTO)"
"GROUP Lp Eth100 Test Results (Results)"

Scope: Device

| | |
|---|---|
| Description | *Lp/n Fddi/n Test*, or<br>*Lp/n Ethernet/n Test*, or<br>*Lp/n TokenRing/n Test, or*<br>*Lp/n IlsForwarder/n Test*<br>The Test component is used to do StartUp port test for LAN cards. |
| Common Verbs | Help<br>List<br>Display |

### VERB Start Lp Eth100 Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to start a test as per the attributes set within each subcomponent of Test. |

### VERB Stop Lp Eth100 Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to stop a test. |

### VERB Reset Lp Eth100 Test

| | |
|---|---|
| Impact | Service |
| Description | This verb is used to reset the Test component. |

### GROUP Lp Eth100 Test PortTestOp (PTO)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the LanPortTest component. |

### ATTRIBUTE Lp Eth100 Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following: card test sets up an internal loop on the board and runs a bit error rate test; manual test assumes the line is looped back externally and a bit error rate test is performed; |

| | |
|---|---|
| | localLoop test loops back the local modem and performs a bit error rate test; remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test; externalLoop test loops back the line to the far end; payloadLoop test only loops back the payload data received from the incoming line; Note that localLoop, remoteLoop and payloadLoop are not supported by all function processors. |
| Values | onCard<br>normal<br>wrapA<br>wrapB<br>thruA<br>thruB<br>extWrapA<br>extWrapB<br>extThruA<br>extThruB<br>extWrapAB<br>extWrapBA |
| Default | No default |

### ATTRIBUTE Lp Eth100 Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Eth100 Test duration (duration)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration (in minutes) that test data will be transmitted. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop. |

| | |
|---|---|
| Values | Decimal (1..30240) |
| Units | minutes |
| Default | 1 |

### GROUP Lp Eth100 Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the Test component. |

### ATTRIBUTE Lp Eth100 Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Eth100 Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute. |
| Values | Decimal (0..4294967295) |
| Units | minutes |
| Default | 0 |

### ATTRIBUTE Lp Eth100 Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute records the reason the test is terminated. |
| Values | testTimeExpired<br>stoppedByOperator |

| | |
|---|---|
| | unknown<br>neverStarted<br>testRunning |
| Default | neverStarted |

### ATTRIBUTE Lp Eth100 Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Eth100 Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits sent during the test period. This counter is not expected to reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Eth100 Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Eth100 Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of bits received during the test period. This counter is not expected to reach its maximum value. |

| | |
|---|---|
| | The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Eth100 Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the total number of errored frames received during the test period. This counter is not expected to reach its maximum value. The counter will wrap around to 0 if it does reach its maximum value. |
| Values | Long Integer |
| Default | No default |

### COMPONENT Lp OamEthernet (OamEnet)

| | |
|---|---|
| Instance | Decimal (0..0) |
| Groups | "GROUP Lp OamEnet CustomerIdentifierData (CidData)"<br>"GROUP Lp OamEnet IfEntryProv (IfEntry)"<br>"GROUP Lp OamEnet Provisioned (Prov)"<br>"GROUP Lp OamEnet AdminInfo (AdminInfo)"<br>"GROUP Lp OamEnet OsiState (State)"<br>"GROUP Lp OamEnet OperationalStatus (OperStatus)"<br>"GROUP Lp OamEnet Operational (Oper)"<br>"GROUP Lp OamEnet OamEnetStatistics (OamEnetStats)"<br>"GROUP Lp OamEnet Statistics (Stats)" |
| Scope | Device |
| Description | Lp/0 OamEthernet<br>This component represents an Ethernet port on the control processor. Only one instance of this component may be created corresponding to the one hardware port on the control processor. This port is designed specifically and exclusively for Passport Operations, Administration and Maintenance purposes; any other use of this port is unsupported and not advised. |

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Lp OamEnet LanTest (Lt)"<br>"COMPONENT Lp OamEnet Test" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>Unlock |

## VERB LOCK Lp OamEnet

| | |
|---|---|
| Impact | Service |
| Description | *Lock [-force] [-forever] <component name>*<br>This verb causes the *OamEthernet* component to first enter the OSI shuttingDown state. In this state all connections to the OAM Ethernet port are severed and any new connections are not accepted. Once shuttingDown state is reached the OSI state will change to locked. When the port is locked it can be tested using the *Test* component.<br><br>The default behavior for this verb is for the port to remain locked for a period of five minutes before automatically unlocking. This behavior can be overridden with the forever option.<br><br>Options:<br>-force<br>If this option is present, service to current clients is terminated and the locked state is entered immediately (that is, without first going through the shuttingDown state). Without this option, *Lock* behaves as described above.<br>-forever<br>If this option is present, then after the locked state is entered an *Unlock* command is required to get the service into the unlocked state. |

### GROUP Lp OamEnet CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp OamEnet customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp OamEnet IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp OamEnet ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp OamEnet ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp OamEnet Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioned attributes for the *OamEthernet* component. |

### ATTRIBUTE Lp OamEnet applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies which *Lan Application* is running on this port. |
| Values | Link (Service, interfaceName) |
| Default | No default |

## ATTRIBUTE Lp OamEnet switchoverOnFailure (switch)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if a CP switchover should occur if a port or link failure is detected by the initial test process or if a steady state link failure is observed. The switchover will occur only if the standby CP's port is operational.<br><br>This attribute can be set to one of the following values:<br>***enabled***: This value indicates that a switchover will take place if a port or link failure is detected.<br><br>***disabled***: This value indicates that a switchover will not take place if a port or link failure is detected. |
| Values | enabled<br>disabled |
| Default | enabled |

## ATTRIBUTE Lp OamEnet extendedStatistics (extStats)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if extended statistics are to be collected for the *OamEthernet* component.<br><br>The extended statistics include: *singleCollisionFrames*, *multipleCollisionFrames*, *lateCollisions*, *excessiveCollisions*, *carrierSenseErrors*, and *clearToSendSignalLoss*. These statistics all require extra processing to gather and store which may have a negative impact on the overall performance of the OAM Ethernet port.<br><br>If *extendedStatistics* is set to disabled, then these particular statistical attributes will be suppressed from display operations. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Lp OamEnet lineSpeed

| | |
|---|---|
| Access | Read and write |
| Description | This attribute sets the operating speed for the OAM Ethernet port. The operating speed is either tenMeg, hundredMeg or autoConfig. If the attribute is set to autoConfig then the operating speed is determined by the autoNegotiation process. The actual line speed will then be displayed by the operational attribute, actualLineSpeed. |
| Values | tenMeg<br>hundredMeg<br>autoConfig |
| Default | autoConfig |

### ATTRIBUTE Lp OamEnet duplexMode

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the duplex mode for the OAM Ethernet port. The duplex mode is either half, full or autoConfig. If the attribute is set to autoConfig then the duplex mode determined by the autoNegitiation process. The actual duplex mode will then be displayed by the operational attribute, actualDuplexMode. |
| Values | half<br>full<br>autoConfig |
| Default | autoConfig |

### ATTRIBUTE Lp OamEnet switchoverHoldoff (soHoldoff)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time interval between detection of a port or link failure and initiation of CP switchover. This attribute is ignored if *switchoverOnFailure* is ***disabled***. The switchover will occur only if the standby CP's port is operational. |
| Values | Decimal (10..60) |
| Units | seconds |

| | |
|---|---|
| Default | 30 |

### GROUP Lp OamEnet AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp OamEnet vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp OamEnet commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp OamEnet OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp OamEnet adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component. |

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp OamEnet operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp OamEnet usageState (osiUsage)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp OamEnet OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp OamEnet snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp OamEnet Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational attributes of the *OamEthernet* component. |

### ATTRIBUTE Lp OamEnet macAddress

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the medium access controller (MAC) address automatically assigned to the *Oam Ethernet* port by the system. The MAC address is displayed in canonical format. |
| Values | String (6, Dashed Hex) |
| Default | No default |

### ATTRIBUTE Lp OamEnet activeStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the *Oam Ethernet* port on the active CP. |
| Values | available<br>notAvailable |
| Default | No default |

### ATTRIBUTE Lp OamEnet standbyStatus

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the status of the *Oam Ethernet* port on the standby CP. |
| Values | available<br>notAvailable |
| Default | No default |

### ATTRIBUTE Lp OamEnet actualLineSpeed

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the actual line speed of the *Oam Ethernet* port. |
| Values | Decimal (10; 100) |

| | |
|---|---|
| Units | Mbit/s |
| Default | No default |

### ATTRIBUTE Lp OamEnet actualDuplexMode

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the actual duplex mode of operation, half or full. |
| Values | half<br>full |
| Default | No default |

### GROUP Lp OamEnet OamEnetStatistics (OamEnetStats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes for the *OamEthernet* component. |

### ATTRIBUTE Lp OamEnet clearToSendSignalLoss

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of times that the clear to send signal was lost when attempting to transmit a frame. This counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is only active if the *extendedStatistics* attribute is enabled. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet frameTooShort

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of frames received whose length is less than the allowed minimum frame length. This counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp OamEnet numberOfRxCollisions

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of collisions detected during reception. This counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet lackOfResourcesDiscards

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of good frames discarded because of a lack of resources available to contain them on the system. This counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet overrunErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the number of frames known to be lost because the local system bus was not available. This counter wraps to zero when it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Lp OamEnet Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical attributes for the *Ethernet* component. |

### ATTRIBUTE Lp OamEnet alignmentErrors

| | |
|---|---|
| Access | Read only |
| Description | The *alignmentErrors* counter indicates the number of frames received which were not an integral number of octets in length. Frames will be checked for *alignmentErrors* before they are checked for Frame Check Sequence (FCS) errors. If there is an alignment error, the error will only be counted here and not in *fcsErrors*. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet fcsErrors

| | |
|---|---|
| Access | Read only |
| Description | The *fcsErrors*, Frame Check Sequence (FCS) error, counter indicates the number of frames received which were an integral number of octets in length and did not pass the FCS check. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet singleCollisionFrames

| | |
|---|---|
| Access | Read only |
| Description | The *singleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced exactly one collision. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet multipleCollisionFrames

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | The *multipleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced more than one collision. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet sqeTestErrors

| | |
|---|---|
| Access | Read only |
| Description | The *sqeTestErrors*, Signal Quality Error (SQE) Test errors, counter indicates the number of times the “SQE Test Error” message has been generated for the station. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet deferredTransmissions

| | |
|---|---|
| Access | Read only |
| Description | The *deferredTransmissions* counter indicates the number of frames which experienced a transmission delay because the medium was busy. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet lateCollisions

| | |
|---|---|
| Access | Read only |
| Description | The *lateCollisions* counter indicates the number of times a collision was detected later than 512 bit-times into the transmission of a packet. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp OamEnet excessiveCollisions

| | |
|---|---|
| Access | Read only |
| Description | The *excessiveCollisions* counter indicates the number of frames which failed to get transmitted due to excessive collisions. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet macTransmitErrors

| | |
|---|---|
| Access | Read only |
| Description | The Medium Access Controller (MAC) transmit error counter indicates the number of times that a transmission failed due to internal MAC transmit errors. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet carrierSenseErrors

| | |
|---|---|
| Access | Read only |
| Description | The carrier sense error counter indicates the number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet frameTooLongs

| | |
|---|---|
| Access | Read only |
| Description | The frame too long counter indicates the number of frames received which exceeded the maximum frame size. This counter wraps around after it exceeds its maximum value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp OamEnet macReceiveErrors

| | |
|---|---|
| Access | Read only |
| Description | The Medium Access Controller (MAC) receive error counter indicates the number of times a receive failed due to internal MAC receive errors. This counter wraps around after it exceeds its maximum value. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### COMPONENT Lp OamEnet LanTest (Lt)

| | |
|---|---|
| Groups | "GROUP Lp OamEnet Lt TestOp (Top)" |
| Scope | Device |
| Description | *Lp/n Fddi/n LanTest*, or<br>*Lp/n Ethernet/n LanTest*, or<br>*Lp/n TokenRing/n LanTest, or*<br>*Lp/n IlsForwarder/n LanTest*<br>The LanTest component is used to control testing on LAN interfaces. ### COMPONENT Lp OamEnet Test

| | |
|---|---|
| Groups | "GROUP Lp OamEnet Test Operational (Oper)"<br>"GROUP Lp OamEnet Test Results" |
| Scope | Device |

Description — Lp/0 OamEthernet Test
The *Test* component appears only for 10BaseT OAM Ethernet ports on the CP. It is used to run the port test for the OAM Ethernet port.

Common Verbs
- Help
- List
- Display

### VERB Start Lp OamEnet Test

Impact — System_admin

Description — This verb is used to start a port test on the OAM Ethernet port as per the configuration of the *Test* component's attributes.

If the port is not in the locked state when the *Start* command is issued it will automatically be locked by the *Test* component before the tests are run.

### GROUP Lp OamEnet Test Operational (Oper)

Properties — Operational

Description — This group contains the operational data for the Test component.

### ATTRIBUTE Lp OamEnet Test type

Access — Read: System_admin
Write: System_admin

Description — This attribute is the type of test to be run. The four types of tests available are: the port hardware logic test, the configure and dump memory registers test, the memory mapping test and the Time Domain Reflectometry (TDR) test.

The possible values of this attribute are:
***hardwareLogic***: this test checks the port hardware controller for logic errors in some of the on-chip counters and shift registers.

***configuration***: this test configures the memory registers of the hardware controller in a predetermined way and then dumps the registers and checks their contents for errors.

***memoryMap***: this test does an extensive test of the memory structures used by the OAM Ethernet port to verify that they are configured correctly and are error-free.

***tdr***: this test is used to detect and locate cable faults caused by either a short or an open circuit on the coaxial cable.

Values
hardwareLogic
configuration
memoryMap
tdr

Default
No default

## GROUP Lp OamEnet Test Results

Properties
Operational

Description
This group contains all the statistics related attributes of the *Test* component.

## ATTRIBUTE Lp OamEnet Test causeOfTermination

Access
Read only

Description
This attribute records the reason why the test terminated.

The possible values of this attribute are:
***testTimeExpired***: this value indicates the time allotted for the test to run has expired which caused the test terminate. If the port is locked without the forever option then it will remain locked for only five minutes before being automatically unlocked. If the port unlocks itself after five minutes while the test is running then this attribute will be set to ***testTimeExpired***. If the forever option is used then the test will run until completion, failure, or a *Stop* command.

***stoppedByOperator***: this value indicates that the test was terminated when an operator issued a *Stop* command.

***unknown***: this value indicates that the test terminated for an unknown reason.

***neverStarted***: this value indicates that the test never started because the port could not be locked or because there is a hardware failure preventing the tests from running.

***testRunning***: this value indicates that the test is currently running.

***testComplete***: this value indicates that the test completed normally.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
testComplete

Default
neverStarted

### ATTRIBUTE Lp OamEnet Test testResult

Access
Read only

Description
This attribute records the result of last port test executed on the OAM Ethernet port. The result can be one of the following values.
***pass***: the test passed
***fail***: the test failed
***neverRun***: the test has not been run
***running***: the test is running

Values
running
pass
fail
neverRun

Default
No default

### COMPONENT Lp EDS1

Instance
Decimal (0..1)

| | |
|---|---|
| Groups | "GROUP Lp EDS1 Provisioned (Prov)"<br>"GROUP Lp EDS1 OperationalStatus (OperStatus)"<br>"GROUP Lp EDS1 OsiState (State)"<br>"GROUP Lp EDS1 Operational (Oper)" |
| Scope | Application |
| Description | *Lp/0 EDS1/n*<br>The *EDS1* component controls a DS1 external timing port on a ***CPeD*** and ***CP*** Control Processor. The *EDS1* component can only be added under the *LP/0* component and only if the CP type is ***CPeD*** or ***CP***. The Control Processor supports up to two external timing ports. |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp EDS1 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for an *EDS1* component. |

## ATTRIBUTE Lp EDS1 lineType (lineType)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the framing format of the DS1 line. The option ***d4*** defines a framing pattern of 12 frames per multiframe. The option ***esf*** defines a framing pattern of 24 frames per multiframe. The default option ***esf*** is permitted. |
| Values | d4<br>esf |
| Default | esf |

### ATTRIBUTE Lp EDS1 ssmRxDefault

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default Synchronization Status Message (SSM) reported to the NS component. The SSM is used by the NS component to select the most suitable clock synchronization reference based on the SSM values recommended by Bellcore standard GR.253 with relative Quality Levels of 0 through 8 and 15 where 1 is the highest quality, 8 is the lowest, 0 indicates “Quality Unknown” and 15 indicates “Do Not Use For Synchronization”. The default SSM is used when the received SSM indicates Quality Unknown or when the SSM is not reported by the hardware. |
| Values | Decimal (0..8; 15) |
| Default | 2 |

### GROUP Lp EDS1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp EDS1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp EDS1 OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lp EDS1 adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE Lp EDS1 operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Lp EDS1 usageState (osiUsage)

Access

Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

## ATTRIBUTE Lp EDS1 availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE Lp EDS1 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp EDS1 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE Lp EDS1 alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp EDS1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp EDS1 unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp EDS1 Operational (Oper)

Properties
Operational

Description
This group contains the common operational data for *EE1* and *EDS1* components.

### ATTRIBUTE Lp EDS1 losAlarm (losAlarm)

Access
Read only

| | |
|---|---|
| Description | This attribute indicates whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 second . A LOS defect is detected upon observing all zeros for 150 ms . If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 second. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp EDS1 lofAlarm (lofAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 second . If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 second. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp EDS1 rxAisAlarm (rxAisAlarm)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates whether an AIS (Alarm Indication Signal) alarm has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 second. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurement based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state. The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 second. |
| Values | on<br>off |
| Default | off |

## COMPONENT Lp EE1

| | |
|---|---|
| Instance | Decimal (0..1) |
| Groups | "GROUP Lp EE1 Provisioned (Prov)"<br>"GROUP Lp EE1 OperationalStatus (OperStatus)"<br>"GROUP Lp EE1 OsiState (State)"<br>"GROUP Lp EE1 Operational (Oper)" |
| Scope | Application |
| Description | *Lp/0 EE1/n*<br>The *EE1* component controls an E1 external timing port on a ***CPeE*** and ***CP*** Control Processor. The *EE1* component can only be added under the *LP/0* component and only if the CP type is ***CPeE*** or ***CP***. The Control Processor supports up to two external timing ports. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp EE1 Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains all of the provisioning data for an *EE1* component. |

## ATTRIBUTE Lp EE1 rxSynchClk

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies if the E1 BIT port is receiving a 2.048 MHz square wave synchronization (analog) clock or a E1 data frame signal as input. A value of ***squareWave*** indicates that the analog clock is received. A value of ***e1Signal*** indicates the E1 data frame signal is received. The default value is ***e1Signal***. |
| Values | e1Signal<br>squareWave |
| Default | e1Signal |

## ATTRIBUTE Lp EE1 ssmRxDefault

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the default Synchronization Status Message (SSM) reported to the NS component. The SSM is used by the NS component to select the most suitable clock synchronization reference based on the SSM values recommended by ITU standard G.704 with relative Quality Levels of 0 through 8 and 15 where 1 is the highest quality, 8 is the lowest, 0 indicates “Quality Unknown” and 15 indicates “Do |

| | |
|---|---|
| | Not Use For Synchronization". The default SSM is used when the received SSM indicates Quality Unknown or when the SSM is not reported by the hardware. |
| Values | Decimal (0..8; 15) |
| Default | 0 |

### GROUP Lp EE1 OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp EE1 snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### GROUP Lp EE1 OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp EE1 adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Lp EE1 operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp EE1 usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE Lp EE1 availabilityStatus (osiAvail)

Access
Read only

Description
If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE Lp EE1 proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been

initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp EE1 controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is

administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE Lp EE1 alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or

***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp EE1 standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)

| | |
|---|---|
| | providingService (serv)<br>notSet (nSet) |
| Default | notSet |

### ATTRIBUTE Lp EE1 unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Lp EE1 Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the common operational data for *EE1* and *EDS1* components. |

### ATTRIBUTE Lp EE1 losAlarm (losAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 second . A LOS defect is detected upon observing all zeros for 150 ms . If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 second. |

| | |
|---|---|
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp EE1 lofAlarm (lofAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 second . If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.<br>The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 second. |
| Values | on<br>off |
| Default | off |

### ATTRIBUTE Lp EE1 rxAisAlarm (rxAisAlarm)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates whether an AIS (Alarm Indication Signal) alarm has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 second. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurement based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state. The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 second. |

## VERB RESET Lp Pcusp PModule

| | |
|---|---|
| Impact | Service |
| Description | *Lp/n Pcusp ProcessingModule RESET*<br>The *Reset* verb is used to reset a processing module. It can be used when a failure has occured on a signal processing module. |

## GROUP Lp Pcusp PModule Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains provisioning data for a *ProcessingModule*. |

## ATTRIBUTE Lp Pcusp PModule moduleType (modType)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |

Description

This attribute specifies the type of Processing Module expected for this *ProcessingModule* instance.

The module types are:
***none*** - No module has been detected.
***spm*** - A module type of SPM has been detected.

Values

none
spm

Default

spm

## GROUP Lp Pcusp PModule OsiState (State)

Properties

Operational

Description

This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE Lp Pcusp PModule adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

| | |
|---|---|
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Pcusp PModule operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Pcusp PModule usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Pcusp PModule Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group indicates operational information on the *ProcessingModule*. |

### ATTRIBUTE Lp Pcusp PModule insertedModuleType (insModType)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of *ProcessingModule* currently present in the physical position on a Packet Control Unit Services Processor FP.<br><br>The module types are:<br>***spm*** **-** A module type of Signal Processing Module has been detected.<br>***none*** - No module has been detected.<br>***unknown*** - The module is of a type not known by the software. |
| Values | none<br>unknown<br>spm |
| Default | No default |

### ATTRIBUTE Lp Pcusp PModule productCode (prc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the product engineering code and release of the *ProcessingModule*. |
| Values | String (0..12, ASCII) |
| Default | No default |

## ATTRIBUTE Lp Pcusp PModule failureCause (failCause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason why the *ProcessingModule* has failed.<br><br>The various failure causes are:<br>***none*** - There is no failure.<br>***cantLoadFirmware*** - A *PModule* has been detected, but the firmware load operation failed.<br>***failedDiagnostics*** - The diagnostics cycle has completed and an error has been detected within the *PModule*.<br>***mismatched*** - The *insertedModuleType* of the *PModule* does not match its provisioned *moduleType*.<br>***connectivityFailed*** - The test cycle has run and an error was detected on one *PBlock*s within the *PModule*.<br>***notResponding*** - One *PBlock* within the *PModule* is not responding.<br>***reset InProgress*** - The *PModule* is resetting. |
| Values | none<br>cantLoadFirmware<br>failedDiagnostics<br>mismatched<br>connectivityFailed<br>notResponding<br>resetInProgress |
| Default | none |

## COMPONENT Lp Pcusp PModule ProcessingBlock (PBlock)

| | |
|---|---|
| Instance | Decimal (1..2) |
| Groups | "GROUP Lp Pcusp PModule PBlock Operational (Oper)"<br>"GROUP Lp Pcusp PModule PBlock PBlockStatistics (Stats)" |

"COLLECTED STATS LogicalProcessor PCUServicesProcessor ProcessingModule ProcessingBlock"

| | |
|---|---|
| Scope | Device |

| | |
|---|---|
| Description | *Lp/n Pcusp PModule/n ProcessingBlock/n*<br>This dynamic component represents a Processing Block within a *ProcessingModule*.<br>The Processing Block is the smallest unit on the PCUSA card on which different Data Processing software sets may be loaded, or on which diagnostics may be performed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Lp Pcusp PModule PBlock Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains status information about the *ProcessingBlock*. |

### ATTRIBUTE Lp Pcusp PModule PBlock serviceList (servList)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates which *Pcusa/n Conn/n PcmLink* components have allocated timeslot resources on this *ProcessingBlock*. |
| List of | The name of the component |
| Default | No default |

### GROUP Lp Pcusp PModule PBlock PBlockStatistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistical data. |

### ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtil (util)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current load of the SPM MPC processor. |
| Values | Decimal (0..100) |
| Units | % |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilAvg (avg)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the average PBlock CPU load. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilMin (min)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum PBlock CPU load. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilMax (max)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the maximum PBlock CPU load. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Pcusp PModule PBlock memoryUsage (mem)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the percentage of RAM memory used by the PCU application. |
| Values | Decimal (0..100) |
| Units | % |

| | |
|---|---|
| Default | No default |
| Default | COLLECTED STATS LogicalProcessor PCUServicesProcessor ProcessingModule ProcessingBlock |
| Description | The statistics record generated by the LogicalProcessor PCUServicesProcessor ProcessingModule ProcessingBlock component. |

### ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilAvg (avg)

| | |
|---|---|
| Description | This attribute indicates the average PBlock CPU load during the statistics collection interval. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilMin (min)

| | |
|---|---|
| Description | This attribute indicates the minimum PBlock CPU load during the statistics collection interval. |
| Values | Decimal (0..100) |
| Units | % |

### ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilMax (max)

| | |
|---|---|
| Description | This attribute indicates the maximum PBlock CPU load during the statistics collection interval. |
| Values | Decimal (0..100) |
| Units | % |

### COMPONENT Lp Pcusp Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Pcusp Test OsiState (State)"<br>"GROUP Lp Pcusp Test Setup (Setup)"<br>"GROUP Lp Pcusp Test Results (Results)" |
| Scope | Application |

| | |
|---|---|
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

### VERB START Lp Pcusp Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

### VERB STOP Lp Pcusp Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

### GROUP Lp Pcusp Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Pcusp Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Pcusp Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Pcusp Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP Lp Pcusp Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

## ATTRIBUTE Lp Pcusp Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

## ATTRIBUTE Lp Pcusp Test type (type)

Access
Read and write

Description
This attribute is the type of test to be run. The available test types include the following:
***card*** test sets up an internal loop on the board and runs a bit error rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.

***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

## ATTRIBUTE Lp Pcusp Test frmSize (size)

Access

Read and write

Description

This attribute defines the size of the test data frames in number of bytes.

| | |
|---|---|
| | This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Pcusp Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Pcusp Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Pcusp Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Pcusp Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Pcusp Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

## GROUP Lp Pcusp Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

## ATTRIBUTE Lp Pcusp Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.<br><br>a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. |

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp Pcusp Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp Pcusp Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Pcusp Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Pcusp Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Pcusp Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Pcusp Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Pcusp Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Pcusp Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Pcusp Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Pcusp Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp MultiLinkFrameRelay (Mlfr)

| | |
|---|---|
| Instance | Decimal (0..111) |
| Groups | "GROUP Lp Mlfr Provisioned (Prov)"<br>"GROUP Lp Mlfr Operational (Oper)"<br>"GROUP Lp Mlfr Statistics (Stats)"<br>"GROUP Lp Mlfr CustomerIdentifierData (CidData)"<br>"GROUP Lp Mlfr OsiState (State)" |
| Scope | Application |
| Description | *Lp/n MultiLinkFrameRelay/n*<br><br>This component represents a group of DS1 links, called a bundle. Multi-Link Frame Relay (MLFR) provides a data rate greater |

| | |
|---|---|
| | than DS1 and less than DS3, in increments of DS1. The *Mlfr* component may be created only if the *cardType* is . |
| Subcomponents | "COMPONENT Lp Mlfr Link (Lk)" |
| Dyn. Subcomp. | "COMPONENT Lp Mlfr Test (Test)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### GROUP Lp Mlfr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Mlfr* component. |

### ATTRIBUTE Lp Mlfr applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the link to the *Framer* component using the *Mlfr component*. An example is *Framer/3*. |
| Values | Link (Service, interfaceName) |
| Default | No default |

### ATTRIBUTE Lp Mlfr activationClass (actClass)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the conditions under which the bundle is activated. There are four classes of activation:<br>***class A***: One or more bundle links are up.<br>***class B***: All bundle links are up.<br>***class C***: A minimum threshold is provisioned. The threshold represents the minimum number of bundle links that must up. |

| | |
|---|---|
| Values | classA<br>classB<br>classC |
| Default | classA |

### ATTRIBUTE Lp Mlfr activationThreshold (thresh)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum number of links that must be up before the bundle will be up. The value of this attribute is only used when the *activationClass* attribute is set to ***classC***. |
| Values | Decimal (1..28) |
| Default | 1 |

### ATTRIBUTE Lp Mlfr maxDiffDelay (delay)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum acceptable differential delay between links in the MLFR bundle. An alarm is generated for links violating the maximum differential delay. Such links are not allowed to remain up. |
| Values | Decimal (80..600) |
| Units | msec |
| Default | 132 |

### ATTRIBUTE Lp Mlfr helloTimer (hello)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the amount of time between consecutive HELLO messages, sent on each link that is up. |
| Values | Decimal (1..180) |
| Units | seconds |
| Default | 10 |

### ATTRIBUTE Lp Mlfr ackTimer (ack)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum time period to wait for an ADD_LINK_ACK, HELLO_ACK, or REMOVE_LINK_ACK message. If *ackTimer* expires before a bundle link endpoint receives a HELLO_ACK or ADD_LINK_ACK message, then every *ackTimer* seconds a HELLO message is sent and every (*maxRetries* + 1) **ackTimer* seconds an ADD_LINK message is sent. If *ackTimer* expires before a bundle link endpoint receives a REMOVE_LINK_ACK message, then every *ackTimer* seconds a HELLO message is sent and after (*maxRetries* + 1) **ackTimer* seconds the bundle link enters in idle state. |
| Values | Decimal (1..10) |
| Units | seconds |
| Default | 4 |

### ATTRIBUTE Lp Mlfr maxRetries (retries)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of retransmission attempts for consecutive HELLO or REMOVE_LINK messages following the expiration of *ackTimer.* |
| Values | Decimal (1..5) |
| Default | 2 |

### ATTRIBUTE Lp Mlfr resequenceTimer (reseqTim)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the interval of time to wait for receiving out-of-order fragments and frames. The value ***autoConfigure*** means that the *resequenceTimer* is internally calculated. The computed value is visible in *opResequenceTimer*. |
| Values | Decimal (1..132)<br>autoConfigure |
| Units | msec |

| | |
|---|---|
| Default | autoConfigure |

### ATTRIBUTE Lp Mlfr fragmenting (frag)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether fragmentation of transmitted frames is permitted. If the value is ***enabled***, frames which are at least *fragmentingThreshold* octets in length are divided into fragments which are at most *fragmentSize* octets long. The value enabled may be used only if the remote end can accept fragmented frames. If the value is ***disabled***, frames are always transmitted without fragmentation. Fragmentation of received frames is always acceptable, regardless of the value of this attribute. |
| Values | enabled<br>disabled |
| Default | disabled |

### ATTRIBUTE Lp Mlfr fragmentSize (fragSize)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the fragment size. A frame is divided in data fragments which are sent over different links in a bundle. The fragment size is configured in the transmitter, and two peer transmitters need not use the same fragment size. The value of this attribute is only used when the *fragmenting* attribute is set to ***enabled***. |
| Values | Decimal (10..8000) |
| Units | octets |
| Default | 128 |

### ATTRIBUTE Lp Mlfr fragmentingThreshold (fragTresh)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the minimum size a frame must have in order to be fragmented. The value of this attribute is only used when the *fragmenting* attribute is set to ***enabled***. Frames smaller |

| | |
|---|---|
| | than this size will not be fragmented. The *fragmentingThreshold* value must be bigger or equal to *fragmentSize* value. |
| Values | Decimal (10..8000) |
| Units | octets |
| Default | 192 |

### GROUP Lp Mlfr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes for the *Mlfr* component. |

### ATTRIBUTE Lp Mlfr remoteName (remName)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the name of the remote bundle, as it was received from the *Link* component. |
| Values | String (1..49, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Mlfr opResequenceTimer (opReseqTim)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the current value for the *resequenceTimer* attribute. |
| Values | Decimal (0..132) |
| Units | msec |
| Default | 0 |

### GROUP Lp Mlfr Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the *Mlfr* component. |

### ATTRIBUTE Lp Mlfr runningTime (running)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the length of time for which the *Mlfr* component has been in the ***unlocked*** state or has been used for operational testing. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lp Mlfr unavailSec (unavail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the length of time for which the *Mlfr* component has been ***unlocked*** and ***disabled***. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lp Mlfr resequenceErrors (reseqErr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the resequencing errors. These are the errors caused by lost or duplicated frames or data fragments. When the maximum count is exceeded, the count wraps to zero.<br>For example, sequence number 56, 59 and 60 are received for DLCI 100. It is decided by some means that sequence 57 and 58 are lost. This counter whould then be incremented by one, even though two frames were lost. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Mlfr discardedFrames (discFrames)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts frames discarded by the receiver bundle due to re sequencing errors. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Lp Mlfr CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Mlfr customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

## GROUP Lp Mlfr OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp Mlfr adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Lp Mlfr operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component. |

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Mlfr usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

### COMPONENT Lp Mlfr Test (Test)

Groups
"GROUP Lp Mlfr Test OsiState (State)"
"GROUP Lp Mlfr Test Setup (Setup)"
"GROUP Lp Mlfr Test Results (Results)"

Scope
Application

Description — The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port.

Common Verbs
- Help
- List
- Display

### VERB START Lp Mlfr Test

Impact — Service

Description — This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

### VERB STOP Lp Mlfr Test

Impact — Service

Description — This command stops a test running on the hardware component.

### GROUP Lp Mlfr Test OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Mlfr Test adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component.

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Mlfr Test operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Mlfr Test usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP Lp Mlfr Test Setup (Setup)

Properties
Operational

Description
This group contains all of the operational data for a *Test* component.

## ATTRIBUTE Lp Mlfr Test purpose (purpose)

Access
Read and write

Description
This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Values
String (0..40, ASCII)

Default
No default

## ATTRIBUTE Lp Mlfr Test type (type)

Access
Read and write

Description
This attribute is the type of test to be run. The available test types include the following:
***card*** test sets up an internal loop on the board and runs a bit error rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.

***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default
card

## ATTRIBUTE Lp MIfr Test frmSize (size)

Access
Read and write

Description
This attribute defines the size of the test data frames in number of bytes.

| | |
|---|---|
| | This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Mlfr Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Mlfr Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Mlfr Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Mlfr Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Mlfr Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 1.00 |

## GROUP Lp Mlfr Test Results (Results)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all the statistics related attributes of the *Test* component. |

## ATTRIBUTE Lp Mlfr Test causeOfTermination

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates either the status of the test or the cause of the test's termination:<br><br>a value of ***neverStarted*** indicates that the test has not yet been started.<br><br>a value of ***testRunning*** indicates that the test has been started.<br><br>a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.<br><br>a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.<br><br>a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.<br><br>a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.<br><br>a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. |

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default
neverStarted

### ATTRIBUTE Lp MIfr Test bitsTx

Access
Read only

Description
This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Values
Long Integer

Default
No default

### ATTRIBUTE Lp MIfr Test bytesTx

Access
Read only

Description
This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values
Long Integer

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp MIfr Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp MIfr Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp MIfr Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp MIfr Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Mlfr Test erroredFrmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.<br><br>For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Mlfr Test bitErrorRate

| | |
|---|---|
| Access | Read only |
| Description | This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported<br><br>For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.<br>Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE Lp Mlfr Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Mlfr Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### COMPONENT Lp Mlfr Link (Lk)

| | |
|---|---|
| Instance | Decimal (0..27) |
| Groups | "GROUP Lp Mlfr Lk Provisioned (Prov)"<br>"GROUP Lp Mlfr Lk Operational (Oper)"<br>"GROUP Lp Mlfr Lk Statistics (Stats)"<br>"GROUP Lp Mlfr Lk OsiState (State)" |
| Scope | Application |
| Description | *Lp/n Mlfr/n Link/m*<br>This component is used to define a DS1 link belonging to an *Mlfr* component. |

| | |
|---|---|
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP Lp Mlfr Lk Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the *Link* subcomponent. |

## ATTRIBUTE Lp Mlfr Lk interfaceName

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the *Link* subcomponent associated with a specific interface on a function processor, for example: *Lp/5 Ds3/0 Ds1/3 Chan/0*. The following checks are performed:<br>1. The *Link*'s *interfaceName* must link to a *DS1 Channel/0* component on the same *Lp* as the *Mlfr* component.<br>2. All the *Link*s of the same *Mlfr* component must be bound to *DS1 Channel/0* components under the same *DS3*.<br>3. All the *Link*s of the same *Mlfr* component must be bound to *DS1 Channel/0* components having the same value for *timeslotDataRate*.<br>4. All the 24 timeslots of the *DS1 Channel/0* component must be provisioned. |
| Values | Link (Hardware, applicationFramerName) |
| Default | No default |

## GROUP Lp Mlfr Lk Operational (Oper)

| | |
|---|---|
| Properties | Operational |

| | |
|---|---|
| Description | This group contains the operational attributes for the *Link* subcomponent. |

### ATTRIBUTE Lp Mlfr Lk errorCause (cause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the error cause on the near end of this link. Possible values are:<br>***noError***: there is no error on the near end of this link.<br>***inconsistentBundle***: Possible configuration mismatch detected for the remote name of the MLFR bundle.<br>***unknownVendor***: Unrecognized Organizationally Unique Identifier (OUI) received.<br>***linkIdle***: The link is not *operational*.<br>***linkDown***: The link physical layer is *down*.<br>***diffDelay***: The link differential delay exceeds the maximum allowed.<br>***loopbackDetected***: The link has detected a potential loopback condition.<br>***unexpectedAddLink***: An ADD_LINK message was received when the link was up. |
| Values | noError<br>inconsistentBundle<br>unknownVendor<br>linkIdle<br>linkDown<br>diffDelay<br>loopbackDetected<br>other<br>unexpectedAddLink |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk remoteCause (remCause)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the error cause on the far end of his link. Possible values are:<br>***noError***: there is no error on the far end of this link.<br>***inconsistentBundle***: Possible configuration mismatch detected |

for the remote name of the MLFR bundle.
***unknownVendor***: Unrecognized Organizationally Unique Identifier (OUI) received.
***linkIdle***: The link is not *operational*.
***linkDown***: The link physical layer is *down*.
***diffDelay***: The link differential delay exceeds the maximum allowed.
***loopbackDetected***: The link has detected a potential loopback condition.
***unexpectedAddLink***: An ADD_LINK message was received when the link was up.
**""**: No error cause was received yet from the far end.

Values
noError
inconsistentBundle
unknownVendor
linkIdle
linkDown
diffDelay
loopbackDetected
other
unexpectedAddLink

Default
No default

### ATTRIBUTE Lp Mlfr Lk remoteName (remName)

Access
Read only

Description
This attribute indicates the name of the remote link.

Values
String (1..49, ASCII)

Default
No default

### ATTRIBUTE Lp Mlfr Lk diffDelay (diff)

Access
Read only

Description
This attribute indicates the differential delay between this link and the link, in the same MLFR bundle, having the least delay. The value ***notMeasured*** means that the relative delay could not be measured. This can be due to physical layer problems or to no

| | |
|---|---|
| | MLFR Link Integrity Protocol (LIP) messages being received on the link. |
| Values | Decimal (0..4294967294)<br>notMeasured |
| Units | msec |
| Default | No default |

### GROUP Lp Mlfr Lk Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the statistics data for the *Link* subcomponent. |

### ATTRIBUTE Lp Mlfr Lk runningTime (running)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the length of time for which the *Link* component has been in the *unlocked* state or has been used for operational testing. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk unavailSec (unavail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the length of time for which the *Link* component has been ***unlocked*** and out of service. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Units | seconds |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk failures (fail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of failures that the *Link* component has experienced since being created. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk framesLipTx (lipTx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Link Integrity Protocol (LIP) frames sent on the link. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk framesLipRx (lipRx)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of LIP frames received on the link. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk framesLipInvalid (lipInv)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of invalid LIP frames received on the link. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk timerExpired (timExp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times the HELLO or ACK timers expired. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk loopback (loop)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times a loopback has been suspected on the link. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE Lp Mlfr Lk mismatch (mis)

| | |
|---|---|
| Access | Read only |
| Description | This attributes counts the number of times far end bundle name doesn't correspond to *remoteName* for *Mlfr* component. When the maximum count is exceeded, the count wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### GROUP Lp Mlfr Lk OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Mlfr Lk adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

### ATTRIBUTE Lp Mlfr Lk operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |

| | |
|---|---|
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

### ATTRIBUTE Lp Mlfr Lk usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### COMPONENT Lp AdjunctProcessor (Ap)

| | |
|---|---|
| Instance | Decimal (0..31) |
| Groups | "GROUP Lp Ap OsiState (State)"<br>"GROUP Lp Ap Properties (Prop)"<br>"GROUP Lp Ap Utilization (Util)" |
| Scope | Device |
| Description | *Lp/n Ap/n*<br>This component represents an Adjunct Processor on a Functional Processor (FP). |

| | |
|---|---|
| Dyn. Subcomp. | "COMPONENT Lp Ap RncApplication (RncAp)" |
| Common Verbs | Help<br>List<br>Display |

### VERB RESET Lp Ap

| | |
|---|---|
| Impact | Service |
| Description | *Reset Lp/n Ap/m*<br>This command is used to reset a single adjunct processor card. Resetting a processor card implies: (1) resetting the hardware (as if the card had just been powered on), (2) performing the card's self-tests, and (3) reloading the software.. |

### GROUP Lp Ap OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE Lp Ap adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE Lp Ap operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE Lp Ap usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp Ap availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE Lp Ap proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp Ap controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

| | |
|---|---|
| | The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Lp Ap alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.<br><br>The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. |

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Ap standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE Lp Ap unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP Lp Ap Properties (Prop)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes which specify characteristics of the Adjunct Processor. |

### ATTRIBUTE Lp Ap productCode (pec)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the product code for the Adjunct Processor. |
| Values | String (0..12, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Ap serialNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor serial number. |
| Values | String (0..16, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Ap memoryCapacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total amount of memory present on the Adjunct Processor. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap sharedMsgBlockCapacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's shared message block memory capacity. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap localMsgBlockCapacity

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's local message block memory capacity. These message blocks are used for local messaging on the card. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap ipAddress (ipAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the IP address of the Adjunct Processor. |
| Values | IP address |

| | |
|---|---|
| Default | No default |

### GROUP Lp Ap Utilization (Util)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes that specify the Adjunct Processor's utilization levels. |

### ATTRIBUTE Lp Ap cpuUtilization (cpuUtil)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates an approximation of the current Adjunct Processor utilization level. |
| Values | Decimal (0..100) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Ap memoryUtilization

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's current memory utilization. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap sharedMsgBlockUsage

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's current shared message block memory utilization. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap sharedMsgBlockUsageAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's average memory utilization of shared message blocks, over the past 15 minutes. This utilization value is calculated using 15 second samples. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap sharedMsgBlockUsageAvgMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's minimum memory utilization of shared message blocks, over the past 15 minutes. This utilization value is calculated using 15 second samples. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap sharedMsgBlockUsageAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's maximum memory utilization of shared message blocks, over the past 15 minutes. This utilization value is calculated using 15 second samples. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap localMsgBlockUsage

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the Adjunct Processor's current memory utilization of message blocks which are used for local messaging on the card. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap localMsgBlockUsageAvg

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's average memory utilization of message blocks used for local messaging on the card over the past 15 minutes. This utilization value is calculated using 15 second samples. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap localMsgBlockUsageAvgMax

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's maximum memory utilization of message blocks used for local messaging on the card over the past 15 minutes. This utilization value is updated at 15 second intervals. |
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

### ATTRIBUTE Lp Ap localMsgBlockUsageAvgMin

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Adjunct Processor's minimum memory utilization of message blocks used for local messaging |

on the card over the past 15 minutes. This utilization value is updated at 15 second intervals.

| | |
|---|---|
| Values | Decimal (0..2147483647) |
| Units | kbyte |
| Default | No default |

## COMPONENT Lp Ap RncApplication (RncAp)

| | |
|---|---|
| Groups | "GROUP Lp Ap RncAp Operational (Oper)" |
| Scope | Device |
| Description | *Lp/n Ap/n RncApplication*<br>This component represents an RNC application running on this Adjunct Processor. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Lp Ap RncAp Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of *RncApplication*. |

## ATTRIBUTE Lp Ap RncAp processorRole (role)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the functional behavior of the Adjunct Processor. Possible values are:<br>- ***none*** indicates that this Adjunct Processor has not been assigned a role yet. This value is only attained when the Adjunct Processor is disabled or just after it has become enabled. Within a few minutes at most, the role will take on one of the 4 pending values, and quickly change the corresponding permanent value.<br>- ***protocolConverterPending*** indicates that initialization of the Adjunct Processor is still in progress. Once initialization is complete, the role will take on the value of protocolConverter.<br>- ***radioAccessBearerPending*** indicates that initialization of the |

Adjunct Processor is still in progress. Once initialization is complete, the role will take on the value of radioAccessBearer.
- ***activeMasterPending*** indicates that initialization of the Adjunct Processor is still in progress. Once initialization is complete, the role will take on the value of activeMaster.
- ***standbyMasterPending*** indicates that initialization of the Adjunct Processor is still in progress. Once initialization is complete, the role will take on the value of standbyMaster.
- ***protocolConverter*** indicates that this Adjunct Processor is responsible for converting packets to and from AAL2 for Iub and IuCS.
- ***radioAccessBearer*** indicates that this Adjunct Processor is responsible for supporting all radio protocols.
- ***activeMaster*** indicates that this Adjunct Processor handles all shelf-wide Packet Server support.
- ***standbyMaster*** indicates that this Adjunct Processor is a spare for the activeMaster.

Set of

none (none)
radioAccessBearer (rab)
protocolConverter (pc)
activeMaster (aMaster)
standbyMaster (sMaster)
radioAccessBearerPending (rabPend)
protocolConverterPending (pcPend)
activeMasterPending (aMstPend)
standbyMasterPending (sMstPend)

Default

## COMPONENT Lp Ethernet

Instance

Decimal (0..3)

Groups

"GROUP Lp Enet Provisioned (Prov)"
"GROUP Lp Enet CustomerIdentifierData (CidData)"
"GROUP Lp Enet AdminInfo (AdminInfo)"
"GROUP Lp Enet IfEntryProv (IfEntry)"
"GROUP Lp Enet OperationalStatus (OperStatus)"
"GROUP Lp Enet OsiState (State)"
"GROUP Lp Enet Operational (Oper)"
"GROUP Lp Enet Statistics (Stats)"

| | |
|---|---|
| Scope | Device |
| Description | Lp/n Ethernet/n<br>The *Ethernet* component controls and monitors an Ethernet port on a function processor. The number of ports supported depends on the type of the card. The instance number of the *Ethernet* component corresponds to the physical port number on the card. |
| Subcomponents | "COMPONENT Lp Ethernet TrafficManager (Tm)" |
| Opt. Subcomp. | "COMPONENT Lp Ethernet OpticalModule (Om)" |
| Dyn. Subcomp. | "COMPONENT Lp Enet Test" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

## GROUP Lp Ethernet Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisioning data for an *Ethernet* component. |

## ATTRIBUTE Lp Ethernet applicationFramerName (framer)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies which application uses the *Ethernet* component. |
| Values | Link (Service, interfaceName) |
| Default | No default |

## ATTRIBUTE Lp Ethernet maxFrameSize

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the maximum frame size allowed on the link. The definition include the ethernet header and, CRC or FCS octets. This attribute should be changed only for uses of Ethernet over ATM (EoATM) service. |
| Values | Decimal (1518..1600) |
| Default | 1518 |

### ATTRIBUTE Lp Ethernet autoNegotiation

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies that auto negotiation is turned on or off for the ethernet port. This attribute must be set to off, if the far-end does not support auto-negotiation. |
| Values | off<br>on |
| Default | on |

### GROUP Lp Ethernet CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE Lp Ethernet customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those |

| | |
|---|---|
| | components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### GROUP Lp Ethernet AdminInfo (AdminInfo)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attributes pertaining to the vendor of the equipment. |

### ATTRIBUTE Lp Ethernet vendor

| | |
|---|---|
| Access | Read and write |
| Description | This is the name of the vendor supplying the facility. |
| Values | String (0..20, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Ethernet commentText

| | |
|---|---|
| Access | Read and write |
| Description | Any miscellaneous text about the facility. |
| Values | String (0..60, ASCII) |
| Default | No default |

### GROUP Lp Ethernet IfEntryProv (IfEntry)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes for the ifEntry. |

### ATTRIBUTE Lp Ethernet ifAdminStatus (ifState)

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |
| Default | up |

### ATTRIBUTE Lp Ethernet ifIndex (ifI)

| | |
|---|---|
| Access | Read: Passive<br>Write: Debug |
| Criticality | Component |
| Description | This is the index for the IfEntry. Its value is automatically initialized during the provisioning process. |
| Values | Decimal (1..65535) |
| Default | No default |

### GROUP Lp Ethernet OperationalStatus (OperStatus)

| | |
|---|---|
| Properties | Operational |
| Description | This group includes the Operational Status attribute. This attribute defines the current operational state of this component. |

### ATTRIBUTE Lp Ethernet snmpOperStatus

| | |
|---|---|
| Access | Read only |
| Description | The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed. |
| Values | up<br>down<br>testing |

Default up

### GROUP Lp Ethernet OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE Lp Ethernet adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

## ATTRIBUTE Lp Ethernet operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Lp Ethernet usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |

| | |
|---|---|
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### ATTRIBUTE Lp Ethernet availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. |

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest

### ATTRIBUTE Lp Ethernet proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the

user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE Lp Ethernet controlStatus (osiCntrl)

Access

Read only

| | |
|---|---|
| Description | If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.<br><br>The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.<br><br>The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.<br><br>The value ***suspended*** indicates that the service has been administratively suspended. |
| Set of | subjectToTest (subTst)<br>partOfServicesLocked (partLk)<br>reservedForTest (rsrvd)<br>suspended (suspnd) |
| Default | No default |

### ATTRIBUTE Lp Ethernet alarmStatus (osiAlarm)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions |

described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE Lp Ethernet standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and

thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE Lp Ethernet unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP Lp Ethernet Operational (Oper)

Properties
Operational

Description This group contains the operational data for an *Ethernet* component.

## ATTRIBUTE Lp Ethernet failureCause

Access Read only

Description This attribute indicates the failure cause of an Ethernet port. The port enters a failed state after the condition has been observed for a period of 2.5 seconds +/-0.5 seconds. The port comes out of the failed state when the condition has been cleared for a period of 10 seconds +/- 0.5 seconds. The attribute is set to one of the following values while the OSI *availabilityStatus* attribute is set to ***failed***:

***lossOfSync***: Port synchronization cannot be achieved.

***remoteOffline***: The far end is offline.

***remoteLinkFailure***: The far end has detected a link failure.

***autoNegError***: The far end does not support a compatible set of auto-negotiation capabilities, or auto-negotiation has failed.

***noFailure***: There is no failure.

Values lossOfSync
remoteLinkFailure
remoteOffline
autoNegError
noFailure

Default noFailure

## ATTRIBUTE Lp Ethernet autoNegStatus

Access Read only

Description This attribute indicates the status of the Ethernet port auto-negotiation. The possible values are:

***succeeded***: Auto-negotiation has completed successfully.

***failed***: Auto-negotiation has failed to mediate a compatible set of capabilities.

***inProgress***: Auto-negotiation is currently in progress.

***disabled****:* The far end does not support auto-negotiation.

Values
succeeded
failed
inProgress
disabled

Default No default

## GROUP Lp Ethernet Statistics (Stats)

Properties Operational

Description This group contains the statistics data for an *Ethernet* component. Each attribute is a positive integer that monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

## ATTRIBUTE Lp Ethernet framesTransmittedOk (frmTxOk)

Access Read only

Description This attribute counts the frames that were transmitted without error.

Values Long Integer

Default No default

## ATTRIBUTE Lp Ethernet framesReceivedOk (frmRxOk)

Access Read only

Description This attribute counts the frames that were received without error.

Values Long Integer

Default No default

### ATTRIBUTE Lp Ethernet octetsTransmittedOk (octTxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets that were transmitted without error. The count includes data, padding octets, destination address (DA), source address (SA), length field, and frame check sequence (FCS), but excludes preamble and source field delimiter (SFD). |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet octetsReceviedOk (octRxOk)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets that were received without error. The count includes data, padding octets, destination address (DA), source address (SA), length field, and frame check sequence (FCS), but excludes preamble and source field delimiter (SFD). The count also excludes octets contained within received frames that are classified as being errored (fcsErrors etc.). |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet undersizeFrames

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded frames that were received with less than the minimum size (64 bytes). |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet fragments

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the discarded frames that were received with less than the minimum size (64 bytes) with a bad frame check sequence (FCS). |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet framesTooLong

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded frames that were received and exceeds the maximum permitted frame size. The maximum size of a frame depends on it supported encapsulated types. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet jabbers

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded frames that were received and exceeds the maximum permitted frame size with a bad frame check sequence (FCS). The maximum size of a frame depends on it supported encapsulated types. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet fcsErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded received frames with an integral number of octets in length and did not pass the Frame Check Sequence (FCS). The count does not include frames received that are too long (jabbers) or too short (fragments). |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Lp Ethernet symbolErrors

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the discarded received frames with a valid length, but at least one data reception error or one symbol error was observed. This counter increments once per valid Carrier Event. |
| Values | Long Integer |
| Default | No default |

## ATTRIBUTE Lp Ethernet pauseFramesReceived

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the PAUSE Media Access Control (MAC) control frames received. |
| Values | Long Integer |
| Default | No default |

## COMPONENT Lp Ethernet TrafficManager (Tm)

| | |
|---|---|
| Scope | Device |
| Description | *Lp/x Ethernet/y Tm*<br>This component contains the emission priority queue (*GrmEmissionPriority*), and service category (*GrmServiceCategory*) subcomponents. It provides traffic management capabilities for absolute (strict) queueing and fair-weighted queueing.<br>This component is required for the 4pGE FP. |
| Opt. Subcomp. | "COMPONENT Lp Ethernet Tm EmissionPriority (Ep)"<br>"COMPONENT Lp Ethernet Tm ServiceCategory (Sc)" |
| Common Verbs | Help<br>List<br>Display |

## COMPONENT Lp Ethernet Tm EmissionPriority (Ep)

| | |
|---|---|
| Instance | Decimal (0..7) |
| Groups | "GROUP Lp Ethernet Tm Ep Operational (Oper)"<br>"GROUP Lp Ethernet Tm Ep ProvQueue (ProvQ)" |
| Scope | Application |
| Description | *Lp/x Ethernet/y Tm Ep/n*<br>This component defines the characteristics of the corresponding emission priority queue for the associated physical links.<br><br>This component have instances of *Ep/0* and *Ep/1* which are absolute priority queues having precedence over queues under *Ep2* to *Ep7* components. Component *Ep/0* has the highest priority. All traffic in *Ep/0* is transmitted on the link first, then traffic from component *Ep/1* is transmitted. When all traffic at *Ep/0* and *Ep/1* have been sent, other *Ep* component queues get the opportunity to transmit with the residual bandwidth.<br><br>This component has instances from *Ep/2* to *Ep/7* that operate under the weighted fair queue strategy, with each queue using a bandwidth attribute for weight to allocate service opportunities left over by *Ep/0* and *Ep/1*. |
| Common Verbs | Help<br>List<br>Display |

## GROUP Lp Ethernet Tm Ep Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains operational attributes of the *Ep* component. |

## ATTRIBUTE Lp Ethernet Tm Ep percentMinimumBandwidthGuarantee (pMinBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the weight as a percentage of the link residual bandwidth available to this queue. |

| | |
|---|---|
| Values | Decimal (0.00..100.00)<br>abs |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Ethernet Tm Ep minimumBandwidthGuaranteeOp (minBwOp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the minimum bandwidth guaranteed for this queue. |
| Values | Decimal (0.00..100.00)<br>abs |
| Default | No default |

### ATTRIBUTE Lp Ethernet Tm Ep congestionState (cs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the congestion control discard priority (CCDP) of traffic destined for each of the 8 queues (*Ep/0* to *Ep/7*). There are 4 discard priorities (***ccdp0*** to ***ccdp3*** corresponding to values 0 to 3, respectively) with ***ccdp0*** traffic being the most sensitive to loss. For example, when the count of cell blocks currently in the queue is greater than the ***ccdp0*** discard threshold, the hardware device discards the arriving ***ccdp0*** traffic. |
| Values | ccdp0<br>ccdp1<br>ccdp2<br>ccdp3 |
| Default | No default |

### ATTRIBUTE Lp Ethernet Tm Ep txQueueSizeOp (qsOp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the queue size associated with the queue for buffering traffic. |
| Values | Decimal (0..7168000) |

| | |
|---|---|
| Units | bytes |
| Default | No default |

### ATTRIBUTE Lp Ethernet Tm Ep txQueueUsage (qu)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current usage of the queue as a percentage of the total queue bandwidth. |
| Values | Decimal (0.00..100.00) |
| Units | % |
| Default | No default |

### ATTRIBUTE Lp Ethernet Tm Ep txQueueMin (qmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the lowest count of bytes allocated to traffic in the queue. |
| Values | Decimal (0..7168000) |
| Units | bytes |
| Default | No default |

### ATTRIBUTE Lp Ethernet Tm Ep txQueueMax (qmax)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the largest count of bytes allocated to traffic in the queue. |
| Values | Decimal (0..7168000) |
| Units | bytes |
| Default | No default |

### GROUP Lp Ethernet Tm Ep ProvQueue (ProvQ)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Ep* component. |

### ATTRIBUTE Lp Ethernet Tm Ep minimumBandwidthGuarantee (minBw)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the weight available to this queue. It determines the relative amount of residual bandwidth left by components *Ep/0* and *Ep/1* that is allocated to this queue.<br><br>The amount of bandwidth allocated is the weight of this queue divided by the sum of the weights of components *Ep/2* through *Ep/7* multiplied against the residual bandwidth. For example, if the weight of this queue divided by the sum of the weights from *Ep/2* through *Ep/7* is 2%, and 80% of the link bandwidth is left after *Ep/0* and *Ep/1* traffic is sent, then the amount of bandwidth available to this *Ep* queue is 2% of 80% (or 1.6%) of the link bandwidth.<br><br>The default weight values are 50, 25, 10, 7, 5, 3 assigned to components *Ep/2*, *Ep/3*, *Ep/4*, *Ep/5*, *Ep/6*, and *Ep/7*, respectively. |
| Values | Decimal (0.00..100.00)<br>autoConfig |
| Default | autoConfig |

### ATTRIBUTE Lp Ethernet Tm Ep redMode (red)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies whether random early packet discard is set to a value of either ***disable*** or ***enable*** for the queue. It serves as an early warning of congestion with the occasional packet being discarded when the queue begins to be congested, but it is not a congestion control mechanism in itself.<br>No frame is randomly discarded if this attribute is set to ***disable***. If it is set to ***enable***, only the frames whose red bit is set are targeted to be randomly discarded. In PCR5.1, the upstream device sets the red bit of every frame so that random eary discard is controlled by the setting of this attribute.<br>The default is ***disable***. |
| Values | disable<br>enable |

| | |
|---|---|
| Default | disable |

### ATTRIBUTE Lp Ethernet Tm Ep txQueueSize (qs)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum size of the link associated with the queue for buffering traffic.<br>For the 4pGE card, each of the port's 8 *Ep/x* queues have a maximum queue size for its *txQueueSize* attribute. The maximum queue sizes are 500K, 500K, 500K, 500K, 7M, 4.2M, 3M, and 2.2M for each *Ep/0*, *Ep/1*, *Ep/2*, *Ep/3*, *Ep/4*, *Ep/5*, *Ep/6* and *Ep/7* components, respectively. The default values are 100K, 300K, 300K, 300K, 7M, 4.2M, 3M, and 2.2M for each of *Ep/0*, *Ep/1*, *Ep/2*, *Ep/3*, *Ep/4*, *Ep/5*, *Ep/6* and *Ep/7* components, respectively. The autoConfig sets the *txQueueSize* to the default value corresponding to the component instance. |
| Values | Decimal (0..7168000)<br>autoConfig |
| Units | bytes |
| Default | autoConfig |

### COMPONENT Lp Ethernet Tm ServiceCategory (Sc)

| | |
|---|---|
| Instance | Decimal (0..7) |
| Groups | "GROUP Lp Ethernet Tm Sc Operational (Oper)" |
| Scope | Application |
| Description | *Lp/x Ethernet/y Tm Sc*<br>This component displays the default characteristics of the service category for queue scheduling. |
| Common Verbs | Help<br>List<br>Display |

### GROUP Lp Ethernet Tm Sc Operational (Oper)

| | |
|---|---|
| Properties | Operational |

Description This group contains the operational attributes of the *Sc* component.

### ATTRIBUTE Lp Ethernet Tm Sc scToEpMappingOp (epOp)

Access Read only

Description This attribute indicates the emission queue which is used for this *Sc* component. The default values are ***ep0***, ***ep1***, ***ep2, ep3***, ***ep4***, ***ep5***, ***ep6*** and ***ep7*** assigned to *Sc/7*, *Sc/6*, *Sc/5*, *Sc/4*, *Sc/3*, *Sc/2*, *Sc/1*, and *Sc/0*, respectively.

## GROUP Lp Ethernet Om OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp Ethernet Om adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.<br><br>The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.<br><br>The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. |
| Values | locked (lck)<br>unlocked (unlck)<br>shuttingDown (shut) |
| Default | unlocked |

## ATTRIBUTE Lp Ethernet Om operationalState (osiOper)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Operational State of the component.<br><br>The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.<br><br>The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. |
| Values | enabled (ena)<br>disabled (dis) |
| Default | disabled |

## ATTRIBUTE Lp Ethernet Om usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## GROUP Lp Ethernet Om Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational data for the *OpticalModule* component. |

## ATTRIBUTE Lp Ethernet Om insertedType

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the inserted optical module type.<br><br>***none***: This value indicates that there is no optical module inserted to the card.<br><br>***LX***: This value indicates that the optical module is a gigabit ethernet type using long wavelength laser devices over multimode and single-mode fiber.<br><br>***SX***: This value indicates that the optical module is a gigabit ethernet type using short wavelength laser devices over multimode fiber.<br><br>***OC3SmLr***: This value indicates that the optical module is an OC3 type using long wavelength laser devices over singlemode fiber.<br><br>***OC3SmIr***: This value indicates that the optical module is an OC3 type using intermediate wavelength laser devices over singlemode fiber.<br><br>***OC3MmSr***: This value indicates that the optical module is an OC3 type using short wavelength laser devices over multimode fiber. |
| Values | none<br>LX<br>SX<br>OC3SmLr<br>OC3SmIr<br>OC3MmSr |

| | |
|---|---|
| Default | none |

### ATTRIBUTE Lp Ethernet Om serialNumber

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the serial number of the inserted optical module. |
| Values | String (0..64, Extended ASCII) |
| Default | "" |

### ATTRIBUTE Lp Ethernet Om failureCause

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the cause for the optical module's failure. The possible values are:<br><br>***typeMismatch***: This error indicates a mismatch between the *type* and *insertedType* attributes.<br><br>***internalError***: This error indicates an internal diagnostic failure of the optical module.<br><br>***unsupportedOm:*** This error indicates that the inserted optical module is not supported on this card.<br><br>***absentOm***: This error indicates that no optical module are currently present on this port.<br><br>***noFailure***: There is no failure. |
| Values | typeMismatch<br>internalError<br>unsupportedOm<br>absentOm<br>noFailure |
| Default | noFailure |

## COMPONENT Lp Ethernet Test (Test)

| | |
|---|---|
| Groups | "GROUP Lp Ethernet Test OsiState (State)"<br>"GROUP Lp Ethernet Test Setup (Setup)"<br>"GROUP Lp Enet Test Results (Results)" |
| Scope | Application |
| Description | The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21*, *DS1*, *E1*, *DS3*, *E3* etc.) or a logical port. |
| Common Verbs | Help<br>List<br>Display |

## VERB START Lp Ethernet Test

| | |
|---|---|
| Impact | Service |
| Description | This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started. |

## VERB STOP Lp Ethernet Test

| | |
|---|---|
| Impact | Service |
| Description | This command stops a test running on the hardware component. |

## GROUP Lp Ethernet Test OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

## ATTRIBUTE Lp Ethernet Test adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

### ATTRIBUTE Lp Ethernet Test operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE Lp Ethernet Test usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

### GROUP Lp Ethernet Test Setup (Setup)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all of the operational data for a *Test* component. |

### ATTRIBUTE Lp Ethernet Test purpose (purpose)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute records the purpose of the test so that the test results can be associated and properly analyzed. |
| Values | String (0..40, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Ethernet Test type (type)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the type of test to be run. The available test types include the following:<br>***card*** test sets up an internal loop on the board and runs a bit error |

rate test.
***manual*** test assumes the line is looped back externally and a bit error rate test is performed.
***localLoop*** test loops back the local modem and performs a bit error rate test.
***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.
***externalLoop*** test loops back the line to the far end.
***payloadLoop*** test only loops back the payload data received from the incoming line.
***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent.
***v54RemoteLoop*** initiates a V.54 Remote Loopback test.
***pn127RemoteLoop*** initiates a PN127 Remote Loopback test.
***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted).
***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted).
***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted).
***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values

card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default

card

### ATTRIBUTE Lp Ethernet Test frmSize (size)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the size of the test data frames in number of bytes.<br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Decimal (4..4096) |
| Units | bytes |
| Default | 1024 |

### ATTRIBUTE Lp Ethernet Test frmPatternType (fpt)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the type of data pattern generation to use. The following lists the available pattern types:<br>***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit.<br>***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit.<br>***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute. |
| Values | ccitt32kBitPattern<br>ccitt8MBitPattern<br>customizedPattern |
| Default | ccitt32kBitPattern |

### ATTRIBUTE Lp Ethernet Test customizedPattern (cp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern. |
| Values | Hex (H.0..H.ffffffff) |
| Units | Hex |
| Default | H.55555555 |

### ATTRIBUTE Lp Ethernet Test dataStartDelay (dsd)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop.<br>This attribute is ignored when the test *type* is set to ***externalLoop***. |
| Values | Decimal (0..1814400) |
| Units | seconds |
| Default | 0 |

### ATTRIBUTE Lp Ethernet Test displayInterval (di)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime. |
| Values | Decimal (0..30240) |
| Units | minutes |
| Default | 5 |

### ATTRIBUTE Lp Ethernet Test duration

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |

Default 1.00

### GROUP Lp Ethernet Test Results (Results)

Properties Operational

Description This group contains all the statistics related attributes of the *Test* component.

### ATTRIBUTE Lp Ethernet Test causeOfTermination

Access Read only

Description This attribute indicates either the status of the test or the cause of the test's termination:

a value of ***neverStarted*** indicates that the test has not yet been started.

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission

errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

| | |
|---|---|
| Values | testTimeExpired<br>stoppedByOperator<br>unknown<br>neverStarted<br>testRunning<br>hardwareReconfigured<br>loopCodeSyncFailed<br>patternSyncFailed<br>patternSyncLost |
| Default | neverStarted |

### ATTRIBUTE Lp Ethernet Test bitsTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet Test bytesTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value. |

| | |
|---|---|
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet Test frmTx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.<br><br>This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet Test bitsRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet Test bytesRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE Lp Ethernet Test frmRx

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. |

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp Ethernet Test erroredFrmRx

Access: Read only

Description: This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values: Long Integer

Default: No default

### ATTRIBUTE Lp Ethernet Test bitErrorRate

Access: Read only

Description: This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable

| | |
|---|---|
| | test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results. |
| Values | String (5, ASCII) |
| Default | No default |

### ATTRIBUTE Lp Ethernet Test elapsedTime

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

### ATTRIBUTE Lp Ethernet Test timeRemaining

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the length of time remaining before the test stops according to the *duration* attribute. |
| Values | Decimal (0.00..30240.00) |
| Units | minutes |
| Default | 0.00 |

# COMPONENT McsManager (McsMgr)

| | |
|---|---|
| Groups | "GROUP McsMgr Provisioned (Prov)"<br>"GROUP McsMgr OsiState (State)"<br>"GROUP McsMgr Operational (Oper)" |
| Scope | Network |
| Description | *McsManager*<br>There is at most one *McsManager* per module. The *McsManager* is required for FRF5 PVC and DPRS MCS functionality. The *McsManager* can run on one of a number of LPs. The LP of the active *McsManager* can be determined by looking at the *currentLp* operational attribute. |
| Opt. Subcomp. | "COMPONENT McsMgr Frf5EndPointGroup (Frf5EpG)" |
| Opt. Subcomp. | "COMPONENT McsMgr DprsMcsEndPointGroup (DprsMcsEpG)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

## GROUP McsMgr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *McsManager*. |

### ATTRIBUTE McsMgr maxEps (mEps)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of end points that will be allowed on the module.This includes end points originating from and terminating on this module. When this limit is reached calls requiring the creation of an end point are rejected. The current number of EPs is indicated by the *currentEps* attribute. |
| Values | Decimal (1..16384) |
| Default | 512 |

### ATTRIBUTE McsMgr epAlarmThreshold (epThresh)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum number of end points that can exist before an alarm is raised. When *currentEps* exceeds this value an alarm is generated. The alarm is cleared when *currentEps* falls below this value. |
| Values | Decimal (1..16384) |
| Default | 128 |

### ATTRIBUTE McsMgr overrideNsapAddress (oNsap)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the NSAP address to use as the address of the *McsManager*. If this attribute is left empty the default *McsManager* NSAP address is used. The *nsapAddress* attribute indicates the NSAP address used by the *McsManager*.<br>The default NSAP address for the *McsManager* takes the form:<br><26 byte module prefix>0020480d100100 |
| Values | String (0..44, AESANsapAddress) |
| Default | "" |

### ATTRIBUTE McsMgr security (sec)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute enables or disables security for the *McsManager*. In the case of DPRS MCS Switched Paths, if security is set to ***on*** this node must have a *DprsMcsEpGroup* with the *nsapAddress* of the *Addr* subcomponent set to the same value as the node originating the call setup for the call to be accepted.If this attribute is set to ***off*** this node will accept DPRS MCS setup requests from any other node in the network.<br>This attribute has no effect on the setup of FRF5 switched paths since an originating and terminating EP are required to establish an FRF5 switched path. |
| Values | off<br>on |
| Default | off |

### GROUP McsMgr OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE McsMgr adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. |

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE McsMgr operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

## ATTRIBUTE McsMgr usageState (osiUsage)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Usage State of the component.<br><br>The value ***idle*** indicates that the component is not currently in use.<br><br>The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.<br><br>The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.<br><br>The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component. |
| Values | idle<br>active (activ)<br>busy |
| Default | idle |

## ATTRIBUTE McsMgr availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. |

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

| | |
|---|---|
| Set of | inTest<br>failed<br>dependency (depend)<br>powerOff (pwrOff)<br>offLine<br>offDuty<br>degraded (degrad)<br>notInstalled (notIn)<br>logFull<br>migrating |
| Default | No default |

### ATTRIBUTE McsMgr proceduralStatus (osiProc)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.<br><br>The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.<br><br>The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. |

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

## ATTRIBUTE McsMgr controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE McsMgr alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE McsMgr standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

| | |
|---|---|
| Default | notSet |

### ATTRIBUTE McsMgr unknownStatus (osiUnknw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Unknown status of the component.<br><br>The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.<br><br>The value ***true*** indicates that the actual state of the component is not known for sure. |
| Values | false<br>true |
| Default | false |

### GROUP McsMgr Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *McsManager* component. |

### ATTRIBUTE McsMgr currentLp (curLp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the current LP on which the *McsManager* resides. If this attribute is blank then no *McsManager* is available. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE McsMgr currentEps (totalEps)

| | |
|---|---|
| Access | Read only |
| Description | The indicates the number of EPs both originating and terminating on this module. |
| Values | Decimal (0..16384) |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE McsMgr nsapAddress (nsap)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the NSAP address of the *McsManager* on this node. The value of this attributed depends on how the *overrideNsapAddress* attribute is set. All DPRS MCS and FRF5 switched paths that are to terminate on this node must specify this NSAP address as their destination. |
| Values | String (0..44, ASCII) |
| Default | No default |

### ATTRIBUTE McsMgr candidateLps (canLps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the set of LPs capable of running the *McsManager*. If this attribute is blank then there are no candidate LPs. |
| List of | The name of the component |
| Default | No default |

### COMPONENT McsMgr DprsMcsEndPointGroup (DprsMcsEpG)

| | |
|---|---|
| Instance | Decimal (1..8191) |
| Groups | "GROUP McsMgr DprsMcsEpG Operational (Oper)" |
| Scope | Network |
| Description | *McsMgr DprsMcsEndPointGroup/n*<br>The *DprsMcsEndPointGroup* component contains all of the provisioned End Points or all of the dynamic End Points that share a common destination NSAP address, thereby terminating on the same destination node.<br>This means that there could be at most two *DprsMcsEndPointGroups* to the same destination, a provisioned *DprsMcsEpG* and a dynamic *DprsMcsEpG*.<br>The associated group is indicated by the *associatedEpGroupName* attribute. |

| | |
|---|---|
| | *DprsMcsEpG* component instances in the 1-4096 range can be provisioned.<br>*DprsMcsEpG* component instances in the 4097-8191 range are dynamic. |
| Subcomponents | "COMPONENT McsMgr DprsMcsEpG Address (Addr)" |
| Subcomponents | "COMPONENT McsMgr DprsMcsEpG EndPoint (Ep)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete |

### GROUP McsMgr DprsMcsEpG Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *DprsMcsEpG* component. |

### ATTRIBUTE McsMgr DprsMcsEpG remoteAddress (rAddr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the NSAP address of the *McsMgr* at the destination module to which all *EndPoints* of this group are connected. |
| Values | String (0..44, ASCII) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG associatedEpGroupName (assocEpGrpName)

| | |
|---|---|
| Access | Read only |
| Description | For a provisioned *DprsMcsEpG*, this attribute indicates the name of the *DprsMcsEpG* that contains the dynamic *Eps* to the same destination.<br>For a dynamic *DprsMcsEpG*, this attribute indicates the name of the<br>*DprsMcsEpG* that contains the provisioned Eps to the same |

| | |
|---|---|
| | destination.<br>A null component name indicates that there is no *DprsMcsEpG* associated with this group. |
| Values | The name of the component |
| Default | No default |

### COMPONENT McsMgr DprsMcsEpG Address (Addr)

| | |
|---|---|
| Groups | "GROUP McsMgr DprsMcsEpG Addr Provisioned (Prov)" |
| Scope | Application |
| Description | *McsMgr DprsMcsEpG/n Address*<br>This component contains the destination NSAP address used by all DPRS MCS End Points provisioned under a *DprsMcsEpG*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP McsMgr DprsMcsEpG Addr Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the *Address* component. |

### ATTRIBUTE McsMgr DprsMcsEpG Addr remoteAddress (rAddr)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the NSAP address of the *McsMgr* at the destination module. This address is used by the *EndPoints* provisioned under this *DprsMcsEpG* to establish a DPRS MCS Switched Path. |
| Values | String (1..44, AESANsapAddress) |
| Default | No default |

## ATTRIBUTE McsMgr DprsMcsEpG Addr commentText

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies additional textual information to be added by the network operator. Typical use of this attribute is to specify the destination module name. |
| Values | String (0..60, ASCII) |
| Default | "" |

## COMPONENT McsMgr DprsMcsEpG EndPoint (Ep)

| | |
|---|---|
| Instance | Decimal (1..256) |
| Groups | "GROUP McsMgr DprsMcsEpG Ep OsiState (State)"<br>"GROUP McsMgr DprsMcsEpG Ep Operational (Oper)"<br>"GROUP McsMgr DprsMcsEpG Ep Statistics (Stats)" |

"COLLECTED STATS McsManager DprsMcsEndPointGroup EndPoint"

| | |
|---|---|
| Scope | Network |
| Description | *McsMgr DprsMcsEpG/n EndPoint/n*<br>The *EndPoint* component represents the DPRS MCS Switched Path. It multiplexes multiple Frame Relay DLCIs and transports them over an underlying PORS or ATM connection. |

| | |
|---|---|
| Subcomponents | "COMPONENT McsMgr DprsMcsEpG Ep EndPointDescriptor (EpD)" |
| Dyn. Subcomp. | "COMPONENT McsMgr DprsMcsEpG Ep AtmConnection (AtmCon)"<br>"COMPONENT McsMgr DprsMcsEpG Ep LogicalConnection (LCo)"<br>"COMPONENT McsMgr DprsMcsEpG Ep Connection (Con)" |
| Dyn. Subcomp. | "COMPONENT McsMgr DprsMcsEpG Ep CallAdmissionControl (Cac)" |
| Common Verbs | Help<br>List<br>Display<br>Add<br>DELete<br>LOCK<br>Unlock |

### VERB Ping McsMgr DprsMcsEpG Ep

| | |
|---|---|
| Impact | Passive |
| Description | *Ping McsMgr DprsMcsEpG/n Ep/n*<br>A *Ping* issued against the *Ep* causes a query packet to be sent to the remote *Ep*, allowing the user to verify that the underlying PORS or ATM transport connection is up.<br>The ping query packet sent includes 10 octets of data and 4 octets of ping packet headers.<br>A ping reply packet expected in response to a ping query also includes 10 octets of data and 4 octets of packet headers. |

### GROUP McsMgr DprsMcsEpG Ep OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values |

and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE McsMgr DprsMcsEpG Ep adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE McsMgr DprsMcsEpG Ep operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for

operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE McsMgr DprsMcsEpG Ep usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE McsMgr DprsMcsEpG Ep availabilityStatus (osiAvail)

Access
Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is

one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE McsMgr DprsMcsEpG Ep proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has

not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but

tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the

role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE McsMgr DprsMcsEpG Ep unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP McsMgr DprsMcsEpG Ep Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes of the *EndPoint* component.

### ATTRIBUTE McsMgr DprsMcsEpG Ep lastTransportConnectionClearCause (lastTrConClearCause)

Access
Read only

Description
This attribute indicates the most recent clear cause for the transport connection.

| | |
|---|---|
| | This indicates the causes provided by the network.<br>A value of zero indicates that the transport connection has never been cleared.<br>A value of 1000 indicates that the network has not provided a clear<br>cause for the transport connection clearing.<br>Section 5.4.5.15 of the ATMF UNI 3.1 specification lists the clear causes provided by the network. |
| Values | Decimal (0..1000) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep type

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the type of the end point. If the value is ***originating***, this *Ep* is provisioned and is responsible for initiating the SPVC call to set up the PORS or ATM connection. If the value is ***terminating***, this *Ep* is created dynamically by the McsMgr at the destination node when it receives a call setup request. |
| Values | originating (orig)<br>terminating (term) |
| Default | originating |

### ATTRIBUTE McsMgr DprsMcsEpG Ep supportedTransferPriorities (supTps)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Frame Relay transfer priorities supported by the transport connection. |
| Set of | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep connectionTransferPriority (connTp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the transfer priority used to establish the transport connection. |

| | |
|---|---|
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep serviceCategory (sc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM service category of the transport connection. |
| Values | ubr<br>cbr<br>rtVbr<br>nrtVbr |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep remoteComponentName (remoteName)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the component name of the remote *Ep*, learned from the remote end.<br>For example: *"EM/NODEY2D0 McsMgr DprsMcsEpG/1 Ep/1"*.<br>The value is a null string if the transport connection is down. |
| Values | String (0..46, ASCII) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep remoteRoutingId (remoteRid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the routing identifier (RID) associated with the Passport node on which the remote *Ep* resides. The remote RID is learned from the remote *Ep*.<br>The value is valid when the transport connection is up and zero otherwise. |
| Values | Decimal (0..126) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep remoteModuleId (remoteMid)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the module identifier (MID) associated with the Passport node on which the remote *Ep* resides. The remote MID is learned from the remote *Ep*.<br>The value is valid when the transport connection is up and zero otherwise. |
| Values | Decimal (0..1909) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep lastTrConnDiagCode (lastTrConnDiagCode)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the diagnostic code of the most recently cleared transport connection.<br>This indicates the diagnostic code (associated with the lastTransportConnectionClearCause) provided by the network.<br>A string containing only a 0 or 00 (zero) indicates that the network has not provided a diagnostic code for the most recently cleared transport connection.<br>Section 5.4.5.15 of the ATMF UNI 3.1 specification lists the diagnostic codes that can be provided by the network. |
| Values | String (0..10, Hex) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep forwardBandwith (fBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bandwidth at which the transport connection agrees to transfer information in the forward (from the originating to the dynamic End Point) direction. |
| Values | Decimal (0..155000000) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep reverseBandwidth (rBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the bandwidth at which the transport connection agrees to transfer information in the reverse (from the dynamic to the to the originating End Point) direction. |
| Values | Decimal (0..155000000) |
| Units | bit/s |
| Default | No default |

### GROUP McsMgr DprsMcsEpG Ep Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains statistics of traffic received on the DPRS MCS Switched Path. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep setupAttempts

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of attempts made to set up the transport connection. The counter wraps around to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr DprsMcsEpG Ep pktDiscErroredFromMcs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts errored packets received on the DPRS MCS Switched Path; these packets are discarded.<br>The counter wraps around to zero when the maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep pktFromMcs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the packets received on the DPRS MCS Switched Path for each discard priority.<br>This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).<br>Each entry (counter) wraps around to zero when the maximum value is exceeded. |
| Vector of | Long Integer |
| Index | discardPriority0 (dp0)<br>discardPriority1 (dp1)<br>discardPriority2 (dp2)<br>discardPriority3 (dp3) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep octetsFromMcs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the octets received on the DPRS MCS Switched Path for each discard priority.<br>This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).<br>Each entry (counter) wraps around to zero when the maximum value is exceeded. |
| Vector of | Long Integer |
| Index | discardPriority0 (dp0)<br>discardPriority1 (dp1)<br>discardPriority2 (dp2)<br>discardPriority3 (dp3) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep pktDiscCongestedFromMcs

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts packets received on the DPRS MCS Switched Path for each discard priority that have been discarded at the transport card due to congestion at the access card.<br>This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).<br>Each entry (counter) wraps around to zero when the maximum value is exceeded. |
| Vector of | Decimal (0..4294967295) |
| Index | discardPriority0 (dp0)<br>discardPriority1 (dp1)<br>discardPriority2 (dp2)<br>discardPriority3 (dp3) |
| Default | No default |

## COLLECTED STATS McsManager DprsMcsEndPointGroup EndPoint

| | |
|---|---|
| Description | The statistics record generated by the McsManager DprsMcsEndPointGroup EndPoint component. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep remoteComponentName (remoteName)

| | |
|---|---|
| Description | This attribute indicates the component name of the remote *Ep*, learned from the remote end.<br>For example: *"EM/NODEY2D0 McsMgr DprsMcsEpG/1 Ep/1"*.<br>The value will be a null string if the transport connection is down at the end of the statistics collection interval. |
| Values | String (0..46, ASCII) |

### ATTRIBUTE McsMgr DprsMcsEpG Ep bandwidthHWM

| | |
|---|---|
| Description | This attribute indicates the high-water mark of the bandwidth at which the transport connection agrees to transfer data during the last statistics collection interval. The value for this attribute is equal to the provisioned bandwidth when the connection is up, |

and is 0 when the transport connection is down.
This attribute, when combined with *bandwidthLWM* can also be used to indicate a transport connection outage occurrence.

Values: Decimal (0..155000000)

Units: bit/s

### ATTRIBUTE McsMgr DprsMcsEpG Ep bandwidthLWM

Description: This attribute indicates the low-water mark of the bandwidth at which the transport connection agrees to transfer data during the last statistics collection interval. The value for this attribute is equal to the provisioned bandwidth when the connection is up, and is 0 when the transport connection is down.
This attribute, when combined with *bandwidthHWM* can also be used to indicate a transport connection outage occurrence.

Values: Decimal (0..155000000)

Units: bit/s

### ATTRIBUTE McsMgr DprsMcsEpG Ep serviceCategory (sc)

Description: This attribute indicates the ATM service category of the transport connection.

Values:
ubr
cbr
rtVbr
nrtVbr

### ATTRIBUTE McsMgr DprsMcsEpG Ep pktFromMcs

Description: This attribute indicates the number of packets received on the DPRS MCS Switched Path End Point for each discard priority in the last statistics collection interval.
This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0(***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).

| | |
|---|---|
| Vector of | Long Integer |
| Index | discardPriority0 (dp0)<br>discardPriority1 (dp1)<br>discardPriority2 (dp2)<br>discardPriority3 (dp3) |

### ATTRIBUTE McsMgr DprsMcsEpG Ep octetsFromMcs

| | |
|---|---|
| Description | This attribute indicates the octets received on the DPRS MCS Switched Path End Point for each discard priority in the last statistics collection interval.<br>This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***). |
| Vector of | Long Integer |
| Index | discardPriority0 (dp0)<br>discardPriority1 (dp1)<br>discardPriority2 (dp2)<br>discardPriority3 (dp3) |

### ATTRIBUTE McsMgr DprsMcsEpG Ep pktDiscCongestedFromMcs

| | |
|---|---|
| Description | This attribute indicates the number of packets received on the DPRS MCS Switched Path End Point for each discard priority that have been discarded at the transport card in the last statistics collection interval due to congestion at the access card.<br>This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***). |
| Vector of | Decimal (0..4294967295) |
| Index | discardPriority0 (dp0)<br>discardPriority1 (dp1)<br>discardPriority2 (dp2)<br>discardPriority3 (dp3) |

### ATTRIBUTE McsMgr DprsMcsEpG Ep pktDiscErroredFromMcs

| | |
|---|---|
| Description | This attribute the number of errored packets received on the DPRS MCS Switched Path End Point that have been discarded in the last statistics collection interval. |
| Values | Decimal (0..4294967295) |

### COMPONENT McsMgr DprsMcsEpG Ep EndPointDescriptor (EpD)

| | |
|---|---|
| Groups | "GROUP McsMgr DprsMcsEpG Ep EpD Provisioned (Prov)" |
| Scope | Network |
| Description | *McsMgr DprsMcsEpG/n Ep/n EndPointDescriptor*<br>This component establishes the underlying PORS or ATM connection. There can only be one DPRS MCS Switched Path for a given Frame Relay transfer priority between a pair of nodes. Therefore, the *supportedTransferPriorities* on this *EndPoint* must be mutually exclusive with the *supportedTransferPriorities* of all other *EndPoints* within this *DprsMcsEndPointGroup*. |
| Common Verbs | Help<br>List<br>Display |

### GROUP McsMgr DprsMcsEpG Ep EpD Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the parameters used to establish the transport connection for this *Ep*. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep EpD connectionTransferPriority (connTp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transfer priority used to establish the transport connection. It references the *ModuleData Frs AtmNet Tpm* to determine the ATM service category to be used by the transport connection.<br>This attribute is used by the *Ep* solely for the purpose of determining the service category that should be used to establish the transport connection. |

| | |
|---|---|
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep EpD transportConnectionPreference (transConPref)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the preference of routing system to be used to set up the transport connection.<br>If a value of ***atmOnly*** is specified, attempts to set up the transport connection will be made using only the ATM routing system's network facilities.<br>If a value of ***porsOnly*** is specified, attempts to set up the transport connection will be made using only PORS network facilities. |
| Values | atmOnly<br>porsOnly |
| Default | porsOnly |

### ATTRIBUTE McsMgr DprsMcsEpG Ep EpD profile (prof)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the PORS profile to be used for the transport connection when it is set up using PORS. This attribute is ignored if the *transportConnectionPreference* is ***atmOnly***. |
| Values | Link (Service, users) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep EpD porsManualPath (mpath)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the PORS manual path to be used for the transport connection when it is set up using PORS. The manual path that this attribute is linked to specifies the sequence of Trunks that will be used when PORS chooses and instantiates the route. |

This attribute is ignored if the *transportConnectionPreference* is ***atmOnly***.

Values: Link (Service, users)

Default: No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep EpD supportedTransferPriorities (supTps)

Access: Read and write

Description: This attribute specifies the Frame Relay transfer priorities that are supported through the transport connection. It is used to determine which *EndPoint* within a *DprsMcsEndPointGroup* is to multiplex a particular Frame Relay DLCI.
A particular transfer priority can be specified on at most one *EndPoint* within a *DprsMcsEndPointGroup.*

Set of: Decimal (0..15)

Default: (0)

### ATTRIBUTE McsMgr DprsMcsEpG Ep EpD forwardBandwidth (fBw)

Access: Read and write

Description: This attribute specifies the bandwidth this End Point will request when setting up a transfer connection which the transport in the forward (from the originating to the terminating End Point) direction.
A conservative value would be the sum of the committed information rates (CIRs) of all individual Frame Relay DLCIs multiplexed on the transport connection.
For ATM connections, the value is converted to an equivalent Peak Cell Rate (PCR01) for all cells with Cell Loss Priority (CLP), CLP = 0 and CLP = 1.
Note that the conversion to an equivalent cell rate for ATM connections may result in some wasted bandwidth depending on the average frame size to cell ratio.

Values: Decimal (56000..155000000)

Units: bit/s

| | |
|---|---|
| Default | 512000 |

### ATTRIBUTE McsMgr DprsMcsEpG Ep EpD reverseBandwidth (rBw)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the bandwidth this End Point will request when setting up a transfer connection which the transport in the reverse (from the terminating to the originating End Point) direction.<br>A conservative value would be the sum of the committed information rates (CIRs) of all individual Frame Relay DLCIs multiplexed on the transport connection.<br>For ATM connections, the value is converted to an equivalent Peak Cell Rate (PCR01) for all cells with Cell Loss Priority (CLP), CLP = 0 and CLP = 1.<br>Note that the conversion to an equivalent cell rate for ATM connections may result in some wasted bandwidth depending on the average frame size to cell ratio. |
| Values | Decimal (56000..155000000)<br>sameAsForward |
| Units | bit/s |
| Default | sameAsForward |

### COMPONENT McsMgr DprsMcsEpG Ep AtmConnection (AtmCon)

| | |
|---|---|
| Groups | "GROUP McsMgr DprsMcsEpG Ep AtmCon Operational (Oper)" |
| Scope | Device |
| Description | An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed. |
| Common Verbs | Help<br>List<br>Display |

### GROUP McsMgr DprsMcsEpG Ep AtmCon Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This attribute group contains the operational attributes for the *NapAtmConnection* component. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep AtmCon nextHop

| | |
|---|---|
| Access | Read only |
| Description | This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established. |
| Values | The name of the component |
| Default | No default |

### COMPONENT McsMgr DprsMcsEpG Ep LogicalConnection (LCo)

| | |
|---|---|
| Groups | "GROUP McsMgr DprsMcsEpG Ep LCo PathData"<br>"GROUP McsMgr DprsMcsEpG Ep LCo Statisitics (Stats)" |
| Scope | Application |
| Description | ...*Lc*<br>This component contains all of the operation attributes for a Path Oriented Logical Connection. |
| Common Verbs | Help<br>List<br>Display |

### VERB RERoute McsMgr DprsMcsEpG Ep LCo

| | |
|---|---|
| Impact | Service |
| Description | RERoute ..Lc<br>This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified.<br>This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively.<br><br>When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path.<br><br>If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent. |

### GROUP McsMgr DprsMcsEpG Ep LCo PathData

| | |
|---|---|
| Properties | Operational |
| Description | This group contains all operational attributes for the path oriented LCo. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo state

| | |
|---|---|
| Access | Read only |
| Description | This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates |

a path that attempted route selection but received no route and is now waiting to retry route selection again.

Values
pathDown
selectingRoute
connecting
pathUp
pathDownRetrying

Default
No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo overrideRemoteName (orn)

Access
Read: All
Write: All

Description
If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.

Values
String (0..40, ASCII)

Default
""

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo end

Access
Read only

Description
This attribute identifies whether this is the calling or called end of the path.

Values
calling
called

Default
No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo costMetric (cost)

Access
Read only

| | |
|---|---|
| Description | This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo delayMetric (delay)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0. |
| Values | Decimal (0..100000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo roundTripDelay (rtd)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond.<br>For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic.<br>For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC.<br>When the *LCo* is originated and terminated on the same module, |

| | |
|---|---|
| | a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond. |
| Values | Decimal (0..200000) |
| Units | msec |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo setupPriority (spri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo holdingPriority (hpri)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. |
| Values | Decimal (0..4) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo requiredTxBandwidth (tbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo requiredRxBandwidth (rbw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value |
| Values | Decimal (0..4294967295) |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo requiredTrafficType (rttyp)

| | |
|---|---|
| Access | Read only |
| Description | This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType***,** will be candidates for this connection. |
| Values | voice<br>data<br>video<br>trafficType1 (tt1)<br>trafficType2 (tt2) |

trafficType3 (tt3)
trafficType4 (tt4)
trafficType5 (tt5)

Default — No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo permittedTrunkTypes (pttyp)

Access — Read only

Description — This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.

Set of — terrestrial
satellite
trunkType1 (tt1)
trunkType2 (tt2)
trunkType3 (tt3)
trunkType4 (tt4)
trunkType5 (tt5)
trunkType6 (tt6)

Default — No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo requiredSecurity (rsec)

Access — Read only

Description — This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity.*

Values — Decimal (0..7)

Default No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo requiredCustomerParameter (rcparm)

Access Read only

Description This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.

Values Decimal (0..7)

Default No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo emissionPriority (epri)

Access Read only

Description This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).

Values Decimal (0..2)

Default No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo discardPriority (dpri)

Access Read only

Description This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with

lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).

Values: Decimal (1..3)

Default: No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo pathType (pType)

Access: Read only

Description: This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).

The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.

Values:
normal
manual
forced

Default: No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo retryCount (rcount)

Access: Read only

Description: This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately.

| | |
|---|---|
| | A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology.<br>This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo pathFailureCount (pfcount)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value. |
| Values | Decimal (0..65535) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo reasonForNoRoute (rnr)

| | |
|---|---|
| Access | Read only |
| Description | This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes. |
| Values | none<br>destinationNameTooLong |

destinationNotSpecified
unknownDestinationName

manualPathIndexProblem

Default none

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo lastTearDownReason

Access Read only

Description This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:
***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up.
***normalShutDown*** - This path has gone down due to normal call termination.
***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.
***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
***trunkCardFailure***- A trunk FP card has failed along the path.
***accessCardFailure***- The FP on which the peer access service was

running has failed.
***operatorForced***- The path has terminated due to the operator locking a trunk along the path.
***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
***networkCongestion*** - The path has failed due to control information being lost and not recoverable.
***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name.
***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid.
***unknownReason*** - The failure was not resolved.
***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled.
***remoteNameMismatch*** - The remote end has alarmed and rejected this setup due to remoteName provisioning.
***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.
***reconnectFromFarEnd*** - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
***bumped*** - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
***optimized*** - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path

changed.
***trunkOrFarEndDidNotSupportMode*** - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

## ATTRIBUTE McsMgr DprsMcsEpG Ep LCo pathFailureAction

Access

Read only

Description

This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Values

reRoutePath
disconnectConnection

Default

No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo bumpPreference (bpref)

Access

Read only

Description

This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority*. A connection may also always bump in order to obtain the best route.

Values

bumpWhenNecessary
bumpToObtainBestRoute

Default

No default

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo optimization (opt)

Access

Read only

| | |
|---|---|
| Description | This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval. |
| Values | disabled<br>enabled |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo pathUpDateTime

| | |
|---|---|
| Access | Read: Service<br>Write: Illegal |
| Description | This is the time stamp when the current path was established or reestablished. |
| Values | Time (DHMS) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo path

| | |
|---|---|
| Access | Read only |
| Description | This attribute contains the trunk component names over which the path has been instantiated and the remote end point name terminating the path. |
| List of | String (0..40, ASCII) |
| List Size | 21 |
| Default | No default |

### GROUP McsMgr DprsMcsEpG Ep LCo Statisitics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics attributes for the path oriented LCo. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo pktsToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets transmitted to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo bytesToNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of bytes sent to the network over this Logical Connection. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo pktsFromNetwork

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of packets received from the remote LCo via the network. |
| Values | Long Integer |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep LCo bytesFromNetwork

| | |
|---|---|
| Access | Read only |

| Values | Long Integer |
| Default | No default |

## COMPONENT McsMgr DprsMcsEpG Ep CallAdmissionControl (Cac)

Groups "GROUP McsMgr DprsMcsEpG Ep Cac Operational (Oper)"

"COLLECTED STATS McsManager DprsMcsEndPointGroup EndPoint CallAdmissionControl"

Scope Network

Description *McsMgr DprsMcsEpG/n Ep/n CallAdmissionControl*
This component indicates the operational values of the attributes specified by the *McsMgr DprsMcsEpG/n Ep/n Cac Cacd* component.
Provisioning this component under an *EndPoint* forces each Frame Relay service connection using the switched path created by the given *EndPoint* to perform a service level CAC as the VC for the Frame Relay service connection is being established. Each Frame Relay service connection is either accepted or rejected based on the CAC attributes specified through the *Cacd* subcomponent.
This component is optional on the originating End Point and Call Admission Control is not performed when this component is not provisioned on the originating End Point.
This component is dynamic on the dynamic End Point and is present when there is a provisioned instance of the *CallAdmissionControl* component on the originating End Point.

## GROUP McsMgr DprsMcsEpG Ep Cac Operational (Oper)

Properties Operational

Description This group contains the operational attributes of the *CallAdmissionControl* component.

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac effectiveBandwidth (eBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total bandwidth which is used as the bandwidth pool for tracking call admission requests.<br>On the originating End Point the *effectiveBandwidth* is equal to the *forwardBandwidth* attribute specified in this End Point's *Epd* component multiplied by the *forwardOversubFactor* specified in the *Cacd* subcomponent.<br>On the terminating End Point the *effectiveBandwidth* is equal to the *reverseBandwidth* attribute specified in this End Point's *Epd* component multiplied by this End Point's *reverseOversubFactor* specified in the *Cacd* subcomponent.<br>This value indicates CIR bandwidth when the *cacType* attribute of the *Cacd* subcomponent is specified as ***cir***.<br>This value indicates EIR bandwidth when the *cacType* attribute of the *Cacd* subcomponent is specified as ***eir***. |
| Values | Long Integer |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac effectiveBandwidthAvailable (eBwAvail)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the effective bandwidth that is still available in the bandwidth pool for use by Frame Relay service connections requesting bandwidth. This value is the amount of *effectiveBandwith* less the amount reserved by Frame Relay service connections that have been admitted.<br>To display the specific Frame Relay service connections which have successfully completed call admission and to see the amount of bandwidth they have reserved, the network operator can use the following command:<br>*Display McsMgr DprsMcsEpG/n Ep/n Connection/**<br>This value indicates CIR bandwidth when the *cacType* attribute of the *Cac* subcomponent is specified as ***cir***.<br>This value indicates EIR bandwidth when the *cacType* attribute of the *Cac* subcomponent is specified as ***eir***. |

| | |
|---|---|
| Values | Long Integer |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac numberOfCallsActive (numOfCalls)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the total number of Frame Relay service connections which have successfully completed call admission and are currently in service.<br>To display the specific Frame Relay service connections which have successfully completed call admission and to see the amount of bandwidth they have reserved the network operator can use the following command:<br>*Display McsMgr DprsMcsEpG/n Ep/n Connection/**  |
| Values | Decimal (0..512) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac cacPolicy (cacp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the CAC policy in use at this end of the switched path.<br>For the originating End Point this is the value specified by the *forwardCacPolicy* attribute of the *Cacd* subcomponent.<br>For the terminating End Point this is the value specified by the *reverseCacPolicy* attribute of the *Cacd* subcomponent of the originating End Point at the other end of the switched path. To determine the component name of the originating End Point, the following command can be used:<br>*Display McsMgr DprsMcsEpG/n Ep/n remoteComponentName* |
| Values | enforced (enf)<br>monitored (mon) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac cacType (cact)

| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the CAC type in use at this end of the switched path.<br>For the originating End Point this is the value specified by the *forwardCacType* attribute of the *Cacd* subcomponent.<br>For the terminating End Point this is the value specified by the *reverseCacType* attribute of the *Cacd* subcomponent of the originating End Point at the other end of the switched path.To determine the component name of the originating End Point, the following command can be used:<br>*Display McsMgr DprsMcsEpG/n Ep/n remoteComponentName* |
| Values | eir<br>cir |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac maximumSvcBandwidth (maxSvcBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the largest amount of SVC bandwidth which can be reserved for a single Frame Relay service connection using the switched path.<br>For the originating End Point this is the value specified by the *forwardMaximumSvcBw* attribute of the *Cacd* subcomponent.<br>For the terminating End Point this is the value specified by the *reverseMaximumSvcBw* attribute of the *Cacd* subcomponent by the originating End Point at the other end of the switched path.<br>This value indicates CIR bandwidth when the *cacType* attribute of the *Cac* subcomponent is ***cir***.<br>This value indicates EIR bandwidth when the *cacType* attribute of the *Cac* subcomponent is ***eir***.<br>The value of ***noMaximum*** for this attribute indicates that this attribute has either been provisioned not to have a maximum value or that the *cacPolicy* is ***monitored.*** |
| Values | Decimal (0..155000000)<br>noMaximum |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac maximumPvcBandwidth (maxPvcBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the largest amount of PVC bandwidth allowed to be reserved for a single Frame Relay service connection using the switched path. For the originating End Point this is the value specified by the *forwardMaximumSvcBw* attribute of the *Cacd* subcomponent.<br>For the terminating End Point this is the value specified by the *reverseMaximumSvcBw* attribute of the *Cacd* subcomponent by the originating End Point at the other end of the switched path.<br>This value indicates CIR bandwidth when the *cacType* attribute of the *Cac* subcomponent is ***cir***.<br>This value indicates EIR bandwidth when the *cacType* attribute of the *Cac* subcomponent is ***eir.***<br>The value of ***noMaximum*** for this attribute indicates that this attribute has either been provisioned not to have a maximum value or that the *cacPolicy* is ***monitored.*** |
| Values | Decimal (0..155000000)<br>noMaximum |
| Units | bit/s |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac numberOfCacFailures (numCacFailed)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the total number of Frame Relay service connections which have failed to successfully complete call admission on the given switched path. This number does not increase if the *cacPolicy* attribute of the *McsMgr DprsMcsEpG/n EndPoint/m Cac* component is set to ***monitored***.<br>This value wraps back to 0 when its maximum value is exceeded. |
| Values | Decimal (0..4294967295) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac lastFailedFrDlci (lastFldFrDlci)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the component name of the last Frame Relay service connection which did not successfully complete call admission. This value is empty if no call admission failure has occurred. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac lastFailedReason (failedReason)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the reason for the failure of the last Frame Relay service connection's attempt at call admission.<br>***none*** indicates that there has been no call admission failure.<br>***noBandwidthAvailable*** indicates that there was insufficient ***effectiveBandwidthAvailable*** to admit the Frame Relay service connection.<br>***maxSvcExceeded*** indicates that an SVC was attempting to reserve more bandwidth than that specified by *maximumSvcBandwidth* attribute.<br>***maxPvcExceeded*** indicates that an SVC was attempting to reserve more bandwidth than that specified by *maximumPvcBandwidth* attribute.<br>***endPointCacUnavailable*** indicates that the End Point was not in a state in which it could process the call admission request. The Frame Relay service should attempt call admission again after a suitable backoff period.<br>***maxConsExceeded*** indicates that 512 call admission connections have already been accepted on this End Point. |
| Values | none<br>noBandwidthAvailable (noBw)<br>maxSvcExceeded (maxSvc)<br>maxPvcExceeded (maxPvc)<br>epCacUnavailable (epCacUnavail)<br>maxConsExceeded (maxCons) |
| Default | none |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac overSubscriptionFactor (osFactor)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the oversubscription factor that is applied to the forward and reverse bandwidth attributes of the parent component to determine the *effectiveBandwidth*.<br>On the originating side of the switched path this value is equal to the *forwardOsFactor* specified in the *Cacd* subcomponent.<br>On the terminating side of the switched path this value is equal to the *reverseOsFactor* attribute of the *Cacd* subcomponent at the originating end of the switched path. |
| Values | Decimal (0.00..100.00) |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac alarmThreshold

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the alarm threshold values that are used at this end of the switched path.<br>On the originating end of the switch path these values are those specified by the *forwardAlarmThresholds* attribute of the *Cacd* subcomponent.<br>On the terminating end of the switched path these values are those specified by the *reverseAlarmThresholds* attribute of the *Cacd* subcomponent on the originating end of the switched path |
| Vector of | Decimal (0..100) |
| Index | minor<br>major<br>critical |
| Default | No default |
| Default | COLLECTED STATS McsManager DprsMcsEndPointGroup EndPoint CallAdmissionControl |
| Description | The statistics record generated by the McsManager DprsMcsEndPointGroup EndPoint CallAdmissionControl component. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac effectiveBandwidth

| | |
|---|---|
| Description | This value indicates the level of effective bandwidth available during the last statistics collection interval, as indicated by the |

*effectiveBandwidth* attribute of the *McsMgr DprsMcsEpG/m EndPoint/n Cac* component in thousands of bits per second.

Values: Decimal (0..4294967295)

Units: kbit/s

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac effectiveBandwidthAvailableLWM

Description: This value indicates the lowest level of effective bandwidth available as indicated by the *effectiveBandwidthAvailable* attribute of the *McsMgr DprsMcsEp/m EndPoint/n Cac* component, in thousands of bits per second during the last statistics collection interval.

Values: Decimal (0..4294967295)

Units: kbit/s

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac numberOfCallsActiveHWM

Description: This value indicates the highest level of the *numberOfCallsActive* attribute of the *McsMgr DprsMcsEp/m EndPoint/n Cac* component, during the last statistics collection interval.

Values: Decimal (0..512)

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac numberOfCacFailures

Description: This value indicates the number of call admission failures in the last statistics collection interval. This value equals the increase in the *numberOfCacFailures* attribute of the *McsMgr DprsMcsEp/m EndPoint/n Cac* component during the last statistics collection interval.

Values: Decimal (0..4294967295)

### COMPONENT McsMgr DprsMcsEpG Ep Cac CallAdmissionControlDescriptor (Cacd)

Groups: "GROUP McsMgr DprsMcsEpG Ep Cac Cacd Forward (Frwd)"
"GROUP McsMgr DprsMcsEpG Ep Cac Cacd Reverse (Rvrs)"

Scope: Network

Description: The component allows the network operator to specify the CAC attributes used for call admission for the originating and

terminating End Points of this switched path. This component is provisioned at the originating End Point only.

Common Verbs

Help
List
Display

## GROUP McsMgr DprsMcsEpG Ep Cac Cacd Forward (Frwd)

Properties: Provisioned

Description: This group contains the parameters that are used to specify the call admission control characteristics for the given End Point in the forward direction.

## ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd forwardCacPolicy (fCacP)

Access: Read and write

Description: This attribute specifies the call admission policy which is to be used in the forward direction.
When this attribute is set to ***enforced***, a Frame Relay service connection fails call admission if there is insufficient *effectiveBandwidth* available in the forward direction, the *forwardMaximumSvcBw* is exceeded, or the *forwardMaximumPvcBw* is exceeded. Call admission failure causes the Frame Relay service connection to clear.
When this attribute is set to ***monitored*** no Frame Relay service call will ever fail call admission.

Values: enforced (enf)
monitored (mon)

Default: monitored

## ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd forwardCacType (fCacT)

Access: Read and write

Description: This attributes specifies whether the *effectiveBandwidth* in the forward direction is treated as ***eir*** or ***cir*** bandwidth.

Values: eir
cir

Default cir

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd forwardOversubFactor (fOsFactor)

Access Read and write

Description This attribute specifies the level of oversubscription to be used when calculating the parent component's *effectiveBandwidth* in the forward direction. The *forwardBandwidth* attribute of the *McsMgr DprsMcsEpG/m Ep/n Epd* subcomponent is multiplied by this attribute to determine the *effectiveBandwidth* attribute.

Values Decimal (0.00..100.00)

Default 1.00

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd forwardMaximumSvcBw (fMaxSvcBw)

Access Read and write

Description This attribute specifies the maximum bandwidth that can be reserved by a Frame Relay SVC. The *forwardCacType* parameter specifies if this value is to be treated as an EIR or CIR value.
If this attribute is set to ***noMaximum*** or the *forwardCacPolicy* is set to ***monitored*** this check is not made.

Values Decimal (0..155000000)
noMaximum

Units bit/s

Default noMaximum

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd forwardMaximumPvcBw (fMaxPvc)

Access Read and write

Description This attribute specifies the maximum bandwidth that can be reserved by a Frame Relay PVC. The *forwardCacType* parameter specifies if this value is to be treated as an EIR or CIR value.
If this attribute is set to ***noMaximum*** or the *forwardCacPolicy* is set to ***monitored*** this check is not made.

Values Decimal (0..155000000)
noMaximum

Units bit/s

| | |
|---|---|
| Default | noMaximum |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd forwardAlarmThresholds (fAlarmThresh)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the bandwidth reservation level at which the minor, major, and critical alarms are raised at in the forward direction. By default all alarms are set to 0 disables alarm generation.<br>Each of these threshold alarms is cleared when the reservation level falls 10% below the respective threshold level. |
| Vector of | Decimal (0..100) |
| Index | minor<br>major<br>critical |
| Default | (0, 0, 0) |

### GROUP McsMgr DprsMcsEpG Ep Cac Cacd Reverse (Rvrs)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the parameters that are used to specify the call admission control characteristics for the given End Point in the reverse direction. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd reverseCacPolicy (rCacPolicy)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute is used to specify the CAC policy to be used in the reverse direction.<br>When this attribute is set to ***enforced*** a Frame Relay service connection will fail call admission if there insufficient *effectiveBandwidth* in the reverse direction, the *reverseMaximumSvcBw* is exceeded or the *reverseMaximumPvcBw* is exceeded. Call admission failure causes the Frame Relay service connection clear.<br>When this attribute is set to ***monitored*** no Frame Relay service call is ever rejected.<br>When this attribute is set to ***sameAsForward*** the *reverseCacPolicy* is the same as that specified by the *forwardCacPolicy* attribute. |

| | |
|---|---|
| Values | enforced (enf)<br>monitored (mon)<br>sameAsForward (sameAsForw) |
| Default | sameAsForward |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd reverseCacType (rCacType)

| | |
|---|---|
| Access | Read and write |
| Description | This attributes specifies if the *effectiveBandwidth* in the reverse direction is treated as ***eir*** or ***cir*** bandwidth.<br>When this attribute is set to ***sameAsForward*** the *reverseCacType* is the same as that specified by the *forwardCacType* attribute. |
| Values | eir<br>cir<br>sameAsForward (sameAsFor) |
| Default | sameAsForward |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd reverseCacOverSub (rOsFactor)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the level of over subscription to be used when calculating the parent component's *effectiveBandwidth* in the reverse direction.<br>The *reverseBandwidth* attribute of the *McsMgr DprsMcsEpG/m Ep/n Epd* subcomponent is multiplied by this attribute to determine the *effectiveBandwidth* in the reverse direction.<br>When this attribute is set to ***sameAsForward*** the *reverseCacOverSub* is the same as that specified by the *forwardCacOverSub* attribute. |
| Values | Decimal (0.00..100.00)<br>sameAsForward |
| Default | sameAsForward |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd reverseMaxSvcBw (rMaxSvcBw)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the maximum bandwidth that can be reserved by a Frame Relay SVC. The *reverseCacType* parameter |

specifies if this value is to be treated as an EIR or CIR value.
If the *reverseCacPolicy* is set to ***monitored*** or the value of this attribute is set to ***noMaximum*** this check is not made.
When this attribute is set to ***sameAsForward*** the *reverseMaxSvcBw* is the same as that specified by the *forwardMaxSvcBw* attribute.

Values
Decimal (0..155000000)
noMaximum
sameAsForward

Default
sameAsForward

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd reverseMaxPvcBw (rMaxPvcBw)

Access
Read and write

Description
This attribute specifies the maximum bandwidth that can be reserved by a Frame Relay PVC. The *reverseCacType* parameter specifies if this value is to be treated as an EIR or CIR value.
If the *reverseCacPolicy* is set to ***monitored*** or the value of this attribute is set to ***noMaximum*** this check is not made.
When this attribute is set to ***sameAsForward*** the *reverseMaxPvcBw* is the same as that specified by the *forwardMaxPvcBw* attribute.

Values
Decimal (0..155000000)
noMaximum
sameAsForward

Default
sameAsForward

### ATTRIBUTE McsMgr DprsMcsEpG Ep Cac Cacd reverseAlarmThresholds (rAlarmThresh)

Access
Read and write

Description
This attribute specifies the reservation level at which the minor, major, and critical alarms are raised in the reverse direction. By default all alarms are set to 0 which is the off setting.
Each of these threshold alarms are cleared when the reservation level falls 10% below each respective threshold level.

| | |
|---|---|
| Vector of | Decimal (0..100) |
| Index | minor<br>major<br>critical |

### COMPONENT McsMgr DprsMcsEpG Ep Connection (Con)

| | |
|---|---|
| Instance | Decimal (1..512) |
| Groups | "GROUP McsMgr DprsMcsEpG Ep Con Operational (Oper)" |
| Scope | Network |
| Description | *McsMgr DprsMcsEpG/n Ep/n Connection/n*<br>This component represents a Frame Relay service connection which has successfully completed call admission on a given switched path. |
| Common Verbs | Help<br>List<br>Display |

### GROUP McsMgr DprsMcsEpG Ep Con Operational (Oper)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational attributes of the *Connection* component. |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Con frameRelayDlci (frDlci)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the DLCI of a Frame Relay service connection that has successfully completed call admission and has reserved bandwidth on this switched path. |
| Values | The name of the component |
| Default | No default |

### ATTRIBUTE McsMgr DprsMcsEpG Ep Con reservedBandwidth (rBw)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the amount of bandwidth reserved by the given Frame Relay service connection. To determine if this is EIR or CIR bandwidth see the *cacType* attribute for this *EndPoint*. |
| Values | Decimal (0..155000000) |
| Units | bit/s |
| Default | No default |

### COMPONENT McsMgr Frf5EndPointGroup (Frf5EpG)

| | |
|---|---|
| Instance | Decimal (1..8191) |
| Scope | Application |
| Description | *McsMgr Frf5EndPointGroup/n*<br>The *Frf5EpG* component contains FRF.5 End Points that share a common destination NSAP address, and a list of address prefixes. |

### GROUP McsMgr Frf5EpG Addr Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes of the *Address* component.

### ATTRIBUTE McsMgr Frf5EpG Addr remoteAddress (rAddr)

Access: Read and write

Description: This attribute specifies the ATM End System Address (AESA) in the ISO NSAP format that is used by each *EndPoint* under this *Frf5EpG* to establish a VCC. For example, NSAP ATM address “45000006138292323F000000000020480D002900”.

Values: String (0..44, ASCII)

Default: No default

### ATTRIBUTE McsMgr Frf5EpG Addr commentText

Access: Read and write

Description: This optional attribute contains additional textual information to be added by the network operator.

Values: String (0..750, ASCII)

Default: ""

### ATTRIBUTE McsMgr Frf5EpG Addr addressPrefix (addrPre)

Access: Read and write

Description: This attribute specifies the list of prefixes directed to the *EndPoints* under this *Frf5EndPointGroup*. The individual end point is selected for each subconnection on the basis of its

| | |
|---|---|
| | *supportedTransferPriorities*.<br>For example, E.164 prefix “e.613722”, X.121 prefix “x.302”. |

## GROUP McsMgr Frf5EpG Ep OsiState (State)

| | |
|---|---|
| Properties | Operational |

Description

This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

## ATTRIBUTE McsMgr Frf5EpG Ep adminState (osiAdmin)

Access

Read only

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default

unlocked

## ATTRIBUTE McsMgr Frf5EpG Ep operationalState (osiOper)

Access

Read only

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

enabled (ena)
disabled (dis)

Default

disabled

### ATTRIBUTE McsMgr Frf5EpG Ep usageState (osiUsage)

Access

Read only

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active (activ)
busy

Default

idle

## ATTRIBUTE McsMgr Frf5EpG Ep availabilityStatus (osiAvail)

| | |
|---|---|
| Access | Read only |
| Description | If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.<br><br>When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.<br><br>The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.<br><br>The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.<br><br>The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.<br><br>The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.<br><br>The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.<br><br>The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. |

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

### ATTRIBUTE McsMgr Frf5EpG Ep proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE McsMgr Frf5EpG Ep controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the

attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default

No default

## ATTRIBUTE McsMgr Frf5EpG Ep alarmStatus (osiAlarm)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are

outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE McsMgr Frf5EpG Ep standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and

containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE McsMgr Frf5EpG Ep unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP McsMgr Frf5EpG Ep Operational (Oper)

Properties
Operational

Description
This group contains the operational attributes for the FRF.5 ATM connection.

### ATTRIBUTE McsMgr Frf5EpG Ep lastVccClearCause

Access
Read only

| | |
|---|---|
| Description | This attribute indicates the clear cause value of the last SPVC release message received on the FRF.5 end point Vcc pipe. |
| Values | Decimal (0..255) |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep connectionTransferPriority (conntp)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the transfer priority used to establish the ATM connection and to multiplex the Frame Relay DLCIs. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep serviceCategory (sc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the ATM service category that is used for this connection. |
| Values | ubr<br>cbr<br>rtVbr<br>nrtVbr |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep peakCellRate01 (pcr01)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Peak Cell Rate (PCR) of the FRF.5 ATM VCC for all cells (with CLP=0 and CLP=1).<br>The *pcr01* is derived from the End Point traffic parameters using the conversion policy of the *connectionTransferPriority.* The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..4294967295) |

| | |
|---|---|
| Units | cell/s |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep sustainedCellRate0 (scr0)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Sustained Cell Rate (SCR) of the FRF.5 ATM VCC for high priority cells (with CLP=0).<br>The *scr0* is derived from the End Point traffic parameters using the conversion policy of the *connectionTransferPriority.* The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep sustainedCellRate01 (scr01)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Sustained Cell Rate (SCR) of the FRF.5 ATM VCC for all cells (with CLP=0 and CLP=1).<br>The *scr01* is derived from the End Point traffic parameters using the conversion policy of the *connectionTransferPriority.* The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..4294967295) |
| Units | cell/s |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep maximumBurstSize0 (mbs0)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Maximum Burst Size (MBS) of the FRF.5 ATM VCC for high priority cells (with CLP=0). |

| | |
|---|---|
| | The *mbs0* is derived from the End Point traffic parameters using the conversion policy of the *connectionTransferPriority.* The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..4294967295) |
| Units | cells |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep maximumBurstSize01 (mbs01)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the Maximum Burst Size (MBS) of the FRF.5 ATM VCC for all cells (with CLP=0 and CLP=1).<br>The *mbs01* is derived from the End Point traffic parameters using the conversion policy of the *connectionTransferPriority.* The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..4294967295) |
| Units | cells |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep avgFrameSize (afs)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the average frame size that is used in the traffic parameter conversion policy calculations for this end point. |
| Values | Decimal (1..8187) |
| Units | bytes |
| Default | 128 |

### ATTRIBUTE McsMgr Frf5EpG Ep trafficParmConvPolicy (tpcp)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute indicates the traffic parameter conversion policy used to specify the equivalent ATM bandwidth rate at this end point.<br><br>Policy 3 characterizes the traffic in the following way:<br>- ATM traffic descriptor type 6 is selected<br>- PCR0+1 is based on the AR<br>- SCR0+1 is based on the CIR and EIR<br>- MBS0+1 is based on Bc,Be,CIR,EIR and AR<br>- Takes into account that the instantaneous rate of the frame relay stream can burst above CIR and up to the AR.<br><br>Policy 4 characterizes the traffic in the following way:<br>- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer.<br>- PCR0+1 is based on the AR<br>- SCR0 is based on the CIR<br>- MBS0 is based on Bc,CIR and AR<br>- There is no direct characterization of EIR. The allowed EIR can be derived using the difference between the AR and CIR.<br><br>Policy 5 characterizes the traffic in the following way:<br>- ATM traffic descriptor type 7 or 8 is selected . Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer<br>- PCR0+1 is based on CIR and EIR<br>- SCR0 is based on the CIR<br>- MBS0 is based on the Bc,CIR and AR<br>- The maximum PCR is no longer based on AR but based on the CIR and EIR.<br><br>Policy 6 characterizes the traffic in the following way:<br>- ATM traffic descriptor type 3 is selected<br>- PCR0+1 is based only on CIR. |
| Values | 3<br>4<br>5<br>6 |

| | |
|---|---|
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep type

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the FRF.5 End Point type. If the value is ***master***, this End Point is responsible for initiating the call to set up the FRF.5 ATM VCC. If the value is ***slave***, this End Point receives call setup requests from the remote end. |
| Values | master<br>slave |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep lastVccCauseDiag

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the diagnostic value of the last SPVC release message received on the FRF.5 end point Vcc pipe. |
| Values | String (1..8, Hex) |
| Default | No default |

### COMPONENT McsMgr Frf5EpG Ep LocalManagementInterface (Lmi)

| | |
|---|---|
| Groups | "GROUP McsMgr Frf5EpG Ep Lmi ProtocolParameters (Parms)"<br>"GROUP McsMgr Frf5EpG Ep Lmi NniProtocolParameters (NniParms)"<br>"GROUP McsMgr Frf5EpG Ep Lmi OsiState (State)"<br>"GROUP McsMgr Frf5EpG Ep Lmi ProtocolStatusInfo (Psi)"<br>"GROUP McsMgr Frf5EpG Ep Lmi Statistics (Stats)" |
| Scope | Application |

Description — *DsMgr Frf5EpG/n Ep/m LocalManagementInterface*
This component defines the parameters for implementing the Frame Relay Forum FRF.5 Local Management Interface protocol.

Common Verbs

- DELete

## GROUP McsMgr Frf5EpG Ep Lmi ProtocolParameters (Parms)

Properties — Provisioned

Description — This group contains the provisionable attributes of the Local Management Interface component.

## ATTRIBUTE McsMgr Frf5EpG Ep Lmi procedures (proc)

Access — Read and write

Description — This attribute selects the procedures to be used for the Local Management Interface. The following are the supported procedures:

***none***: no Local Management Interface procedures are running on the ATM VCC. This accommodates remote interworking functions which do not implement LMI procedures. In this case, the remaining attributes of this group will be ignored.

***ccitt***: Local Management Interface procedures from the CCITT specification are supported. *Dlci/0* is used for the LMI protocol, to comply with FRF.5.

***ansi***: Local Management Interface procedures from the ANSI specification are supported. *DLCI 0* is used for the LMI protocol.

Values
- none
- ansi
- ccitt

Default — ccitt

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi asyncStatusReport (asr)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute selects the use of asynchronous PVC status report procedures as specified in the CCITT specification (ITU-T Q.933, Annex A), and the ANSI specification Annex D. |
| Values | off<br>on |
| Default | on |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi errorEventThreshold (n392)

| | |
|---|---|
| Access | Read and write |
| Description | For the network side procedure, an event is defined as follows: (1) receipt of a STATUS ENQUIRY message, or (2) expiration of timer T392. An error event is (1) nonreceipt of STATUS ENQUIRY in T392 seconds; (2) invalid format of an LMI message; (3) invalid receive sequence number.<br>For the user side procedure, an event is defined as a polling cycle or a status enquiry and status report exchange. An error event is (1) non-receipt of a STATUS within the polling cycle, or (2) invalid format of an LMI message, or (3) invalid sequence number.<br><br>This attribute specifies the number of error events which, if they occur within *eventCount* events, will cause a protocol error condition. The condition is cleared after *eventCount* sequential correct events occur.<br><br>It must be less than or equal to *eventCount* (n393). |
| Values | Decimal (1..10) |
| Default | 3 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi eventCount (n393)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are |

| | |
|---|---|
| | allowed.<br><br>It must be greater than or equal to *errorEventThreshold* (n392). |
| Values | Decimal (1..10) |
| Default | 4 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi checkPointTimer (t392)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute selects the time (in seconds) within which a STATUS ENQUIRY message is expected. It must be greater than *linkVerificationTimer* (t391). |
| Values | Decimal (5..255) |
| Units | seconds |
| Default | 200 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi side

| | |
|---|---|
| Access | Read and write |
| Description | This attribute selects the user side procedure (DTE), or the network side procedure (DCE), or both the user side and the network side procedures of the LMI.<br><br>This attribute can be set to ***user, network*** or ***both***. |
| Values | network<br>user<br>both |
| Default | both |

### GROUP McsMgr Frf5EpG Ep Lmi NniProtocolParameters (NniParms)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the provisionable attributes of the FRF.5 LMI procedures which are unique to NNI. |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi fullStatusPollingCycles (n391)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how frequently the FRF.5 LMI initiates a Status Enquiry for a full PVC status report. A polling cycle is a Status Enquiry and Status Report exchange. |
| Values | Decimal (1..255) |
| Default | 1 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi linkVerificationTimer (t391)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies how frequently the FRF.5 LMI initiates a Status Enquiry for link integrity verification. It must be less than *checkPointTimer* (t392). |
| Values | Decimal (5..255) |
| Units | seconds |
| Default | 180 |

### GROUP McsMgr Frf5EpG Ep Lmi OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP. |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi adminState (osiAdmin)

| | |
|---|---|
| Access | Read only |
| Description | This attribute indicates the OSI Administrative State of the component.<br><br>The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. |

When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default
unlocked

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi operationalState (osiOper)

Access
Read only

Description
This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Values
idle
active (activ)
busy

Default
idle

## GROUP McsMgr Frf5EpG Ep Lmi ProtocolStatusInfo (Psi)

Properties
Operational

Description
This group provides the protocol status of the Local Management Interface.

## ATTRIBUTE McsMgr Frf5EpG Ep Lmi protocolStatus

Access
Read only

Description
This attribute indicates whether the LMI is in an error condition or whether the protocol is behaving normally. This attribute will be set to ***errorCondition*** after enough LMI errors have been detected to warrant a change in condition. This occurs when *n392* of the last *n393* events are in error.
The error condition is lifted when a sufficient number of consecutive events has occurred without error. This occurs when *n393* consecutive good events take place.
The consequence of an error condition is that all DLCIs on this interface will become inactive in both directions.

Values
errorCondition
normalCondition

Default
normalCondition

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi opProcedures (opProc)

| | |
|---|---|
| Access | Read only |
| Criticality | Process |
| Description | This attribute indicates the procedures being used for the Local Management Interface. This attribute should be ignored if *protocolStatus* is not ***normalCondition***. The following procedures are supported:<br><br>***none***: Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures.<br><br>***ansi***: Local Management Interface procedures from the ANSI specification are being used. DLCI 0 is used for the LMI protocol.<br><br>***itu***: Local Management Interface procedures from the ITU-T specification are being used. DLCI 0 is used for the LMI protocol. |
| Values | none<br>ansi<br>itu |
| Default | No default |

### GROUP McsMgr Frf5EpG Ep Lmi Statistics (Stats)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the operational statistics for the FRF.5 NNI Local Management Interface. |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi keepAliveStatusToInterface (kasti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Local Management Interface keep alive status messages sent to the ATM VCC in response to a status enquiry for keep alive status. When the maximum count is reached it wraps to zero. |

| | |
|---|---|
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi fullStatusToInterface (fsti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Local Management Interface full status messages sent to the ATM VCC in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi keepAliveStatusEnqFromInterface (kafi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Local Management Interface valid keep alive status enquiry messages received from the ATM VCC. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi fullStatusEnqFromInterface (fsfi)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the Local Management Interface valid full status enquiry messages received from the ATM VCC. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi networkSideEventHistory (nsh)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Local Management Interface network side procedure event history in order of occurrence. An event is represented by a single symbol. A ‘+’ symbol indicates a good |

| | |
|---|---|
| | event. An ‘X‘ symbol indicates a protocol error event. The left most event is the most recent to occur. The provisioned *eventCount* dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status enquiry message. An error event is either a T392 timer expiry or receipt of a status enquiry with an incorrect sequence number. |
| Values | String (1..10, ASCII) |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi userSideEventHistory (ush)

| | |
|---|---|
| Access | Read only |
| Description | This attribute displays the Local Management Interface user side procedure event history in order of occurrence. An event is represented by a single symbol. A ‘+’ symbol indicates a good event. An ‘X‘ symbol indicates a protocol error event. The left most event is the most recent to occur. The provisioned *eventCount* dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status message. An error event is either a T391 timer expiry or receipt of a status message with an incorrect sequence number. |
| Values | String (1..10, ASCII) |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi protocolErrors (proto)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface protocol errors. It is the sum of the sequence (*sequenceErrors* and *statusSequenceErrors*) and timeout (*pollingVerifTimeouts* and *noStatusReportCount*) errors. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi unexpectedIes (uie)

| | |
|---|---|
| Access | Read only |

| | |
|---|---|
| Description | This attribute counts the number of Local Management Interface frames received with an Information Element identifier that is unknown or unexpected. An unexpected Information Element is not a protocol error. When the maximum count is reached, this counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi sequenceErrors (seq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface Status Enquiry message sequence errors. A sequence error is receipt of a Status Enquiry message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi statusSequenceErrors (stseq)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface Status message sequence errors. A sequence error is receipt of a Status message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi unexpectedReports (ur)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface frames received with an unknown or unexpected report type. An |

| | |
|---|---|
| | unexpected report type is not a protocol error. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi pollingVerifTimeouts (tmo)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the *checkPointTimer* (T392) expiries occurring on the Local Management Interface. When the maximum count is reached the counter wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi noStatusReportCount (nsrc)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented:<br>i) after a status enquiry is sent out and the T391 timer expires without having a status report received.<br>ii) if an invalid status report is received.<br><br>When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi keepAliveEnqToIf (kaeti)

| | |
|---|---|
| Access | Read only |
| Description | This attribute counts the number of Local Management Interface keep alive enquiry status messages sent to the external user device for keep alive status. When the maximum count is reached it wraps to zero. |
| Values | Decimal (0..4294967295) |

Default 0

### ATTRIBUTE McsMgr Frf5EpG Ep Lmi fullStatusEnqToIf (fseti)

Access Read only

Description This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero.

Values Decimal (0..4294967295)

Default 0

### COMPONENT McsMgr Frf5EpG Ep EndPointDescriptor (Epd)

Groups "GROUP McsMgr Frf5EpG Ep Epd Provisioned (Prov)"
"GROUP McsMgr Frf5EpG Ep Epd CustomerIdentifierData (CidData)"

Scope Application

Description *McsMgr Frf5EpG/n Ep/n EndPointDescriptor*
This component describes the ATM SPVC which supports the FRF.5 connection.

Common Verbs
Help
List
Display

### GROUP McsMgr Frf5EpG Ep Epd Provisioned (Prov)

Properties Provisioned

Description This group contains the provisionable attributes of the FRF.5 End Point.

### ATTRIBUTE McsMgr Frf5EpG Ep Epd remoteConnectionIdentifier (rci)

Access Read and write

Description This attribute specifies the remote connection identifier. It either represents the VPI.VCI logical channel number assignment of a

| | |
|---|---|
| | remote ATM interface, or the *Endpoint.Frf5EndPointGroup* instances of a remote Passport FRF.5 EndPoint. |
| Values | Integer Sequence (0..255; 0..16128) |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep Epd connectionTransferPriority (conntp)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the transfer priority used to establish the ATM connection. The *EndPoint* references the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component to determine the ATM service category to be used by the connection.<br>This attribute is also used to determine which *EndPoint* within an *Frf5EndPointGroup* is to multiplex a particular *FrAtm Dlci*. |
| Values | Decimal (0..15) |
| Default | No default |

### ATTRIBUTE McsMgr Frf5EpG Ep Epd committedInformationRate (cir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed information rate (CIR), and represents the rate at which the network FRF.5 ATM VCC agrees to transfer information under normal conditions. A conservative CIR value would be the sum of the CIRs of all the individual *FrAtm Dlci*s multiplexed by the VCC.<br>The *cir* is converted into ATM service parameters according to the conversion policy specified by the *connectionTransferPriority* attribute. The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | 64000 |

### ATTRIBUTE McsMgr Frf5EpG Ep Epd excessInformationRate (eir)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the excess information rate (EIR), and represents the rate at which the network FRF.5 ATM VCC attempts to transfer information. A conservative EIR value would be the sum of the EIRs of all the individual *FrAtm Dlci*s multiplexed by the VCC.<br>The *eir* is converted into ATM service parameters according to the conversion policy specified by the *connectionTransferPriority* attribute. The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | 0 |

### ATTRIBUTE McsMgr Frf5EpG Ep Epd committedBurstSize (bc)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the committed burst size (Bc), and represents the amount of data that the network FRF.5 ATM VCC agrees to transfer under normal conditions. A conservative Bc value would be the sum of the Bcs of all the individual *FrAtm Dlci*s multiplexed by the VCC.<br>The *bc* is converted into ATM service parameters according to the conversion policy specified by the *connectionTransferPriority* attribute. The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..50000000) |
| Units | bits |
| Default | 16000 |

### ATTRIBUTE McsMgr Frf5EpG Ep Epd type

| | |
|---|---|
| Access | Read and write |

| | |
|---|---|
| Description | This attribute specifies the FRF.5 End Point type. If the value is provisioned as ***master***, this End Point is responsible for initiating the SPVC call to set up the FRF.5 ATM VCC. If the value is provisioned as ***slave***, this End Point receives call setup requests from a master remote end. |
| Values | master<br>slave |
| Default | master |

### ATTRIBUTE McsMgr Frf5EpG Ep Epd accessRate (ar)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute represents the access rate of the FRF.5 EndPoint. A conservative value would be the sum of the access rates of all the *FrAtms'* that have DLCIs multiplexed by the VCC. The access rate is converted into ATM service parameters when conversion policies 3, 4 and 5 are used. For policy 6, this attribute is ignored. |
| Values | Decimal (0..50000000) |
| Units | bit/s |
| Default | 1536000 |

### ATTRIBUTE McsMgr Frf5EpG Ep Epd excessBurstSize (be)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute specifies the excess burst size (Be), and represents the amount of uncommitted data that the network FRF.5 ATM VCC agrees to transfer under normal conditions. A conservative Be value would be the sum of the Bes of all the individual *FrAtm Dlci*s multiplexed by the VCC.<br>The *be* is converted into ATM service parameters according to the conversion policy specified by the *connectionTransferPriority* attribute. The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component. |
| Values | Decimal (0..50000000) |
| Units | bits |

| | |
|---|---|
| Default | 0 |

### GROUP McsMgr Frf5EpG Ep Epd CustomerIdentifierData (CidData)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs. |

### ATTRIBUTE McsMgr Frf5EpG Ep Epd customerIdentifier (cid)

| | |
|---|---|
| Access | Read and write |
| Description | This attribute holds the Customer Identifier (CID).<br><br>Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.<br><br>Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.<br><br>An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers. |
| Values | Decimal (0; 1..8191) |
| Default | 0 |

### COMPONENT McsMgr Frf5EpG Ep DataLinkConnectionIdentifier (Dlci)

| | |
|---|---|
| Instance | Decimal (16..1007; 1022) |
| Groups | "GROUP McsMgr Frf5EpG Ep Dlci Operational (Oper)" |
| Scope | Application |

Description — *McsMgr Frf5EpGrp/n Ep/n DataLinkConnectionIdentifier/n*
This component represents a logical connection multiplexed inside the FRF.5 ATM VCC.

### GROUP McsMgr Frf5EpG Ep Dlci Operational (Oper)

Properties — Operational

Description — This group contains the operational attributes for the FRF.5 DLCI.

### ATTRIBUTE McsMgr Frf5EpG Ep Dlci aBitStatusToIf (abti)

Access — Read only

Description — This attribute indicates the most recent A-bit status sent to the ATM VCC. If the value is ***inactive***, the reason for the LMI failure is given by the *aBitReasonToNetwork*.

Values
inactive
active

Default — inactive

### ATTRIBUTE McsMgr Frf5EpG Ep Dlci aBitReasonToIf (abrti)

Access — Read only

Description — This attribute indicates the reason for the latest inactive A-bit status sent to the ATM VCC.
The value is ***notApplicable*** when the *aBitStatusToNetwork* is ***active***.
The value is ***remoteUserSignaled*** if the *FrAtm* originating the A-Bit status has detected that the virtual circuit is down at the remote network through the LMI protocol. The *FrAtm* must be running network site LMI protocol for this A-Bit status reason to be sent.
The value is ***localLmiError*** if the LMI protocol is down at this *Ep*.
The value is ***remoteLmiError*** if the LMI protocol is down at the

*FrAtm* originating this A-Bit status reason.
The value is ***localLinkDown*** if the physical interface is disabled at this *Ep*.
The value is ***pvcDown*** if no A-Bit status has been sent to this *Ep* (i.e., no A-Bit status has been relayed from the *FrAtm*).
The value is ***remoteLinkDown*** if the physical interface is disabled at the *FrAtm* originating this A-Bit status reason.

Values
notApplicable
remoteUserSignaled
localLmiError
remoteLmiError
localLinkDown
remoteLinkDown
pvcDown

Default
notApplicable

### ATTRIBUTE McsMgr Frf5EpG Ep Dlci aBitStatusFromIf (abfi)

Access
Read only

Description
This attribute indicates the most recent A-bit status received from the ATM VCC. If the value is ***inactive***, the reason for the LMI failure is given by the *aBitReasonFromNetwork*.

Values
inactive
active

Default
inactive

### ATTRIBUTE McsMgr Frf5EpG Ep Dlci aBitReasonFromIf (abrfi)

Access
Read only

Description
This attributes indicates the reason for the latest inactive A-bit status received from the ATM VCC.
The value is ***notApplicable*** when the *aBitStatusFromNetwork* is ***active***.
The value is ***remoteUserSignaled*** if the remote FRF.5 End Point originating the A-Bit status has detected that the virtual circuit is down at the remote network through the LMI protocol. The remote FRF.5 End Point must be running network site LMI protocol for this A-Bit status reason to be sent.

The value is ***localLmiError*** if the LMI protocol is down at this *Ep*.
The value is ***localLinkDown*** if the physical interface is disabled at this *Ep*.
The value is ***missingFromLmiReport*** if the remote FRF.5 End Point did not provide a reason along with the inactive A-Bit status.

Values
notApplicable
remoteUserSignalled
localLmiError
localLinkDown
missingFromLmiReport

Default
notApplicable

## ATTRIBUTE McsMgr Frf5EpG Ep Dlci accessConnectionComponent (acc)

Access
Read only

Description
This attribute identifies the *FrAtm Dlci* to which this *Dlci* component is bound.

Values
String (0..26, ASCII)

Default
No default

## COMPONENT McsMgr Frf5EpG Ep AtmConnection (AtmCon)

Groups
"GROUP McsMgr Frf5EpG Ep AtmCon Operational (Oper)"

Scope
Device

Description
An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed.

Common Verbs

# COMPONENT MaintenanceMonitorTx (MmTx)

| | |
|---|---|
| Instance | Decimal (1..15) |
| Groups | "GROUP MmTx CustomerIdentifierData (CidData)"<br>"GROUP MmTx Provisioned (Prov)"<br>"GROUP MmTx OsiState (State)"<br>"GROUP MmTx Operational (Oper)" |
| Scope | Application |
| Description | *MaintenanceMonitorTx/n* |

A *MaintenanceMonitorTx* component identifies an instance of the MaintenanceMonitor AAL1 Circuit Emulation Service. The service that is used to transport the copy of the monitored traffic to a local or remote observer is basic structured AAL1 CES. This stream is mono directional from the monitor point to the observer. Any ATM traffic that is received from the observer (which may occur if the observer uses a standard AAL1 CES service) is discarded at the monitoring point.

A separate instance of this component is required for each monitored channel.

Instance numbers, which are used to uniquely identify *MaintenanceMonitorTx* component instances, are arbitrary.

Only one instance of *MaintenanceMonitorTx* may be linked to a particular *LogicalProcessor*.

## GROUP MmTx CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

## ATTRIBUTE MmTx customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values Decimal (0; 1..8191)

| | |
|---|---|
| Default | 0 |

### GROUP MmTx Provisioned (Prov)

| | |
|---|---|
| Properties | Provisioned |
| Description | This group contains basic provisioning data for the Maintenance Monitor Transmitter (MmTx). A MmTx represents a mono-directional AAL1 Circuit Emulation Service. AAL1 CES attributes in this group are essential information to the operator about the AAL1 CES service that must be matched in the *Aal1Ces* component that receives the monitored stream.<br><br>The check escape checks that only one instance of a *MaintenanceMonitorTx* is linked to any one *Lp*. |

### ATTRIBUTE MmTx linkToLogicalProcessor (lpName)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the instance of a hardware component to which an instance of this component is linked. Only *Lp* components may be linked. |
| Values | Link (Hardware, linkToApplications) |
| Default | No default |

### ATTRIBUTE MmTx monitoredDirection (direction)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the direction of the monitored traffic.<br><br>When ***ingress*** value is specified, the traffic coming from the interface and going to the backplane is monitored and specified by *chanToMonitor.*<br><br>When ***Egress*** value is specified, the traffic coming from the backplane and going to the interface is monitored and specified by *chanToMonitor.* |

| | |
|---|---|
| Values | ingress<br>egress |
| Default | ingress |

### ATTRIBUTE MmTx serviceType (servType)

| | |
|---|---|
| Access | Read and write |
| Criticality | Process |
| Description | This attribute specifies the service type of the CES.<br><br>The *serviceType* attribute in the receiving *Aal1Ces* component must have the same value as this attribute. |
| Values | basicStructured |
| Default | basicStructured |

### ATTRIBUTE MmTx partialFill (partFill)

| | |
|---|---|
| Access | Read and write |
| Criticality | Component |
| Description | This attribute specifies the number of octets that are carried in an ATM cell by the AAL1 CES service. A full cell contains 47 octets.<br><br>The *partialFill* attribute in the receiving *Aal1Ces* component must have the same value as this attribute. |
| Values | Decimal (47) |
| Units | octets |
| Default | 47 |

### GROUP MmTx OsiState (State)

| | |
|---|---|
| Properties | Operational |
| Description | This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values |

and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

### ATTRIBUTE MmTx adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

### ATTRIBUTE MmTx operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for

operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
enabled (ena)
disabled (dis)

Default
disabled

### ATTRIBUTE MmTx usageState (osiUsage)

Access
Read only

Description
This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values
idle
active (activ)
busy

Default
idle

### ATTRIBUTE MmTx availabilityStatus (osiAvail)

Access
Read only

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is

one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default

No default

## ATTRIBUTE MmTx proceduralStatus (osiProc)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn’t initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has

not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default

No default

### ATTRIBUTE MmTx controlStatus (osiCntrl)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but

tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of: subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

### ATTRIBUTE MmTx alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default

No default

### ATTRIBUTE MmTx standbyStatus (osiStby)

Access

Read only

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the

role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default
notSet

### ATTRIBUTE MmTx unknownStatus (osiUnknw)

Access
Read only

Description
This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Values
false
true

Default
false

### GROUP MmTx Operational (Oper)

Properties
Operational

Description
This group contains status information about the AAL1 Circuit Emulation Service and the related ATM service. It also specifies the Channel to be monitored.

### ATTRIBUTE MmTx connectionStatus (connStatus)

Access
Read only

Description
This attribute indicates if a service is non-operational because of a problem with the service interface side of the service (in which

case, it is set to ***channelNotReady***) or because of a problem with the ATM side of the service (in which case, it is set to ***atmNotConfigured*** or ***atmNotReady***).

When this attribute is set to ***channelNotReady***, it is an indication that the corresponding *Chan* component (as defined by the attribute *interfaceName*) or the *Chan* component's parent port component (*Lp/n Ds1/m* or *Lp/n E1/m*) is locked.

When this attribute is set to ***atmNotConfigured***, it is an indication that no sub-component has been provisioned, and thus no ATM connection has been configured for the service.

When this attribute is set to ***atmNotReady***, it is an indication that the ATM connection with which the service is associated (as defined by a sub-component) has been lost or that it is currently unable to carry CES data.

When this attribute is set to ***channelNotSpecified***, it is an indication that the *chanToMonitor* attribute is not set to a valid channel.

This attribute is set to ***connected*** when a service is operational (that is, the OSI attribute *operationalState* is ***enabled***.)

Values
connected
channelNotReady
atmNotReady
atmNotConfigured
channelNotSpecified

Default
channelNotReady

## ATTRIBUTE MmTx chanToMonitor (chan)

Access
Read and write

Description
*chanToMonitor* specifies the LP, port (*E1* or *DS1*), and channel to monitor. The LP must be the same LP specified in the provisionable attribute *linkToLogicalProcessor*. This attribute's value is of the form Lp/x E1/y Chan/z or Lp/x DS1/y Chan/z.

Values
The name of the component

| | |
|---|---|
| Default | No default |

## COMPONENT MmTx NailedUpAdaptationPoint (Nap)

| | |
|---|---|
| Groups | "GROUP MmTx Nap Provisioned (Prov)" |
| Scope | Application |
